Some Children have their Legs bent in an unseemly manner, either from their Birth, or if they are used by the Nurse to Standing or Walking too early: In some the *Tibia* are crooked, in others the Knees are distorted, in some the Feet, at the Articulation of the *Tibia* with the *Tarsus*, are turned inwards, and they are denominated *Vari*; and in some outwards, who are named *Valgi*. This Disorder requires a different Method, according to its different Degrees and Situation. 1. The most certain and mildest Method of preventing it, is to take care, that tender Children, and those who are otherwise exposed to this Disorder, especially by the Rickets, be restrained from Standing and Walking, but be allowed to lie down, sit, or be carried, either in the Arms, or some Vehicle, till the Bones, as they increase in Age, are strengthened and confirmed. But if the Disorder increase, or is born with the Child, it will be expedient, after the Application of Emollients, according to *Hildanus*, to use certain Instruments, or a kind of Boots, such as *Paré* has delineated, (see *Tab. LVII. Fig. 14, 15.*) made of strong Leather, Wood, or thin Plates of Iron, and adapted to the Size of the Leg. These Boots, being applied to the crooked Legs, especially to those of the *Vari* and *Valgi*, dispose them as they naturally grow, to receive by Degrees a proper Shape. The Boots must be worn Day and Night. But as several Inconveniencies may proceed from the Use of these Boots, especially if they do not fit exactly, Surgeons have thought it expedient to contrive other Instruments for this Purpose, as in *Tab. XXXVI. Fig. 16.* where AA represent the two Sides, made of strong Leather, or thick Pasteboard, or of thin Plates of Iron or Brass, so joined by the Piece BB, that one may answer to the interior, and the other to the exterior Side of the Legs, as in *Fig. 17.* where they are represented applied; and they may be so fastened by the Cord, or Thong, CC, as to be kept on for a considerable time Night and Day, and gradually reduce the crooked Legs to their natural Figure and Position. If the Disorder be not seated in the *Tibia*, but rather in the Ancles, whether the Feet be turned outwards or inwards, these Instruments of *Hildanus*, *Fig. 16. 17.* may be advantageously used; but if, by reason of the Rigidity of the Limb, it cannot easily be turned to its proper Position, let emollient Fomentations, Liniments, and Baths, be used for some Days before the Application of the Instrument. But, if the Disorder be but slight, in my Opinion, the Use of these Instruments should be neglected; which are not only very troublesome, but may, also, be hurtful by binding the Leg too hard, and hindering its Growth. And I have often observed, when the Legs have been moderately bent, and sometimes when they have been greatly incurvated, if the Children be young, and not suffered to use their Feet, but to be carried or wheeled about, that their Legs have been spontaneously restored to their proper Figure. *Hildanus* may be consulted on this Head, who has given the Figures of other Instruments suited to different Cases. *Solingen*, and *Le Clerc*, may, also, be consulted. *Heister. Chir.*

VALIGA. A Name given by some to an Infusion of Jalap, by some called *Rhabarbarum nigrum*, in Spirit of Wine, or, which is better, in Spirit of Citron; then carefully strained, and some time afterwards coloured with a little Saffron; so that it seems to be the same with the *Phalaia* of *Rolsinkius. Castel.*

VALLI. *Noel-valli*, & *Panni-valli*. *H. M. Siliquosa Indica Flore papilionaceo. Siliquis planis brevibus duo aut tria semina isthmia continentibus.* This is an Indian Shrub, which unites itself by its small Branches with the neighbouring Trees; the Leaves are like those of the *Fraxinus*, and have somewhat of an acrimonious Taste; the Flowers are papilionaceous, and void of Smell; the Pods are an Inch in Length, and as much in Compass, very flat, and contain two or three Seeds separated by Isthmuses, or narrow Intervals. The Beans, when parched by the Sun's Heat, are of a cineritious Colour, and an ungrateful Taste. It flowers in *August*, and the Fruit is thoroughly ripe in *December* and *January*.

The Beans, eaten crude, provoke to Stool with Gripings. The Leaves, made into a Cataplasm, cure an Erysipelas. The Bark supplies the Place of Hemp, in making of Ropes. *Raii Hist. Plant.*

VALLUM. The Eye-brow, and a Species of Bandage, are called by this Name.

VALRAT. A Leaf. *Ralandus*.

VALVULA. A Valve. There are many Sorts of Valves in various Parts of the Body. Thus in the Intestines there are the *Valvulae Conniventes*, and the Valve of the *Colon*; see *COELIA*. In the Heart are found Valves at its Orifices. See *COR*; and Anatomists have discovered Valves in the Veins, and Lymphatic Vessels.

VANELLUS. The Lapwing. See *PLUVIALIS*.

VANILIA, BANILIA. Offic. *Vaynillus, Vayniglia*. Mont. Exot. 9. *Vanillia Piperis Arbori Jamaicensis immascens*. Pluk. Almag. 301. *Volubilis siliquosa Mexicana foliis Plantaginis*. Rati Hist. 2. 1330. *Lathyrus Mexicanus siliquis longissimis, meschatis, nigris*. Ammon. Char. Plant. 436. *Aracus aromaticus, Tlilxochitl, seu Flos niger*. Hern. 38. *Lobus oblongus aromaticus*. Cat. Jam. 70. *Lobus aromaticus subfuscus Terebinthi corniculis-similis*. C. B. P. 404. *Lobus oblongus aromaticus, odore fere Belzaniini*. J. B. I. 428. **THE VANELLOES, or BANILAS.**

These are dark-brown flat Pods, or Sheaths, five or six Inches long, and scarce an Inch broad, wrinkled on the Outside, full of a vast Number of small black Grains, almost as fine as Sand, of a pleasant Smell, like Balsam of *Peru*. The Plant which bears these Vanelloes, climbs the Trees like Bindweed; the Leaves are smooth and broad, in Shape like Plantain-leaves, set in an alternate Order; the Flowers are of a dark Colour, which are succeeded by the Vanelloes. They grow in *New-Spain*, and other Parts of the *West-Indies*, from whence they are brought to us.

They are only used with us, as an Ingredient in Chocolate, to which they give a pleasant Flavour. They are commended by *Hernandez*, in his *Descriptio Rerum Medicarum Novae Hispaniae*, Lib. 2. Cap. 15. to be grateful to the Stomach and Brain, to expel Wind, to provoke Urine, and the Menstrues, to promote the Birth, and bring away the After-birth, to resist Poison, and cure the Bites of venomous Creatures. *Miller's Bot. Off.*

VAPORES. Vapours. See *HYSTERICA*.

VAPORARIUM. A Vapour Bath.

VAPORATIO. A Fomentation by the Vapours or Steam of warm Liquors.

VAPPA is Wine deprived of all its spirituous Parts, and what is usually called *dead*. This corrupt State of Wine is frequently, and very properly, by modern Physicians, compared with a particular Corruption of the Blood, when it is in a low, spiritless, and, as we say, a *vapid* State, as the Case is in healthy Persons, when their Spirits are exhausted by immoderate Labour, or in sick Persons labouring under a Quartan, and in cachectic and scorbutic Indispositions. *Castellus*.

VARENI, VARI. Names for a scorbutic Affection, otherwise called *Arthritis vaga*, the wandering Gout, consisting in a wandering, or shifting Pain, affecting the nervous Parts about the Joints, and proceeding from an acid and malignant Acrimony of the nervous Fluid, or serous Lymph, together with an extraordinary Mobility and Vaporosity of the same, on account of the Thinness of its Contexture.

Vareni, with some, signifies a quite different Affection from *Vari*, being the same with the *AMBULO*; which see.

VARICIFORMES PARASTATÆ, in Anatomy, are continuous to the *Epididymides*, and are Vessels so called, because they appear full of Flexures and Contortions, like the *Varices*, for the better Elaboration, as it is supposed, of the Semen.

VARICOSUS, *zigzozedus*, is an Epithet apply'd to several Plexuses of the Vessels about the Pudenda, particularly of the Male. *Castellus*.

VARICULA, a Diminutive of *Varix*, is a Name given by *M. A. Severinus* to an Intumescence of the Veins in the *Tunica Adnata* of the Eye, proceeding from a Distention of them by black Blood. *Castellus*.

VARIEGATIO, Variegation, in Botany, is a Diversifying with several Colours, as is observed in the Leaves and Flowers of Plants.

VARIOLÆ. The Small-pox.

Perhaps from the Time of *Hippocrates* to this very Period, there never happened any thing so remarkable in Physic, as the Appearance of this new and surprising Distemper; the Original of which may be traced up from the *Arabian* Authors much farther backward, than is commonly imagined; even up to the famous Epoch of *Mahomet* himself, in the Beginning of the Seventh Century. The Measles, which no doubt was of the same Age, (called not improperly, by *Avicenna*, *Variola Chole-rica*) they look upon as a Disease so near akin to the Small-pox, that they generally treat of them both together, as if the greater included the less. This was a Distemper, without Dispute, unknown to the *Greeks*, whatever some of the Moderns have said to the contrary; and first observed and described

by the *Mahometans*. And since it is one so extraordinary in its Symptoms, so constant and regular in its Stages, and so universally incident to all Mankind, it were to be wished, that Mr. *Le Clerc* had thought fit to have given us a short Extract, at least, of what these original Writers have said of it; especially, when, in its very Infancy, we may find the Image of this Disease very well painted in their Works, and the Practice clearly enough delivered. That Tract of *Rhazes* alone, intitled, *A Discourse of the Pestilence*, would very fully explain to us the Idea they had of this Distemper, and shew us, that they were not at all acquainted with the Difference of the distinct and the confluent Sort. By the earliest Account we have of the Small-pox, we find, that it first appeared in *Egypt*, in the time of *Omar*, Successor to *Mahomet*; though no doubt, since the *Greeks* knew nothing of it, the *Arabians* brought it from their own Country, and might derive it originally from some of the more distant Regions of the East: For the oldest of their Writers do not speak of it as a Distemper, which had taken its Rise very lately. And as this People in less than thirty Years did propagate its Religion, and Empire, so did it no less this modern Evil, not only through *Egypt*, but *Syria*, *Palestine*, and *Persia*; and a little while after, along the *Asiatic Coast*, through *Lycia* and *Cilicia*: And, in the very Beginning of the next Century, farther into the maritime Parts of *Africa*, and cross the *Mediterranean*, even into *Spain* itself.

Here, indeed, is a new Field in Physic. I will only give you a short Plan of this Disease, as it lies in their own Authors, and especially in one of the oldest and best of them, *Rhazes*; the first, indeed, as he says himself, who wrote any distinct or exact Treatise upon this Subject. To begin then in his Method; as the Evil was unheard of before, so he assigned a Cause as entirely new in Physic, a sort of an innate Contagion. This is a Ferment in the Blood, like that in Must, which purifies itself sooner or later, by throwing off the peccant Matter at the Glands of the Skin; an Hypothesis since applied, though upon very slight Grounds, to Fevers in general, by many Moderns. This Ferment he supposes to be derived from the Mother in the Womb, which is the Reason why the Disease is so universal, and so equally incident to all. It is most epidemical in Spring, and Autumn, especially after a wet Summer, or a warm Winter: Children, and Adults, are most subject to it; old Age but seldom, unless in a very pestilential Season. Corpulent flabby Bodies which abound in Humours, and which have been used to much Wine or Milk, receive the Infection soonest; they who are of this dry Habit of Body, and of a bilious Constitution, are more subject to have a more violent Sort. The *Greek* Translator, who made his Version from the *Syriac*, (the original Language probably in which *Rhazes* wrote) calls this Sort by a Term never heard of, *Eûploia*, which, he tells us, answers to the *Syriac*, *Chaspe* *. This Word, indeed, in that Tongue, as well as in the *Hebrew*, and *Arabic*, signifies *Ἐξάνθημα*, an inflammatory Pustule; and, therefore, *N. Machelli*, who has given us a very elegant Translation of the *Greek*, expresses it properly enough by *Incendium*; but the *Greek*, he says, calls it *Eûploia*. If we go a little farther, and suppose it should be read *Ἐξπλοia*, the Sense of the Author would be entirely preserved, and very little Variation made in the Reading.

The forerunning Symptoms of this Distemper are, an acute Fever, violent Pain in the Head and Back, (the last particularly a sure Sign) Dryness of the Skin, Heaviness, Difficulty of Breathing, frightful Sleeps, Redness of the Eyes, Pricking all over the Body, Yawning, Stretching, Pulsation, and Weight in the Head, Sickness, and Inclination to vomit; Great Pain in the Back, violent Sickness, Restlessness, and Burning all over the Body, and an high flaming Colour, especially about the Throat, Signs of an ill Sort. He calls the Pustules, either *Sublimia*, which must be distinct, pointed, or rising high; or *Lata*, flat and broad, as in the confluent Kind. Many of these Symptoms are common to the Measles; and, if the Heat is more intense, and the Straintness and Oppression extremely great, especially if there be a Cough, and Itching of the Ears and Nose, 'tis rather a Sign of this last Distemper, which is sometimes more dangerous than the Small-pox.

He is very particular in relating the Differences and Prognostics of the Small-pox. If the Eruption is easy, and the Maturation comes on well, and the Fever vanishes, no Danger; otherwise, if the Fever continues after the Eruption. It is a kindly Sort when the Breathing is good, the Pulse regular, the Sense perfect, and the Person can take Nourishment, and Sleep. When the Pustules, containing a white Matter, are large, distinct, and few, and ripen without any great Fever; and even though there be many, and in some Places confluent, yet, if they are for the most part large, and advance kindly, and if, with this, the Strength keeps up, and there be no

* *Caphe*, for *Capheph*, in *Arabic*, signifies an Eruption of Pustules.

Castelli Lexicon, sub Pace 737B.

Oppression or Burning, this is to be reckoned one of the worst Sort. But when they are thick and coherent, so that a great many of them make one by running together, when the Circle of these Clusters is very large, and the Appearance of them like Fat or Suet, when they run like an Herpes, or like what they call a *Formica*, corroding, ulcerating, and contracting the Skin; when they rise like Warts, and have no Matter in them, it is a very malignant Sort; especially, if after the Eruption, they don't come on well, and the Patient be not relieved. If the Fever increases after the Eruption, an ill Sign: So a new Crop of Pustules, as it sometimes happens, shews a great Plenitude of Humours. The Sort is more kindly, when it is not attended with violent Redness; but if with great Paleness, dangerous. If the Eruption is made on the first Day of the Distemper, it shews the Humours to be too brisk and impetuous; if upon the third Day, it denotes they are more tempered and languid; if in the critical Days, by which I suppose he means the fourth and seventh, the Distemper is still milder; if there be great Pain in any Part, and that Part grows greenish or black, and the Strength fails, it is fatal; if the Pustules are extremely little, hard, of a violet, green, high-red, or a black Colour, and don't come to Maturation, it portends Ill: If they continue so throughout the whole Course of the Disease; if the Fever be not removed, and is attended with a Syncope, Sickness, or Trembling of the Heart, nothing to be expected but present Death. Thus far of the Symptoms, and the Judgment to be formed of the Event.

The Cure follows: And the better to judge of this, we must always carry it in our Memory, that *Rhazes* lived and wrote in the warm Climate of *Persia*. He bleeds, or cups immediately, even in Children; and, if the Symptoms be violent, even to Faintness; otherwise, a less Quantity is sufficient. If a Vein in the Arm be not easily found, the *Poplitea* may be open'd: The Room to be kept cool; all the Regimen to be, also, cool; Ptisane the Nourishment, and the Medicines principally Troches of Spodium, (a good Absorbent) and the Juice of Pomegranate, and all other acid and astringent Plants. And the Rule, in using this refrigerating Method, must be with regard to the intense Burning of the Disease, and managed with that Moderation, as not to extinguish the natural Heat. At first he gives Ice-water, till the Patient vomits and sweats; then vaporates with warm Water; and this he reckons the most effectual way to drive out the Pustules: So for Prevention and Preparation, he advises Bleeding, Swimming, using Ice-water, and all the coldest acid Diet, as the Juice of unripe Grapes, Salading, &c. He gives a Receipt made of Acids and Spodium, much in Vogue among the *Indians*, who, it seems, affirmed, that whoever used it would not have ten Pustules in the Whole. The Body, if bound, to be kept open, by some Infusions taken twice a Day; this will make the Pustules fewer; and to be done, if the Distemper be violent. After the Eruption, strong Purging to be avoided, especially towards the Crisis, for fear of a Dyentery; and too great a Flux is to be restrained. If Bleeding has been omitted in the Beginning, then gentle Sweating, and promoting the Eruption. If the Patient be hot, and the Pustules do not advance, the Decoction with Figs, Raisins, Lentils, &c. to be constantly used. If the Disease be slight, and the Oppression little, and the Small-pox be out, Coolers not to be given to any great Degree, for fear of retarding the Eruption; but the Decoction to be continued, with some Saffron, &c. When they are all come out, Vaporations with Water. For Dilution, Water of Barley, Pomegranates, Melons, &c. and other temperate Liquors; and any thing, which more resolves the Humours, is less necessary, especially in the Measles. If the Oppression be very great, and near to a Syncope, dipping in cold Water, and Friction, to drive out the Measles; and to take care there be not too great a Solution of the Fluids, or too profuse a Sweat. After the fifth Day, (reckoning from the first Seizure) if the Pustules don't advance, use those Medicines which promote the Eruption. But this is to be done with Circumspection, and with regard to the Symptoms; especially the Fever, which will be best judged of by the Breathing, and the Pulse. But, if the Pustules are hard and rough, like the Warts, and the Patient languid, it is to no Purpose to attempt any Maturation; for that cannot be done; such a State of the Disease being plainly pernicious. Opiates, above all things, are proper in Want of Sleep, or in case of a Looseness. The Body is open generally towards the End of this Disease, especially in the worst Kind. No Purging before the Crisis; but, if need be, and the Body be dry, purge at the Beginning, and before the Declension; the first to abate the Heat and Beating of the Head; the latter to ease Nature of her Burden, and to carry off the morbid Matter. This to be judged of either before or after Bleeding, by the Body's being weakly, yet bloated, and full of Humours; a lurking Feverishness, and undulating Pulse. In this Case, Purging answers best; but if the Mouth be bitter, if

Vomiting, and great Inflammation, if the Throat is so stuffed, as to endanger Strangling, it is proper to bleed. The Directions are very full, which relate to Gargles, Collyriums, &c. and the preventing any Ulcers, or Pitting, from the Small-pox.

This is the Description *Rhazes* gives of the Small-pox; a very true one, though it does not minutely descend into Particulars; and, for above 500 Years, it was thought so complete, that succeeding Writers scarce added any thing to it: Till at last, indeed, they came to distinguish the several Stages of this Distemper, and observe the very Days in each of them with great Exactness. However, even since that Time to our own, though the modern Authors have enter'd into a more precise Detail of the Appearances, and the Symptoms, which attend the Disease; yet, as far as regards the practical Part, we see here the Foundation of every thing they have advanced. To instance in a few Particulars:

The *Arabians* have rightly distinguished between the two Sorts of Small-pox, and between each of them, and the Measles; and have described not only the regular Sorts, but have taken Notice of the anomalous too. They have, also, observed, where one Crop has succeeded another.

At the Beginning, and sometimes even after the Eruption, they prescribe Evacuations, both by Bleeding and Purging. And, indeed, they thought, that the good or ill Event of the Distemper, depended so much upon the Treatment they used at the first Seizure, or in the first Days of it at least, that they are extraordinarily careful and exact in the Regimen, which they order to be extremely cool, as was most proper and suitable in so sultry a Climate as theirs was. Their Practice surely was founded upon good Grounds; though others have followed it in an extravagant manner, and even exceeded what they did in Nations, where neither the Nature of the Disease, nor the Constitution of the Air, required it. Even our Countryman *Sydenham* carried this Notion to an Extremity in the first Edition of his Works; though afterwards he was so wise as to retract a great deal of what he had said; and came into the moderate Method, as, without Dispute, more agreeable to Reason, and to the Temper of our own Island.

We may observe, that their whole Management, both as to Diet and Medicine, in this Stage, ran upon Dilution; which they thought the most effectual Means to produce a kindly Eruption, and to keep the Pustules out. And as to this last Point, however cooling their Regimen in general was, they made no Scruple to use warm and generous Cordials, when Nature seemed to want Assistance, or when they apprehended any Danger of their striking in. To the same End, when there was any great Disorder and Ferment in the Humours, which ought to be allay'd, or any terrible Symptom, which hindered the Maturation of the Pock, they had recourse to that sovereign and divine Remedy, Opium; a Remedy often used by them in this Case; though *Sydenham* seems to have been the first, who ever gave the least Hint of such a Practice among ourselves.

Here, too, you will find, that in the Declension of the Disease, when Nature has discharged all she can, and is ready to sink under the Load of the morbid Matter, they took the proper ways to relieve her by Art; and for that Purpose direct us, how to apply both Bleeding and Purging, in such a Case of Extremity. *Freind's Hist. of Physic.*

HISTORY OF THE DISEASE.

When the Small-pox proves epidemic, and is mild and regular, it usually begins about the vernal Equinox; but, when it is not only epidemic, but irregular and dangerous, it appears about *January*. The Small-pox is of two Kinds, the *distinct*, and the *confluent*; which though they differ not essentially, are easily distinguished by some considerable Symptoms peculiar to each Kind.

The *distinct* Kind begins, (1.) with a Chills and Shivering, immediately followed by (2.) extreme Heat, (3.) violent Pain in the Head and Back, (4.) Vomiting, (5.) and in Adults, a great Tendency to Sweat; (6.) Pain in the Parts immediately below the *Scrobiculum Cordis*, if they be pressed with the Hand; (7.) Sleepiness and *Stupor*, especially in Children, and sometimes Convulsions, which happening after Dention, I always suspect the Small-pox to be approaching; and the Eruptions, appearing in a few Hours after, generally confirm the Prognostic; and I have frequently observed, that the Small-pox immediately succeeding such Fits throws out large Eruptions, is of a mild and favourable Kind, and seldom proves confluent. It may be proper to observe here, that in such whose Blood is of a looser Texture, and easily admits of a Change, it sometimes happens, that the Course of Separation is performed by degrees, without any considerable Sickness previous to the Expulsion of the Matter, and Eruption of the Pustules.

The *distinct* Small-pox come out mostly on the fourth Day inclusive, from the Beginning of the Illness, and sometimes a little

little later, but very rarely sooner; at which time the Symptoms are usually much abated, or even entirely vanish, so that the Patient seems tolerably well; only Adults can scarcely be prevented from sweating, however thinly they are covered; and this Disposition continues till the Eruptions begin to ripen, and then disappear spontaneously. The Eruption proceeds nearly in the following manner: First, a kind of pale-red Pustules, as large as the Head of a small Pin, appear dispersed, first on the Head, Neck, and Breasts, and afterwards on the whole Body. During this Stage of the Disease, the Throat is affected with a Soreness, that increases proportionably as the Pustules rise, which, growing every Day larger, and sharper at the Top, diffuse a Redness and Inflammation over the Skin and Flesh of the Parts adjacent.

This happens about the eighth Day from the Beginning of the Disease, which time I always particularly observe; for then the Spaces between the Pustules, that appeared before of a pale White, begin to grow red, and swell in proportion to the Number of Pustules; and are affected with a Pain, and, as it were, a Laceration of the Parts, which continually increasing, promotes the Inflammation and Swelling; so that, in the Progress of the Disease, the Eye-lids are so distended, as sometimes to render the Patient blind; and they shine, and nearly resemble an inflated Bladder. Sometimes the Blindness is induced sooner, a great Number of Pustules fixing on the Eyes from the Beginning of the Eruption; next, the Face, the Hands, and Fingers swell in proportion to the Quantity of the Pustules. The Pustules on the Face, that till this Day were smooth and red, now grow rough and whitish, which is the first Sign of a beginning Suppuration; and they, also, gradually discharge a yellow Matter, in Colour resembling an Honey-comb. The Inflammation of the Hands and Face, being arrived at its Height, produces in the Spaces between the Eruptions, a florid Colour, like that of Damask-roses; and the more mild and genuine the Disorder is, the more the Eruptions, and their intermediate Spaces approach this Colour. As the Pustules in the Face appear rougher and yellower every Day as they ripen, those of the Hands, and other Parts, appear smoother and whiter.

On the eleventh Day, the Swelling and Inflammation manifestly abate, and the Eruptions both of the Face, and the rest of the Body, being come to their Maturity, and just Bigness, equal to that of a large Pea, dry and scale off; and, in this kind of Small-pox, they commonly disappear on the fourteenth and fifteenth Day. But the Eruptions of the Hands generally prove more obstinate than those of the other Parts; and, being yet fresh and white, remain a Day or two after the rest. Those of the Face and Body scale off, but these of the Hands burst, and so vanish. The Pustules of the Skin are succeeded by a Scurf, or branny Scales, and these sometimes by Pits, or Pock-marks; for when the Pustules first fall off, no Unevenness is perceived in the Skin; but these Scales often coming on, and falling off alternately, at length those Pits are produced, which frequently appear long after the Recovery of the Patient; tho' the distinct Small-pox very rarely leaves any Marks behind it. The Patient is either quite costive, or has few Stools, during the whole Course of the Distemper.

That Species of the Small-pox, which we call the *confluent*, is attended with the same Symptoms in common as the *distinct*, only they prove more violent; and by that Sign the *confluent* Kind may be distinguished from the *distinct*, even before the Eruption. Nevertheless, the Patient is not so ready to sweat in the *confluent* Kind as in the other; and a Looseness sometimes precedes, and continues a Day or two after the Eruption; a Symptom which I have not hitherto met with in the *distinct* Small-pox.

The *confluent* Small-pox generally comes out on the third Day, sometimes earlier, but scarcely ever later; whereas the *distinct* appears on the fourth Day, or later; but very rarely before; and the sooner the Pustules come out before the fourth Day, the more they run together. However, though this be true in general, and the *confluent* Kind scarcely ever appears so late as the fourth Day; yet, sometimes, the Eruption is deferred, by some violent Symptom, to the fourth or fifth Day. Thus, 1. Sometimes, by a sharp Pain in the Loins, resembling a Fit of the Stone. 2. Sometimes in the Side, like a Pleurisy. 3. Sometimes in the Limbs, as in a Rheumatism. Or, lastly, 4. In the Stomach, attended with great Sickness and Vomiting. In these Cases, which, however, are not common, I have observed the Small Pox to come out later than ordinary, as being retarded by the considerable Violence of the Symptoms, which, being more severe than usual, when they arise in the very Beginning, manifestly indicate the subsequent Small Pox to be of the *confluent* Kind, and not void of Danger.

Though the first Symptoms of the *distinct* Kind vanish immediately after the Eruption, yet, in the *confluent* Kind, they afflict the Patient several Days after the Pustules appear.

Sometimes this sort comes out like an *Erysipelas*, and sometimes like the Measles, from which they are difficult to be distinguished, without carefully attending to the different Times of the Eruption in these Diseases, and other Circumstances, in which they differ extremely. As the Distemper increases, the Pustules, especially of the Face, do not rise plump, as in the *distinct* Kind, but run together; and appear, at first, like a red Bladder, covering the whole Face, and making it swell sooner than in the *distinct* sort, till, at last, they appear like a thin white Pellicle, closely adhering to the Face, and rising little higher than the Surface of the Skin.

After the eighth Day, this Pellicle grows every Day gradually rougher, as appears by the Touch, and inclines to a brown, and not to a yellow Colour, as in the *distinct* Kind: The Roughness and Colour of the Skin daily increase, till, at length, the Pellicle falls off in large Scales; but, when the Disease has been very severe, it usually sticks to some Part of the Face, till after the twentieth Day. The more violent the Distemper proves, the nearer the Eruptions, as they ripen, incline to a dark-brown Colour; and the longer they are in falling off, if left to themselves; but the less they run together, the yellower they are, and the sooner they scale off. When this Pellicle, or Scab, which covers the Face, first falls off, it leaves no Roughness behind; but it is immediately succeeded with branny Scales, of a very corrosive Nature, which not only make larger Pits than the *distinct* Kind generally do, but, also, much disfigure the Face with unseemly Scars: And, in the *confluent* Kind, if the Disease has been very violent, the Skin of the Shoulders and Back sometimes scales off, leaving these Parts bare.

It must be observ'd, that this Disease is not to be esteem'd dangerous from the Number of Eruptions scatter'd over the Body, but only from that in the Face; for if they be very thick in the Face, though there are but few, and those of the *distinct* Kind, every-where else, the Patient is equally endangered, as if all the Limbs were extremely full. But, on the contrary, though every Part besides be full, if there be but few in the Face, the Danger is less. In this manner, therefore, must we judge of the Kind.

In the *confluent* Small Pox I have always observ'd, the Eruptions in the Hands and Feet were larger than those of the other Parts, and were gradually less and less, the nearer they approached the Body.

The *confluent* Small Pox is attended with two other considerable Symptoms: 1. A Salivation, or Spitting, in Adults. And, 2. A Looseness, in Children. The former is so constant an Attendant on this Disease, in Adults, that I never met with but one Patient who was free from it; but the Looseness does not so certainly affect Children. The Evacuation made by these Symptoms is as necessary as either the Eruptions, or the Swelling of the Face and Hands.

The Salivation sometimes begins as soon as the Eruptions appear, and sometimes not till a Day or two after: The Matter is for some time thin, easily and plentifully expectorated; and this Salivation resembles that raised by Mercury, only the *Saliva* is not so fetid: But, towards the eleventh Day, the *Saliva* now becomes more viscous; is raised with great Difficulty; the Patient is thirsty, coughs often whilst he drinks; and the Liquor flies out at the Nostrils; from this Day the Salivation generally stops; though sometimes but rarely, after it has ceased for a Day or two, it returns: At the same time, the Swelling of the Face begins to abate, but then the Hands commonly swell, or, at least, ought to do so.

The Looseness, in Children, appears not so soon as the Salivation in Adults; but, whenever it begins, unless it be stoppt by Art, it attends the Distemper throughout.

In both Kinds of the Small Pox the Fever rages most from the Beginning to the time of the Eruption, after which, it abates, and continues much more moderate, till the Suppuration begins, which being finished, it ceases entirely.

I have always observed, when the Disease proved very violent, that the Patient had a Kind of Paroxysm towards Evening, at which time the more dangerous Symptoms arose, and raged most severely.

IRREGULAR SYMPTOMS, ARISING FROM UNSKILFUL TREATMENT.

The irregular Symptoms which happen on the eighth Day, in the *distinct* Kind, and on the eleventh, in the *confluent*, always calculating from the first Beginning of the Distemper, most eminently concern the Life or Death of the Patient, it being apparent, that most of those who perish by either Species, die on one of the above-mentioned Days.

In the *distinct* Kind, as the Patient, if an Adult, usually sweats freely, he conceives Hope of Recovery, thinking the Malignity of the Disease will thus be expelled through the Pores of the Skin; and therefore diligently promotes the Sweat, by a
hot

hot Regimen. But those Particles being, at length, expelled by Sweat, which should have served to raise the Pustules, and swell the Face, on the eighth Day; the Face, instead of being swelled, appears flaccid; and the intermediate Spaces, instead of being inflamed, appear white, or pale, whilst the Pustules look red, and continue elevated, even after the Death of the Patient. The Sweat, which had flowed freely to this Day, now ceases suddenly and spontaneously, and can't be raised again by the warmest Cordials. In the mean time, the Patient is seized with a Delirium, great Restlessness and Sickness, a Frequency of making Urine in small Quantities, and expires in a few Hours. But it must here be observed, that, if the Eruptions be few, the Disease happens in the Winter, and in a Person in Years, or if Bleeding has been previously used, this hot Regimen does not then so certainly hinder the Swelling of the Face, and, consequently, hasten Death, as where the Eruptions are many, the Patients in the Prime of Life, and no Blood has been taken away.

But, in the *confluent* Kind, the Danger is greatest, and the greatest Number die on the eleventh Day: For as the Salivation, which had hitherto preserved the Patient, commonly ceases spontaneously about this time, unless the Swelling of the Face continues longer, and that of the Hands, now manifestly beginning, supplies its Place, Death must certainly ensue. For it must be considered, that, in this Kind of Small Pox, where the Eruptions are so small, not only the Salivation, but, also, the Swelling of the Face and Hands, is absolutely required, in order to a proper Discharge of the morbid Matter; and if either be wanting, or disappear too soon, the Patient must perish immediately. But it happens too frequently, in this hot Distemper, that the Texture of the Blood is so much weaken'd, and broke, and so highly inflamed, by an over-hot Regimen, as to be no longer able to perform the Expulsion of the inflammatory Particles in a slow and gradual manner (not to mention now the Mischiefs proceeding from forcing Sweat improperly); whence either the Face and Hands do not swell at all, or the Swelling vanishes with the Salivation. For though the Swelling of the Face ought to abate a little on this Day, yet it should not go off entirely, till a Day or two after; the Swelling of the Hands, in the mean while, continuing, and increasing, which is one of the most certain Signs of Recovery, as the contrary is of imminent Danger.

The *Saliva*, on this Day, becomes so viscid, and tough, as to endanger Suffocation; and, when the Patient drinks, the Liquor falls down the Windpipe; whence it is thrown up through the Nostrils with a violent Cough: He is seized with a Hoarseness, a great Stupor, and Drowsiness; and, being wholly oppressed by the Violence of the Disease, generally sinks under the Difficulties on this Day.

There are, also, other Symptoms, which happen in any Stage of the Distemper, and which are equally common in the *distinct* and *confluent* Kinds of the Small Pox. Thus a *Delirium* sometimes seizes the Patient, occasioned by the excessive Ebullition of the Blood; and the Heat is so intolerable, that he endeavours furiously to get loose from those who confine him in Bed. Sometimes the same Cause produces a Kind of *Coma*, so that the Patient almost continually dozes, unless he be constantly roused.

Sometimes, also, in this Disease, as in the Plague, the Texture of the Blood, being dissolv'd by the Violence of the Inflammation, purple Spots appear in the Spaces between the Eruptions, which are generally Forerunners of Death: This Circumstance happens oftener, when the Constitution of the Air chiefly favours this epidemic Disease. Sometimes black Spots, scarce so large as small Pins Heads, and depressed in the Middle, appear on the Tops of the Eruptions, in different Places; which, as they proceed from too much Heat, at length, by the Use of a cooler Regimen, acquire a brown, and afterwards a yellow Colour, which naturally belongs to the genuine and regular Small Pox; and the nearer the Eruptions, when come to Suppuration, resemble this Colour, all the Symptoms become proportionably milder, and *vice versa*.

The Blood of young, and of vigorous Persons, is sometimes so much inflamed, in this Disease, especially if too liberal an Use of Wine, or any spirituous Liquor, has preceded, as to break through the Arteries into the Bladder, and so occasion bloody Urine; which is one of the most dangerous Symptoms of this Distemper.

Sometimes, but not so frequently, a Flux of Blood from the Lungs, proceeds from the same Cause: But either of these Hæmorrhages usually happen in the Beginning, before the Eruptions appear, which would prove particularly *confluent*.

Sometimes, also, especially in young Persons, there happens a total Suppression of Urine, either at the Height or Declension of the *distinct* Kind.

Other Symptoms arise, when the Patient has been injured, 1. By too intense Cold. 2. Improper Bleeding in a very large

Quantity. Or, 3. Over-purging. Whence the Eruptions sometimes suddenly sink, and a Looseness comes on, which, in Adults, proves highly dangerous, the variolous Matter being thereby struck in, so that Nature is utterly unable to expel it: By these means, also, the Swelling of the Face and Hands is check'd.

But the Symptoms, which proceed from taking Cold, seldom appear, if compared with those that arise from the hot Regimen: For as this Disease may deservedly be reckon'd among those of the most inflammatory Kind, a Mistake, on this hand, happens much more frequently than on the other.

The Essence of this Disease seems to be an Inflammation of the Blood and Juices, (yet of a different Kind from other Inflammations) in removing which, Nature, during the first two or three Days, endeavours to correct and digest the inflamed Particles, which, being afterwards thrown out on the Surface of the Body, she further ripens, and, at length, totally expels them, in the Form of small Abscesses. Hence, in order to lay a Foundation for the Method of Cure, it must be remarked, that this Disease has two Stages; the first is that of the Separation, the second that of the Expulsion.

1. The Separation is mostly accompanied with a febrile Ebullition, and is ordinarily finished in three or four Days, during which time, Nature is employed in collecting the inflamed Particles that disturb the Blood, and, expelling them to the fleshy Parts; which being over, the former Calm returns. 2. The Expulsion next succeeds, which is performed during the Remainder of the Disease, by means of those small Abscesses in the Flesh, which, like other Abscesses, undergo the States of Crudity, Suppuration, and Exsiccation; and if these States are finished in a suitable manner, the Danger is past; but, if otherwise, all is disordered. The Expulsion requires a much longer time than the Separation, this being performed in a thin fluid Body, but that in a dense Substance, at a greater Distance from the Fountain of Life.

Hence the Indications are, 1. That such an equable Ebullition of the Blood be maintain'd, that it may neither finish the Separation too hastily, by rising too high; nor retard, or render it incomplete, by sinking too low. 2. That the Abscesses or Eruptions be carefully kept up, so that, running through their proper States, they may, at length, entirely discharge the Matter they contain, and vanish.

With regard to the first Indication, great Caution is requir'd, especially during the Separation, that the Ebullition may not rise too high, either from heaping too many Cloaths on the Patient, over-heating the Air, by keeping too large a Fire in the Room, or using heating Medicines and Cardiacs, especially if the Patient be in the Prime of Life, or if his Blood be too much enriched by spirituous Liquors, or if it be the Spring Season, or, at least, only the Beginning of Summer; otherwise, the Separation, which should be carried on slowly, and gradually, for the better promoting an universal Despumation, will hence be hurried on too fast, and thus either there will not be a sufficient Number of Particles collected, or, perhaps, some Particles may be brought to Secretion, which Nature would not, otherwise, have secreted, were she not forced beyond her just Limits, and made to injure herself: For when such Particles are separated, as are unfit for Separation, the Motion of others, that have a Tendency to it, is hindered, by their mixing with these; and thus they are rendered less fit for Expulsion.

It seems agreeable to Reason, that the more time Nature employs in perfecting the Separation, provided the Ebullition does not entirely subside, so much the more certainly and universally it is completed; upon which the Success of the subsequent Cure must needs principally depend, as a different Event must manifestly ensue from the contrary Method. For as over-early Fruit does not come to Perfection, so no Good arises from the hot Regimen, but it frequently produces an immediate Delirium, or profuse Sweats arise, whereby such Particles are separated as are unfit for Secretion, and not agreeable to the Nature of *Pus*; or else the Eruptions, being driven out too much by Cardiacs, and a hot Regimen, become of a terrible and fatal *confluent* Kind.

From the other Method I have never observed any Mischief; for Nature, left to herself, finishes her Work in a proper time and manner, so as to need no Assistance, at least in the Young and Robust.

But the Danger of raising the Ebullition, by a hot Regimen, is not greater than the Danger of depressing it by Bleeding, Emetics, Cathartics, Clysters, and the like Evacuations: For, by them, not only the Ebullition is too much diminished, by means of which the Parts, intended for Despumation, should have been carefully separated; but the Matter, also, is wasted, which should continually serve as Fuel to the Secretion once begun: Whence it frequently happens, that the Eruptions, which came out kindly in the Beginning, and, perhaps, so much the better from the previous Use of the above-mentioned Evacuations,

cuations, sink soon after, as if they were suddenly struck in ; occasioned, principally, by a want of a fresh Supply of Matter to succeed the former, and finish the Separation. We shall, afterwards, shew, that Bleeding and Vomiting are necessary, in the *confluent* Kind.

To proceed to the second Indication : As it has been shewn, that it is highly dangerous to keep the Patient over-warm, during the time of Separation, whilst the Fever is present, and the Eruptions scarcely appear ; so an Error of this Kind is equally dangerous, at any time of the Disease, and especially towards the Beginning of the Expulsion, whilst the Eruptions are yet in a State of Crudity. For though the tumultuary Motion of the Blood be considerably abated, upon the Separation and Translation of the Matter to the fleshy Parts ; yet, being still weak, and having scarcely acquired a new State and Texture, it is easily affected by the immoderate Heat arising from all Parts ; and, upon the least Occasion given, becomes inflamed with a Tendency to a new Ebullition, which does not promote Separation, that Business being already finished, but produces dangerous Symptoms, disturbs the Eruption begun, and proves detrimental, by putting the Contents of the Pustules into violent Motion. By these means, either the Particles, already secreted, and deposited in the Habit, being hurried away by the violent and rapid Motion of the Blood, are absorbed by it ; or the fleshy Parts, being heated beyond the Degree requisite for Suppuration, do not finish it so completely : Or, lastly, perhaps, upon the coming of this new Disorder, the Texture of the Blood, and the Tone of the fleshy Parts, suffer so great an Alteration, that they cannot overcome the Matter expelled, and digest it in the usual Way of Abscesses.

But we must not be so intent upon preventing an immoderate Ebullition of the Blood, as to check the Eruption of the Pustules, by exposing the Patient to the Injuries of the Cold : The fittest Degree of Heat, to promote their Expulsion, is the natural one, as this is suitable to the Temper of the fleshy Parts ; and to exceed, or fall short of it, is dangerous, on either hand.

From what has been deliver'd, it seems manifest, that this Disease is a very dangerous one, and the Method of Cure difficult to be ascertained.

If the Eruptions recede, or the Swelling of the Face and Hands fall, either from unseasonable Bleeding, or taking Cold, recourse must be had to Cardiacs ; but we must be careful of giving them too freely, lest a new Ebullition should be suddenly raised ; the Blood being, yet, weak, and easily affected by a hot Stimulus.

As soon as the Signs of the Disease appear, I confine the Patient within Doors, forbid the Use of Wine and Fleishmeats, and allow Small Beer, moderately warm, with a Toast, for common Drink ; and sometimes suffer it to be drank at Pleasure : I, also, direct Water-gruel, Barley-broth, roasted Apples, and other Kinds of Aliment, that are neither remarkably heating, nor cooling, nor hard to digest ; nor do I much disapprove of Milk, with roast Apples bruised in it, provided it be given warm, and sparingly. I immediately caution against a hotter Regimen, and the Use of all Cardiacs.

Bloody Urine, purple Spots, and other mortal Symptoms above specified, happen only from a too early Confinement in Bed, especially in young Persons : I do not, therefore, direct the Patient to be put to Bed till the fourth Day ; at which time, if the Eruption does not come kindly forward, it is proper to give some gentle Cardiac, at least for once, to drive out the Pustules. Among the Medicines that produce this Effect, those called Purgatives, or Opiates, such as Liquid Laudanum, Diacordium, and the like, given in a small Quantity, mixed with some proper Cordial Water, are the most efficacious : For as they abate the Ebullition of the Blood, Nature expels the morbid Matter with greater Ease and Convenience. But I would not advise the giving a Cardiac before this Juncture, even though there be a Looseness, that should require such a Remedy ; for the Looseness goes off spontaneously, as does a Vomiting, when Nature expels the variolous Matter by the Skin.

But if I am called to a strong young Man, who, besides, has been addicted to a free Use of Wine, or any other spirituous Liquor, I think, for him to keep from Bed, and refrain from Cordials, not sufficient to check the Ebullition of the Blood, unless Bleeding in the Arm be, also, used : For the Motion of the Blood, being rendered so violent by its Inflammation, it frequently bursts through the Vessels into the Bladder, or occasions purple Spots, and other malignant Symptoms, which destroy the Patient.

As soon as the Pustules appear, I examine carefully, whether they are of the *distinct* or *confluent* Kind, as they differ extremely from each other : If, therefore, upon considering the Symptoms above-enumerated, they appear of the *distinct* Kind, I take care, that the Patient be refreshed with Small Beer, Wa-

ter-gruel, Barley-water, or the like, in the manner above directed ; and, if it be Summer, the Weather exceeding hot, and the Pustules few, I see no Reason why the Patient should be confined in Bed, but, rather, that he may rise, and sit up a few Hours every Day, provided the Injuries, arising from the Extremes of Heat or Cold, be prevented, both with respect to the Place where he lies, and the manner of Clothing : For when the Patient sits up between-whiles, the Distemper finishes its Course with greater Ease, and, also, more expeditiously, than if he had been constantly kept in Bed ; which not only prolongs the Illness, but, likewise, promotes the febrile Heat, and occasions a painful Inflammation, upon the Rising of the Pustules : But if the Coldness of the Season, or a numerous Eruption, makes it necessary for the Patient to keep his Bed constantly, I take care to prevent his lying warmer, or with more Cloaths on him, than he used to do whilst in Health ; and that only a moderate Fire be made in the Room, Morning and Night, unless it be the Winter Season. Neither do I require, that he should lie always in the same Place in Bed, lest a Sweat should be raised, which can't be promoted without very great Danger.

In the Declension of the Illness, when the free Exhalation of the *Effluvia*, proceeding from the Matter, now chang'd into Pus, is prevented by the Hardness and Dryness of the Pustules, it will be proper to give five or six Spoonfuls of *Canary*, or some other mild Cardiac ; lest these putrid *Effluvia* return again into the Blood. At this time, also, and not before, Cardiacs, and a warmer, and more cordial Diet, may be allow'd ; as Sugar-sops, Oatmeal-caudle, and the like. Nor will any thing further be needful, in the kindly *distinct* Species, provided the Patient will conform to this temperate Method and Diet ; unless, perhaps, Restlessness, Watchings, or other Symptoms, threatening a Delirium, should occasionally require an Opiate.

This is the true and genuine Method of treating this Kind of Small Pox ; but if, through the Prejudices or Obstinacy of the Friends, or Diffidence of the Patient, this Regimen be opposed, I esteem it safest to bleed ; which though it is, in its own Nature, prejudicial in this Kind of Small Pox, as it disturbs the Separation, and lessens the Supplies intended to keep up the Eruptions and Swelling, yet it makes some little Amends for the Injuries of the subsequent hot Regimen ; and therefore renders this Method, which I would not use without Compulsion, less dangerous.

Greater is the Danger in the *confluent* Small Pox, which proceeds from a greater Inflammation of the Blood, and therefore more Caution is required, not to heat the Patient. But though this Kind naturally demands greater Cooling than the other, yet, in order to promote the Swelling of the Face and Hands, (without which Death must ensue) and the Elevation and Increase of the Eruptions ; and, also, because the Patient, on account of the painful Ulcerations, cannot sit up, it is proper he should keep his Body, and even his Hands, in Bed, provided he be lightly covered, and allowed to turn himself therein, as he pleases : And, in the Declension of the Distemper, upon the Approach of the suppurative Fever, he must not only be allow'd this Liberty, but admonished to make use of it ; and must be turned often, Night and Day, to moderate the excessive Heat, and prevent Sweat, by which the Humour is discharged, wherewith the Small Pox should be diluted, to render them mild.

As the Salivation, which constantly attends this Kind of Small Pox, is one of Nature's principal Evacuations, and is here substituted instead of that which should have been made by Pustules, (for the Evacuation by Pustules does not proceed so well in this low and flat Sort, as in the other) we must diligently endeavour to keep it at its Height, and prevent its untimely Stoppage, either from the Use of heating Medicines, or by forbidding the free Use of Small Beer, or some such Liquor. Now as the Spitting, in its natural Order, is to begin as soon as the Eruptions appear, and abate on the eleventh Day, but not entirely vanish till a Day or two after, so, if it ceases before that Day, the Danger is great : For as the Swelling of the Face, by which some Part of the morbid Matter is evacuated, always vanishes on that Day, if the Salivation stops at the same time, the Patient is infected by the variolous Matter, now become corrupt, as by a Poison ; and there being no way left for it to pass off, the Danger is imminent, unless, as it sometimes happens, the Swelling of the Hands be so considerable, as to snatch the Patient from impending Death. This Salivation may be promoted by drinking Small Beer freely, or some other Liquor, that neither heats, nor excites Sweat.

Besides these, in order to check the violent Ebullition, and promote the Spitting, Opiates are more proper than any other Remedies ; and though, by their incrassating Quality, they may seem, in some measure, to hinder the Expectoration, yet I have long shaken off that Prejudice, and given them in this Disease with great Success, provided the Patient was above Fourteen.

For as the Blood of Infants and Children, who generally sleep tolerably well throughout this Disease, ferments more gently, it stands less in need of such a Check; besides, by the Use of this Kind of Remedy, the Looseness, which Nature appoints to be an Evacuation for Children in this Species of the Disease, is stop'd, to the Detriment of the Patient.

In Adults, the frequent Use of Opiates is attended with the following Advantages: 1. By procuring moderate Rest, they abate the violent Ebullition of the Blood, and prevent a Delirium. 2. They promote the Swelling of the Face and Hands. 3. They support and prolong the Swelling to its natural Period. 4. They promote the Salivation, which, though it may be stop'd in some Subjects for a few Hours, by means of so powerful an incrustating Medicine; yet the Strength being increased by these new Helps, Nature resumes fresh Vigour, and happily finishes the Work. 5. I have observed, that the Spitting, which usually abates about the eleventh Day, and sometimes earlier, to the great Detriment of the Patient, by giving Opiates a few times, has been raised anew, and not ceased before the fourteenth Day, and sometimes later. I usually give about fourteen Drops of liquid Laudanum, or an Ounce of Syrup of white Poppies, in a little Cowslip-flower water, or some such distill'd Water, to Adults, every Night after the Eruption is over, to the End of the Disease. And as in the worst Kind of Small Pox a hot Fit, attended with Restlessness, Anxiety, and other Symptoms, generally come on in the Evening; this may, in some measure, be prevented, by administering the Opiate at Six or Seven at Night.

As a Looseness as certainly accompanies the *confluent* Small Pox in Children, as a Salivation in Adults, I take care by no means to check this Looseness; and direct the Children to be kept sometimes in the Cradle, and sometimes taken up, allowing them the same Diet, if they be weaned, as I directed for Adults.

In the Declension of the Disease, when the Face is stiff, occasioned by the Eruptions becoming crusty, hard, and dry, I anoint it frequently with Oil of sweet Almonds, as well to ease the Pain, as to promote a freer Exhalation of the hot *Effluvia*. I use no Endeavours to prevent the Pitting of the Face, as Oils, Liniments, and the like; these only causing the Scurf to scale off more slowly, which is gradually succeeded by unseemly Scars. But the Patient need not be very anxious about these, when, by reason of a previous temperate Regimen, the Eruptions, having been little irritated, have contracted no caustic Quality.

Now though this Method, provided it be carefully and prudently suited to particular Circumstances, will render the Disease very gentle and safe; yet, in some Cases, I find it necessary to use a different Treatment.

First, therefore, if in the *distinct* Kind, by means of an over-hot Regimen, and continual Sweats, the Face does not swell on the eighth Day, but is flaccid, and the Spaces between the Eruptions look pale, whilst the Pustules appear in great abundance; besides using my utmost Endeavours by a more temperate Regimen, to check the violent Motion of the Blood, I immediately direct an Opiate to be given, which, by gently procuring Sleep, (unless the Brain be over-heated) and, consequently, moderating the Tumult raised in the Blood, seasonably determines it, together with the Heat, to the Face, as the Nature of the Disease demands.

But if the Mischief, hence arising, has proceeded so far, that the Sweat, which had hitherto flowed plentifully, ceases spontaneously, the Patient is seized with a Delirium, complains of great Sickness, and makes Urine often in a small Quantity; in this Case, the Danger of Death being imminent, I conceive he can only be reliev'd, either by giving Opiates freely, or taking away a large Quantity of Blood, and exposing his Body to the open Air. Nor will what I have now propos'd seem imprudent, and unreasonable, if we attend to those who have escap'd imminent Death, by the plentiful Bleeding at the Nose, suddenly arising: Besides, it must be considered, that, in this dangerous Extremity, Death does not ensue, because the Eruptions strike in; for they appear red and plump, even when the Patient is expiring; but because the Face does not swell. Now whatever tends to abate the Heat of the Blood, and I conceive, that none will deny that Bleeding, and moderate Cooling, have this Virtue, must necessarily help to promote the Swelling of the Face, as much as the Use of Opiates, and apparently for the same Reasons.

But I would not be understood to advise Bleeding immediately, in every *Delirium* happening in the Small Pox, since no Symptom oftener occurs in this Disease: But, 1. In that only which happens because the Face does not swell, that is, in the *distinct* kind, the Eruptions being, at the same time, pretty numerous; or, 2. Where the Motion of the Blood is become so violent and immoderate, by means of a very hot Regimen, and the Use of Cardiacs, as to render it unsafe to wait till it can be reduced to a due Temper, by Opiates, and other pro-

per Medicines. In such Cases, also, it has frequently seem'd sufficient to me, for the Patient to rise and sit up awhile in his raving Fit; by which Expedient I have saved several from Death. And, besides those I have seen, there are numberless Instances of Persons, who, by these means, have been snatched from imminent Danger. For some delirious Persons, deceiving their Nurses, and getting out of Bed, have remained exposed to the cold Air, even in the Night-time; and others have secretly, or by Intreaty, procured cold Water to drink; and thus, by an happy Mistake, saved their Lives, when despaired of.

I shall here set down the History of a Case, which I had from the Person concerned: He told me, that when he was a young Man, he went to *Bristol*, and was there seized with the Small Pox, about Midsummer, followed soon after with a Delirium: His Nurse, going into the City, left him in the mean while to the Care of some other Persons, intending to be back soon; but, making a pretty long Stay, the Patient in the mean while died, as the Attendants thought; who, considering the Heat of the Season, and his Corpulence, that the Body might not smell, took it out of Bed, and laid it naked on a Table, throwing a Sheet over it. The Nurse at length returning, and looking on his Face, she imagined she saw some small Signs of Life, and, therefore, put him to Bed again directly, and brought him to himself; and he recovered in a few Days.

If the Saliva in the *confluent* Small Pox be render'd so hard and viscid by the preceding Heat, as to endanger Suffocation, which commonly happens on the eleventh Day, a Gargarism must absolutely be used, and great Charge given, to syringe the Throat with it Night and Day. Small Beer, or Barley-water, mixed with Honey of Roses, may be employed for this Purpose, or the following:

Take of the Bark of Elm, six Drams; Liquorice-root, half an Ounce; twenty stoned Raisins; red Roses, two Pugsils: Boil them together, in a sufficient Quantity of Water, to leave a Pint and half; in which, when strained off, dissolve, of simple Oxymel, and Honey of Roses, each two Ounces: Mix the Whole for a Gargarism.

But, if the Patient has been treated in a proper manner, the Salivation, even though it has begun to abate, will so effectually answer its End, as to render this Remedy superfluous. And, in reality, when the Patient is every moment in danger of Suffocation, oppress'd with a *Stupor*, and breathes with the utmost Difficulty, it is not safe to trust to this Remedy. In this Case I have sometimes seasonably and successfully given a Vomit, of the Infusion of *Crocus Metallorum*, in a larger Dose than ordinary, to an Ounce and an half; because the *Stupor* is so considerable, that a smaller Quantity will not operate, but by disturbing those Humours which it cannot eject, greatly endangers the Life of the Patient. Neither can we wholly trust to this Remedy, and, which is truly to be regretted, we are hitherto unprovided with a more certain and effectual one, to conquer this dreadful Symptom, which alone destroys most of those who die on the eleventh Day, in this kind of Small Pox.

As the other Symptoms happening in this Distemper are prevented, so, likewise, most of them are relieved, by a temperate Regimen. For Instance, as the Delirium above-mentioned, proceeding from the too great Heat of the Brain, is removed by cooling the Blood, so, by the same means, a Coma is easily remedied; which seems to be a quite different Symptom. By cooling the Blood in this manner, I have seen purple Spots removed; but have not yet been able, by this or any other Method, to stop bloody Urine, or a violent Flux of Blood from the Lungs; but so far as I have hitherto observed, both these Hemorrhages prognosticate certain Death.

In a Suppression of Urine, which sometimes happens in the Young and Vigorous, from the great Confusion and Disorder of the Spirits, subservient to this Excretion, by reason of the immoderate Heat and Agitation of the Blood and Juices, I have had recourse to all the Kinds of Diuretics; but nothing has succeeded so well with me as taking the Patient out of Bed, who, after walking twice or thrice cross the Room, supported by the Attendants, has immediately voided Urine pretty plentifully, to his great Relief.

But the Symptoms proceeding from the Striking-in of the various Matter from intense Cold, or unseasonable Evacuations, must be remedied by Cardiacs, and a suitable Regimen; which, however, must not be continued longer than those Symptoms last: The principal of these are a Depression, or Sinking of the Pustules, and a Looseness, both in the *distinct* Kind: For, in the *confluent* Kind, neither the Depression nor Sinking of the Pustules, threaten Danger, this being the Nature of the Disease; nor a Looseness in Children, because it promotes their Recovery. In either Case, it is highly proper to give a cordial Draught, made of some proper distill'd Waters, mixed with Diafcoridium, liquid Laudanum, and the like, not only to re-

move the above-mentioned Symptoms; but at any time of the Disease, if the Patient complains of a Pain at the Heart and Sickness. I judge, that the Notion of the frequent Striking-in of the Eruptions, proceeds from hence, that such as have observed the Depression of them, in the *confluent* Kind, esteemed it to be a Striking-in of the variolous Matter from taking Cold; whereas here it is only the Nature of the Disease; and they suspect the same in the distinct Kind, because they look for the Eruption, and Increase of the Pustules, before the due time; not having sufficiently attended to the time wherein Nature usually finishes the Suppuration of this Kind of Small Pox.

When the Patient begins to recover, and the Eruptions scale off, and he has eat Flesh a few Days, for Example, the one-and-twentieth Day, I judge it requisite to bleed in the Arm, if the Disease has been violent: For the Inflammation communicated to the Blood by the Small Pox, whether in Adults or Children, equally indicates Bleeding; as the Foulness collected in the Habit, does Purging; as appears sufficiently both from the Colour of the Blood, taken away after a severe Small Pox; which exactly resembles that of Pleuritis; and, likewise, from the great Inflammations that fall on the Eyes, after it is gone off; and other pernicious Effects, arising from the Blood overheated, and vitiated thereby: Hence, also, it follows, that such as enjoyed a good State before the Attack, are afterwards afflicted with a Defluxion of sharp hot Humours upon the Lungs, or some other Part, for the Remainder of Life. But if the Pustules were few, Bleeding is unnecessary: After Bleeding I purge three or four times.

After the Patient has been long recovered from the confluent Small Pox, and rises every Day, there sometimes happens a troublesome Swelling of the Legs; which either goes off spontaneously, after Bleeding and Purging; or is easily cured by the Use of Fomentations, made of emollient and discutient Herbs, boiled in Milk; as the Leaves of Mallows, Mullein, Elder, Laurel, and Chamomile and Melilot-flowers. *Sydenham*.

These Species of Small Pox, adds Dr. *Sydenham*, prevailed in 1667, 1668, and Part of 1669, which he chose to call *legitimate*, or *regular*, to distinguish them from the other Kinds that succeeded them, in the Years 1670, 1671, and 1672, which he denominated *anomalous*, or *irregular*; and gives us the following Account of them.

The irregular Species of Small Pox was introduced by the Measles, (see *MORBILLI*), and arose in the Beginning of *January*, 1670, much about the same time that the Measles did; and though it was not so epidemic, it, notwithstanding, accompanied that Disease whilst it prevailed, and continued after it went off; as long as this Constitution lasted. Nevertheless it yielded to the Dysentery, which raged in Autumn, this Season being peculiarly disposed to favour it. But in the Winter this Kind of Small Pox returned again, the Dysentery being overcome by the Cold. In this Order did these Distempers succeed each other, through all the Years of this Constitution, except that in Autumn 1672, the last Year it prevailed, the Constitution being then in its Decline, and slowly promoting the Dysentery, which, at that time, was, also, declining, the Small Pox, contrary to Custom, raged, also, at the same time, and prevailed so equally with the Dysentery, that it was not easy to ascertain, which of the two Diseases were most predominant, though, to me, the Dysentery seemed to prevail. This Small Pox, like other Epidemics, was very violent in the Beginning, and increased daily till it came to the Height; after which it gradually decreased, both with respect to the Violence of the Symptoms, and the Numbers it attacked.

I was very much surpris'd, upon the Rise of this Small Pox, when I found that it differed, in several considerable Symptoms, from the Kind produced by the preceding Constitution, already described. Of these different Symptoms I shall now treat, omitting those which were common to both Species.

The distinct Kind of this Small Pox differed from the common distinct one, of the preceding Constitution, only in the following Symptoms: 1. The Eruptions generally came out on the third Day, which indeed is usual in the confluent Sort; whereas, in the distinct Kind of the former Constitution, they appeared not before the fourth Day. 2. They did not grow so big, in the Course of the Disease, as those of that kind. But, 3. Were more inflamed; and, in their Declension, after their Suppuration, frequently looked black. 4. Sometimes, but very rarely, a Spitting happened, as in the confluent Kind, though the Eruptions were very few. Whence it appears, that the Small Pox of this Constitution greatly resembled the confluent Kind; and was attended with a more violent Inflammation, than is usual in the distinct Kind.

The confluent Species of this Constitution, differed from those I had observed in other Years, in several Particulars: 1. The Eruptions sometimes appeared on the second Day; at

others on the third, in Form of an equal redish Swelling, covering the whole Face, and thicker than an Erysipelas; nor could any Spaces easily be perceived between the Eruptions. 2. The rest of the Body seemed to be overspread with an almost infinite Number of red inflamed Pustules, joined together in one. 3. In the intermediate Spaces, especially in the Thighs, little Bladders arose, like those occasioned by Burns, full of a limpid Serum, which flowed out plentifully, upon the Bursting of the Skin, the Flesh underneath appearing black, and as if it were gangrened. This dreadful Symptom happened very rarely, and only in the first Month that this Species prevailed, but proved always mortal. 4. About the eleventh Day, a white shining Pellicle extended itself over the redish Humour, in several Parts of the Face; and, by degrees, over the Whole. 5. Soon after, this Pellicle discharged a shining crusty Matter, not of a yellow or brown Colour, as in the other Small Pox; but of a deep-red, like congealed Blood; which, as the Pustules ripened, grew every Day blacker, till at length the whole Face appeared as black as Soot. 6. And whereas, in the other Kind of confluent Small Pox, the Patient was in most Danger on the eleventh Day, which put an End to the Lives of the greatest Part of those that died; in this Sort, unless an extreme hot Regimen destroyed him in a shorter time, he generally lived to the fourteenth, and sometimes to the seventeenth Day, after which the Danger was over. 7. But those who had the Bladders with the Mortification, died in a few Days after the Eruption. 8. The Fever, and all other Symptoms, which either preceded or accompanied this Species of the Small Pox, were more violent, than in the foregoing Kind; and it had manifest Signs of greater Inflammation. 9. The Patient was more subject to a Spitting. 10. The Pustules were considerably more inflamed, and much smaller; so that it was difficult, upon their first Appearance, to distinguish them from an *Erysipelas*, or the Measles. 11. The Scales remained a long time after the Eruptions vanished, and left more unseemly Scars behind them. It is worthy of Notice, that during the whole three Years which this Constitution lasted, in which the Dysentery raged so epidemically, the Small Pox, when exasperated by an immoderate hot Regimen, sometimes terminated in a Dysentery.

But this Small Pox was not attended with such fatal Symptoms during the whole time of its Continuance; for, after having prevailed two Years, it began to grow milder in 1672, and the Eruptions having lost their Blackness, grew by degrees yellow, like an Honey-comb, which is peculiar to the regular Small Pox, during the Suppuration of the Pustules; so that in the last Year of this Constitution, it proved very mild and gentle, considering its Kind. Nevertheless it is manifestly to be referred to a quite different Species, on account, 1. Of the remarkable Smallness of the Eruptions. 2. The Tendency to a Salivation: And, 3. Other concomitant Symptoms.

As this Species was attended with greater Inflammation than the other, the sole Intention in the Cure must be, to give a greater Check to the violent Ebullition of the Blood. And this is chiefly effected by a temperate Regimen, after exhibiting Opium, as above directed; and allowing the free Use of some Liquor that is not heating, but will rather immediately abate the violent Heat, wherewith this Disease is attended, especially during the time of the Suppuration of the Pustules. The white Decoction, made of Bread, and a small Quantity of burnt Hartshorn, boiled in a large Proportion of Water, and sweetened with Sugar, is beneficial here: But Milk, boiled with thrice its Quantity of Water, is generally a more grateful Liquor, and better answers the End of Cooling: Nor is the Abundance of Liquor only proper to diminish the extreme Heat, which chiefly prevails during the secondary Fever, but it, also, promotes the Salivation, and keeps it up longer than it could be continued, if the Patient were over-heated. And further I have often observed, that cooling Liquors, drank plentifully, have succeeded so well, that, by the Use thereof, the Small Pox, which appeared at the Beginning with the worst Signs of the confluent Kind, has, in the Course of the Disease, been rendered distinct; and the Eruptions, which, as they ripened, would otherwise have first discharged a red, and soon after a black Matter, have looked very yellow; and instead of being inflamed, and very small, proved of a mild and good Kind.

Nor does the menstrual Discharge, which frequently happens in this Disease, forbid, but rather encourage the free Use of these Liquors; especially if it comes at an unusual Time. For Women are endangered here from no other Cause but from the Blood's being too much attenuated, so that it escapes where it can find a Passage; especially when unskilful Nurses add Oil to the Flame, by using an hot Regimen. Now whatever greatly dilutes and cools the Blood, as it checks this Flux, does necessarily, though not immediately, tend to preserve the Eruptions, and the Swelling of the Face and Hands, in their due State; whereas heating Remedies, although they may seem better

better suited to this Purpose, yet, as they promote this Discharge, they fall short of answering the End, even though Astringents be mixed with the Cardiacs.

I lately attended a Lady, who had this dangerous black Small Pox; and though I forbid every thing, at the Beginning, which might agitate the Blood, yet, as she was of a very sanguine Complexion, in the Flower of her Age, and of a lively Disposition, and the Weather, at the same time, very warm, she was suddenly seized, on the third Day after the Eruption, with so copious a menstrual Discharge, at an unusual time, that the Women about her suspected she had miscarried. Though this Symptom was very urgent for several Days, yet I did not, therefore, judge that the Use of the Milk and Water was to be discontinued; but rather esteemed it necessary to be drank plentifully now, and, also, through the whole Course of the Disease; particularly on the coming on of the Suppuratory Fever. This Liquor she often declared, was particularly grateful to her, promoted the Spitting, and both cooled and refreshed her. But, when the Face began to harden, lest the Patient should be injured by the putrid Vapours proceeding from the purulent Matter of the Eruptions, which had a very fetid Smell in this worst Kind of Small Pox, a few Spoonfuls of mulled Sack were directed to be taken once a Day, or as often as she perceived any Sickness at her Stomach. By the Use of these few Things, along with a quieting Draught every Night, she recovered, without having been attacked with a Delirium, or any other dangerous Symptom, except the Hæmorrhage. The Face and Hands swelled sufficiently; the Eruptions were as large as this Kind of Small Pox would permit; the Salivation was easy and copious to the End; and though the Eruptions in the Face, seemed blackish whilst they ripened, yet they were yellow in most other Parts.

But how much soever this Kind of Small Pox, peculiar to this Constitution, exceeded those of other Constitutions in point of Heat and Inflammation, yet, when the Eruptions were distinct, or few, Experience shewed it to be needless to drink so copiously of the above-mentioned Liquors. But it sufficed if the Patient drank Small Beer, as the Thirst required, and supped Water-gruel and Panada, and sometimes eat a roasted Apple; and if he exceeded Fourteen, took a Dose of *Diacodium*, when he was sick, or delirious for want of Rest. And I did nothing more, when the Pustules were few, except keeping the Patient in Bed.

The same excellent Physician, in his Epistle to Dr. Cole, dated Jan. 20. 1681-2. gives us farther Observations on the Small Pox; which, he informs us, are the Result of longer Experience.

Previous to these Remarks, says he, I must observe, that a Species of intermitting Fevers, which arose in 1677. still prevailed in 1681. These Fevers, throughout those Years in which they reigned, like all Epidemics, principally raged in those Seasons, that conspired most with their Nature; but, upon the Approach of another Season, yielded to such Epidemics, as that Season principally favoured. Thus, upon the coming in of Winter, they always yielded to the Cough, and peripneumonic Fevers, and, also, to the Small Pox; but, upon the Return of the Spring, they re-appeared. So, in the Year 1680. when these Intermitments had prevailed universally during the Autumn, the Small Pox succeeded them in the Winter, and spread much. But in 1681. the Intermitments returned, though they did not spread so epidemically, their Violence being abated; so that the Small Pox, in some Places, appeared along with them. But, at the Beginning of Summer, the Small Pox increased every Day, and, at length, became epidemical.

It now appeared to me manifestly improper to confine the Patient constantly in Bed, before the total Eruption of the Pustules; for the Spring and Summer having been the driest Season that any Person could remember, the Blood was, by these means, deprived of the greater Part of the Humidity, which the Air otherwise usually communicated to it: Whence the then reigning Small Pox was accompanied with a more considerable Inflammation than ordinary; and the other Symptoms thence arising were more violent. This I conceive was the Cause that purple Spots frequently preceded the total Eruption of the Pustules; and that the violent Inflammation which expelled them, by dissolving the Texture of the Blood, suddenly destroyed the Patient, before the due Expulsion of the morbid Matter. The Disease proved the more destructive, because the Eruptions more readily run together; the Intemperature of the Air now doing the same Mischief spontaneously, which ignorant Practitioners ordinarily occasion, by using an hot Regimen and Cardiacs, at the Beginning of the Distemper: For the Danger of the Small Pox is least, when the Eruptions are few; and greatest, when they are numerous; but the bloody Urine, and purple Spots, destroy the Patient, before the total Eruption of the Pustules.

It is easy to account for the Patient's being more or less endangered, in proportion to the Paucity or Number of the Eruptions; for as every Pustule is, at first, a Phlegmon, though of a very small Size, and soon impostumates, so a secondary Fever, which depends on the Matter hereafter to be produced, must needs be more or less violent, at the Height of the Disease, according to the Quantity of Matter to be suppured, which is usually completed in the mildest Species of the confluent Small Pox, on the eleventh Day; in the middle Sort, on the fourteenth; and the worst, on the seventeenth Day.

Now a Phlegmon in the Arm, or any other Part, will occasion a Fever whilst it suppurates; the Blood being inflamed by the purulent Particles, which are received into the Mass from the Veins, according to the Laws of Circulation; and thus giving Rise to the Fever: Hence the Physician has more Reason to foretel Death, on one of the above-mentioned Days, when the Face, at the Beginning of the Disease, appears totally covered with small Eruptions, resembling the Filings of Steel, on account of the extreme Violence of the succeeding Fever, which necessarily rages in proportion to the Quantity of Matter thrown out of these innumerable Impostumes into the Blood. And it is easy to foresee the Destruction of the Patient some Days before it happens, though he think himself in a fair Way.

If, therefore, the Danger of the Patient proceeds only from the Abundance of the Eruptions, I use all my Endeavours to repress them, which is the Way to relieve the Patient; every thing being doubtful and dangerous, when this Species of the Disease is confirmed; so that, if the Patient should escape, it may rather be ascribed to some Bleeding at the Nose, or other accidental Alteration, happening in the Course of the Disease, than to the Care of the Physician. Now such an extraordinary Eruption of the Pustules proceeds from the too sudden Assimilation of the variolous Matter; which seems principally to arise, either from the over-hot and spirituous Constitution of the Patient, or from his having raised the Fermentation too high, by a too early Confinement in Bed; the Use of hot Cardiacs, or any spirituous Liquor.

The immoderate Assimilation of the variolous Matter, however, cannot be more effectually promoted, than by the Patient's confining himself in Bed unseasonably, that is, before the sixth Day from the Beginning of the Illness; or the fourth inclusive from the Eruption, when all the Pustules are come out, and no more are expected. And though the moderate Warmth of the Bed, even after this Time, does in some Measure contribute to the Rise of the Delirium, Watching, and other Symptoms, yet these are of such a Nature, that they readily yield to proper Remedies; whilst the imminent Danger of Death, that happens on the eleventh Day, from the great Abundance of the Pustules, cannot be prevented or removed by Medicine.

The Patient, therefore, is here to be diligently admonished, by no means to keep his Bed in the Day-time, till towards the Evening of the sixth Day; whereby the Eruptions will be fewer, and he will be greatly refreshed. But, after this time, if the Pustules be very numerous, he will scarce be able to leave his Bed at all, on account of the Pain thence arising, and a greater Disposition to Fainting, upon sitting up; so that having frequently remarked this, I imagined, that Nature, in the common Course of the Disease, first pointed out the Time, when a total Confinement in Bed becomes necessary.

For the Essence of this Disease seems to consist in a peculiar Inflammation of the Blood; in the Course of which, Nature is employed for some Days, in the Beginning, in preparing and moulding the inflamed Particles, for their readier Expulsion to the external Parts; at which time the Blood being disturbed, a Fever must needs be occasioned. For the agitated Particles, hurrying in a tumultuary manner through the Vessels, necessarily cause a Sickness at the Stomach, sharp Pains in the Head, and all the other Symptoms preceding the Expulsion, according as they are carried to this or that particular Part. But when the Eruption is over, the fleshy Part becomes the Seat of the Disease; and, as Nature has no other Method of expelling the peccant Matter from the Blood, but by raising a Fever, so, likewise, it does not free the fleshy Parts from any extraneous Body, but by Impostumation: Thus, if, by Accident, a Thorn, or the like sharp-pointed Body, be lodged in the Flesh, unless it be immediately extracted, the Parts around soon impostumate. Hence, when their Particles are lodged in the Flesh, they at first occasion very small Phlegmons, wherein they lie concealed; which increasing every Hour, and becoming more inflamed, at length come to Suppuration, when a Part of the Matter must needs be absorbed by the Blood, which returns by the Veins; and if too large a Quantity thereof be received into the Mass, it is not only productive of a Fever, which the debilitated Patient is unable to bear, but, also, taints the whole Mass. Besides, by the extreme Heat of the Fever,

Fever, during the last Days of the Illness, the Salivation, which ought always to accompany the confluent Small Pox, is stopped too soon; whence immediate Death ensues. But, if only a small Quantity of the purulent Matter be received into the Blood, the Violence of the secondary Fever is easily checked by the increasing Strength of Nature, and, the Pustules drying away gradually, the Patient soon recovers.

Hence it is manifest, that if these hot and spirituous Particles be quickened by hot Medicines, and especially by a constant Confinement in Bed, the assimilating Virtue, which they already possess in too great a Degree, will necessarily be heightened and increased. Besides, the Blood, and other Juices, being hereby heated, yield more readily to the stronger Impression of the Particles; whence more Eruptions appear than should. Whereas the moderate cooling Regimen, and the free Use of the Air, not only abate the Force of the hot tumultuary Particles; but, also, thicken and strengthen the Juices; whence they are better enabled to resist the morbidic Spirits, and support their Violence: And hence no greater Quantity of variolous Matter is prepared, than is natural in this Disease.

A too early Confinement in Bed produces, besides the Assimilation of too large a Quantity of the morbidic Matter, and the immoderate Exaltation of the Ferment of the Disease, bloody Urine, and purple Spots, especially in Summer, and in Persons in the Vigour of Life. I conceive, that both these Symptoms proceed from the Heat and Commotion raised in the Blood, by hot and spirituous Particles, by which it is exagitated, and considerably attenuated, so that it bursts the Vessels, causing bloody Urine, when it forces its way through the Kidneys; and purple Spots, when it is strained through the Extremities of the Arteries, terminating in the Muscles and Skin, which resemble so many Mortifications in those Parts wherein the extravasated Blood is coagulated. And though both these Symptoms might have been easily prevented by a cooling Regimen and Diet, yet, when they actually appear, all Remedies prove ineffectual.

It is not only unsafe to keep the Patient always in Bed the first Days of the Illness, but sometimes necessary to expose him to the open Air; especially if it be the Summer-season, and he not past the Prime of Life, or if he has been accustomed to spirituous Liquors; and, particularly, if the Disease proceeds from hard drinking.

I have hitherto found, that Bleeding, though it be used early, does not so effectually check the over-hasty Assimilation of the variolous Matter, as cooling the Blood by the Air received by Inspiration, especially if the Patient be put to Bed immediately after the Operation, and injured by hot Cardiacs; the Blood being by these means, more disposed to receive the Impressions of the adventitious Heat, than it was before Bleeding. And one of the worst Cases I ever met with in the confluent Small Pox, happened in a young Woman soon after her Recovery from a Rheumatism, by the usual Method of copious and repeated Bleeding, who died on the eleventh Day. From this Instance I first learned, that Bleeding did not contribute so much to keep the Small Pox within its due Limits, as I had imagined; though I have frequently observed, that repeated Purging, while the Blood remains uninfected, generally renders the subsequent Small Pox of a mild and distinct Kind.

To this Method it is objected, that sitting up in the first Days of the Disease hinders the Eruption of the Pustules, and of course prolongs the Sickness, and other Symptoms, which indeed I own, and Experience confirms it. But then it must be inquired, whether it is most dangerous to give a little Check to the variolous Matter, and thus prolong the Sickness by keeping back the Eruption; or to urge the Ferment of the Disease, and assimilate so large a Quantity of variolous Matter, as to endanger the Life of the Patient by the secondary Fever. I conceive it will appear, upon duly considering the Matter, that very few have died merely because the Small Pox did not come out sooner or later; unless, perhaps, a few of those, whose Blood, being inflamed by excessive Heat and Motion, circulated with such Velocity, as not to allow sufficient Time for the morbidic Matter to be expelled slowly; which is an Argument in favour of my Opinion.

For we may be assured, though nothing be done, that the variolous Matter will at length be conquered by Nature, and driven to the Skin; especially as the Coarseness of the Patient to this time, promises a certain, though a late Eruption of the Pustules afterwards. But of the many dangerous Symptoms which ensue, when the Eruption is unseasonably promoted, I shall only mention the principal: 1. The Number of Eruptions is too much augmented; and thus the secondary Fever is proportionably increased. 2. Bloody Urine, and purple Spots are produced. 3. The immoderate Exaltation of the Ferment frequently increases the Force of the variolous Matter so much, that the Patient sinks at the Beginning of the Disease; when the morbidic Matter cannot disentangle itself, and come out, by

reason of the confused and irregular Motion raised in the Blood.

If it be demanded, why a proper Separation of the variolous Matter may not be as well promoted at the Beginning of the Disease, by refreshing the Patient with the moderate Warmth of the Bed, as without it; I ask, by way of Reply, whether Experience does not testify, that a Person in Winter, whilst he lies in Bed moderately covered, without a Fire in the Room, is much warmer than when he sits up in it well clothed? And if the Difference here be remarkable, I next inquire, which of these Methods is best adapted to check the immoderate Motion of the variolous Ferment?

But what has principally imposed upon the Unattentive in this Case is, their having observed a Tendency in the Patient to spontaneous Sweats; which continually flowing whilst he remained in Bed, greatly abated the feverish Heats, otherwise than in those who did not sweat. Let us therefore consider, why we so solicitously endeavour to check the Fever, since it is the Instrument which Nature ordinarily and principally uses in preparing and expelling all kinds of noxious Matter, which lurk in the Blood. It is evident, that whilst we carefully promote Sweat, in order to lessen the Fever, we thus drive out a crude and indigested Humour, like unripe Fruit, and afterwards cause a Fever; the Serum of the Blood, with which the Blood itself, and those newly generated hot variolous Particles are diluted, is expelled, whilst the Particles, being freed from the Serum wasted by the Sweat, have their Violence and Activity increased.

But it is to be observed, that I injoin the Patient to refrain from Bed, on Supposition only, that the approaching Small Pox is of the confluent Kind. For in the distinct Species, if it can be certainly foreseen, the Patient need neither be confined to Bed, nor enjoined to sit up, as the Paucity of the Eruptions prevents all Danger either way.

Hence, then, it appears to me from frequent Experience, that he who refrains from Bed in the Day-time, at the Beginning of the Disease, abstains entirely from Flesh, and drinks only small Liquors, is abundantly safer than he who confines himself immediately in Bed, and takes hot Cardiacs. And the Patient finds a singular Refreshment from the Admission of fresh Air, every time he is taken out of his warm Bed; which all those, whom I was suffered to treat in this manner, thankfully acknowledged. Whence it should seem, that more regard is due to the Appetites and Longings of the Patient, if they be not very irregular, or immediately destructive, than is due to the more precarious and fallacious Rules of the Healing Art.

But, how advantageous soever it may be, in general, to keep the Patient from Bed at the Beginning of the Disease, yet sometimes he must be wholly confined to it before the Eruption. Thus, when a Child, after Dentition, is suddenly seized with Convulsions, we are to consider, that this probably arises from the Endeavour of Nature to drive out the Eruptions of the Small Pox, Measles, or Scarlet Fever, though they yet lie concealed in the Skin. In this dangerous Case, a Blister must be immediately applied to the Neck, and the Child put to Bed, and a Cordial exhibited with a small Quantity of an Opiate; by which the Cause of the Disease may be more forcibly expelled, and the Disturbance, also, quieted, which gave Rise to the Fit. Thus, for a Child of three Years of Age, I prescribe five Drops of Liquid Laudanum in a Spoonful of Plague-water, or the like. I suspect, that Thousands of Children, besides some Adults, have been destroyed for want of considering, that these Convulsions are only the Forerunners of the above-mentioned Diseases; whereas inconsiderate Practitioners, taking these Fits, which are really symptomatical, for essential Diseases, and attempting the Cure by a frequent Repetition of Clysters, and other Evacuations, hinder the Eruption of the Small Pox, and prolong the Fits, which they so solicitously endeavour to conquer, and which would otherwise assuredly vanish spontaneously, upon the Appearance of the Pustules. Besides, the Small Pox, that is preceded by Convulsions in Children, is generally distinct; so that the Patient may be put to Bed with much less Danger in the Beginning of the Disease.

But I have observed, that the Small Pox, which immediately succeeds comatous Disorders, proves very confluent; in which Case I rather order a Blister, and the Opiate described above, than let the Patient keep his Bed before the Eruption. But sometimes, though very rarely, I have known the Fits of Intermittents preceded by such Convulsions; and have often seen them begun, and terminated, by comatous Disorders, both in Children and Adults: But both these Symptoms require no particular Treatment, it being only necessary to oppose the Fever, which is the primary and essential Disease. For, if I were to attend principally to these comatous Disorders accompanying the Fever, and accordingly endeavour to conquer them by Bleeding, Purging, and repeated Clysters, I should heighten the

the Fever, and consequently increase the Coma, so as to convert it into a fatal Lethargy; whereas, if I use all my Efforts to cure the Fever, the other Symptoms proceeding from it will easily vanish.

Though the Patient may sometimes refrain from Bed in the Day-time, yet in extreme Sickness, an high Fever, enormous Vomiting, a Vertigo, rheumatic Pains of the Limbs, and the like Disorders, he cannot be indulged this Refreshment, these Symptoms indicating the contrary; which, if they be violent, especially in the young and sanguine, prognosticate, that a large Quantity of variolous Matter is generated in the Body, and threaten great Danger from the tumultuary Eruption of the Pustules, which will prove very confluent. In this Case, therefore, as all Endeavours must be used to check the immoderate Ferment, which will rage more by the continual Warmth of the Bed, and yet the Patient cannot be kept up by reason of extreme Sickness, it is indispensably necessary to bleed first in the Arm, and a few Hours after to give a Vomit of the Infusion of *Crocus Metallorum*, which not only expels the Matter occasioning this unusual Sickness, but refreshes the Patient so considerably, that being much relieved, he is able to refrain from Bed; and, in order to weaken the Force of the Ferment further, it will, also, be proper to give him a large Dose of Spirit of Vitriol in every Draught of Small Beer, till the Eruption be over. Notwithstanding these Evacuations, and the Use of the cooling Drink, the Patient must refrain from Bed in the Day-time, if he can bear to sit up; because these general Remedies do not check the Assimilation of the variolous Matter so effectually, as once cooling the Blood by drawing in the fresh Air, and breathing it out by the Lungs, which alone immediately abates the symptomatic Sickness, as I have often experienced. But this unusual Method is necessary in those only who are in the Prime of Life, whose Blood has been over-heated by Venery or Wine, and in others, (always excepting young Children) who, together with the Small Pox, struggle with the above-mentioned violent Symptoms. For, where the Blood is less inflamed, and the Symptoms milder, as there is much less Danger of assimilating the variolous Matter too hastily, neither the Evacuations, nor the Spirit of Vitriol, need be used.

The Eruption being completed, which happens on the sixth Day from the Beginning of the Illness, or the fourth, inclusive, from the first Appearance of the Pustules, the Patient is not to be longer detained from Bed, as the Case will scarcely admit of its being longer delay'd, if the Small Pox be of the confluent Kind. And let it be remembered, that this is the only Species of which I am now treating; for, if the Eruptions be few and distinct, there is naturally little Danger.

From this time, the Eruptions increase in Magnitude, and inflame the whole Body, especially the Head; so that the Patient, if not a Child, grows restless, and cannot sleep readily, which is next to be carefully attended to in this Disease; for the calmer the Motion of the Blood is, the better the Pustules fill, and come to their due Size; and, on the contrary, the more violent it is, the more the Eruptions sink, their farther Progress being checked; so that the Expulsion of the peccant Matter is not only obstructed, but the Order and natural Progress of every particular Phlegmon is, also, disturbed; whence the Eruptions either do not come to Suppuration in due time, or, instead of Pus, an Ichor is at length generated; and, instead of the yellow Matter, resembling the Colour of an Honeycomb, some black, or other preternatural Humour, unlike the genuine Eruptions of the Small Pox, is discharged. I conceive, therefore, that Opiates are as much indicated in the Small Pox, as any particular Remedy in any other Disease, as they quiet the tumultuary Motion of the Blood and Spirits, which always accompanies the confluent Small Pox. He, therefore, is not enough acquainted with the Nature of this Disease, who esteems these Symptoms to proceed only from the Watchings; for though it may sometimes happen, in Watchings, that the Patient's Spirits may be composed and calm, which frequently proceeds from taking Laudanum, so, also, the Spirits, being sometimes in violent Motion, check the laudable Eruption of the Pustules, though the Patient sleeps much, which is worthy of Observation.

Though I have given Laudanum several Years successfully in this Case, yet I give the Preference to Syrup of Poppies, because I esteem Laudanum more heating; but both may be used for the same Purpose. As to the Dose of this Syrup, it is to be proportioned to the Age of the Patient, and the Urgency of the Symptoms; for what might be too much for one whose Spirits are composed, would be too little for another, whose Spirits are greatly agitated. For Instance, suppose in general, that six Drams is a sufficient Dose, yet in the Small Pox, when the Medicine is required, near an Ounce must be given, in order to obtain the desired Effect; and as much must be prescribed for a Dose, throughout the Course of the Disease. We

speak of Adults now; for in Children, the Dose must be lessened in proportion to their Age. Children, however, have not the same Occasion for Opiates in this Disease, as Adults, because they are more disposed to sleep during the Course thereof; yet, when they are much endangered by the Disease, I should be afraid to refrain from Opiates. But it is difficult to settle the Dose of Opiates; for whether they be required in a tumultuary Motion of the Spirits, a violent Vomiting and Purging, or severe Pain, these being the three Disorders in which Opiates are principally indicated, they are to be exhibited in such a manner, that if the first Dose avails not, it is to be repeated at proper Intervals, till it answers the Intention of the Physician, having less regard to the Quantity taken, than to the Effect it should produce; which being answered, it is to be administered less frequently and copiously. Nor must we forget to interpose such a Space between every Dose, that we may be able to learn, whether the last has taken Effect, before prescribing another; which being obtained, the Dose is to be diminished in the Course of the Disease, as there shall be Occasion.

This Method I shall illustrate by a Case: On April 13. 1681. a Neighbour of mine came to me in Tears, begging, that I would visit her Son about ten Years of Age, who having been ill four Days, she apprehended the Small Pox. The Mother had, by the Advice of some Woman, given him the Countess of Kent's Powder, and other hot Medicines; and had besides, in a manner, buried him under the Cloaths, in order to raise a Sweat, to which the Women have recourse in this Disease, as an assured Remedy. She had, also, given him a large Quantity of Posset-drink, in which Marigold-flowers and Hartshorn had been boiled; which increased the Fever, and caused such a Disturbance of the Spirits, that the Child was very delirious, and could not be kept in Bed by the Attendants. The Pustules did not yet appear, at least very visibly, but lay very thick in the Skin, the Eruption being manifestly hindered by this violent Method, which was intended to promote it. I ordered him to be immediately taken out of Bed, and not to be laid in it again, excepting a-nights, till after the sixth Day: I, also, prescribed half an Ounce of *Diacodium* to be taken directly, which proving ineffectual, I ordered the same Dose to be repeated an Hour after, but unsuccessfully; for the Blood was so violently agitated, that it could not be quieted before he had taken two Ounces and an half; but such a Space was interposed between every Dose, that I might be certain what Effect the last had. Afterwards, I prescribed only half an Ounce, to be given every Night at Bed-time, to the End of the Disease; which proved sufficient to preserve the Calm, that had already been obtained, by a more frequent Use of it; and thus the Patient recovered.

If the Heat and Motion of the Blood and Spirits be extremely violent in the Beginning, an Opiate, though given in the largest Dose, and frequently repeated, will scarcely avail, unless the Patient quits his Bed; for the Warmth of the Bed increases the Heat of the Disease, so as to render it necessary to exhibit the Opiate in a larger Dose, than, perhaps, Nature is able to bear.

I would have this Remedy first exhibited in the Evening, when the Patient is wholly confined to his Bed, that is, the sixth from the Beginning of the Illness; and repeated afterwards, every Evening, till the seventeenth Day, or at least till the Danger be over. For on the sixth Day the fleshy Parts are inflamed; whence the Head begins to be disturbed by the Humours, which are, also, inflamed from this Cause.

But great Care must be had to give the Opiate earlier in this, than in other Diseases; because a kind of Fit of Heat, and Restlessness, always comes on towards Evening; at some times it happens, unless the Opiate be given early at the Decline of the Disease, that the Patient, becoming suddenly somewhat heavier, immediately grows hot, and afterwards complains of Sickness, which soon terminates in Death, to the Astonishment, and contrary to the Expectation of his Friends, who, a little before, conceived great Hopes of his Recovery; and his Death might, perhaps, have been prevented by giving an Opiate directly. On these Days, therefore, but especially on the eleventh Day, I order the Opiate to be given earlier, as at five or six o'Clock in the Afternoon; and a second Dose to be kept in Readiness, lest Sickness should come on suddenly.

Since, therefore, it is so dangerous, either to omit giving an Opiate soon enough, or on the other hand, to give it so early, that its quieting Virtue be spent before the Time comes for repeating it; it is safest, in this Uncertainty, to order an Opiate to be taken at a set Hour, every Morning and Night, at the Declension of the Disease, when there is most Danger. Nor is an Ounce of *Diacodium* always a sufficient Dose at these times; for this Quantity avails no more in a violent Inflammation of the Blood, and a very tumultuary Motion of the animal Spirits, than half an Ounce in a milder Disease. For I have learnt

from repeated Experience, that an Ounce and half is required in the young and sanguine, to mitigate the Violence of the Symptoms wherewith they are seized; and in such Subjects, this Dose may be repeated with Safety and great Advantage, at such times, Morning and Night, till the Patient recovers.

Sometimes, also, I have found it necessary at the Decline of a bad Species of the confluent Small Pox, to exhibit an Opiate thrice in twenty-four Hours, that is, every eighth Hour, on account of the violent Motion, or Disturbance of the Spirits, occasioning some Sickness. But it is to be observed, that if the exhibiting Diacodium so frequently be nauseous to the Patient, which often happens on the above-mentioned Days, Liquid Laudanum must be prescribed instead of it; sixteen Drops of which are equivalent to an Ounce of *Diacodium*.

I am well aware, that it will be objected by those of a different Opinion, that the peccant Matter will be fixed, and the Salivation diminished, by repeating the Opiate so often, and in so large a Dose. But though the Ptyalism will indeed be in some measure abated, it will not, however, cease so entirely, as not to rise again in some Degree, after the Opiate has been taken a considerable time, and its Virtue is nearly spent. Besides, the Patient, being strengthened by the Opiate, will be better able to expectorate the Phlegm; and the Saliva, though less copious, will be better concocted; and the Want of Sputa-tion is abundantly supplied by the Swelling of the Hands and Face, which happens more certainly, and rises higher, from the repeated Use of the Opiate, on those Days wherein these Parts usually swell, that is, the Face from the eighth to the eleventh Day, when it commonly begins to fall; but the Hands from the eleventh Day, till the Pustules upon these Parts be entirely ripe; and the Want of either of these Swellings, when they ought to appear, threatens more Danger than the Stoppage of the Salivation.

But I would not be understood to advise the daily Use of Diacodium, though in a suitable Dose, in young Children afflicted with the confluent Small Pox, unless the Case appear very dangerous; because Children are not so hot as Persons in the Prime of Life; and their tender Age is less able to bear the continued Use of Opiates. Besides Children, thus affected, sleep most Part of the Time spontaneously, and are consequently less sensible of the tediousness of the Disease. Yet when the Eruptions are of a bad Kind, or when they become delirious, Opiates are always indicated; these being certain Signs of the irregular Motion of the Blood, and animal Spirits.

The Method of preventing the over-hasty Assimilation of the variolous Matter, at the Beginning of the Disease, and the Manner of checking the inordinate Motion of the Spirits, arising from the Inflammation of the external Parts, are the two Points wherein the Cure of this Disease consists; as the ill Accidents which succeed for want of preventing these two Dangers, sufficiently occasion those fatal Symptoms, which destroy the Patient.

If there be Occasion for a Blister, it should be made very large, and sufficiently sharp, and applied to the Neck; but neither too early, that it may not cease running before the eleventh Day, which is attended with most Danger; nor deferred to that Day, so as to prove prejudicial at this time, from being laid on too late, by increasing the Heat of the Blood, which is then scarce able to struggle with the secondary Fever. The fittest Time, therefore, to apply a Blister, is the Evening preceding the great Crisis of the Disease, presently after the Opiate which is to be taken at this time. For, if it be applied now, the Pain it causes will go off before the critical Day; and there will then be a Discharge of the peccant Matter, which is necessary to conquer the violent Symptoms happening on this Day. For now the Swelling of the Face first begins to sink, and the Salivation, which had hitherto been copious, to abate; the Humour which occasioned it being thickened, and, with Difficulty, raised. Besides, the Blister supplies, in some measure, the Sinking of the Swelling of the Face, and the Abatement of the Salivation; and, likewise, contributes somewhat to check the secondary Fever, which is then very high, the Blood being in a manner oppressed, and totally infected, with the Abundance of Pus absorbed from such a Multitude of little Imposthumes; so that, in most of the Patients I have treated in this Disease, I have observed, that the Pulse in the Wrist could scarce be felt at this time, though it was easily felt the preceding, and following Day.

But, among all the Remedies that occasion a Derivation, or Revulsion, from the Head, none, in my Opinion, seems to operate so efficaciously as Garlick applied to the Soles of the Feet. The Revulsion it occasions is evident, by the Blisters it frequently raises, and the intolerable Pain it sometimes, though rarely, causes, by inviting the Humours to those Parts, even without raising Blisters; so that, to ease it, I have found it necessary to order a Cataplasm, made of the Crumbs of white Bread, boiled in Milk, to be applied to the Part. In Adults,

therefore, afflicted with the confluent Small Pox, I usually apply Garlick sliced, and included in Linen, to the Soles of the Feet, from the eighth Day, when the Face first begins to swell; and renew the Application every Day till the Danger be past.

I must further observe, that the Patient must be kept from Flesh throughout the Course of the Disease, and only allowed Small Beer for his common Drink. In the mean time, it will be convenient for him to live on Water-gruel, roasted Apples, and the like. But, upon the Approach of the Suppuration, when the purulent Particles return into the Blood, and taint the Mass, it will be proper to give a few Spoonfuls of Wine every Morning and Night. As to the Coverings of the Bed, they are to be entirely the same he made use of in Health; and he is to be permitted to turn himself in Bed as he pleases, for the Reasons already given.

I will subjoin a Case, as a Specimen of this whole Procedure: I was called this Winter, to attend a Gentleman of a very sanguine Constitution, and in the Prime of Life. The Day before I came, he was seized with an high Fever, vomited a considerable Quantity of bilious Matter, and had a violent Pain in his Back. In order to mitigate these Symptoms, he went to Bed, and, by heaping on Cloaths, and taking hot Liquors, spent a Day to no Purpose in endeavouring to force Sweat; the great Tendency to vomiting, and the Purging, though moderate, rendering the Sudorifics ineffectual, and, in the mean time, increasing the Fever. I suspected the Small Pox would shortly appear, and, also, prove very confluent, both on account of his Youth, and the great Inflammation raised in his Blood by the fruitless Attempt to procure Sweat, which, if the Disease had happened in the Summer, would certainly have occasioned bloody Urine, and purple Spots; but chiefly because I have always observed, that in young Persons attacked with excessive Vomiting, Sickness, and extraordinary Pain, the succeeding Small Pox proved highly confluent. For this Reason, judging it requisite to use all Endeavours to prevent the too hasty Assimilation of the variolous Matter, I kept him up till his usual time of going to Bed; and the next Day in the Morning, which was the third, the Small Pox not appearing, I directed eight Ounces of Blood to be taken away from the Right Arm. The Blood was good and florid, having as yet only received the spirituous Miasma, and not that Putrefaction occasioned by a longer Continuance of the Disease. The same Day at five in the Afternoon, I exhibited an Ounce of the Infusion of *Crocus Metallorum*, which operated well, carrying off his Sickness, so that he seemed much better, and willingly refrained from Bed, which he did not care to quit before, by reason of his great Sickness and Giddiness. On the fourth Day in the Morning, I found the Eruptions coming out so copiously, notwithstanding the Endeavours I had used to prevent it, that they threatened the utmost Danger; I was therefore very cautious to keep him up in the Day-time; and advised the drinking of Small Beer acidulated with Spirit of Vitriol. This Advice he followed to the sixth Day, when, though he was not sick, but much refreshed by the Air, yet his Belly was soluble between whites; towards Night he was obliged to go to Bed, which is common in this Case; and therefore he continued therein, by my Consent, during the whole Course of the Disease, the Eruption being now over. Though the Pustules were fewer than I have observed in some that died of this Disease, yet they were more numerous than they generally are in most that recover. I first exhibited this Evening, an Ounce of *Diacodium*, in Cowslip-flower-water, and directed it to be repeated every Night: I likewise advised, that he should have no more Cloaths laid on him, than he was accustomed to in Health; and prescribed for his Diet, Water-gruel, Barley-broth, and sometimes a roasted Apple; and, for his Drink, Small Beer. On the eighth Day I ordered sliced Garlick, folded in Linen, to be applied to the Soles of the Feet, and renewed every Day, till the Danger was past. After this, the Pustules ripened kindly to the tenth Day, when, visiting him in the Morning, though I found him in a fair way, yet I perceived some Signs of the secondary Fever, along with some kind of Restlessness. Apprehending, therefore, the approaching Danger, I immediately exhibited the Opiate above-mentioned, which quieted all the Symptoms; and the same Evening I prescribed an Ounce and half of *Diacodium*. The next Morning, which was the eleventh Day, (the Virtue of the Opiate, he had taken the Night before, being spent) he began to grow restless again; whereupon I gave him the same Quantity immediately, and repeated it in the Evening, and ordered it to be continued Morning and Night, till he was perfectly recovered. The Patient complied, and no dangerous Symptom afterwards appeared, except a Suppression of Urine sometimes, which frequently attacks young Persons in this Disease; but he, however, made Water kneeling in Bed. With regard to the Salivation, though it was checked, in some measure, by the frequent Repetition of Opiates in so large a Dose, yet at distant Intervals, from the Use

of them, he expectorated concocted Phlegm, and his Face and Hands swelled sufficiently at the proper time. On the eighteenth Day he rose from Bed, and then I first allowed him to sup some Chicken-broth; and afterwards he returned by Degrees to his usual manner of Living. On the twenty-first Day, eight Ounces of Blood were taken away from his Arm, which resembled pleuritic Blood, and differed little from Pus. Lastly, he was purged four times at proper Intervals.

It is here to be noted, that as often as the Day, from the Beginning of the Illness, is here mentioned, for Instance, the sixth, the eleventh, and the like, I would not be understood to insinuate, that the confluent Small Pox always comes out on the third Day; because I am well aware, that sometimes, even in the worst Species, the Pustules do not appear till after the third Day. But in general the Eruption happens on the third Day, inclusive, from the Beginning of the Disease. Thus a Person who is seized with the confluent Small Pox on Monday, will find the Pustules appear on the Wednesday following; and the second Thursday after the first Monday, will be the eleventh Day, which is full of Danger, unless the Physician prevents it. And I repeat it once more, that these Observations relate only to the confluent Small Pox.

The same illustrious Author, in another Dissertation, gives us some further Remarks on the putrid, or secondary Fever, happening in the Small Pox, to the following Effect:

I have already shewn wherein the great Difference consists between the distinct and confluent Small Pox; that the distinct Kind is so void of Danger, as to stand in need of very little Assistance from Medicine, unless the Patient happens to promote Sweat in the Beginning, by lying always in Bed. But the youthful Part of Mankind chiefly perish by the confluent Small Pox; when the Patient, who before seemed to be in no great Danger, is often seized on the eleventh Day, or one of the other dangerous Days already mentioned, with an high Fever, very difficult Respiration, and great Restlessness, which suddenly put an End to his Life, to the Astonishment of his Friends, who, till this fatal Period, had Hopes of his Recovery. In this Case it ought to be considered, that this adventitious Fever, which happens in the confluent Small Pox, is a Distemper entirely different from the Small Pox, and that Fever, which either precedes the Eruption, or arises sometimes from the Inflammation of the Pustules at the Beginning: For, properly speaking, it is only a putrid Fever, proceeding from the Transmission of the putrid Particles of the Pustules, now in a State of Suppuration, into the Blood; which, being prejudicial to Nature, at the same time infect the Patient, and occasion a very malignant Fever.

Those, then, are the only proper Remedies, which will most effectually check this secondary, or putrid Fever; and nothing answers this Intention better, than plentiful Bleeding, which clears the Blood of the morbid Particles which nourish the Disease. Nor is this Practice, in my Opinion, in the least contra-indicated by the Distemper, considering the present State of the Eruptions, since, if the Patient should die at this Period, and be interred, yet the Eruptions, being crufted, could not recede, nor grow less. And, in Effect, we have nothing to do now with the Small Pox, but with the putrid Fever, which is a very different Disease.

When, therefore, the Patient is threatened with immediate Death, from the uncommon Violence of the Symptoms; without speedy Assistance, whether it be on the eleventh Day, or afterwards, I order ten or twelve Ounces of Blood to be immediately taken away from that Arm, which hath the fewest Eruptions, as being the fittest for the Operation; for though Opiates, and refraining from Bed in the Day-time, may be sufficient in the Beginning of the Disease without Bleeding, to conquer the Fit which comes mostly towards Evening; yet on these Days of the secondary Fever, plentiful Bleeding alone can be safely depended on; this being the sole Means of quieting the present Tumult. An Opiate is, therefore, to be exhibited in a large Dose, in the Evening, as before; and it is to be repeated from this time, Morning and Night, and sometimes oftener, as there is Occasion: For it must be carefully noted, that the Symptoms in some Persons are so extremely violent, that an Opiate given in a very large Quantity cannot overcome, nor even check them in less than twelve Hours; in which Case it is indispensably necessary to repeat the Opiate in the same Dose every six or eight Hours.

But, as it frequently happens in the Declension of the Distemper, partly from its Nature, and partly from the great Virtue of the Opiate, that the Patient becomes so very covetous, as to be in Danger of Suffocation, and that the Fever rises so high, as to leave little Hopes of Recovery, we must suit the Remedy to the present Exigency; and less Danger will ensue from taking a gentle Purge, than from the Fever much increased by the Retention of the Fæces. I have successfully ordered here, an Ounce and half of lenitive Electuary to be dissolved

in four Ounces of some small distilled Water, as of Succory, of Milk-water, and taken immediately; and, though this Draught may not operate speedily, on account of the usual Costiveness in this Disease, and, also, of the long-continued Use of Opiates, yet being administered in the Morning, it ordinarily gives a few Motions before Night; but, if it should not, the Opiate must be exhibited in the Evening, and indeed earlier, notwithstanding the Purge, if great Restlessness, or Sickness, threaten Danger, lest the Patient, for want of this Assistance, should perish, whilst the Operation of the Medicine is waited for. Nor will so mild a Purge occasion the least Mischief, though it should not work at all; so that, if it does not answer the Intention the first Day, repeat it the next, which will seldom fail to work. But, if it should seem to have procured a sufficient Discharge for the present, and the Patient grows better, the second Draught may be deferred to another time.

In this manner, Bleeding and Purging may be repeated by Intervals, as the Fever and Restlessness seem to require, till the Patient be out of Danger. But, let it be carefully remembered, that a Purge is not to be exhibited till the Declension of the Disease, that is, on the thirteenth, or subsequent Day; and not then, unless some Blood has been taken away upon the first Appearance of the secondary Fever.

Though purple Spots may be removed by duly cooling the Blood; yet both bloody Urine, and a violent Flux of Blood from the Lungs, ordinarily forebode certain Death: Nevertheless, this dreadful Difficulty may, likewise, be overcome, and Life preserved: For as both these Symptoms proceed from the vehement Inflammation, and of course, the exceeding Thinness, or dissolved State of the Blood, such Medicines as cool, and, also, thicken the Blood, by their binding and incrassating Quality, admirably check these Bleedings. For this Reason, after Bleeding once plentifully, give an Opiate.

Take of distilled Water of red Poppies, two Ounces; Liquid Laudanum, fourteen Drops; distilled Vinegar, three Drams; Diacodium, half an Ounce: Mix them together for a Draught.

Then, let the following, or the like Remedies, be used till the Bleeding stops.

Take of the Troches of Lemnian Earth, and Armenian Bole, each a Dram; Seal'd Earth, Blood-stone, Dragons-blood, and prepared red Coral, each half a Dram; Mastic, and Gum Arabic, each a Scruple: Make them into a fine Powder; of which, let half a Dram be taken every three Hours, in a Spoonful of Syrup of Comfrey, drinking after it four or five Spoonfuls of the following Julap:

Take of the best distilled Waters of Plantain, and Oak-buds, each three Ounces; Cinnamon-water without Spirit, two Ounces; Syrup of dried Roses, an Ounce; Spirit of Vitriol, enough to give it a moderate Tartness: Mix the Whole for a Julap.

In the mean time the Opiate above prescribed must be given in the Evening: Emulsions, also, made of the four greater cold Seeds, and white Poppy-seeds, are very beneficial. But, after the Bleeding is stopped, the Distemper is to be treated in all other respects, according to the Method above delivered.

When I order Liquid Laudanum, I mean my own Laudanum, which is prepared in the following simple manner:

Take of Spanish Wine, one Pint; Opium, two Ounces; Saffron, one Ounce; Cinnamon and Cloves, reduced to Powder, each one Dram: Infuse them together in a Bath-heat for two or three Days, till the Tincture becomes of a due Consistence; and, after straining it off, set it by for Use.

I would have the Syrup of Poppies, or Diacodium, thus made:

Take of the Heads of the white Poppy, well dry'd, fourteen Ounces; let them infuse for twenty-four Hours in a Gallon of Spring-water; then boil them well, and press out the Remainder strongly; to which add, twenty-four Ounces of Sugar, and boil them together into a Syrup.

I esteem these two Preparations the best of their Kind, especially the Diacodium, an Ounce of which will do more Service, than two of that which is made with green Poppy-heads, (without pressing the Liquor out so strongly) and a large Quantity sometimes of the black Heads of the wild Poppy, which have little Virtue. Accordingly, whenever I am not satisfied about the Strength of any of these Opiates, I usually order, in their stead, a Grain and half, or two Grains,

of solid *London Laudanum*, dissolved in some proper distilled Water; by which means I avoid making any Mistake, and injuring my Patient.

Helvetius, like other Authors, divides the Small Pox into distinct and confluent. Of the distinct Species he mentions two Sorts, the *simple*, and the *malignant*, which last, he again divides into two Species.

The confluent Small Pox he distinguishes into the *simple*, and the *malignant*; of which last he makes four Species.

THE SIMPLE DISTINCT.

The simple Distinct are distinguished from the other by a Cessation of all the Symptoms after the Eruption. The Symptoms are, a brisk Fever, Drowsiness, Deliriousness, convulsive Motions, Head-ach, Pains about the Region of the Kidneys, a Propensity to vomit, and Vomiting. In this Case the Patient must be bled in the first place. *Helvetius* recommends Bleeding in the Foot, if the Physician is called in late. The Patient must, also, drink a large Quantity of a light Ptisan; and must have an emollient Clyster, made purgative, if occasion requires. He must be supported with Broths made of Veal and Fowls.

When the Violence of the Fever is a little over, he must take a Vomit, and be gently purged in case the Vomit do not work downwards. Nor need one to fear to purge the first or second Day, in case the Symptoms require it.

The Patient's Regimen, after the Eruption, must be of Broths somewhat stronger, to which Beef may be added with Rice. He must, also, take twice or thrice a Day an absorbent Potion, composed of simple Water, and some testaceous Powders, as Powder of Coral, Crabs-eyes, prepared Pearls, Species Confectionis Hyacinthinæ, the Countess of Kent's Powder, and diaphoretic Antimony. In Children subject to Worms or Convulsions, or in case their Stools are greenish or slimy, the *Pulvis ad Guttatam*, Oyster-shells, and calcined Egg-shells, are preferable to those above-named.

If the Pock does not rise, and the Circle at the Base becomes pale, the Patient should take a larger Dose of diaphoretic Antimony, or the Countess of Kent's Powder; or with an Addition of Saffron, or Theriaca. In case the Belly is not relaxed, he must take a Clyster, especially if an Adult, as he may a gentle Narcotic, in case of Want of Sleep, proceeding from Pain and Uneasiness caused by the Pock. These Narcotics should be mixed with some Absorbent, in order to hinder them from growing sour on the Stomach. Whilst the Pustules suppurate, he must not drink such large Quantities of Broths as before; but plentifully of some light Ptisan, with some proper Apozem. When the Suppuration is over, he may come to a stronger Regimen, but continue his Ptisan, and take a Clyster every Day. As soon as ever the Pock falls off, the Patient must be purged, which must be often repeated to hinder ill Consequences.

THE DISTINCT MALIGNANT.

In the *Distinct malignant*, the Patient has a burning and continued Fever; a great Oppression; a dry and burning Skin; a considerable Pulsation in the Carotid Arteries; a Stiffness of the Tendons; the Eyes animated and sparkling; and the Vessels of the *Tunica Conjunctiva* red and distended; a considerable Pain in the Small of the Back and Head, oftentimes without Deliriousness, and without Heaviness or Inclination to sleep. These are the Symptoms before the Eruption. These Symptoms generally cease after the Eruption; but the Fever soon after returns, and brings on frightful Dreams, Deliriousness, Inquietudes, Bleeding at the Nose, more particularly at the Increase of the Fever, often profuse Sweats, notwithstanding which, the Skin remains burning, and dry.

Frequently upon the Skin, between the Interstices of the Pocks, red Spots appear, which make a sort of universal Inflammation.

The Fever, and other Symptoms, increase at the Suppuration, as, great Agitations, violent Deliriousness, and convulsive Motions; notwithstanding which, the Pock remains elevated, and of a good Kind. As the principal Danger in the Small Pox is the inflammatory Fever, so the greatest Care ought to be taken to diminish this, especially at the Suppuration, when there is the most Danger, the Symptoms then increasing considerably. For answering this Intention, the Physician must order the Patient to be bled in the Arm, if he is sent for before the Eruption, or when the Eruption is but just begun. But in case he is called in too late, he must not neglect Venesection immediately in the Foot. For this Species of Evacuation, besides the Advantage common to it, and Venesection in the Arm, which is diminishing the Quantity of the Blood, is excellently calculated for making a Revulsion, and by that means keeping the Brain, and Parts adjacent, free from Inflammation. But Bleeding in the Foot is never so effectual,

unless the Blood-vessels of the Body are first sufficiently emptied. Mean while, Care must be taken to dilute the Humours, by a plentiful drinking some proper Ptisan, and diluting Apozem, every third Hour, and to ease the Intestines by some proper Clyster. But the principal Care must be to observe the Diminution of the Fever, and then exhibit a Purge, and, also, a Vomit. *Helvetius* prefers soluble Salt of Antimony; but the Emetic must not be given till the Vessels are emptied enough; afterwards, if the Evacuation is not large enough, a Purge must be given; after which, some absorbent Draughts every third Hour. If more Evacuation is required, a Purge, Vomit, or both, may be repeated, to hinder Returns of the Fever, colliquative Sweats, Hæmorrhages, Suppression of Urine, &c. *Helvetius* orders a febrifuge Ptisan of the *Peruvian Bark*, with the Leaves of Borrage and Bugloss; but never when the Skin is burning, and the Tongue dry, nor continued past the fourth Day. Sometimes the Patient must be bled twice or thrice in one Day, and be purged the next; and even sometimes take a Vomit, or a Purge, some few Hours after the last Bleeding, according as the Symptoms are violent, the Quickness of their Increase, the Ardour of the Fever, and the quick Returns of it; so that there is but little Interval between. If all this should have been neglected at first, before the Eruption, they must be put in Practice the three first Days of the Eruption. And though the Effects are more uncertain in this latter Case, yet all the Ill that happens from it is, that the Circles are paler, and the Eruption more slow. A gentle slow Eruption is better than a precipitated one. When the Symptoms do not demand the Ptisan of the Bark, the principal Care must be to dilute the Blood, and evacuate its Salts by the urinary Passages, to keep up a free Transpiration, and to keep the Intestines relaxed. *Helvetius* recommends diaphoretic Antimony for this Purpose, and says, he uses it in the *distinct simple* Small Pox, when, being called in too late to purge, he observes any Symptom, which ought to determine him to purge. In case diluting Apozems do not keep the Intestines relaxed enough, Clysters must be used; or two, three, or four Grains of soluble Salt of Antimony, dissolved in four Doses of the Apozem, which he recommends, and says, it may be used from the Eruption to the Suppuration, the Fever of which it diminishes. If a Looseness happens after the Eruption, and immediately before the Suppuration, or whilst it last, if the Stools are crude, serous, and greenish, they must be corrected by Absorbents. In case the Looseness appears crude and serous before, or at the Beginning of the Eruption, Absorbents must be deferred till after some proper Cathartic. But, if the Looseness is bilious, and of a good Kind; if it do not stop the Eruption, or the Fever do not increase, it is very salutary, though it happens at the time of Suppuration: And should it cease too suddenly, it must be provoked again. But if the Evacuations are too large, they may be moderated. *Helvetius* thinks Clysters very proper thro' the whole Course of the Disease, if the Patient has his Belly swelled, if he finds a Working of his Intestines, and Uneasiness. The Patient ought, also, to drink a large Quantity of Liquors. In case of Watchings and Inquietudes, a gentle Narcotic may be used, provided that there are no considerable Complaints of the Head, no Deliriums, Convulsions, Giddiness, nor Heaviness; provided, also, that the Watchings, &c. are not caused by the Violence of the Fever: In which Case only, Syrup of white Water-lily should be tried. But in case they are so violent as to oblige to have recourse to a Narcotic, *Sydenham's Liquid Laudanum*, or some other Composition charged with Aromatics, which correct the Opium: For *Helvetius* has often remarked, that Opium, or the *Syrupus à Meconio*, by themselves, have often caused troublesome Drowsiness, and increased the Delirium.

At the Suppuration the diaphoretic Antimony must be left off, and the Apozem taken alone, or with some testaceous Powder, and diluting Liquors must be drank in great Plenty; the Broths the same as prescribed before. When these Deliria, Convulsions, &c. grow violent, they are mortal. In case an Epispastic can be applied twelve or fourteen Hours before these Symptoms are grown considerable, it is the best thing that can be applied, both to stop and prevent the ill Consequences. In case the Fever returns, after the Suppuration is ended, Emetics and Cathartics succeed best; if the Pus is too thin, and hinders the Suppuration, the Pocks must all be cut, and, mean while, Cathartics and Lenients must be used.

The second Sort of the *distinct Malignant* is, when there is a strong Fever with Purples, and a Multitude of little Vesicles, fill'd with a limpid Serum, more particularly on the Breast, and very few Pocks: This must be treated after the manner of *malignant Fevers*.

THE CONFLUENT SIMPLE.

In the *confluent Simple* the Fever ceases, for the most part, after the Eruption, but returns violently at the time of Suppuration;

ration, and sometimes with an Inflammation. Though it is difficult to tell if the Lymphatics have been obstructed from the Beginning, or not; the following are, however, Signs of it, especially if they all, or most part of them, appear at once, though some separately may appear without any Obstruction.

If the Patient was not blooded at first, and has taken strong Cordials.

If he is too drowsy after the Eruption.

If he feels a continual Humming, and Noise, in his Ears.

If, during his Drowsiness, he has slight and frequent Wanderings.

If he is uneasy, and tosses about.

If his Belly remains puffed, and swelled, although it has been evacuated by Clysters.

If the Tongue is very dry.

If his Urine is made in a small Quantity, and that high-colour'd.

If the Pock is flat, and sunk in the Centre.

Though there is no Reason to suspect any Obstruction from the Beginning, yet there is great Danger at the Suppuration; and the only Reason one can have to hope for Recovery, is, the Management of the Patient from the Beginning. Convulsions and Raving are very bad Accidents; and, if they come on a sudden, at the latter End of the Suppuration, and after proper Evacuations by Bleeding and Cathartics, they almost always prognosticate a near and inevitable Death: But if proper Evacuants have not been us'd, they are less dangerous, there being a Possibility of preventing the ill Consequences by Bleeding, Cathartics, &c.

This Sort of Small Pox is not near so terrible as the *distinct malignant*: It is, however, very dangerous, about the Time of Suppuration. When the Patient is first seiz'd, he must be blooded in the Arm, once or twice, if he is past Twenty, and of a sanguine Constitution; and afterwards must be blooded in the Foot.

Afterwards, Cathartics and Emetics must be us'd, but with this Precaution, that as there is not now, as in those of the *malignant* Kind, any Fever independent and distinct from the Small Pox to combat, for that Reason the Evacuations must be less: After proper Evacuations, the three principal Views must be, to dilute the Blood; to promote a large Quantity of Urine; to attenuate the Bile, and make it fit for Secretion: For no Part of the Body is so subject to be disorder'd in this Sort of Small Pox, as the Glands of the Liver, which often causes irregular Fits of a Fever, Hæmorrhages, Vomiting, Weaknesses, &c. To satisfy these Intentions, the Patient must take fifteen or twenty Grains of diaphoretic Antimony, and half a Grain of soluble stibiatis Salt, in four Ounces of some proper diluting Apozem. When the Suppuration begins, the diaphoretic Antimony and Salt must be discontinued, and the Apozem given alone, or with some simple testaceous Powders.

It sometimes happens, that, at the first Days of the Eruption, the Pock is not elevated as it ought, but is sunk at the Centre: In this Case, the diaphoretic Antimony must be us'd without the soluble stibiatis Salt; and, if that is not sufficient, some Kermes Mineral, the Countess of Kent's Powder, or the Species for the Confection of Hyacinth, may be join'd to it. If the Urine is thick, of an ardent or deep-colour'd Yellow; one must have recourse to *Glauber's Sal Mirabile*: Clysters are, also, very useful: The Regimen must, also, tend to dilute and sweeten the Blood. Often, at the End of the Suppuration, arrive, a brisk Fever, Hæmorrhages, Convulsions, a profound Heaviness, Weaknesses, or Syncope, and Inclination to vomit: In this Case, if the Patient has not had necessary Evacuations, and these Symptoms have not yet appear'd in the Course of the Disease, he must be immediately blooded in the Foot, even though the Pock is still suppurating. In case the Symptoms require it, it may be safely repeated, using, at the same time, diluting Apozems.

When these Symptoms are preceded by a distinct Fit of Shivering, a Pilsan, of the *Peruvian Bark*, must be us'd; but after Bleeding, and when the Fit is considerably diminish'd. In case the Patient has a Propension to vomit, or Weakness, Eruption, or a swell'd Stomach, he must take a Vomit after Bleeding; but not unless the Diminution of the Fever, and the End of the Fit, permit.

On the contrary, if the Symptoms have been eas'd by Bleeding and Diluters, the Patient must wait for his Cathartics and Emetics, till the Suppuration is entirely ended.

Sometimes these Accidents do not appear, till the Pock is dry'd, and the Suppuration ended: To avoid a Return of the Fever, the Patient must be purged, or vomited, immediately after Bleeding: This Practice has always succeeded perfectly well with *Helvetius*.

But if these Symptoms appear'd at first, or in the Course of the Distemper, one can expect no Success from these Methods,

but must have recourse to Vesicatories, the only Remedy that can be of Service; which will not avail, unless applied, at least, twelve or fourteen Hours before the Symptoms are at their Height. Bleeding, after the Suppuration, succeeds, in this Sort, oftener than in the *malignant* ones.

THE CONFLUENT MALIGNANT, CALLED CRYSTALLINE.

All the four Sorts of the *confluent malignant* Small Pox have this common Symptom; the Fever never ceases throughout the whole Course of the Distemper: The first Sort is distinguish'd by the Pocks, which are clear, transparent, and full of a limpid Serosity; wherefore they are call'd *crystalline*.

Though it is difficult to distinguish this Sort at first, yet it may be guess'd at, by a brisk Fever, a considerable serous Looseness, a great Headach, and great Thirst; the Skin of a white pale, and all the Parts a little swell'd: At the Eruption, the Pock appears of a paler red, rises sooner, and higher, and becomes larger than in the other Sorts; the Circle at the Base remains always paler; the Pellicle, which contains the Humour, is very thin; often many Grains join, and form a Sort of Bladder full of Serosity, which, if pierced, and the Liquor let out, looks pale at Bottom: All the Parts, in general, have an extraordinary cedematous Swelling; and, at last, the *malignant* Fever manifests itself, by Symptoms proper to it, or a miliary Erysipelas. As the Blood, in this Sort of Small Pox, is too fluid, there is no Occasion to bleed so much as in the other Sorts: But as the Head is always disorder'd, there is a Necessity for bleeding in the Foot, which has seldom Occasion to be repeated. One of the principal Accidents is, a Flux of a crude, serous Matter, of a green or whitish Colour; in which Case the Patient must be gently vomited. *Helvetius* recommends one Ounce of the Magisterial Syrup, and ten or twelve Grains of Ipecacuanha, mix'd up with some spirituous Cordial; after which, some Bolus, of the testaceous Powders, must be given: The next Day, or Day after, some gentle and astringent Cathartic; after that, a Draught, with some testaceous Powders, or very gentle Astringents, and in a small Quantity; for the Flux must be moderated only, not stop'd; inasmuch, that, in case it should stop, or diminish so much that the Belly becomes swell'd, it must be promoted by proper Clysters. If there is any Occasion for Narcotics, only the *Syrupus de Nymphaea* must be us'd.

In case the Fever and Looseness return towards the End of the Suppuration, (for during the time of Suppuration the aforesaid Conduct must be observ'd) proper Cathartics must be us'd, but defer'd longer than in the other Sorts; because the Humour suppurates slower: When the Suppuration is entirely ended, the Pus should be let out of the Pock all over the Body, the Face excepted. During the whole Course of this Distemper, as the greatest Danger proceeds from a total Dissolution of the Juices, so the Design ought to be, to give them a Consistence. The Patient should never take, at the same time, Emulsions, or milky Liquors, and Acids; nor Acids, and testaceous Absorbents.

THE SECOND SORT OF THE CONFLUENT MALIGNANT.

The Accidents that appear before the second Sort of the *confluent malignant*, are much the same as those preceding the first Sort of the *distinct malignant*; but the Fever is generally brisker, and the Returns of it longer, and more violent; but it is not always attended with Vomitings, or a Propensity thereto, with Drowsiness, Wanderings, and other terrible Symptoms. The principal of the Symptoms are, a Beating of the Carotid Arteries, a Redness of the Eyes, and Stiffness of the Tendons.

The Eruption is often sudden, the Figure of the Pocks more irregular than in the other Sorts, are flat in the middle, and have their Circles of a deep Red: They rise but indifferently, especially on the Face, which puffs and swells from the very first Day of the Eruption; the Cuticle of the Face rises, and appears all one Pock, flat, and of an even Surface. If there is any Interval betwixt the Pocks, it is mark'd with erysipelatous, and, often, purple Spots; the Skin is dry, and very burning; sometimes there are abundant Sweats, though the Skin remains still very hot; the Urine is in a very small Quantity, and of a high-colour'd Yellow; the Pulse is either hard and small, or very large, and very much elevated; the Eyes sometimes are red, sparkling, and incapable of suffering the Light, sometimes very heavy, and the Pupil dilated more than usual: The Patient has violent Headachs, especially if he has neither Drowsiness nor Wanderings: Inflexibility of the Tendons, convulsive Motions, and Deliria, are more frequent, and considerable, than in the other Sorts; the Patient, in this, must be blooded, and purged, as soon as possible: If, after a sufficient Evacuation, the Fever remains still very strong and ardent, diluting Apozems must be given alone; if it remains brisk, but less violent, with diaphoretic Antimony, and soluble stibiatis Salt; but

if the Fever is but moderate, and the Pock remain sunk in the Centre, half a Grain or a Grain of Kermes Mineral must be given, instead of the Salt. If the Intestines are too much relax'd, some of the Species of the Confection of Hyacinth, or Confection of Kermes, must be added to the Apozem; or the Powders may be taken separately, drinking a Glass of Ptisan after it, in case there appears any Danger of too great a Relaxation of the Intestines. If, at the Suppuration, the Accidents return, notwithstanding all these Precautions, the Effects of Bleeding and Cathartics would then be fatal; the only Things that can be of Service, are Vescicatories.

About the End of Autumn, in the Year 1719, a Small Pox, of the *confluent* and *malignant* Kind, appear'd at Paris, and rag'd with such Violence, that no Remedies could afford Relief to those who labour'd under it: The Symptoms could not be hinder'd, either from appearing, or returning again in the very Beginning of the Suppuration; and though the Suppuration does not generally begin till the fifth, or End of the fourth Day, in this Species it often began on the End of the third. Nothing was capable of stopping the rapid Course of the Symptoms, and few Patients were so happy as to escape their Violence, in whatever Method they were treated, but generally died on the fifth or seventh Day of the Eruption, and, sometimes, at the Beginning of the Suppuration. The only Difference we could then observe, was, that those who were blooded and purged in the Beginning, were more calm, and less agitated, during the first Days of the Disorder: But this was a fallacious Respite, always succeeded by fatal Consequences, and only capable of imposing on those who had not had an Opportunity of observing a great Number of such Patients. The Pain, and other Symptoms, were less violent, but the Death of the Patient was not less certain.

In reflecting upon the Causes of this terrible Disorder, I imagin'd, that the excessive Heat and Drought, which had lasted, without Interruption, from the middle of the Spring, had induced a Change in the Blood, by depriving it of its most serous Parts; a Misfortune which may easily happen in France, where the Inhabitants generally neglect to defend themselves from the Heat of the Sun, and to correct their Blood by proper Aliments.

The Characters and Obstinacy of some other Diseases, which then rag'd, made us conjecture, that all the Fluids of the Body, and especially the Lymph, were much inspissated, and wanted a sufficient Quantity of that aqueous Vehicle which is so necessary for their free Circulation: We, also, observ'd, that, in this Pock, of the *confluent* and *malignant* Kind, the Spit discharg'd during the Ptyalism was more thick and viscid, than at other Times. The Neck, the Face, the Hands and Arms of the Patients, were violently inflat'd, and far more firm and hard than they usually are on the like Occasions. When the Inflation was arriv'd at its greatest Height, and the Fever of the Suppuration begun, the Spots disappear'd gradually more and more, till, at last, nothing at all was expectorated; a Symptom which always prognosticates a speedy Death. These Observations laid a Foundation for our suspecting,

1. That Symptoms, so terrible and frequent, depended on the Inspissation of the Lymph; which, being depriv'd of its Serosity, circulated slowly in the Vessels, and especially in those of the Head.

2. That this Lymph was very susceptible of Rarefaction, and greatly dispos'd to obstruct the Vessels; a Circumstance which interrupted the Circulation of the Fluids, and, in a few Days, prov'd fatal to the Patient.

The Remedies generally us'd, on Occasions of a like Nature, such as spirituous Cordials, and others, seemingly calculated to attenuate the inspissated Lymph, excited too great a Rarefaction in that Juice, and put all the Fluids into too violent a Motion; they augmented the Fever, threw all the solid Parts into a fatal Rigor, and, instead of rendering the Lymph fluid, they thicken'd it more, and often hasten'd the Death of the Patient.

As aqueous and diluting Medicines were incapable of penetrating this inspissated Lymph, so neither could they subdue the Symptoms of the Disease; nor could a Cure be expected from any other mild and temperate Medicines, which were too weak to attenuate and colliquate the gross tenacious Lymph. We, therefore, thought, we had Reason to have recourse to Vescicatories, as seemingly best calculated to answer the several Intentions of Cure; and though the Success of these Remedies, when us'd, did not answer our Expectation, yet we concluded, that the Error must have consisted in applying them too late: For both Reason and Experience evince, that Vescicatories generally evacuate but a small Quantity of Serum; that they operate much less powerfully by their attractive Quality, than by their acrid Salts, which mix with the Blood, and effectually attenuate the Lymph, without exciting violent Commotions in the Fluids. Hence Vescicatories must be applied in the first Days of the Disorder, to prevent, if possible, the Obstruction

of the Glands and Vessels; for if such an Obstruction is once form'd, and arriv'd at a certain Height, Vescicatories do not operate efficaciously, even though they should procure a Discharge of a large Quantity of Serum.

These Reasons influenced us to apply Vescicatories on the first, the second, or the third Day of the Eruption; by which means, we found the Appearance of fresh Symptoms prevented: But, for fear of exciting a too violent Irritation, we always delay'd the Application of the Vescicatories, till the Operation of the Purgative was entirely over: And this Caution is so much the more necessary, because the Vescicatories might be misplaced by the Motion the Patient must necessarily use during the Operation of the Medicine. In order to hinder these Plaisters from communicating a preternatural Heat to the Urine, the Patient must be order'd to use no other Kind of Drink than a Ptisan prepar'd with Mallows, or Barley.

But the Use of Vescicatories ought not to supersede that of simple Apozems, with which we may mix diaphoretic Antimony, or Absorbents, or stibiated Salt, according as the State and Condition of the Patient shall require.

But if the Body is not kept sufficiently soluble, Irritations of the Bladder are to be dreaded, and some other Symptoms, which, however, are of a far less dangerous Nature than those intended to be remov'd by the Vescicatories.

It is to be observ'd, that, in the Small Pox, Vescicatories adhere with Difficulty, and act but slowly, on account of the Inflammation produced in the Skin by the Pusules: For which Reason, the Plaisters us'd in this Disorder must be newly made, richly impregnated with Powder of Cantharides, sufficiently moisten'd with Vinegar, and secur'd by proper Bandages: These Vescicatories ought to be left on the Part for about twenty-four Hours, after which, we are to cut off not only the Blisters which are elevated, but, also, the Whole of the Epidermis, which is separated from the Skin.

The Dressing is to be of the ordinary Kind, with fresh Butter and Beet-leaves.

It frequently happens, that the Part of the Skin from which the Epidermis is remov'd, becomes dry, in a very short time, a sure Proof of the small and inconsiderable Effects the Vescicatories have produced on the Lymph.

To remove this Misfortune, instead of Beet-leaves, we are to apply a Plaister prepar'd of an Ounce of suppurative Ointment, and two Scruples or a Dram of the Powder of Cantharides. When a sufficient Discharge is made from the Part, we are to remove the Plaister, and dress with fresh Butter and Beet-leaves.

If Vescicatories have been applied from the first, one may judge of their good Effects, by the following Symptoms:

If the Spitting is more abundant, and more fluid.

If the Pock, sunk before, now rises.

If the swell'd Parts grow less firm, and yield to the Touch.

Two Inconveniences may happen from these Vescicatories: 1. That the Humour in the Pock remains too clear, and fluid. And, 2. That the Fever of the Suppuration is prolong'd. To prevent the first, all the Pocks, unless those on the Face, must be cut; which Method, sometimes alone, makes the Fever cease; if it does not, gentle Cathartics must be us'd. The Regimen must be incrassating. There is no Danger in using these Vescicatories, even to Women who have actually their Menes.

THE THIRD SORT OF THE CONFLUENT MALIGNANT.

The third Sort of the *confluent malignant* is preceded by the same Symptoms as the other *malignant* Kind; but the Eruption begins on the second Day. The Pock is of a black Colour, and but little elevated; when open'd, a black, and very livid, Blood issues out, and the Bottom appears gangren'd. The Patient generally makes bloody Urine; many render it by Stool, and some by the Nose, others by the Mouth, in Spitting, Coughing, or Vomiting; some by the Eyes. The Intervals between the Pocks are of an obscure Black, the Fever is brisk, and the Returns violent: They are almost always mortal.

If the Physician is call'd in time, he must begin the Cure by bleeding often in the Arm: If the Patient spits or vomits Blood; if he has with these a Bleeding at the Nose, violent Headachs, Convulsions, Drowiness, and Wanderings, the Patient must be purged gently, as soon as possible: If there is no Evacuation of Blood by Stool, or Vomit, he must, also, be vomited: After the Effect of each Cathartic, or at the Interval betwixt each, he must take some acid Potion. Sydenham recommends Spirit of Vitriol. If, by these Methods, the Patient can be brought to the End of the Suppuration, which seldom happens, the Patient must take some gentle Cathartic, after which, he must conform to an incrassating Regimen; and the Cure must be ended by some Antiscorbutic.

THE FOURTH SORT OF THE CONFLUENT MALIGNANT SMALL POX.

This Species of Small Pox partakes of the Nature both of the *confluent* and *distinct malignant* Kinds, though it has a greater Affinity to the latter Species, since it hardly differs from it, and ought to be treated in the same manner.

The following Symptoms are favourable, in the *malignant* Sort of Small Pox:

If the Fever, and all the Symptoms which preceded the Eruption, abate at the Eruption.

If the Eruption is gradual.

The Elevation of the Pock, and the Redness of the Circle at their Base.

The Whiteness and Consistence of the Liquor contain'd in the Pock.

A Softness of the Skin and Tendons.

A gentle Transpiration.

A moist Heat.

A large Quantity of Urine, and that of a good Colour.

No Disturbance in the Head, Breast, or Belly.

A Cessation of all the Symptoms which generally accompany the *malignant* Fever, join'd to the Small Pox.

Division of the bad Symptoms which appear in the Small Pox, into those before the Eruption, those at the Eruption, and those at the Suppuration.

BEFORE THE ERUPTION.

An Inflammation of the Eyes.

A violent Beating of the Carotid Arteries, if compar'd with the Pulse.

A dry, hard, burning, and painful Skin.

AT THE TIME OF THE ERUPTION.

A too sudden Eruption of the Pocks, in which most of them appear in twenty Hours.

A considerable Swelling of the Face and Head.

A Stiffness of the Tendons, without Convulsions.

Profuse Sweats.

A Depressure, and want of Elevation, of the Pock.

An erysipelatous Inflammation in the Interstices between the Pocks.

A small Quantity of Urine, and that thick and cloudy.

A too large Quantity and Crudity of Urine.

An involuntary Fluxion of Tears, from one or both the Eyes, without any considerable Inflammation of the Eye-lids, or when the Patient winks with one Eye oftener than with the other, or can't endure the Light.

Such a *Confluence* of the Pocks, as the whole Face seems to be but one, is very dangerous.

When the Ptyalism, which happens at the Beginning of the Eruption, is thick and glutinous.

AT THE SUPPURATION.

If, at the Suppuration, all the Accidents, which ceas'd at the Eruption, return with Violence, the Patient is in great Danger.

When the Pus is clear; not so ill in the crystalline Sort, as the others.

The Blackness of the Pock is a very bad Sign, unless, upon Opening, some Drops of Blood are mix'd with the Pus, and the Skin at the Bottom appears of a vermilion Red; but if it is of a blackish deep Red, it is very bad.

When the Pock sinks suddenly, or the swell'd Parts sink.

When the Stools are greenish, and serous, it is bad; when thick, bilious, and like a Pus, it is a good Symptom, provided the Pock does not fall.

When the Ptyalism ceases suddenly, and, at the same time, the Glands of the Throat swell, there is no Hope.

A Pomatum, to be us'd in the Small Pox.

Take two Ounces of the Oil of the Four cold Seeds; of *Sperma Ceti*, two Drams; and of Virgin Wax, three Drams: Melt all in *Balneo Mariae*, and strain; then slice it down with a wooden Spoon, and put it, by small Portions, into a marble Mortar: Beat the Whole, for three or four Hours, with a wooden Pestle, pouring now-and-then upon it a little pure Spring-water: Then add some Drops of the Oil of Citron, or a few Spoonfuls of Orange-flower-water.

When this Pomatum is to be us'd, we are to take some of it on the Point of a Feather, and gently anoint all the Pustules on the Face.

We may begin to use it when the greatest Part of the Pustules, being suppurated, appear white, which generally happens about the End of the seventh Day; though there would be no Danger in using it before the End of the Suppuration. This

Liniment may be repeated frequently every Day, and ought to be applied as often as the Face becomes dry, in order to hinder, as much as possible, the exterior Pellicle of the Pustules from becoming hard and dry too soon.

In preparing this Pomatum, it is absolutely necessary to beat it very long, in order to procure an intimate Incorporation of its Ingredients, and render it as white and light as possible.

It may be preserv'd for several Days, without Corruption, provided it is kept in a cool Place: If it should become too thick, it must be again beaten in the Mortar, observing, now-and-then, to mix some Drops of Water with it. But if it should become yellow, or contract a bad Smell, we must use it no more, but make a fresh Pomatum of the same Kind. *Helvetius.*

The Small Pox is a Disorder very frequent among Infants; and though it is so accurately describ'd by *Sydenham*, that his Account of it deserves to be read with the greatest Care, yet I shall specify some Things which evince, that the Small Pox may be reduced to the same Simplicity with the other Diseases, and that something is, as yet, wanting, in the Method of Cure.

The Small Pox is generally epidemical, beginning first in the Spring, increasing in the Summer, languishing in the Autumn, generally disappearing in the subsequent Winter, and next Spring returning in the same Order. The sooner it begins before the End of the Winter, the more malignant is its Nature; and, the later it begins, the more mild and benign the Disorder is. Hence it is obvious at what particular Season of the Year it is most dangerous.

It seizes Persons of all Ages, and Sexes, but especially Children, provided they have not before labour'd under it. The more Age has dissipated the Fluids, and corroborated the Solids, the more violent the Disorder: Hence the Small Pox is milder, and more easily cur'd, in Children, Women, and those of soft or lax Habits, than in those accusom'd to Labour, full-grown, and old Persons.

Though this Disorder is epidemical, it is, nevertheless, convey'd from an infected to a sound Person, by a certain Contagion, which, being lodg'd in the Air, is with it communicated to the Lungs, Fauces, Nostrils, Oesophagus, Stomach, and Intestines; so that the Disorder seems, at first, to arise from a small Quantity of poisonous, or peccant Matter.

This contagious Matter, when mix'd with the Fluids, immediately produces certain Effects, which mutually succeed each other, such as Horripilation, Rigor, an acute Fever, an intense and perpetual Heat, a preternatural Splendor of the Eyes, arising from a Defluxion of a hot and subtil Liquor; an intense Pain of the Head and Limbs, but especially about the Parts below the Pit of the Stomach; a Vomiting, and Nausea; an insupportable Inquietude; a Stupor; a Drowsiness; and, in Infants, epileptic Fits.

In the Beginning of this Stage of the Disease, the Blood, taken from the Patient's Veins, is beautiful, and resembling that of a sound Person; but, on the third or fourth Day, it appears like pleuritic, or inflam'd Blood, and the more it assumes this Appearance, the longer, or more violent, the Disorder has been.

This Stage continues in Proportion to the Variety of epidemical Causes, the Violence of the Disease, the Habit of the Patient, and the various Seasons of the Year. The longer this Stage naturally is, the milder it will be, through all its Stages; and the shorter, the more violent.

Hence this Stage of the Small Pox seems to consist in an increas'd Velocity of the Fluids, by means of an inflammatory Stimulus mix'd with all the Parts of the Blood.

The Small Pox, therefore, which bears an Affinity to all acute inflammatory Disorders, is, in this Stage, with Difficulty distinguished from them: A Knowledge that the Disease rages epidemically; that the Patient is disposed to it; that there is a previous Contagion, and the Symptoms of it produced, evince, that the Small Pox is present, and that the Pustules will succeed in its other Stage, to be afterwards described.

When the first Stage of the Disease is known, the sole Intention of Cure seems to consist in removing the inflammatory Stimulus, curing the present Disorder, hindering its farther Progress, and preventing a future Suppuration and Gangrene.

The inflammatory Stimulus may be removed, by Correction with Specifics, or by an universal antiphlogistic Method.

The specific Correction of the inflammatory Stimulus ought to be obtained by Remedies opposite to the contagious Poison, so small a Quantity of which, admitted into the Body, produces all the other Symptoms of the Small Pox.

A strict Comparison of the History of Antidotes, and the Nature of the Small Pox, afford some Reason to hope that such a Remedy may be found, and that great Advantages may arise to Mankind from it.

The Success of Antimony and Mercury, by Art rendered highly penetrating, not corrosive with a too saline Acrimony, but duly mixed with each other, induces us to seek for such a Remedy in these two Medicines. Thus,

Take of unwashed diaphoretic Antimony, six Drams; of *Mercurius Dulcis*, half a Dram; and of the best *Sal Polychrestum*, one Dram: By long Trituration reduce to a fine Powder; to be divided into twenty-four equal Doses; one of which is to be taken every three Hours, drinking after it four Ounces of recent Whey. Or,

Take of the Flowers of Sulphur, one Dram; of Cinnabar of Antimony, one Scruple; and of nitrated diaphoretic Antimony, and *Sal Polychrestum*, each one Dram and an half: Reduce to a fine Powder; to be divided and taken in the same manner with the former.

In the Small Pox we may, also, use the universal antiphlogistic Method, and take those Measures which, in all inflammatory Disorders, are found effectual for hindering the Inflammation from degenerating into Pus, or a Gangrene. Nor, as these Measures prove successful in other Disorders, is it to be doubted, but they would, also, do so in this. Hence it is not impossible that a variolous Fever may be often present, without the Small Pox.

That the universal antiphlogistic Method may be observed, it is necessary, first, that the Patient should have a sufficient Quantity of Blood taken from him. Secondly, That the whole Skin, Fauces, Oesophagus, and Intestines, should be frequently relaxed with Clysters and Fomentations. Thus,

Take of the Flowers of Mallows, Marshmallows, Dandelion, Mullein, and Soapwort, each half an Ounce; and of Linseed-meal, two Drams: Boil in twelve Ounces of Water, for a Clyster; to be injected every twelve Hours.

Woollen Cloaths, also, wet in the same Decoction, are to be applied warm to the inferior Parts of the Body; such as the Feet, Hams, Groins, Thighs, and Legs: The Mouth, Fauces, and Nostrils, are, also, to be washed and moistened with the same Decoction. Thirdly, The Patient must drink large Quantities of thin, acidulated, or nitrated farinaceous Water; he must, also, drink antimoniated Nitre, or the *Sal Polychrestum*, in Milk and Water. Thus,

Take of the recent Flowers of the wild Poppy, and Elder, each one Ounce; and of entire Oats, half an Ounce: Boil in a sufficient Quantity of Water, with each twenty Ounces of which mix, of sublimed Nitre, that is, such as has been separated from diaphoretic Antimony by washing and Crystallization, half an Ounce; of recent Citron-juice, one Ounce; and of the Syrup of Violets, one Ounce and an half: Of which Preparation the Patient may drink as much as he pleases.

Fourthly, The Patient's Aliments ought to be light, the Air drawn into his Lungs pretty cool, and his Body must be kept well covered, and perspirable. For Aliments of this Kind, see the Article FIBRA.

Though in the Small Pox the Intention of Cure, and especially the Method of obtaining it, already mentioned, are rarely thought of; yet such Measures have accidentally proved successful, even when Physicians have been ignorant of the Disease.

When this Disorder finishes its first Stage, which is that of Contagion, it enters upon another, which may be described thus: The Skin, first, of the Head and Face, then of the Hands and Arms, and, lastly, of the Trunk and interior Parts of the Body, is infected with small red Specks, like those produced by the Bites of Gnats; soon after, all the Symptoms are mitigated, and every Hour the red Pustules are continually enlarged in Bulk, and Number: They are, also, more elevated and inflamed, till, at last, the Skin becomes tense: Heat and Pain are produced, and the Circulation of the Blood, and Perspiration of the Humours, are retarded. Hence arise the greater Repulsion of the Humours to the internal Parts; the Fever; the Anxiety; the Difficulty of Breathing; the Pain of the Fauces; the Quinsy; the *Diarrhæa*; the Dysentery; the Discharge of bloody Urine; the Spitting of Blood; and the hot, red, and painful Inflammation of the Skin lying between the Pustules; which, when they have continued four, five, or six Days, are absolutely suppurated, and converted into as many small Abscesses. I call this Stage of the Disease the Progress of the Inflammation into an Abscess: This Stage lasts, according to the Variety of epidemical Causes, the Temperature of the Patient, the Violence of the Disease, the Regimen, and the various Seasons of the Year, for the most part, four or five Days; so that on the eighth Day, from the Beginning, there is

generally a Suppuration, at which time the Blood is highly inflamed.

If the Contagion is violent, the Pustules numerous, adjacent to each other, and, as it were, intermixed, all the Signs of the Inflammation great, the Patient of a saline oleous Temperament, in the Vigor of his Age, and accustomed to delicate Living; if the Regimen and Remedies greatly increase the Circulation of the Humours, and if the Summer is very hot; then, towards the End of the Inflammation, red Vesicles, distended with Lymph, appear, and are Marks of a gangrenous State of the Juices. Hence the Skin becomes unfit for the Circulation and Exhalation of the Fluids, which are, for that Reason, more repelled to the internal Parts. Hence arises the excessive Salivation, and the Swellings of the Hands and Feet.

From what has been said, we may learn the Diagnostics and Prognostics of the second Stage of the Small Pox; as, also, the Nature of the Disease, and its Symptoms, which are generally circumscribed within these Rules.

The milder the Stage of the Contagion is, the gentler, also, that of the Inflammation will be.

The more slowly the Pustules make their Eruption, and, consequently, the longer the State of the Contagion is, the Disorder is proportionably slighter.

The larger, fewer, more distant, more remote from the Face, the whiter, and, at last, yellower the Pustules are, or the more slowly they proceed, the better, and more favourable, they are.

The more numerous, small, and intricate, the Pustules are, the more there are on the Face, the more brown or black, or the quicker their Progress, the worse they are.

The more the Matter of the Pustules resembles mild and perfect Pus, the better it is.

The more the Matter of Pustules resembles a gangrenous Ichor, the worse it is.

The redder the Interstices between the Pustules are, and the more hot, tense, and tumid, about the Time of Suppuration, it is so much the better, on account of the Circulation still remaining in these Parts.

The more the Parts lying between the Pustules are pale, or blackish, the worse; since these Signs prognosticate a mortal Quinsy, or a Peripneumony, unless a copious Salivation, or an excessive Tumor of the Hands, should come on: For the Circulation of the Blood is retarded here, and, consequently, increased towards the internal Parts.

If, in the Places between the Pustules, purple-coloured Spots appear, a mortal Gangrene is denoted.

The Intentions of Cure to be pursued in this Stage of the Small Pox, are various, according to the Degrees and Duration of the Disease: For, in the first Beginning of the apparent external Inflammation, Care seems requisite, to prevent degenerating into a Suppuration, concerning which, we have already treated: Or, if this Caution is neglected, we are to take care that the Suppuration be as small as possible, far from the Head, and slow; which End is obtained, first, by the lightest Aliments, and such as resist Putrefaction. See FIBRA. Secondly, By diluting, mild, and somewhat acid Liquors, such as those already mentioned. Thirdly, By deobstruent, aperient, and diluting Liquors, continually drank in large Quantities. Thus,

Take of the recently extracted Juices of Succory, Lettuce, Dandelion, and Fumitory, each two Ounces; of the Roots of Vipers Grass, four Ounces; and of pure Nitre, one Dram and a half: Mix all together, and let the Patient take one Ounce every Hour of the Day. Or,

Take of China Root, and the Roots of Sarsaparilla, and Grass, each two Ounces; of the Roots of Vipers-grass, eight Ounces; and of Elder-flowers, one Ounce: Boil for an Hour, in a sufficient Quantity of Water, to six Pints; of which let the Patient take five Ounces every Hour.

Fourthly, By bathing the Feet twice a Day, and continually fomenting them with a tepid Fomentation; applying, at the same time, epispastic Plaisters to the Soles of the Feet, and the Hams. Thus,

Take of the Melilot Plaister, of *Galbanum*, and *Sagapenum*, each one Ounce: Mix all, spread upon a Piece of Leather, and apply to the Soles of the Feet. Or,

Take of the Crums of stale Bread, six Ounces; of Rue, a Handful; of bruised Mustard-seed, six Drams; and of Salt, and Vinegar, each four Drams: Mix all together, and apply to the Soles of the Feet, and the Hams.

Fifthly, By a somewhat cold Regimen, and especially by the Admission of a pretty pure and cool Air; taking care, particularly, to guard the inferior Parts of the Body from Cold.

Sixthly,

Fifthly, These Measures are to be taken in the very Beginning of the Disorder. And, sixthly, If the Disease is intolerably violent, Opiates are to be used in the Afternoon, at Five o'Clock; taking care not to neglect the other Circumstances prescribed. Thus,

Take of the Syrup of white Poppies, one Ounce: Make into a Draught. Or,

Take of pure *Laudanum*, one Grain: Reduce to the Form of a Pill. Or,

Take of pure *Laudanum*, one Grain; and of distil'd Mint-water, half an Ounce: Mix for a Draught.

After this second Stage of the Small Pox, there succeeds a third, which is that of the Suppuration; in which the Disease is gradually increased, and perfected. During this Stage, the purulent Pustules are daily increased, and then, being matured, become white, or yellow, and break on the third or fourth Day of this Stage: Then the whole Face and Skin abound with a moveable *Pus*, whilst the external Parts are dry'd, and such of them as are disengaged from Pustules, inflamed. Hence, by the Obstruction of the Circulation and Perspiration, by the Irritation of the nervous and membranous Systems, and the Absorption of the *Pus* into the Veins, a malignant Fever, accompanied with the most terrible Symptoms, is produced. If this purulent Matter is mixed, and circulates long with the Blood, hence, according to its Congestion in various Parts of the Body, it produces various, and hardly surmountable Effects, such as a *Delirium*, a *Phrenitis*, a *Peripneumony*, a *Pleurisy*, a *Vomiting*, a *Dysentery*, an *Hepatitis*, *Apostems*, *Carbuncles*, Tumors of the Joints, Abscesses, Stagnations of the Fluids, a tabid Disposition, a *Phthisis*, and many other terrible Disorders.

But if the variolous Matter is subtle and acrid, and the Disease violent, the Skin, Fat, and Muscles, are corroded, whilst broad malignant Ulcers are formed, which often penetrate to the Bone, and leave unseemly Cicatrices behind them.

In this Stage of the Small Pox, a Discharge of the *Pus* to the external, and a Repulsion of it from the internal Parts, are to be obtained; which Ends are best answered by relaxing the Skin with tepid and relaxing Fomentations, carefully and constantly renewed; by frequently washing and gargarizing the Mouth and Fauces; by liberal Draughts of warm, cardiac, detergent, aperient, and antiseptic Liquors; by mild, diluting, emollient, and laxative Clysters, daily injected, and long retained; by living upon Broths prepared of Flesh, and seasoned with Salt and Acids; and by the moderate, though not too frequent, Use of generous Wines; exhibiting, at the same time, proper Doses of Opium, against the violent Shocks of the Disorder. The Liquors and Medicines proper for these Intentions are already specified under this Article.

If the Disease is violent; if there is a gangrenous Ichor, instead of *Pus*; if almost the whole Skin is covered with Pustules; it is sufficiently obvious, why the Small Pox is productive of so unhappy Effects, and even of Death: But this will be best understood by him, who, from Anatomy, knows, that not only the external Skin, but, also, the Eyes, all the Membranes of the Nostrils and Mouth, the *Aspera Arteria*, the *Bronchia*, the *Oesophagus*, the Stomach, the Intestines, the Liver, the Spleen, and the Lungs, are full of these Pustules: For the Person who knows this, understands the Reasons of what has been said, perceives what is necessary to the Cure, and whether the Violence of the Disease, and the Death of so many Patients, always happening after the Use of common Means, are not Circumstances which ought to excite the Care and Industry of the Physician in the Beginning of the Disease, since, by the common Method, accidental Cures are only produced, by the Force of Nature. Inoculation seems to be a Practice sufficiently certain and safe. *Boerhaave*.

Boerhaave's Judgment, with respect to the ordinary Method of treating the Small Pox, is very remarkable. His Words are, "Vulgata quippe Methodo nullus nisi sponte emergit:" By the common Method, accidental Cures are only produced, spontaneously, that is, by the Force of Nature. I will not presume to determine how far this Assertion is true; though I should sooner believe it of this Distemper, than of almost any other I am acquainted with; and candid Physicians are sensible that it is not entirely without Foundation. Whoever, therefore, proposes a more certain, and less exceptionable Method, deserves, at least, that his Sentiments should be examin'd with Candor; and, if Experience gives a Sanction to the Novelty, the Inventor merits all Kinds of Acknowledgments from Mankind, for the important Discovery.

As I had heard of considerable Successes in the Treatment of the Small Pox, attending a Method within these few Years introduced by *Dr. Thompson*, I judg'd it my Duty to enquire of

himself what that Method was, and upon what Observation, it was founded. The *Doctor* has been so obliging to me, and the World, as to communicate what I ask'd, without Reserve; and has given me Leave to make publick the following Treatise on this hitherto invincible Distemper; which I hope and believe will be agreeable to all those who consider Truth as the End of their Researches, and prefer the Welfare of Mankind, and Improvement of Physic, to all less generous Considerations.

The Small Pox is a Disease, that, at this time, is spread, in a manner, over all the known World, seizing, first or last, all Sorts of People, not sparing either Sex, Constitution, Climate, or Age; and whether it be from a Violence peculiar to the Disease, or from the various or improper Methods of Treatment, I cannot say, but, at least, every Day's Experience shews us, that it is, at this time, more universal than the Plague, and not much inferior to it in Danger. The many Authors who have treated expressly upon this Subject, the many Revolutions which have happen'd, both in the Theory and Practice, the Controversies yet subsisting, and the Points in Debate of such Consequence, their Opinions being so extremely wide from each other, that any Physician, who attempts the Cure of this Disease, should he not be entirely in the Right, would be so far from relieving the Patient, that he must rather join with the Disease, and render it more fatal, are the Motives that have induced me to give the Observations I have made in the Course of my Practice, concerning the Small Pox, which was, as it appears from History, unknown till the seventh Century, but now has taken such Root in the World, that it is even become hereditary to us.

The Small Pox, not being described by any of our *Greek* or *Roman* Physicians, proves almost to a Demonstration, that it never appeared either in the *Greek* or *Roman* World. Such Authors as *Hippocrates*, *Aretaeus*, *Celsus*, and *Caelius the African*, (rather *Soranus the Ephesian*) who were so excellent in the descriptive Part of Physic; inasmuch that I might say, we have rather the most finished Pictures of Diseases, than Histories (for they excelled in Description, as they did in Poetry, Sculptures, and Painting); it was impossible this Disease, had it then existed, could have escaped their Attention: Yet it is not impossible, but it might have then existed, in some other Parts of the World: And there have been those Physicians, who have endeavour'd to trace it from *India*, from thence to *Arabia*; but we all know it appeared in *Egypt*, brought there by the *Arabians*, when they conquered that Kingdom, during the Caliphate of *Omer*; from thence it spread where-ever they carried their Arms, their Religion, and their Commerce; through *Egypt*, *Syria*, *Palestine*, *Persia*, *Lycia*, along the maritime Parts of *Africa*, from thence into *Spain*, and afterwards diffused itself, by the Progress of our *European* Discoveries, Wars, and Trade, over almost all the known Parts of the World. *Rhazes*, who flourished in the Ninth Century, a *Syrian* by Birth, *Arabian* by Extraction, and *Mahometan* by Religion, appears to be the first Writer we have extant, who treats of this Disease.

We have had, at least, a thousand Authors, who have treated of the Small Pox: Those for the first five hundred Years varied but very little; neither can I say there have appeared any controversial Writings, among Physicians, of Moment, till *Sydenham*, the great Observer, arose. The Practice for a Century or two before his Time was a common beaten Path, supported only by some foolish *Hypothesis*, or empirical Receipts. They aimed chiefly, with Cordials, and other means, to promote the Eruption: Hence they imagined a kind of Poison expelled from the vital Parts to the Circumference. In the Course of Maturation, or the Filling of the Small Pox, the same Method was continued, lest the Poison should revert again to the noble Parts. The Reasons which induced Physicians to this Comportment in their Practice, seem to me to be these: They observed, during the first Stage of this Distemper, that is, till the last Day of the Eruption, their Patients to be agitated with great Inquietudes, and the Symptoms to be extremely high, which generally abated, when the Small Pox was entirely out: Wherefore, by promoting the Eruption (which they thought could not be done, but by Warmth, and hot Medicines) they imagined the Poison expelled; and expected the Symptoms would abate, which appeared to them a Demonstration of an Expulsion of morbid Matter. But how great will *Sydenham* appear, when we show the Motives which led that great Man to a Method of Practice, which entirely overthrew the vicious Practice that then prevailed with respect to this Distemper? He took Nature for his Guide, depending chiefly upon Observation and Experience, supported by Reason. He observed, that, among common People, where nothing was done, that the slower, and the later the Eruptions appeared, the more favourable was the Sort; and laid down this as a kind of Aphorism, that if the Small Pox appears the first Day of the Sickness, it might be looked upon as a kind of Plague; if it came

out on the second Day, extremely dangerous; if on the third, less so; if on the fourth, the distinct Sort, and generally without any Danger. From whence he justly concluded, that the Physicians were entirely in the wrong to hasten the Eruption, which a prudent Man would dread to see till the fourth Day.

Sydenham had his Followers: The Populace, who think they have a Right to give their Opinions in Physic, made this Distinction; the cool Regimen, and the hot; observing one Set of Physicians confining their Patients immediately to their Beds, and giving them Medicines of the warmest Kind, in order to drive out the Small Pox; the others leaving, as it were, the Eruption to Nature alone; and sometimes taking a little Blood away, as their great Master *Sydenham* directed. We shall omit speaking of the Variety of empirical or quack Medicines, since they generally were of the stimulating and heating Kind, that were given, in order to promote either the Eruption, or, after they were out, to ripen and carry on Maturation; for I allow of no peculiar Virtues in any Medicines, but in the Application, according to the Intention of an understanding Physician. *Sydenham*, then, made no farther Discoveries in the Small Pox, if we except the elegant Description he gives of the Disease, than during the first Period, that is, till the sixth or seventh Day, when the secondary Fever begins to arise. At this Period he took Notice, that towards the seventh Day, at Night, all of a sudden, notwithstanding the Symptoms were appeased, the Pulse became regular, and all the Small Pox out over the whole Body; the Water well coloured, or thick; the Eyes cool, and not with that fiery Lustre as before; the whole Storm allayed, that agitated the Sick, during this first Stage of the Small Pox: He observed, and, perhaps, this Observation may be looked upon as one of the most important in Physic, that, upon the coming on of the secondary Fever, it came not on by degrees, but like a Storm, which begins at once like a violent Hurricane; the Patient becomes suddenly light-headed; the Eyes blood-shot, streaming with Water; the Urine pale; the Pulse quick and hard; a sore Throat, &c. Here again he departs from former Physicians: He orders his Patient to be taken out of Bed, to be kept cool; the Feet bathed in warm Water, and Opiates repeated from time to time, till this Kind of Phrensy, and other violent Symptoms, cease. He then falls into the Practice of the Physicians he opposed, from this Time to the next remarkable Stage of the Small Pox, by allowing some cordial Medicines to keep up, as they term it, the Pock; but upon the Face subsiding, the Spitting growing more viscid, and, at last, stopping, on the tenth or eleventh Day, he falls into the most fatal Mistake, as well as others, and thinks there can be no Safety, if the Spitting returns not again, and the Hands swell, unless these Points are obtained by the Administration of the strongest and most powerful Medicines; and this fatal Mistake is owing to an *Hypothesis*, which involved at that time all the World, and even *Sydenham* himself. For they supposed an essential Poison peculiar to the Small Pox, which, till this time, spent itself by Salivation, and the Swelling of the Face, reverted back to the nobler Parts; that Nature being weak and debilitated, unable to expel this morbid Matter, falls under the Weight, and the poor Patient expires. Notwithstanding he was unable to obviate this last terrible Stage of the Disease, and reasoned and acted but as others did, however, like an able Mariner, who had made many Discoveries, and wanted still more to complete his Voyage, announces, like a Prophet, those Dangers he was unable to shun; and points out those Rocks, against which he and the rest had been shipwrecked. He says, and, in this Part, he even excels the *Greeks* in Description, that if the Spitile grows thick and ropy, and stops entirely, the Face, which was elevated and swelled before, suddenly falling, and the Hands not swelling, the Patient necessarily dies: But if the Face continues elevated beyond such a time, the Spitting continuing, also, beyond such a Period, the Patient certainly lives.

We may compare what *Sydenham* did, to what my Lord *Verulam*, that noble and illustrious Observer of Nature, did on another Occasion: He not only made surprising Discoveries himself, but he laid down a Plan, and recommended a Continuation of Natural History to Posterity to trace out, it being impossible for the short Life of one Man to compile so immense an History, as the boundless Field of Nature affords. The Honourable Mr. *Boyle* began where the other left off, and happily executed the Plan the other great Philosopher had laid down.

Sydenham then, having made many Discoveries, in regard to the Small Pox, looked upon it as a true inflammatory Fever; every Pustule he considered as a phlegmonous Tumor; he conducted his Patient extremely well to the Beginning of the secondary Fever; but when that rose too high; when the Matter was ill concocted; the Face sinking; the Spit growing viscid, and, at last, stopping; like a Prophet indeed, he an-

nounces the Danger, though his incomparable Skill in Physic, great as it was, could not avert it.

Thus Physic stood, after his Death, with regard to the Small Pox, till *Helvetius* appeared, who found, that, at the Turn of the Pox, when those fatal Symptoms, which *Sydenham* took Notice of, presaged certain Death, there had been no other Means used than by giving the Patient the strongest Cordials, which always failed; he introduced, therefore, Purging; a Method as essentially different from the then established Doctrine in the last Stage of the Small Pox, as *Sydenham's* was, with respect to the first: Here, then, they promoted, and raised a Fever, which was too high already; there he restrains it by Purging. But *Helvetius* being led through a kind of Hypothesis to these Motives, and not from any Experience or Reason, no Wonder he remained still in the Dark, unable to unveil the Difficulties attending this Disease. He divides the Small Pox into several Species, and notwithstanding his being sensible of its being an Inflammation *sui Generis*, yet is very far from treating it always as such. I can find nothing remarkable in what he has done, unless the Purging at the Turn of the Small Pox. This Method Dr. *Freind*, in England, followed, and took a great deal of Pains to establish this Doctrine here among us. It was with the utmost Difficulty he carried his Point: This Practice being so extremely wide of what was then so firmly established for many Ages, the giving of Cordials to promote the Eruption; as the Patient sunk under the Load, still the more Cordials were given: And thus they continued augmenting their Doses, till the Patient was burnt up. This was the Doctrine and Style of the Physicians, which the Standers by, and the Women, came readily into. Nurses, then, found it no hard matter to conceive the Force of their Doctrine: They saw it only consisted in confining a Person to a warm Room, always in Bed; and with the greatest Diligence taking Care, that the Patient might not be exposed to the Air; and all this, lest the Eruption should fall back; and giving the Patient continually a Set of Cordials, to strengthen, support, and keep the Disease from the Heart. This Jargon squared with the common People; and, as they found one half of the Cure depended upon Nursing, they claimed soon the Province of being Doctors in this Distemper. No Wonder, when *Freind* introduced this French Custom of Purging, and at a Period of the Disease, when they imagined, that, if ever, Cordials were of Use, they were at that time, when the Patient was languishing, and dying, on the eleventh Day, that his Method of Purging was so great a Contradiction to their Method, that they thought it downright Murdering the Sick. *Freind* wrote to support this new Practice; and the Drs. *Mead*, *Frewin*, and *Cade* came into it. As a Controversy arose, *Woodward* and others opposed it. However, the Physicians, from that time to this, have ventured, in extreme Danger, in the last Stage, to give a Dose of purging Physic; and sometimes to take away a little Blood. But as *Freind* reasoned, also, on an Hypothesis, and considered a Poison to be carried off by Purging, he ventured not to give such a Medicine as long as there was any Swelling, and till the Spitting was in a manner over. Thus he stayed till the Patient was upon the Point of expiring, before he began this Method, which was generally too late. Besides, this Hypothesis detained him in a most profound Ignorance of the Nature and Cure of this Disease; for he reasoned thus: While there is any of the morbid Matter passing off the usual Way, by the Swelling of the Face, however little, as well as by the Spit, however viscid and detaching, we are to expect no farther Assistance this Way, when we once begin Purging: For the Whole depends, then, upon carrying off the morbid Matter by Stool: He considered the Patient in a depressed State; not depressed by the Violence of a Fever: For, if he had considered this Case, as that of a Person sinking in a common Pleurisy, from the Height of the Inflammation, he would have avoided this Error. While he purges, he fears his Patient may sink, and so supports him with Cordials. By these means he is lost and puzzled, not acting rationally, as in an Inflammation well known, such as a Pleurisy; where Physicians consider a depressed and undulating Pulse, clammy Sweats, great Weakness, &c. as Signs of the Effect of an high Inflammation; they consider the Patient oppressed by the Violence of the Fever: Nay, should a Looseness appear, it alters not the Case, their whole Aim is at curing the Inflammation by Evacuations, whence they justly expect the Pulse to rise, become fuller and more distinct, which, in Reality, if the Patient be recoverable, always happens. *Freind*, and his Followers, then reasoned not in the Small Pox, as *Sydenham* did in a Pleurisy; but the Expulsion of the morbid Matter was what he chiefly aimed at; which Hypothesis kept him from the true Knowledge of the Nature of this Disease. And, notwithstanding he followed *Helvetius*, in Purging in the last Stage of the Small Pox, which Evacuation, I must own, is one of the proper Means

Means to limit the Fever: Yet, as what he did, proceeded from Hypothesis, and not from Reason, he deserves no just Praise, because Hypothesis kept him in the Dark, from knowing at what Time a Medicine should be given; how often it should be repeated; or what kind of Purges were preferable; or what other Means would more effectually oppose that Fever, which, if not checked betimes, most certainly destroys the Patient. His considering Purging in the Small Pox, without knowing the Reason for acting so, is, after all, but a kind of Empiricism; for he depends upon the specific Force of one Medicine: Whereas, had he been led by Reason, he would have known, that, by subduing the Fever, he obtains his Ends; and that this Point may be obtained by various Means: For whatever Medicine that has Power to effect this, will both prolong the Spitting, and the Swelling of the Face, the two principal Objects, in the last Stage of the Small Pox, deserving the Attention of the Physician: For, if these two Circumstances succeed, the Patient certainly lives.

Boerhaave is the next Author who has wrote expressly on this Disease; an Author of the most profound Erudition, and extensive Practice, who, after having read, as he says, a thousand Authors, gives it as his Opinion, that there are scarce any worthy to be read, unless the second *Hippocrates*, *Sydenham*.

Boerhaave has gone farther towards a Discovery of the Nature and Cure of the Disease, than all the Physicians who preceded him: He considers the Disease as a true Inflammation: He not only thought it improper to force the Small Pox out; for he very well knew, the sooner the Eruption appeared, the more fatal: But he, also, ventured to restrain a too sudden Eruption: And he even ventures farther, and recommends it to Physicians hereafter, to attempt to cure this Disease in the very first Stage, by preventing even a Suppuration of the Pustules. And he reasoned thus: In a Pleurisy, in a Quinsy, and other inflammatory Fevers, is not the Physicians Attention principally to resolve the Tumors; and do not they labour all they can to prevent the Formation of Matter; why then do we suffer Matter to be formed in this Distemper? And is not the Resolution of such Tumors, by the Power of Medicines, in other Words, the curing of such Distempers?

Although *Boerhaave* reasoned so justly, yet he either was not capable of bringing this to bear, or the Disease is impossible to be subdued, without taking its usual Course, that is, by Suppuration: Yet this Advantage accrued from such Reflections, by endeavouring to prevent the Eruption, which could not be retarded, generally, beyond the fourth Day; yet the Violence of the Fever was so far abated, though not to be extinguished, that it produced the Eruption later, and, of consequence, with fewer Pustules; and for the same Reason, the Suppuration was kinder; and, therefore, the Disease less dangerous.

It seems wonderful to me, that so great a Man, who reasoned with such Precision, and practised with so much Judgment, had not thoroughly comprehended this Disease.

Upon the Rise of the secondary Fever, as that increased, and the Spit became more viscid, the Face subsiding, he abandons, as it were, his former Reasons and Method of Practice; his Views are now entirely for promoting Salivation: And, in order to promote this great End, he thinks some Means may be found out. Antimonial Medicines he seems to think the most probable to effect it. Although he mentions no morbid Matter, yet what he proposes, implies as much. He must suppose, that the Spitting carries off some Poison, or morbid Matter, as People think a Salivation answers the same Purpose in the Venereal Disease.

Here then he falls into an Hypothesis, which points out to him the Use of an empirical Medicine; for had he reasoned as justly on this Stage of the Disease, as he did on the first, he would have found, that the limiting the Violence of the Fever, let the Medicines or Methods be what they will, that controul it, would have carried on the Salivation, and answered this Point, as it did in the first Stage of the Disease, when the Inflammation being abated, the Pustules rose higher, and suppurated with kinder Matter.

Authors, who have wrote since, as they have said nothing worth our Notice, but what they have gleaned, and generally misapplied, from the Writers I have already mentioned, we shall pass over in Silence; and come to the History of this kind of universal Disease.

The Small Pox, in general, is of the inflammatory Kind, having all the Signs in common with other Inflammations; but in Species it differs essentially from all these Diseases. But in order to prove that it is an Inflammation, it will be proper here to determine the true Signification of the Word *Inflammation*, by giving as clear a Notion of it as the Nature of the Thing requires: Besides, it will be necessary to lay this down as a kind of Theorem, agreeable to the Custom of Mathematicians; because, when we have a perfect Notion of an Inflammation in general, we shall then proceed, by way of Analogy,

to treat of the Nature and Cure of this particular Species of inflammatory Fever.

A Tumor, from whatever Cause, that arises upon an human Body, attended with Pain, Pulsation, Heat; the Part being, also, discoloured; the Blood, at the same time, sized; the Urine generally higher coloured; the Pulse quicker than ordinary, and often harder: These Symptoms arising still higher, such a Tumor, if not opposed, passes on to Matter, or ends in Sphacelation, which is an entire Corruption of the Part affected: Such a Tumor is called by Surgeons *Phlegmonous*, a Term imported into our *English* Tongue, that signifies burning or inflammatory. As there is always a Fever attending the Progress of such Tumors, such Fevers are called *inflammatory*; and as the Blood is always sized, in proportion to the State of such Tumors, such Blood may be properly called *inflammatory*. And as the Blood is one of the most distinguishing Signs of an Inflammation, it will be proper to shew the various Changes in this vital Fluid, during the Course of such Tumors. Whether a Tumor arises from a Contusion, fractured Bones, from the Poison of Serpents, from Contagion, or from whatever internal or external Quality or Cause, the Moment it begins to be formed, that Moment the Blood begins to be changed. If ten thousand Men were let Blood, and not one of them had the least Appearance of Size in their Blood, and presently after, if some Cause or other should produce an inflammatory Tumor, the Blood soon becomes sized, and, as that Tumor hastens on to Matter, or Sphacelation, that Size increases according to the Progress and State of the Tumor: So that in the time of Suppuration, the Size of the Blood will be more in Quantity than it was the Day before; and more that Day than the first of its Beginning. But, in a State of Mortification, the Quantity of the Size will still be in proportion equal to that calamitous State of an Inflammation. As to the Colour of the Size, there is, also, something necessary to be observed: The yellow Colour shews more of Heat, or Fire, or Inflammation; than the pale; the green, more than the yellow; and the dark, more than any. The Consistence of the Size, which is always upon the Surface of the *Craassamentum*, or Cake, which swims in the Serum, the more viscid and tenacious, the less Fire; the more dissolved (which sometimes is like a Jelly half boiled) infinitely the more Danger: For when it is thus in a State of Dissolution, the Parts inflamed always mortify; and, when it is in this State, the inferior Parts of the *Craassamentum* are a black putrid Gore, and, also, in a State of Dissolution. What I have here said, with respect to the Blood, is the Result of above a thousand Observations, on all Kinds of Inflammations in general.

This is the clearest Notion I am able to give of an Inflammation; and I may venture to say, is what may be the most certainly known in the whole Practice of Physic. I have fixed this, as it were a Basis, to build the whole Superstructure upon; and what I thought absolutely necessary, because I shall have perpetual Recourse to it, in order to prove what I am about to treat of.

The Small Pox, then, answers, in general, to these Signs of an Inflammation; and, therefore, ought to be looked upon, and treated, in general, as such: But as it differs, also, specifically from all other Diseases, it, also, requires a particular History, and Method of Cure.

The Small Pox being an inflammatory Disease, it is certain that the Body must be disposed to receive an Inflammation; and whatever Cause hath Power to produce an Inflammation, may possibly produce this Species of it. The Disease, then, may be produced from violent Exercise, Change of Air, particular Climates, drinking spirituous Liquors: For those Causes productive of Inflammations, in such as have had the Distemper, also, produce the Small Pox instead of such Inflammations in those who have not had this Distemper: History proves this to be true; and daily Observation still confirms it the more. Who has not observed, that, upon hard Drinking, upon Change of Air, upon violent Exercise, People have fallen into the Small Pox, Pleurisy, Quinsys, or other Inflammations? But why these Causes should produce the Small Pox in some Subjects, and not in others, is, I must confess, as yet inexplicable to me; and will, perhaps, be for ever a Secret to others. When there is some particular Constitution of Air producing Inflammations, in general, it, also, produces the Small Pox at those Seasons; and as these are epidemical, so are, also, those: This explains the Reason, why the Small Pox begins at those Times of the Year, which the Physicians call an *irregular Season*; I mean in the Winter, the very Beginning of the Spring, or even in the Autumn; for we should naturally expect it from the Middle of the Spring to the latter End of the Summer; for, at this Season of the Year, we observe Fevers to be generally of the inflammatory Kind. In those Countries where the Plague, and malignant Fevers, are stationary, according to the Climate and Disposition of the Air in those Countries, we observe

serve the Small Pox to be, also, epidemical, and generally fatal. And, perhaps, under the Appearance of the Small Pox, they sometimes have the Plague.

Sydenham observed this in our own Kingdom; and Prosper Alpinus, in Egypt. We have had many Physicians, who have laboured to solve the Phenomena, and to shew what there is in Man which disposes him to the Infection of this Disease, which, when he has once had it, returns no more. Fuller, Drake, Helvetius, and many more, have ventured to assign such physical and mechanical Reasons, that, out of pure Respect to their Characters, I am even ashamed to mention. And what they have said, with respect to the morbid Matter, seems, in my Opinion, to be just as much to the Purpose. What we have here taken Notice of, enables us to prognosticate, what Seasons, and what Constitutions, are most probable to produce this Disease, and to whom the Small Pox is generally most fatal.

Since every Person in the World that is seized with the Small Pox, although his Blood was not inflamed before, must necessarily now undergo a State of Inflammation; and which generally begins to appear so upon the second or third Day; therefore, all such as are of an inflammatory Habit of Body, whether hereditary or acquired, must, of consequence, be disposed to have this Malady in an higher Degree than those of a contrary Disposition. Such People, who labour under any inflammatory Disease, must, of course, be still in greater Danger; because, if the Small Pox seizes upon such, before such Maladies are spent, they must expect the most fatal Sort, because then, the Patients must struggle with two Diseases; the former, and the Small Pox, both at the same time: For upon the second or third Day, the Blood, that was inflamed by the preceding Disease, now begins to acquire another Degree of Inflammation, peculiar to the Small Pox, which will then be as Fire added to Fire. But there are some again, in more danger on account of the Parts of the Body, that were before in a State of Inflammation before the Small Pox begins, that is, such whose Lungs or Brain, or Throat, are particularly inflamed, when this Malady first seizes: For as no Person dies of an Inflammation, till the Throat, Lungs, or Brain become affected; and, as no Person passes through the Small Pox, without these noble Parts being, in a most particular manner, inflamed more or less, so such must be exposed to the greatest Danger, since, besides undergoing the Small Pox, they must, also, undergo at the same time, a true Peripneumony, a true Quinsy, or a true Phreny; that is, they will have the Small Pox complicated with an Inflammation of the Throat, Lungs, or Brain. And I believe no one ever died of the Small Pox, but of one or other of these Diseases.

In the latter Stages of Life, or in such Constitutions, with whom Contusions, Fractures, Dislocations, and Ulcers, are more subject to inflame; in these, phlegmonous Tumors are more difficult to resolve; which, of consequence, proves, that in such the Small Pox must be raised to an high Degree: Therefore, Women, before the Menstrues are over, have it more favourable than after; Women, than Men; and Children, than Men or Women: And this is so, generally speaking; not but particular Cases are Exceptions to this Rule.

Occupations of Life, attended with Labour, as Watching, Fatigue, Encampments, Sieges, bad Air, Diet, or whatever Accidents attending War, provided they excite Heat, inflame. If the Small Pox seizes at such times, and such Constitutions, it must be of a bad Kind. Such Seasons of the Year, such Climates, such Dispositions of Air, producing malignant Fevers; if the Small Pox comes on at such Times, in such Climates, it always runs very high.

Sydenham, as I said before, observed, that to those who had the Small Pox during the Years 1639 and 1669, when malignant Fevers raged in London, it was very fatal. And Prosper Alpinus says, that, in Grand Cairo, in Egypt, during the time of the Year, when the Plague rages in that populous City, the Small Pox is commonly attended with purple and livid Spots, emulating even the Plague in Degree of Inflammation and Putrefaction. From hence we may certainly conclude, that all such People who are subject to Diseases, not attended with fixed and inflamed Blood, such as the aguish, hysterical, or flatulent Constitutions; those who have suffered the Loss of much Blood, either from Wounds, the Menstrues, Hemorrhoids, Miscarriages; or those whose Blood is impoverished by too low a Diet, can never have the Small Pox to an high Degree, provided such Causes just precede the Disease. We shall now shew the Signs and State of the Disease which precede the Eruption.

The Fever preceding the Eruption we will call *variola*, (for, till the Eruption appears, it cannot properly be called the *Small Pox*), arising from some Infection, communicated by the Air, or the Touch of a variolous Subject, Fear, or some other Cause, which hath Power to produce this Species of Inflammation, which begins generally with Shiverings, Rigors,

Paleness of the Lips, Lividness of the Nails, with other inflammatory Symptoms. Sometimes this Disease arises by way of Revolution, from some other Disease to this, as a common Cold, a slight Pleurisy, or Quinsy, the Measles, the Chicken Pox: And if it comes on before these Diseases have spent themselves, yet are we able to distinguish the Origin of the variolous Fever: Suppose a Person some Days ill of some one or other of these preceding Maladies, notwithstanding the usual Symptoms peculiar to these continuing, especially Heat, and a feverish quick Pulse, the Patient is suddenly seized with Shiverings, Rigors, or a violent cold Fit, like an Ague, the Lips and Nails are pale or livid; and although the Hands and Feet are extremely cold and chilled, yet is the Pulse, although quick before, now become much more so, inasmuch that we might plainly perceive the Addition of a new Fever. These following Symptoms preface a future Eruption of the Small Pox; Headach, Lassitude, the Limbs cramped, painful, heavy; the Patient is thirsty, extremely sick, or vomits; if Women or Children, the Matter thrown up is generally green, resembling an hysterical Case; the Eyes glaring, the Lids edged round with an Inflammation, resembling a Person who had drank much, unable to bear the Light; the Face glowing, great Heat and Dryness over the whole Body, Costiveness. But if the Inflammation runs very high, the Patient purges; the Stools are generally dark and fetid; Pains in the Small of the Back, across the Loins, and an unusual Weight; Oppression at the Pit of the Stomach. These last Symptoms, when attended with Nauseas, with a drowsy soporiferous Aspect, are the most distinguishing Signs, which Signs Physicians call *Pathognomonic*, distinguishing essentially this variolous Fever from all others; unless we except the Measles and Chicken Pox; where indeed the Symptoms are somewhat equivocal: But the Violence and particular Duration of these Symptoms will always distinguish the Small Pox from these.

There is one Symptom yet, which Sydenham observed, but that is peculiar to Children, I mean, a Convulsion Fit; but an extraordinary Drowsiness must precede the Fit, and a more than ordinary Lustre in the Eyes; such a Fit announces the Eruption to be near at hand. During the variolous Fever, if the Patient is inclined to sweat, it rather prefaces the distinct Kind. But we are not to depend too much on this Symptom; for the confluent Kind hath sometimes followed.

These are the Symptoms which precede the Eruption, and, also, continue increasing, and rising higher, till the Small Pox be, in a manner, entirely out; and the Pulse is remarkably quicker the last Day but one of the Eruption, than at any other time.

There is no Disease demands so much of the Physician's Attention, in observing the Time, Circumstances, and peculiar Stages, so remarkable as they really are in the Small Pox. Hence the most certain Indications arise, pointing out when we are to act, and when we are not. From hence we, also, may attain to a degree of Knowledge, so as to prognosticate either the Life or Death of the Patient.

The time of its first Appearance is, of all, the most important, and, therefore, first to be well consider'd; and as it is a Point of the greatest Moment, I wonder Authors have been so loose in the Calculation of the Time. If the Small Pox appears the first Day of Sickness, it is mortal; if on the second, not much safer; if on the third, dangerous; if on the fourth, or a little later, the Small Pox is generally of the *distinct* Sort, and without Danger. The summing up, and dating the Time of the Eruption, we will illustrate, by this Example.

A Man is seiz'd with a variolous Fever at three, five, six, or eight in the Morning, at Noon, or at six at Night, or at any time between twelve in the Morning and twelve at Night; the Day consisting of twenty-four Hours, or a natural Day. If the Small Pox begins to appear at Ten at Night, and the Patient sicken'd at Three, Five, or Eight, in the Morning, Physicians say, the Small Pox came out the first Day; but if the Patient sicken'd at Noon, Six in the Evening, or Eleven at Night, and the Small Pox begins to appear at Six the next Morning, at Noon, or at Eleven at Night, Physicians say, it broke out upon the second Day. If the Patient sickens, for Example, April 1. at Three in the Morning, Six in the Evening, or Eleven at Night, and the Small Pox appears April 3. at One in the Morning, Four in the Afternoon, or Ten at Night, they still say, the Small Pox came out on the third Day. If a Patient sickens on Monday Morning at Two, One in the Afternoon, or Eleven at Night, and the Small Pox makes its Appearance on Thursday, about Two in the Morning, Five in the Afternoon, or Ten or Eleven at Night, we fix the Eruption to the fourth Day. Any one may see how loose and equivocal these Calculations, hitherto establish'd by Physicians, are. Hence, their not having fix'd the Time of the Eruption exactly enough, has been the Occasion of the prognosticating the Small Pox to be a kind Sort, when it was not; to be the *confluent*, when

when sometimes it happen'd to be the *distinct*: And as, therefore, fixing the Time of Eruption with great Precision, is one of the greatest and most certain Indications in our Practice, the Omission of this hath too often been the Occasion of fatal Mistakes in Practice: Let us now shew the Incertitude of this rambling Method of reckoning the Eruption, and establish as exact an Account of the Time of the Eruption, as the Nature of the Thing will bear. In order to this, we must come to a Calculation by Hours.

A Patient sickens at Two in the Morning; the Small Pox appears at Eleven at Night; it comes out the first Day, the Patient having been sick twenty-one Hours, and no more, before the Eruption: Suppose, again, he sicken'd at Six in the Evening, and the next Morning it appear'd at Five; Physicians will tell you, it came out on the second Day; yet the Patient, all the while, was only sick eleven Hours before the Eruption; and, consequently, the Eruption appear'd sooner by ten Hours, in this Case, than in the other; which Case was call'd Eruption on the first Day. Again, a Man is seiz'd with the Small Pox about Eleven, for Example, on *Monday* Night; it makes its Appearance on *Wednesday* Morning, about Two; the Small Pox, in the common way of reckoning, appear'd on the third Day; yet, after all, the Person was ill of the variolous Fever but three Hours above one natural Day. Suppose one sicken'd of the Small Pox at Two on *Tuesday* Morning, and it made its Appearance on *Thursday* Night at Eleven, it is said to come out on the third Day; in this Case, the Patient labours under a variolous Fever the Space of sixty-nine Hours, in the former only twenty-seven Hours; and, consequently, there is forty-two Hours Difference: We may from hence conclude, how uncertainly Physicians must prognosticate from such an erroneous manner of calculating the Time of the Eruption.

Let us fix this as a Truth in general, to be regarded, that by how much the later the Small Pox makes its Appearance, by so much the kinder, and more distinct; and that the former manner, of calculating by Days, is too equivocal to be depended upon: We will, also, fix upon this for such a Compass of time, to be call'd late or early: If the Small Pox makes its Appearance before the first twenty-four Hours of Illness are expir'd, we are to expect the Disease to prove as fatal as the Plague: If from thirty to thirty-five Hours after the first Illness, extremely dangerous: After forty, to forty-seven or forty-eight Hours, less so, but rather the Flux Sort, than not: If it appear after seventy to eighty Hours, commonly the *distinct* Sort.

Having now fix'd the Time of the Eruption, and shewn the Signs or Symptoms which precede this Stage; we shall now give a History of the Signs and Symptoms attending the whole Course of the Eruption. According to the Violence of the variolous Fever, the Eruptions appear sooner or later, and they are of the *distinct* or the *confluent* Kind; that is, they are more or less in Number; or they are so few, that they are scatter'd over the Body, like so many Grains of Corn sown and springing up distinct from each other; or, otherwise, in Heaps, or Clusters, the Roots being entangled together. Now the Small Pox, in the thick Sort, when they first appear, are extremely small; but, as they grow, their Bases enlarge; so that, as these spread, several Pimples, that were distinct Yesterday, To-day become complicated; as so many small Grains of Quicksilver strew'd thick upon a Table, if each Globule was to swell and extend, they must run into one-another. After this manner, we say, the Small Pox runs together; hence we call it the *distinct* Sort, or the *confluent*; and as it is impossible for a very great Number of these Pustules to be upon the Body, without running together, because they are all in a State of growing and extending at the Basis, after four or five Days, they must take up greater Spaces: We may conclude, then, the Fluxing is but the Effect of the Number of the Eruptions. But there is, indeed, something here worthy a Distinction (for I think we cannot be too exact in the Description of this Disease); although we are principally to depend on the Number of the Pustules, yet the Distribution of them over the Body deserves some Attention: In one Subject there may be a greater Number of Eruptions, and those, by their Situation, distinct from each other; in another Case fewer, and yet they run together, are complicated, or flux, viz. as, in the Field sown by a skilful Farmer, a greater Quantity of Wheat arises distinct; in that sown carelessly, and in Heaps, it arises in Parcels entangled and matted together, with great Spaces between. Now should the Small Pox on the Face, or Body, appear in this *confluent* manner, it should be call'd the flux Sort. It is of much Importance what Parts of the Body are infected more or less: The Small Pox fluxing upon the Face and Head, although the other Parts of the Body were exempt from the Disease, yet is the Case not without Danger: But if the Face be entirely cover'd, and the Body too, the Danger must be still the greater. We are not to be surpris'd at the Danger being greater, when the Face and Head are principally affected; because all Phy-

sicians very well know, that a Turgency of the Vessels about the Brain must give us just Cause to fear a fatal Event.

Having thus given an Idea of what the *distinct* and *confluent* Sorts are, let us trace and describe these Eruptions from their first Appearance, till they are entirely out, and spread over the whole Body. This Period of Time, hitherto, has been said to take up the Space of three Days; but this demands as scrupulous an Inquiry as the variolous Fever did: For Example, the Eruptions begin to appear this Day at Three in the Morning; Physicians tell you, they will be all come out on the third Day, dating the first Day of their beginning to mature, the fourth Day after the Appearance of the Small Pox; they, therefore, allow three Days for the Eruption.

The following Example will sufficiently shew the Fallacy of this way of calculating, as well as the Necessity of a more exact History of the Breaking-out of the Pox: Suppose a Physician attends a Patient on *Monday* Night, about Eleven of the Clock, and discovers the Small Pox just appearing; he returns again on *Wednesday*, no matter what Hour, whether in the Morning, or Eleven at Night; he declares the Eruption entirely over, assigning this Reason, it appear'd on *Monday*; and this being the third Day, the Eruption must be complete. How equivocal is this, as to Time? As if the Appearance of the Small Pox at One in the Morning, Two in the Afternoon, or Eleven at Night, his visiting on *Wednesday*, early in the Morning, or late at Night, made no Difference! when it is visible that there may be even twenty-three Hours taken out of the first Day, and as many out of the third Day, which, together, make up forty-six Hours: Therefore their asserting, that the Small Pox is three Days in coming out, concludes as equivocally, as to Time, as if seventy-two Hours and twenty-six Hours differ'd not at all. Now there is nothing more uncertain, or, rather, impossible, than to fix one certain Period of time for the Eruption; because it is an Effect flowing from a peculiar Cause, which varies perpetually, and therefore the Eruption must vary accordingly. An inflammatory Fever is that Cause which runs higher, or not, and acts with more Force in one Constitution than another. A Man may, with as much Propriety, ask how long it will be before this Tree buds, when it will blossom, or the Fruit ripen? And although there must be necessarily a certain time, yet that time will vary, and be circumscrib'd, according to the Climate it flourishes in, and the Soil that nourishes it, added to the Culture and Skill of the Gardener. As the Violence of the variolous Fever caus'd the Eruption of the Pustules sooner or later, according to the Degree of its Inflammation; so the same Cause either forces it out by Degrees, or suddenly: Thus some little hard Pimples appear on the Forehead, Nose, Cheeks, then upon the Breast, the Hips, Thighs, over the Trunk of the Body, and, last of all, upon the Legs, especially about the Feet: Or this Cause acts with more Energy; and then they break out over the whole Body, like a Rash; or the Fever being rais'd to an immense Degree, either from some peculiar Habit of Body, pestiferous Air, or hot Medicines, and then the reverse appears, the Pimples are few in Appearance, rather a Blush upon the Face, the Skin arid and dry, and, upon a closer Inspection, there appear Numbers sticking in the Skin, unable to break forth; purple or livid Spots are sprinkled over the Body, but more about the Breast, Neck, Loins, and Hips, than any-where else: The Patient often makes bloody Water, and these two last Symptoms may be foretold by another Symptom, which is this, an excessive Pain across the Small of the Back.

As the Fever is higher in some Constitutions than others, and therefore occasions the Appearance of the Small Pox sooner or later; so, also, there are some Parts of the Body where this Inflammation exerts itself with greater Force, which is the Occasion of the Eruptions appearing sooner or later, in greater Numbers, or not, according to the Situation of that Fire, or Inflammation. We can compare the Time and Course of the Eruption to nothing more aptly, than to a Field sown with Corn; although sown at the same time, yet the Grain comes up, or is retarded, ripens, or is backward, according to the Situation, the Soil, or Manure, of the different Parts of the Field.

The fixing the Course of the Eruption to three Days, indiscriminately, in all Constitutions, as hath been done hitherto, is, for the Reasons I have given, without any solid Foundation; but, nevertheless, there is a certain Period of time necessary for an entire Eruption: Yet that varies, according to the Force of the Fever, and which Time, also, may be calculated: But, certainly, such Calculation, by Days, would render this Part of the History of the Small Pox as obscure, and equivocal, as Physicians have been in calculating that Period of time from the first Attack of the variolous Fever, to the first Appearance of the Small Pox.

In the *confluent* Sort, we may look upon the Eruption to be entirely over between the fifth and the sixth Day, counting from the first Day of Sickness; the *distinct* Sort demands six natural

natural Days. We must expect some Cases where the Small Pox is retarded, or a new Eruption added to the former, occasion'd by some Accidents, or improper or rash Methods pursu'd. The Fever, and other variolous Symptoms, which ran very high before the Eruption, and, rising with greater Violence till the midst of the Eruption, now begin to relax, and entirely abate upon the total Eruption of the Pock, I mean in the *distinct* Sort, and ought, also, to be so in the *confluent*, if the Physician does his Duty. The Equality of the Pulse, upon the sixth Day, resembling that of Health, will be the distinguishing Sign of this second Stage, which may be look'd upon as the most remarkable Stage in the Small Pox: Here, then, is a Pause; the Patient seems to rest, for a time; he is easy; the first Fever, which was without Intermission, ceases now, and is the only time of Intermission Nature has allotted, till the Disease be entirely over; it may be look'd upon as a Calm between two Storms; but this Calm precedes the most violent Storm, which is to come: The Patient reposes thus for six, ten, or twenty Hours; and then, sooner or later, according to the Violence of the Disease, all on a sudden, the secondary Fever comes on, by flow Degrees, if it be a benign Sort; or it bursts out, like a Hurricane, if the Inflammation be high; the Eyes becoming suddenly bloodshot, or streaming with Water; the Pulse quick; the Throat sore; the Urine crude, pale, or of a Straw-colour; the Patient, agitated with great Restlessness and Inquietude, burning with Heat, starts from the Bed; unable to bear Confinement, he seeks the Air; endeavours all he can to free himself from this ardent Heat; he becomes delirious, and often even phrenetic.

This last Symptom is the most violent during the Course of the Disease, as well as the most obstinate: The secondary Fever, which is the Fever of Maturation, begins, as I have said, about the sixth or seventh Day; and, according to the Violence and State of the Inflammation, the several Eruptions begin to spread, grow redder, rise with a Point, elevated or depress'd; they hasten on to Matter sooner or later; the Matter is benign, well-concocted, or sanious, or full of Water, like a Blister rais'd by Fire; they bleed; or, lastly, if the Inflammation be carried to the highest Degree, these small Tumors, or Eruptions, pass beyond the State of Suppuration; they are burnt at top, as if sear'd with an Iron; the Skin, or Spaces between the Clusters, is no longer florid, of a Rose-colour, but dark, purplish, or black, or cover'd over with innumerable small Pimples, or erysipelatous; the Skin arid, stretch'd, or distended, like a Piece of Parchment; or a considerable Tumor arises, cover'd over with Numbers of the Eruptions, resembling a true Anthrax, or pestiferous Boil. No Wonder Sydenham call'd every Eruption a phlegmonous Tumor, since, most certainly, it is so; and all the Phenomena correspond, in every Degree, with a Tumor of that Species.

The Eruptions in the Small Pox arise, take their Course, and are subject to all the Variations, several Appearances, and Terminations, agreeable to all common inflammatory Tumors in general: Now all these Changes and Variations are purely the Effects of the Cause I mention'd before; the Fervor, Inflammation, or Fire of this Fever.

Physicians, not apprehending that an Inflammation was the Cause of the several Changes and Appearances of the Symptoms in this Disease, and not discovering that such *Phænomena* only shew'd that the Disease differ'd more or less, as to Heat, Inflammation, or Fire, but differ'd not at all in Nature or Kind; divided the Small Pox, as it were, into different Diseases: For Instance, *Helvetius* distinguishes many Kinds of this Disease; one, whilst they have a Spotted Fever attending; another, a Quinsey, or an Intermittent, &c. Their not knowing the Nature of the Small Pox, but dividing it essentially into different Classes, their conceiving a Complication of Diseases with the Small Pox, differing essentially from it, led them to a Practice extremely dangerous, and often, I fear, fatal: But, above all, they err'd most in not distinguishing the Nature of the Small Pox: For although many knew this Disease to be an Inflammation, yet, led by some Hypothesis or other, they consider'd a Pleurisy, or Quinsey, as Diseases differing in Kind from that of the Small Pox; and this one Example of their Practice proves the Fallacy of their Theory, as well as the Danger of their Practice. Let one of these Physicians attend a Patient in the Small Pox, complicated with an Inflammation of the Throat, Lungs, or Pleura; if the Small Pox be past the Eruption, would they venture to cure that Inflammation of the Lungs, or Pleura, by the usual means? No, they dare not: For should they bleed, or purge, they imagine the morbid Matter, peculiar to the Small Pox, would be struck in from the Circumference to the nobler Parts; which is a Demonstration, that they are entirely ignorant of the Nature of the Disease.

The Small Pox, in its Nature, then, is wholly of the inflammatory Kind, and can only differ, according to the several Constitutions, Air, and Climate, of People: Wherefore we

will go on with a History of this Disease, considering all the Accidents and different Appearances of this Distemper, as the Effect of more or less of the Degree of Inflammation, in the same manner as if we were treating of a Pleurisy, or common Tumor. We do not say these differ in any other manner than this: If the Inflammation be very high, such a Tumor will be hard to resolve; and those Tumors which are hard to resolve, rather incline to mortify, than suppurate kindly. Upon this Foundation, and no other, I shall go on to describe the Small Pox, and attempt the Method of Cure. I shall consider every Pustule as a common inflammatory Tumor, subject to all these several Stages, in common with such Inflammations, which are all the Distinctions this Disease admits of.

Now we are got to the total Eruption of the Small Pox, from henceforth we are to look upon the Progress of the Eruptions, and their several Changes and Appearances, as the most distinguishing and pathognomonic Signs, enabling us to presage either a fortunate or fatal Event.

Let us first describe the *distinct* Sort, where the Inflammation is not high, where the Eruptions pass gradually to a proper State of Maturation. As, even in this, they make their Appearance not all at the same time, so they rise, and go on to Suppuration, in the same Order, and Succession of Time: So those on the Face necessarily are ripe two or three Days before those on the Feet. When they come to the highest State of Maturation, they begin to dry, and therefore must begin to sink, of course; those on the Face come to this State about the ninth or tenth Day, dating the time from the first Day of Sickness; of course, those about the Feet and Legs arrive not to that State till the eleventh, twelfth, or thirteenth Day. What, then, have Authors hitherto meant, in fixing the Turn to one certain Day? When, it is visible, the Small Pox is as long in turning, as in coming out. That Period of the Disease, call'd the Turn, is a Point of the highest Importance, because it is, at that time, those who perish by the Small Pox generally die, unless it be when bloody Urine is made, and then they generally die on the seventh Day; but the Turn of the Small Pox cannot be limited to any one Day, unless they all made their Appearance on the same Day; here is another Circumstance which alters the Turn, and makes it impossible to fix this Change to a certain Day, any more than they could the Day of the Eruption: For the Eruption appears sooner or later, as the Fever is more or less violent; so, also, the Eruptions turn sooner or later, according to the Force of the Inflammation.

The Order, and several Stages, of these Eruptions, through which they pass, will be best understood by the following Description, which will illustrate that Period of the Small Pox call'd the *Change*, a Time more equivocally and uncertainly describ'd than any other Stage of the Disease. To do this, we must describe the Course of one single Eruption; for it would be impossible to describe the Whole at the same time, because some are just appearing, when others begin to mature; some in the highest State of Maturation, while others are drying; these drying, and others are scabbing, and falling away.

First, they are small, upon the Eruption, red, watery, and hard; to be felt, rather than seen; the pathognomonic Distinction, with respect to the Measles, which are an Efflorescence. It grows larger, rises sharper, and spreads at the Basis, making so little a Progress for two or three Days, that one would scarcely think it would ever come to any thing; but, on the fourth Day after its first Appearance, it begins to look white; is much larger, but often depress'd, and flattish at the Top: It grows now larger, whiter, and very much inflam'd at the Bottom; the Skin round it, for some Distance, is extremely florid, like a red Rose-leaf: The Matter now seems to be perfect Pus; but white and thin, and this in six Days from its first Appearance; it is then swell'd, and comes to the highest State of Inflammation: The Matter now begins to grow thicker, and something yellower, and that in the middle of the Pustule; and, at last, thickens into a yellowish Scab, the Inflammation still continuing about the Basis of the Eruption; and this, also, takes up about three Days time; and, when it is thus scab'd, the Pustule can be no longer in a State of Inflammation; and, of course, the Swelling subsides, which puts a Period to the Disease.

The secondary Fever, that began with the Maturation of the Eruption, rises gradually, and is a concomitant Symptom with the several Stages of the Pustules, as the Pustules are of the Fever. We are but to suppose all the Eruptions, in any particular Case, to resemble this I have describ'd, and we have an Idea of a distinct and kind Sort.

In such a distinct Sort as this, the secondary Fever arising about the seventh Day, the Small Pox, also, beginning to fill at the same time, the Fever still increasing as the Eruptions go on to Maturation, the Fever, of consequence, will be rais'd to the highest Degree at that time the greatest Number of the Eruptions

Eruptions are at the highest State of Maturation: So that if all the Eruptions of the Body were to come out at one and the same time, and all the several Parts of the Body were of equal Heat and Warmth, the Pustules would then, on the ninth Day, be all in the highest State of Maturation; that is, they would begin to dry all at the same time, and we could then fix the Turn not only to one certain Day; but, as it happens quite otherwise, we cannot fix the Time of the Turn to such or such a Day, much less such an Hour of a Day, as some pretend to do. As the Small Pox even takes up two or three Days in coming out on the Face, so some of these begin to turn two or three Days before others do; henceforth I would lay down this as a Maxim; as soon as ever any of the Eruptions begin to dry, I say, the Small Pox begins to turn, and that the Turn of the Small Pox continues two, three, or four Days; and that the Height of the Turn will be about a Day and a half after the Beginning of the Turn; and at this time the Fever ascends to the highest Pitch.

From the History I have now given of the *distinct* Kind, we find ourselves no longer puzzled about fixing the Time of the Turn, even in the *confluent* Kind, or the Time of its Eruption: For as the Eruption takes up two or three Days, so, also, does the Turn: But the Eruption, the Maturation, and Turn, are all controul'd and govern'd by the Inflammation, Fire, or Heat, peculiar to the Constitution, as will be illustrated by the History of the *confluent* Kind.

Let us now describe the *confluent* Sort, and by it will be shewn all the Variations, Changes, and Distinctions, peculiar to the Small Pox in general.

The Fever not running very high, yet high enough to produce the *confluent* Sort, the Symptoms attending this Stage of Maturation, in that Case, with respect to the Eruptions and the Fever, resemble, exactly, those of the *distinct* Sort, (only they begin to turn rather sooner on the Face, because the Fever, or Inflammation, was something higher; but they take up a much longer time in turning, because there are a much greater Number of the Eruptions) if we except a Looseness in Children, and the Spitting in grown People.

Spitting, or Salivation, is the most extraordinary Symptom: It begins, generally, with the secondary Fever, and, sometimes, before the Eruption be over: It is more fluid, and copious, the first two or three Days, than afterwards; for as Maturation goes on, the Fever, also, ascending, the Spittle becomes thicker, more viscid, decreasing daily; but if the secondary Fever be carried immensely high, the Spitting ceases, and the Patient dies: But if the Fever of Maturation becomes not higher than necessary to produce a laudable and kind Suppuration, the Spitting goes on to the thirteenth, fourteenth, fifteenth, and, sometimes, to the twentieth Day; that is, till the Small Pox is entirely dry over the whole Body.

It will be necessary here to give three distinct Histories of three different Subjects labouring under this Disease, from the coming on of the secondary Fever; as, also, the Beginning, Progress, State, and Declension, of the Eruption.

The first shews the kind and *distinct* Sort; the second a benign, but flux'd Pox; the third the flux'd or *confluent*, the most fatal; with all the several Accidents and Variations this Disease admits of.

About the sixth Day of the Disease, in the *distinct* Sort, the secondary Fever comes on; the Pulse begins to quicken, and becomes harder; the Face begins to look more florid and red, the Urine something higher colour'd than natural, with a Cloud suspended in the Middle, or subsiding to the Bottom. This Night, that is, the first Night of Maturation, the Patient is restless, and sleeps with more Difficulty than at any other time in the Disease; the Eyes often water, or are bloodshot. The seventh or eighth Day the Face swells more than at any other time, the Eyelids swelling first of all, and are generally blown up, and shining like a Bladder, and are generally clos'd, at this time. The Pustules on the Face are large, and begin to look white on the Top; the Interstices, that is, the Skin between the Pustules, seems to be extended, inflamed, of a red florid Colour; and some few Pustules, even now, begin to dry about the Nose, Cheeks, or Forehead; the Pulse still quickens, and grows harder; the Voice something alter'd, as if the Patient had a Cold; the Mind dejected, and sometimes Sighs break out; the Urine rather paler, and less turbid. The Eruptions on the Breast, which are fewer than on any other Parts of the Body, are as forward, very near, as those on the Face; those on the Arms are now very large, whitish a-top, and very much inflam'd at the Bottom; those on the Hands and Feet come on but slowly. On the ninth Day the Face appears to be swell'd to the utmost; the Eruptions are now larger, and the Matter extremely white, and the Skin, or Interstices, still more inflam'd, and redder, many on the Face drying on this Day; and some few beginning to dry on the Breast; the Eyelids of a darkish red; the Pulse now extremely quick, and very hard; the Water

paler, thinner, and clearer, than at any other time: Those on the Arms very much inflam'd, and the Interstices, or Skin, between the Pustules, almost as much inflam'd as on the Face; and, if there are many Eruptions, the whole Arms seem to swell. At this time, some little Rigors appear, now-and-then. On the tenth, the Symptoms are much the same as the Day before; the Pulse as high, and as quick; the Water as clear, the Face as much swell'd, only the Eye-lids begin to subside a little; many more drying on the Face, and turning to a yellowish Scab. Sometimes the Face sinks a little on this Day, which, if it does, the Hands begin to puff up, and swell on the Back. On the eleventh, the Face begins to fall, especially about the Cheeks and Eyes, the Hands swelling more; those on the Hands are quite green, but full ripe, as they were on the Face, on the eighth and ninth Day; the Pulse now begins to become more regular, not so quick, nor hard, as on the two preceding Days; the Urine not so thin, or so pale, but with a Cloud suspended, turbid, or with a Sediment. On the twelfth the Face continues sinking, drying, scabbing; the Patient has, perhaps, the Eyes still clos'd up, not so much of the Swelling, which now seems to be gone, as the Matter's gluing up the Lids; as the Face sinks, the Hands continue swell'd; the Interstices between the Eruptions not so florid; the Skin not so much extended, not so hard, more pliable and soft to the Touch; that is, the Inflammation remits round the Basis of each Pustule; those on the Hands are still full and white, but the Matter begins to thicken, the Pulse more regular, even than the Day before. On the thirteenth the Hands fall; and if the Feet, as sometimes they do, that is, if there are many Eruptions on the Instep, puff up, and swell, as the Hands subside, and at this time the Eruptions on the Feet are at the highest State of Maturation: And as those Pustules on the Face, after they came to Maturation, turn'd and dry'd into a yellow Scab, these, upon the Body, break, and dry away: Upon this Day they are generally turn'd all over the Body, unless some few on the Hands, and those on the Feet: So that here we may say, the Distemper ends; inasmuch that the secondary Fever, which began about the sixth or seventh Day, and continued rising gradually till the tenth, when it came to the highest Pitch, and continued, as it were, so for about twenty Hours, and afterwards sunk by Degrees, upon the thirteenth or fourteenth vanishes entirely. As there is no more Matter to be form'd now in any Pustules, so all the Eruptions take the same Course, ending in Matter, unless those at the Bottoms of the Feet, where the Skin, being thick, hard, and callous, resists the Eruption of the Pustules, and is the Cause of their ending in yellowish or dark Warts, resembling so many Corns. There is this Distinction to be made between Children and grown People: In those the Urine is more turbid, not straw-colour'd, but rather white, the Body not so costive; in these, when the Fever is highest, the Water is clear, of a Flame or Straw-colour; in both, at the Declension of the Disease, the Urine becomes thick and turbid.

The *confluent*, when it is kind, differs not at all from the *distinct* Sort, if we except the Spitting, or Salivation, which continues during the whole Course of the secondary Fever. As the Fever, in this *confluent* Sort, ascends from Day to Day, and comes to the highest State about the tenth or eleventh Day; so the Spitting, which began with the secondary Fever, every Day, as the Fever increases, lessens in Quantity, and becomes constantly more and more viscid; of course, as the Fever, on the eleventh Day, is at the highest Pitch, the Spittle must be, also, at this time, extremely viscid, and therefore hard to be brought up. If it ceases at this time, the Patient generally dies. The Pulse, the Urine, and the Eruptions, were the only Signs we could form Predictions from in the *distinct* Sort; but they are not the only Signs in the *confluent*, since the Spitting, a Symptom the most considerable, always attends the Maturation of the Pustules in the flux Sort, which is over either on the thirteenth, fourteenth, or fifteenth Day.

We have describ'd the second Stage of a regular and kind Small Pox; but it will be necessary here to shew the various Symptoms. We shall now give the History of this.

The Eruptions, and other Circumstances, of this Disease vary according to the Force of the Fever, the Inflammation, or Fire, in the Constitution; so that it is impossible for any Man in the World to have the Small Pox, if some Cause or other did not inflame his Blood. Neither is it possible for any of these Eruptions, Symptoms, Circumstances, or Variations, during the Course of the secondary Fever, to exist; but what are natural to the Distemper, and which are equally essential to all phlegmonous Tumors in general. Therefore all these Phenomena arise, change, or fall, according to the Degree of Inflammation, in such a particular Man, at such a particular Time, whether his Diet be high or low; whether he is an *Egyptian* or *Indian*; let the Medicines, Regimen, Diet, Air, be whatever they will; neither will Constitution, Sex, Age, or Climate, avail; the Small Pox will be always the same; it can

only differ as to Degree of Inflammation: So that, the Physician, who had known this, might have given an History of the Small Pox, that would have taken in People of all Degrees, Countries, Ages, Sexes, and Constitutions. Let us return back to the Beginning of the secondary Fever in the confluent Sort, of an higher Degree than what we have already described. This Fever coming on, as I shew'd before, not arising by Degrees, but all at once, like a Storm or Hurricane, altho' the whole Body at this time labours under an Inflammation, yet this Inflammation, as a real Fire, burns and destroys, and acts with greater Violence on some Parts of the Body than others. About the sixth Day of the Disease, the Head seems to be the principal Seat of the Inflammation; for the Patient suddenly becomes furiously light-headed, the Eyes streaming with Water, blood-shot, glaring; the Sick has a fierce Aspect; the Spitting, the constant Attendant on Maturation in the Flux Sort, more copious, and more fluid in the Beginning, than afterwards; but if the Inflammation be very high, it is even viscid at this time; a Quinsey, also, attends, a Strangury, and sometimes bloody Water, which is the most fatal Symptom of any in this Disease, and, therefore, a Mark of the highest Inflammation; a short dry Cough, with Stitches, and what is spit up from the Lungs, not seldom streaked with Blood. For when the Lungs are much inflamed, the Patient, also, spits the Matter flowing from the Lungs, as in a common Cold, Pleurisy, or Peripneumony, and the Spittle varies, is cruder, or more digested, or tinged with Blood, agreeable to the several Stages of these Diseases; or from the salival Glands, or Parts peculiar to a common Salivation raised by Mercury, or produced by the Small Pox. This Spittle is, also, more or less fluid, or extremely viscid, just agreeable to the State of the Inflammation. Another Mark of high Inflammation at this time are, profuse Sweats: If the Fever is not extremely high, the Patient is costive; otherwise has a Looseness, the Stools black and fetid; if the Fever, or Inflammation, be still higher, they are tinged with Blood; or the Inflammation ascending still higher, a Bloody-flux may be produced. The Pulse, if the Inflammation be tolerable, is quick, hard, and full; if raised higher, it quickens more, is still hard, but not so full. If the Lungs be principally inflamed, the Pulse undulates; if the Brain, depressed, small, and threading; the higher the Inflammation is, the colder and paler are the external and extreme Parts; and even sometimes to that Degree as to produce a cold clammy Sweat: The Tongue and Voice faltering, the Lips trembling, or convulsed, as, also, what Physicians call *Subsultus Tendinum*. The Urine being of a Flame-colour, is a Mark of high Inflammation; but the crude Straw-colour marks an higher Degree; and, that the Head will be principally affected. Next to the making of bloody Urine, there is no Symptom more fatal than Spots appearing between the Eruptions of the Small Pox; the Red less dangerous than the Purple; and the Purple less than the Black: For, if the Patient recovers, these Spots return from Black to Purple, from Purple to Red, and from Red to the natural Colour of the Skin. Although these *Purples*, as they are called, are Marks of the highest Degree of Inflammation, yet, if it is possible for any Symptom to exceed these, it is when the Skin, upon several Parts of the Body, especially the Legs and Thighs, in great Patches, is black and hard, as if burnt with a hot Iron, or Lightning. If the Inflammation in the flux Sort, on the sixth or seventh Day, be higher than it should be, the Face begins to swell soon, the Pulse is quicker on that Day than it ought to be, and the Spittle too viscid: If the Inflammation be in an higher Degree at this time, the Pustules, that came on and ripened slowly, are now many of them even passed Maturation; many of them scorched or burnt at Top, as if seared with an Iron: The Skin of the Forehead, Arms, and other Parts, either hard, stretched, of a darkish red, and sometimes covered between the Pustules, with very small Eruptions like a Rash; or else, the Skin is of a palish, livid, cadaverous Aspect. With these Symptoms the Patient may live from Day to Day, that is, from the sixth to the seventh, from the seventh to the eighth, and so on, always in Danger, but does not die till the Face begins to sink; and then, if it sinks suddenly, the Spitting ceases, the Voice alters, he grows hoarse, unable to swallow, and then he dies; or should the Face not swell at all, as sometimes it happens, yet he struggles through these horrid Symptoms, as long as the Pulse continues any thing full, and the Spitting, however viscid and decreasing, perseveres; but, whenever the Pulse quickens excessively, and sinks, and the Spitting stops, then he perishes, which generally happens about the eleventh Day. If the Patient survives beyond this Day, as the Face dries, it turns not, as in the kinder Sort, to a yellowish Scab, but a black dark Crust. If the Patient dies upon the tenth, twelfth, or even later, on the fifteenth, or twentieth Day, a Looseness, profuse Sweats, or an intolerable Smell, or Stench, resembling a putrefied Carcase, precedes the fatal Event.

It will be proper to mention here the Disposition of Mind in the Course of the Disease: If the Patient appears to be lively, far from dejected, but speaks with Alacrity; and some Degree of Boldness, it is a Mark of the Height of the Fever, and very near allied to Lightheadedness; on the other hand, a Sighing, and great Dejection of Mind, a sorrowful, mournful, and weeping Aspect, are Marks of the highest Degree of Inflammation.

Thus have we given an History of the several Stages of the Small Pox; and it appears from this History, there can be no Changes or Variations, but what flow from one Cause, that is, Fire, Inflammation, or Heat, however produced; that there can be no Diseases complicated with the Small Pox, but of the inflammatory Kind; so that this Disease will be the same in all Countries, and have the like Nature and Symptoms, in all Ages, Constitutions, and Sexes. The Eruptions of the Small Pox may be not improperly compared to some particular Kind of Fruit; the Maturation of this Fruit depending upon a certain Degree of Heat, it will be ripened gradually, or very soon, or not at all; it may be blighted or burnt up, just according to the Disposition of the Climate, the Soil, or Culture, or Skill of the Planter, whether it be planted, inoculated, or grows spontaneously.

We come now to treat of the Cure of this Disease; and, as we have endeavoured to shew the several evident Causes that produce the Small Pox, or have Power to raise it to an high Degree, so as to render the Distemper fatal to many; and, if it be true, that such Causes, which I have mentioned, are found to have that Force or Power to dispose an human Body to Inflammation, Fire, or Putrefaction, the Consequence of these; and, if it be certain, that the Small Pox is a Disease founded upon an Inflammation, and one of the most eminent among the Diseases of the inflammatory Kind, which I am convinced it is, and of which, the History I have given is a full Demonstration; it necessarily follows, that if we could evade those Causes productive of Inflammations, in general, we evade the Small Pox; or, should we not be able to evade those Causes, could we at least find means to resist and oppose such Causes, that is, prevent such Causes to produce their usual Effects; could we obtain this, could we prevent this, an human Body would not suffer an Inflammation; and, therefore, we prevent the Small Pox. But should the Art of Physic, or the Sagacity of the Physician, not always extend so far as to avert such Causes, or so far oppose them, as entirely to destroy their Effects, yet if we prevail so far as to lessen those Causes productive of Inflammations, or considerably lessen their Effects, we should then have Power to dispose an human Body to a less Degree of Inflammation; and of consequence, to render People less subject to the Small Pox; or, should they have it, less fatal. To be able to effect this, and lay down such Rules that are certain, either to prevent People from falling into the Distemper, or to controul the Violence of it, and render it more supportable, and more benign, it was necessary for us to collect such Observations as were sufficient to prove, that such evident Causes would always produce, raise, and exasperate this Disease; and, that it was only an Inflammation, tho' *sui Generis*: It will be now necessary to shew, what are those Means that have, also, Power to avert, oppose, or controul this Disease; which, if we are able to do, we are able to cure the Small Pox.

Whether the Physician obtains his Ends by the Use of Medicines, Choice of Air, Diet, Exercise, Repose, indulging of Sleep, Watching, or manual Operation, or some, or all of these together, it matters not. For by whatever Means the Physician obtains his Point in View, they are just and necessary, and are all confined within the Verge of his Prescription. Whatever there be within the whole Compass of Nature, that can possibly affect an human Body, ought, if possible, by the Physician, to be taken Notice of and observed; because, every Moment there may be something that offends, and, therefore, to be opposed. Of what Extent then are the Physician's Views? How can he be confined to one Medicine, or such a particular Method of Cure? Curing then does not consist perpetually in prescribing this or that Medicine; not but they are sometimes necessary. The Physician as often prescribes happily, and gains his Ends, by forbidding the Use of such Medicines, or ordering such and such things to be avoided, which were injudiciously directed. Suppose an ignorant Person confined to the Bed in a small Room, covered with a Load of Cloaths, and a great Fire, taking every Moment strong Broths, or Wine; his Pulse becomes quick, and the Man is all on Fire, as well he may be: A Physician comes; he orders the Fire to be put out, the Gloaths to be taken off; he suffers him to cool by Degrees, and the Man is well. I mention this, because I would be rightly understood, that I am not going to lay any Stress upon particular empirical Medicines; for that would be Quackery: I would endeavour to shew a rational Comportment, a

Conduct to be observed by all Physicians, the various Methods, Regimen, and Medicines, to be used in all Constitutions, Climates, Ages, and Sexes. We insist rather on such Rules as direct us what not to do, than on those which shew us what to do.

But, before we come to those particular Precepts concerning the curative Part, it will be necessary for me to lay down some Rules concerning the Effect of Medicines, as well as the Motives a Physician acts from in the Choice of his Medicines: For unless the Physician acts by Motives that are rational and just, he can never judge and determine on the real Virtue and Force of a Medicine. The present State of Physic, built unhappily upon the sandy Foundation of *Hypothesis*, and the general Propensity to Empiricism, that is, the Use of Quack-medicines, deserves a more exact Scrutiny into the Efficacy of Medicines.

Thus have I hitherto confined myself, before the Cure, to a bare historical Account of the Small Pox, and divided the History of it into several Stages; having, also, given my Opinion concerning the Nature of the Disease, as well as the several Maladies that are often complicated with it: Hence the Nature of the Disease (or, at least, as I imagine) appears to be fully proved to be an Inflammation *sui Generis*; yet we have an Opportunity to confirm and illustrate this essential Point, I mean, the Nature of the Disease, in considering the Regimen, Medicines, Diet, &c. which I propose; the Result of which will still add a greater Weight, if possible, to the Doctrine I have already laid down, concerning the Nature of this Disease in particular, as well as all other Inflammations in general. This will be then proving *a posteriori*, what I have asserted; and I may venture to say, there cannot be a more certain Method found out to discover the Nature of a Disease, than by that of observing, with the greatest Attention, the Power and Efficacy, as well as various Effects of Medicines on human Bodies; which cannot be determined, unless the State and Circumstances of the Sick, existing at those particular Times, are duly considered, when such or such Medicines were administered. The Operations then of such Medicines will best shew the Nature of the Disease.

As the descriptive Part, then, of this Treatise on the Small Pox took in an Account of the Seasons of the Year, the Climates, Ages, Sexes, and Constitutions of People, which have an Influence so as to raise or oppose this Disease; as, also, what those Diseases were which dispose Men to imminent Danger, should they then have the Distemper, as well as the various apparent Causes productive of the Small Pox; this may be said to regard what precedes the Distemper. Next to this, we described what preceded the Eruption; then, whatever relates to the Small Pox, during the whole Course of the Eruption, till that Period of the Disease be over.

I have next described the Rise of the secondary Fever, the Maturation of the Pustules, till they are fully ripe, till they dry and fall away, which is the last Stage.

This Order then should be observed in the curative Part, and such Precepts proposed concerning those Medicines, as well as Regimen and Diet, that may have Power sufficient to resist, or mitigate, to controul, or conquer, a Disease hitherto, in a manner irresistible.

But, to obtain the End we have in View, let the Means or Method be whatever it will, (whether by Diet, by Regimen, by Medicine; whether by Exercise, Repose, the Change of Air or Climate, by Watching, or indulging of Sleep, or, lastly, by what other Means soever) provided they are found to have Power to prevent, to restrain, or subdue an Inflammation, they are certainly necessary: If it be true, that the Small Pox is nothing but one of the Species of Inflammations, of consequence, all such Methods and Means are absolutely necessary to be put in Execution.

But we are forced by Necessity to prove what those things are that raise an Inflammation, as, also, what those things are which produce contrary Effects; or we prove nothing certain to our Point. And there is nothing so uncertain in Physic, as the Knowledge of the real Effect of that almost infinite Number of Medicines we have of late Years introduced among us, concerning which there are many things very confidently and falsely asserted.

Boerhaave himself laments this deplorable Branch of our Art, and is even unwilling himself to give particular Receipts when he treats of Diseases. And well he might: For the Effects of Medicines rather arise and take their Force from the Judgment of a Physician in their just Application, than from any Virtues inherent in themselves. An Example will illustrate this, and confound all the Empirics in the World. A Dispensatory will tell you, that Opium will put a Man to sleep; that a Tincture of *Hiera Picra* will purge; that *Mercurius Dulcis* will abate the Inflammation of a Wound; that Broom-ashes will promote

Urine; that the Bark is an Astringent: It is true, these Medicines are found to have such Effects; but that is, when they are applied in such particular Cases, in such particular Constitutions, in such particular Diseases; nay, limited to such particular Stages of Diseases. Let but such Cases, such Constitutions, such Stages of a Disease vary, behold these Effects of Medicines vanish in a Moment, and quite the contrary arise. Half a Grain, or a Grain of Opium, given to a Man upon his coming out of a tepid Bath, having been cupped or bled, the Body not costive, will dispose that Man to sleep: But where the Body is costive, the Constitution adust, inflammatory, being heated with Exercise in an hot Summer's Day, in such a Case the same Quantity of Opium will be found to have a quite contrary Effect; the Person, instead of being drowsy, and inclined to sleep, watches, and becomes delirious, for want of Sleep. Aloes, infused in Wine, purges easily a Person of a cold flatulent Constitution, where there is no Inflammation: But with such whose Blood is much inflamed, who are costive, and whose Urine is high-coloured, should Aloes infused in Wine, or Brandy, be given in such a Case, it would not purge at all; and the oftener this Medicine is repeated, the more it would act as an Astringent, and the more obstinately costive would the Body be rendered; the Person must certainly die of an Inflammation of the Bowels before the Medicine will be found to have the Effect of Purging. The Bark given after the hot Fit of an Ague is spent, is an Astringent; but given during the hot Fit, it generally purges: When it binds, or is an Astringent, it puts a Stop to the Distemper; when it purges, it has no such Effect. A Wound growing foul, and obstinate to heal, requires the Administration of some Medicines, in order to lower the Inflammation, and bring it to digest: If you bleed such a Man, and give him fifteen or twenty Grains of *Mercurius Dulcis*, prescribing a low Regimen, and let the Mercury purge freely, as it generally will, if there be not an high Inflammation in his Blood, and no great Costiveness preceding, the Mercury will be found to check the Inflammation of such a Wound: But should it be given where there is a great Inflammation in the Blood, the Body very much bound, the Person exposed to the cold Air, or shut up in an hot Room, the Mercury will then have a quite contrary Effect; it will be found to add not only a new Degree of Inflammation to the Wound, but may, also, inflame the Bowels, Stomach, the Throat, or the Mouth, and even to such a Degree as if burnt with an Iron. Who has not observed the Mouth ulcerated deeply, and in a very little Time, by Mercury's being given injudiciously? Broom-ashes, being given to an hydropical Woman, of a cold phlegmatic Constitution, no Fever or Inflammation attending, would promote Urine to a great Degree, that is, would be, as the Apothecaries call it, *diuretic*; but given in a Dropsy, where the Liver, or any other Part of the Bowels is ulcerated, tabid, or highly inflamed, if so, there must then be a Fever, and the Blood will be, also, much inflamed; this Medicine will then have no such Effect, but quite the reverse; the Urine will be less and less, higher coloured one Day than another, as the Fever rises from this alkaline Medicine, till the Patient dies of a Mortification.

This I think sufficiently proves, that the Effect and Property of Medicines, as the *Subject* varies upon which they act, vary also; and as this Subject, or particular Body admits of infinite Variations, so do Medicines. Who is there then that can limit the Effects and Properties of Medicines? Or who is there, that can tell how far their Virtues may extend? We can only determine their Powers and Efficacy, in some particular Cases, at such particular Times, and in such particular Constitutions.

The more we consider Physic in this Light, the more we still recede from Empyrism: For rational Physic and Empyrism are as inconsistent, as common Sense and Reason are with Enthusiasm.

We shall now proceed to point out a certain Method of Cure: But the Means, or Instruments, necessary to effect this End, must be proved to have such Force and Efficacy, that may avert, restrain, or conquer, an Inflammation; since those Accidents and Changes in the Small Pox depend upon an Inflammation, and are the necessary Consequences thereof: And, at the same time that we prove such Medicines, Regimen, Diet, &c. to have such Virtues, being applied at such particular Times and Circumstances of the Disease, we shall, also, demonstrate what those Medicines, Regimen, and Diet are, that act upon an human Body so as to create, raise, and exasperate an inflammatory Disease. This a Physician ought to know, because it is as incumbent upon him, and of as much Consequence in the Cure of his Patient, what to forbid him not to do, as what he is to do; that is, to know what to forbid him the Use of, as well as what to prescribe: For that Physician often happily directs, who only prohibits the Use of such and such things, and prescribes nothing.

First, then, in order to prevent the Small Pox, could we propose something that hath Power to destroy the Infection exciting this Species of Inflammation, we prevent the Small Pox. Or, could we find out some Means or other, that hath Power over an human Body, so as to prevent the usual Effects flowing from such a Cause, we then resist that Cause: Altho' the Cause be not destroyed, nevertheless the Effects can never arise: If so, we equally obtain our Ends. We observe the Waters of a smooth and tranquil Sea soon arise, and swell, and roll, from a sudden Storm of Wind. Were it in the Power of any to stay that Storm of Wind, the Sea would be calm and not agitated: Or, suppose there were some Means to add a vast Weight to those Waters, superior to the Force of a Storm of Wind; if so, that Sea would be still and calm, notwithstanding the Winds were uncontrollable, yet they would blow without Effect, and have no more Power over the Waters, than if they blew over a dry barren Piece of Land. Causes exciting the Small Pox are infinite. Some are evident, but many more unknown to us as yet; but whatever they are, they must first raise an Inflammation in the Blood before this Disease can appear, since all Mankind have their Blood inflamed before the fourth Day.

Since many then of these Causes which produce the Small Pox are hidden Causes, it is impossible to endeavour at any Means to destroy those Causes: Yet could we propose such Means that have Power to prevent the Body's being subject to an Inflammation, we could then resist those Causes productive of the Small Pox, by hindering those Causes to have their usual Effects. Hence then, we have Indications sufficient for our Conduct in avoiding this Distemper. The Diet should be cooling, diluting, and subacid, &c.

In short, every Method must be tried that can lower and impoverish the Blood: Or, were it possible even to give a Disease, such as a true intermittent Fever, or any Distemper of a contrary Nature from that of the Small Pox; for two Diseases, differing essentially in Kind, cannot exist at one and the same time. A Person who would avoid the Small Pox, ought to choose such Air, or Climate, where inflammatory Diseases are less frequent, for I believe there is not a Climate wholly exempt, especially such Places where inflammatory Diseases are epidemic, and at that Time stationary. A Man would be most likely at such Times, and in such Places, to be subject to the Small Pox, and that Constitution of Air productive of the Plague, spotted Fevers, or whatever other Fever of the inflammatory Kind at that Time epidemic, whether in a Camp, a besieged Town, in the hot Months of *June, July and August*, will add so much Fever, or Inflammation, to the Small Pox, as to render it fatal. Neither will it be sufficient to avoid violent Exercise, an high Regimen, strong spirituous Liquors, the Mind's being agitated with Passions, or depressed by too reclusive a Life, intense Thought, Application to Business, or hard Study; the Constitution is even to be lowered from that of a vigorous State of Health: For a florid healthy State is very nearly allied to what we may call the *first Degree of Inflammation*. A Man who would avoid the Small Pox, should betake himself to a lower and more cooling Regimen in his Diet than usual; the Liquors, small, diluting, and of the acid Kind; Repletion prevented by Bleeding, and cooling Physic; the Mind kept in a profound Repose; gentle Exercise: By these Means the Constitution will be reduced, as I would have it, rather to the State of a convalescent, than one in a perfect State of Health. The cold Bath, in this Part of the World, hath been esteemed of late Years, by Physicians of Eminence, as a powerful Means to prevent the Return of inflammatory Diseases: Therefore it must be of Force, to oppose, in some Degree, the coming on of this Disease, since it is of the inflammatory Kind; even a perfect State of Health is thought to be too near a State of Inflammation to receive the Small Pox, either by Inoculation, or Infection. With how much Attention, then, ought we not to examine, whether a Patient, who would avoid the Small Pox, or have it in a favourable manner, is not already affected with some inflammatory Disease or other? And, if there should be any such Diseases, they are instantly, if possible, to be cured, lest the Small Pox should come on, and affect the Patient with a Complication of Diseases, which would be, in such a Case, as so many Fires multiplied by one another.

Now there are a thousand Medicines that will raise an Inflammation in the Blood; and the Cause, the morbid Matter, whatever it be, acts as these Medicines, by raising an Inflammation: Why then should there not be some Medicines, or Means, powerful enough to prevent an Inflammation? Certainly there are; altho' not always powerful enough to prevent, yet they are always found powerful enough to restrain or lower an Inflammation: Therefore, it is in our Power to prevent many from falling into this Disease; and even those that do, by ob-

serving proper Rules and Methods, will seldom be exposed to Danger, the Disease not ascending to an high Degree of Malignity.

In Diseases, such as the Plague, Small Pox, or spotted Fever, it is not sufficient to begin to oppose the Disease, when the Disease begins; we are, if possible, to prepare the Body, and prevent the Disease: For such as these, in some particular Climates, Seasons of the Year, and Constitutions, concur in such a manner, that Inflammations of so high a Degree strike instantaneously like Lightning; they consume and burn with such Rapidity, that the Body is wounded, and some Parts destroyed on the first Attack. Whoever, then, stays till the Disease begins, generally comes too late. It is with us often as with those at Sea: A good Sailor, from what he has diligently observed, can by certain Signs foretel an approaching Storm: He lies by, furls his Sails, and prepares himself for the Reception of a furious Blast of Wind, which might otherwise, in an Instant, shatter and tear his Vessel to Pieces. Thus then, the Means I have proposed, in order to avert or prevent the Small Pox, or, at least, prepare the Body, so that the Disease may be more gentle and benign, seem not to be very extraordinary, particularly to those, who have great Confidence in the Pomp of Medicine. Could we persuade Mankind to believe, that the Virtues of Medicines depend wholly on the Judgment of the Physician, we should have no Empirics. What, can living lower than usual, changing of Air, a little Blood taken away, or a little gentle Physic; can such common Means as these have such powerful Effects? Those who are well acquainted with Physic know, that they have. But these Powers and Virtues depend upon the particular Circumstances of Time. There is nothing more easy than to prove this. Suppose the Sagacity of a Physician extended so far as to know, that such a Man would in ten Minutes fall down in an Apoplexy from a Fulness of Blood might not the Loss of only eight or ten Ounces of Blood from the Arm, or the Feet, preserve that Man? After the Vessels of the Brain are lacerated and broke with a Profusion of Blood pent up, the Bleeding to fifty Ounces would have no Effect. What, if a Man were seized with a Shortness of Breath, a Suffocation with an unusual Heat in the Chest, the Cheeks more than usually florid, Signs marking the Distention of the Lungs, from too great a Fulness of Blood? At this time the poor Man, being ignorant of the State he is in, finds himself dispirited, drinks a Glass of strong Wine, or Brandy, or a Glass of Water, with perhaps forty or fifty Drops of Spirit of Hartshorn, or some such fiery Medicine: Upon this he vomits Blood, he is seized with a cold shivering Fit like an Ague, he spits Matter, and at last dies of a Consumption. Had a Physician, in such a Case, directed only a Glass of Water, and the abstaining from every thing that could heat or inflame, it is not improbable but that Nature alone, unopposed by Medicine ill applied, having only the Disease at that time to struggle with, might free herself. It is then the Timing and the Application of Medicines, or the Means we have proposed, that gives the Force and Efficacy. Bleeding a few Ounces, a Cordial, a few Drops of Hartshorn, a Fire in the sick Man's Room, may be said to be of no great Consequence: There are such Circumstances of a Disease, there are such Times, and such Occasions, when they are not of any great Moment, nay, of no Effect: But there are Times, when such things will absolutely kill, or absolutely cure.

We are every Moment to consider Nature, and the Disease, opposing each other, as Weights in a Scale: We are to add, to her Side, that she may preponderate; and there are such Times, when the least Weight is of the greatest Moment, and will turn the Scale. A Cypher in Arithmetic, placed among Figures, affects those Figures just according to the Position or Application of that Cypher; the Value still rising, or decreasing, according as it is placed: So do Medicines, Diet, Exercise, Regimen, &c.

As I have already, under the Article INFLAMMATIO, treated largely of the Treatment due to an Inflammation; a Repetition of what is said there would be superfluous: The prudent Physician, upon whose Conduct and Abilities much depends, will judge the Occasions of preventing and checking a threatening Degree of Inflammation, and will discern the Seasons when Remedies are to be applied, and of what Sort they ought to be.

OF INOCULATION.

As Inoculation for the Small Pox has raised the Attention of all Nations, it cannot be thought improper, for the sake of young Beginners, to describe the Method of this Operation, which may be so beneficial to Mankind.

The Design, then, of Inoculation, is, to communicate a mild Species of the Small Pox to Infants, or Adults; and the Method is, to make a small Incision in the Arm, or Leg, with a Knife; and therein insert some of the purulent Matter, taken from

from Patients labouring under a mild Kind; then dress the Wound with Lint, and a Plaister. Dr. Harris, in *Dissert. Chirurg.* orders only the *Cuticula* to be abraded, and the Matter to be spread on the naked Skin. After the Operation, the Patient should keep himself moderately warm, and observe a proper Regimen; by which means, the Disorder will appear in about seven Days, without any dangerous Symptoms; and, if assisted by a regular Diet, and moderate Warmth, generally goes through all its Stages with Success. Experience evinces, that this Distemper is never caught a second time after Inoculation; which is a sufficient Reason for the Opinion of those who assert, that this Operation might be of universal Benefit to Mankind, by saving the Lives of some, and preserving a Beauty of Countenance, and Strength of Sight, in others.

We learn, from History, that *Inoculation* has, for a long time, been practis'd by the *Greeks* and *Turks*, though it is of modern Date in *Europe*; and was first encourag'd by the *English*, who met with so much Success, that King *George II.* without any Hesitation, had the Operation perform'd on all his Children: So that the *Germans*, especially the Inhabitants of *Hanover*, *Onolsbac*, and *Pyrmont*, came very readily into it.

Some, I confess, amongst the *French* and *English*, have, in their Writings, condemned this Practice, as fatal to Mankind, and unbecoming a Christian; but these Objections have been long ago fully answered by Men of great Learning. If the Reader desires a more particular Account of this Operation, he may consult *Pylarinus* an *Italian*, *Maitland* an *Englishman*, and the celebrated *Vaterus* of *Wirttemberg*; and the *Acta Erudit. Lips.* An. 1723, 1725, &c. *Acta Natur. curios.* Vol. I. Obs. 75. and the *Acta Uratistavienfis*; where this Subject is handled at greater Length. The Practice of *Inoculation* has, also, the Sanction of Experience, the best Master and Instructor in every Science. For my own Part, I am so far from thinking *Inoculation* fatal, that I am convinced it might be thoroughly beneficial to Mankind: For, in my Opinion, the Small Pox proceeds from a peccant Matter intermixed with the Blood from the very Day of our Birth, and which generally breaks out in every Person sooner or later; and the sooner, generally the better; for this Distemper is often fatal to Persons advanced in Years: So that the *Virus* seems to increase with the Patient's Age. And this seems the very Reason why the Small Pox is more favourable to Infants than Adults. If, therefore, the Disorder be procured from a mild Kind, and the Venom discharged from the Blood, while it is small in Quantity, and the Infant young, I make no doubt but many Children, especially those of Princes and Noblemen, might be preserved, not only from the most malignant Symptoms, but even from Death. When this Distemper is received from a natural Infection, it often proves very mortal; on the contrary, if procured by Art, the Patient is prepared by a proper Diet and Medicines, and usually finds it less severe. It is unnecessary to produce any further Reasons in Justification of this Practice, as these must be sufficient to convince every reasonable Man. *Heister. Chirurg.*

VARIUS, seu *Phoxinus levis*. J. Jonst. Is a small River-Fish, which the *Italians* call *Morella*, and the *French* *petite Truite*, "a small Trout." It is scarce above a Digit in Length, its Skin even, smooth, and polished. It is of various Colours, whence it has its Name; yellow on the Back, silver-coloured on the Belly, purple on the Sides, and marked all over with black Spots; the Flesh is soft, tender, and good to eat.

As to its medicinal Virtues, it is pectoral, restorative, and aperitive. *Lemery des Drogues.*

VARIX, plur. **VARICES**.

By the Name *Varices*, among Physicians, are meant those unequal, nodous, and blackish Tubercles of the Veins*, which are subject to rise in any Part of the Body; but most frequently in the Feet, about the Anles; though sometimes higher, as about the Legs, Thighs, and other Places, as the *Scrotum*; and even in the Head and Belly, as *Celsus* observes, *Lib. 7. Cap. 31.* This Disease most frequently infects pregnant Women, but is incident to any other Persons, especially those who abound with thick Blood, or are affected with a Pain of the *Hypochondria*, an Obstruction of the Liver, or a *Scirrhus*. The more the *Varices* increase, the more painful and troublesome they become, on account of the more violent Tension of the Membranes; and, sometimes, they even come to a Rupture, and discharge Plenty of Blood, or degenerate into malignant Ulcers, as I have sometimes observed. The smaller Kinds of *Varices* usually create but little Uneasiness; and are, therefore, neglected by the Patient, as not requiring the Assistance of the Surgeon.

In order, however, to prevent a small, and, at first, inconsiderable Evil, from increasing by degrees, and growing formidable, to the great Detriment and Annoyance of the Patient, it will be advisable to open a Vein, with all Speed, and take away a Quantity of Blood; and, after that, to prescribe a proper Regimen of Diet: This done, it will be convenient to secure the

diseased Feet in the most careful and exact manner, with a repellent, or, as it is commonly called, expulsive Bandage [*Tab. XXIV. Fig. 1. F*]; and whenever you perceive it to slacken, in any measure, or become loose, to straiten it anew, and never to remove, or throw it off, while you are under the least Apprehensions of an Increase of the Disorder. The Antients, as we learn from *Celsus*, freed their Patients from the *Varices* by a speedy Cauterisation, or Excision; but we Moderns use a milder way of proceeding: If the *Varices*, then, are increased to a considerable Bigness, we apply the Bandage before-mentioned for the Constriction and Strengthening of the Veins, which are dilated beyond their just Measure, moistening the Fillet with red Wine warm, or a Decoction of Astringents, or of Vinegar and Alum; and binding, also, a thin Plate of Lead upon the Part affected. *Dionis* assures us, that there is no Method more effectual for repressing the *Varices*, than by Stockings made of Dog-skins, or other Skins fit for the Purpose, and so contrived, as, by Help of a Cord, to be straitened, and drawn as close as the Patient can well suffer it; by which means, the Legs may be kept under a close and exact Constriction, both Day and Night. The Form of those directed by *Dionis*, is represented *Tab. LVII. Fig. 11.* Such Spatterdashies may, also, be made, in the same Fashion, of grey linen Cloth, which is strong enough, as I have seen them myself. The most effectual Remedy against the *Varices*, in the Opinion of *Harris, Dissertat. Chirurg. 8.* is Tincture of Myrrh, if the Part affected be frequently anointed with it, and then covered with *Rulandus's Emplastrum Diasulphuris*: And if there be, afterwards, a Bandage applied, or a Constriction of the Place effected, by means of Stockings, in the manner before described, the greater is the Success to be expected from this Remedy.

Where the *Varices* are increased beyond Measure, and swelled to so enormous a Degree, as to threaten a Rupture, and a dangerous Hæmorrhage is to be feared, or if they grow intolerable to the Patient on any other Account, recourse must be had to the Knife, and Section must be used. In this Operation we make a longitudinal Incision into those Tubercles of the Veins which are most swelled, or which excite the greatest Pain; and after evacuating the thick Blood, to the Quantity of eight, ten, or twelve Ounces, according to the various Habits of the Patient, we dextrously cover the Wound with Lint dipt in Bole Armoniac and Vinegar; and upon this applying a leaden Plate, we secure the Whole with a Bandage. If the Operation be rightly performed, there generally succeeds a Coalition of the Veins, in much the same manner as after Phlebotomy, and the Vesicles are strenghten'd by their Cicatrices; so that the same Place is scarce ever infested with *Varices* afterwards. The antient Surgeons, as we said, cured *Varices* by Cautery or Excision. See *Celsus, Lib. 7. Cap. 31.* The Method in which the latter was performed, was thus: First, They cut the Skin upon the distended Vein; then took hold of the vitiated Part of the Vein with an Hook, and with a Knife cut it quite off, and separated it entirely from the Body, after which they healed up the Wound with a Plaister. *Gouey*, in *Chirurgie veritable*, declares himself of Opinion, that the quickest, and, at the same time, the safest Method of curing *Varices*, is to pass a crooked Needle with a double waxed Thread, quite under the distended Vein; and by drawing the same into a Knot, to make a firm Ligature upon the Vein, then immediately to make an Incision with the Knife into the tumid Vein, and discharge a sufficient Quantity of the thick Blood: This done, the Wound is to be treated with some digestive Ointment, and the Patient is to keep his Bed, till the Wound is almost conglutinated. The antient Method by Cautery was first to cut the Skin, then lay open the Vein; and this done, gently to press the same with a slender, blunt, red-hot Iron; the Lips of the Wound being held asunder with Hooks, to prevent their being burnt, (*Celsus*, in the Place before-quoted): When this was over, they treated the Wound with Remedies adapted to Combuitions. *Harris*, indeed, judges all Methods of Excision and Burning not only rash, but cruel; it must, however, be confessed, that the Molestations and Pains, created by the *Varices*, are sometimes so violent, that a Rupture may be dreaded, and that in the Night, (of which I know a very remarkable Instance) with Danger of Death; for which Reasons the Assistance of such potent Remedies, as the Knife and Needle, is on such Occasions necessarily required.

But by whatever means the *Varices* are cured, it seems highly necessary, in order to prevent the Return of so troublesome a Disorder, to use the proper Cautions of avoiding too gross and plentiful Feeding, and to drink smaller Liquors; such as Water, Water-gruel, Tea, Coffee, or Infusions of other proper Vegetables. The Body, also, is very frequently to be exercised; the Feet are every Day to be well rubbed; and Phlebotomy is to be administered at least twice in the Year, that is, in Spring and Autumn. The same Precautions are to be observed

served by those who are but newly or slightly affected, and are willing to avoid greater Inconveniencies, not to be removed but by the Knife and Fire. *Muys* has a singular Instance of a Varix, combined with Ulcers, which he opened once every Year, and discharged a Pound of Blood; by which Means the Eruption of the Ulcers was prevented. See his *Chirurg. Rational. Dec. 1. Obs. 6. Heisteri Chirurg.*

VANUS. A Pimple on the Face. See **FURUNCULUS.**

VAS. A Vessel either for mechanical, chymical, culinary, or any other Uses. In Anatomy, all the Parts which convey a Fluid are called *Vessels*, as the Veins, Arteries, and Lymphatics.

VASTUS EXTERNUS.

This is a very large fleshy Muscle, almost as long as the Os Femoris, broad at the Extremities, and thick in the Middle, lying on the Outside of the Thigh.

Its upper Insertion being something tendinous, is in the posterior, or convex rough Surface, of the great *Trochanter*: It is, also, fixed by a fleshy Insertion along the Outside of the Os Femoris, for above two Thirds of its Length downward, in the corresponding Part of the *Linea Aspera*, and in the neighbouring Portion of the *Fascia Lata*.

From all this Extent, the fleshy Fibres running downward, and a little obliquely forward toward the *Rectus Anterior*, terminate insensibly in a kind of short Aponeurosis, which is fixed in all the nearest Edge of the Tendon of the *Rectus*, in the Side of the Patella, in the Edge of the Ligament of that Bone, and in the neighbouring lateral Part of the Head of the Tibia.

The Body or Belly of this Muscle grows bigger gradually, from its upper Extremity to the Middle; and from thence diminishes again by Degrees. Its lowest Fibres run in a little behind the *Rectus*, and are inserted there.

VASTUS INTERNUS.

This Muscle is very like the former, and situated in the same manner, on the Inside of the Os Femoris.

It is fixed above by a short flat Tendon, in the anterior rough Surface of the great *Trochanter*, and, by fleshy Fibres, in that oblique Line which terminates the Basis of the Collum Femoris anteriorly, on the Foreside of the Insertions of the *Psoas* and *Iliacus*; in the whole Inside of the Os Femoris; and in the *Linea Aspera* on one Side of the Insertions of the three *Tricipites*, almost down to the internal Condyle.

From all this Extent the Fibres run downward, and a little obliquely forward; and the Body of the Muscle increases, in the same manner as the *Vastus Externus*. It terminates below in an Aponeurosis, which is fixed in the Edge of the Tendon of the *Rectus Anterior*, in the Side of the Patella, and of its tendinous Ligament; and in the Side of the Head, or upper Extremity of the Tibia.

The two *Vasti* and *Crureus* ought to be looked upon as a true *Triceps*; the Uses of which, in relation to the Bones, are only to extend the Tibia on the Os Femoris, and the Os Femoris on the Tibia. The Extension of the Tibia on the Os Femoris happens, principally, when we sit or lie, and that of the Os Femoris on the Tibia, when we stand or walk. All the three Muscles move the Patella uniformly, in the Direction of the Os Femoris, on the Pulley at the lower Extremity of that Bone. The external or broad Portion of this Pulley, and of the Patella, answers to this Direction, and seems to be more exposed to the Action of these Muscles, than the internal and narrow Portion, on which the necessary Obliquity of that Pulley depends.

The Insertion of both the *Vasti* immediately in the Head of the Tibia, prevents the Patella from being luxated laterally on some Occasions, in which the Muscles may act with more Force on one Side than on the other, or remain without Action, in which Case the Patella is loose and floating.

To be convinced of this Inaction, and of the Moveableness of the Patella at the same time, let us either in Sitting or Standing, with the Leg extended, rest the Leg only upon the Backside of the Heel, so as that the whole lower Extremity may be supported on the Heel, and on the Head of the Os Femoris, the Knee, and the Body of the Os Femoris, resting on nothing, and the Extension being made only by the Weight of the Bones, without any Assistance from the Muscles. If in this Situation we lay the Thumb on the Basis of the Patella, and the fore Finger on the Apex, and press these two Parts alternately, the Patella will be perceived to be raised and depressed.

In the Description of these Muscles, I forgot an Observation which I have made on the Insertion of several Fibres immediately in the Capsular Ligament of the Joint of the Knee. I have seen these Fibres run down, as if they came principally from the *Crureus*; and their Insertion in the Ligament was oblique, and made by degrees.

By the Insertion of these Muscles in the Patella, their Line

of Direction is removed to a greater Distance from the Centre or Axis of Motion of the Joint, which facilitates their Action, and defends their common Tendon from Compression and Contusions. *Winslow.*

VASUM, in *Scribonius Largus*, is a Vessel.

VATICANÆ PILULÆ. The Name of some purging Pills, described in the Old London Dispensatory, thus:

Take of Calamus Aromaticus, Anise, Mastic, Ginger, Cinnamon, Zedoary, the lesser Cardamoms, Mace, Nutmegs, Cloves, Saffron, Cubebs, Aloes-wood, Turbith, Manna, Agaric, Sena-leaves, Cassia-wood, and all the Species of Myrobalans, each one Scruple; of the Leaves of Scordium, and Carduus Benedictus, each half a Dram; and of the best Rhubarb, one Ounce, two Scruples: Reduce to a fine Powder: To which add of the best Aloes, two Ounces, four Scruples; and of the Solutive Syrup of Roses, and Violets, each a sufficient Quantity: Make into a Mass of Pills, according to Art.

VAYNILLAS. The same as **VANILIA.**

UCAUNA. A Sort of Cray-fish of an olive Colour, mentioned by *Lemery*, in his Treatise on Drugs, which, he says, is pectoral and aperient.

VEEL-GUTTA is, according to *Blancard*, a Name for the **OREOSELINUM.**

VEGETATIO. Vegetation. See **BOTANY.**

VEHICULUM. A Vehicle, in Pharmacy, is any Liquor in which a Medicine is given to a Patient, in order to render the Exhibition more grateful and commodious.

VELONÆ. Certain Fishes mentioned by *Oribasius, Collect. Medic. Lib. 2. Cap. 58.* whose Beaks, he says, are horny, and that they afford a very bad Juice.

VENÆ. The Veins.

The Veins are only a Continuation of the extreme Capillary Arteries, reflected back again towards the Heart, and uniting their Channels as they approach it, till at last they all form three large Veins; the *Cava Descendens*, which brings the Blood back from all the Parts above the Heart; the *Cava Ascendens*, which brings the Blood from all the Parts below the Heart; and the *Porta*, which carries the Blood to the Liver.

The Coats of the Veins are the same with those of the Arteries, only the muscular Coat is as thin in all the Veins, as it is in the Capillary Arteries; the Pressure of the Blood against the Sides of the Veins being less than that against the Sides of the Arteries.

In the Veins there is no Pulse, because the Blood is thrown into them with a continued Stream; and because it moves from a narrow Channel to a wider.

The Capillary Veins unite with one another, as has been said of the Capillary Arteries.

In all the Veins which are perpendicular to the Horizon, excepting those of the Uterus, and of the *Porta*, there are small Membranes or Valves; sometimes there is only one; sometimes there are two, and sometimes three placed together, like so many half Thimbles stuck to the Sides of the Veins, with their Mouths towards the Heart. In the Motion of the Blood towards the Heart, they are pressed close to the Sides of the Vein; but if Blood should fall back, it must fill the Valves; and they, being distended, stop up the Channel, so that no Blood can repass them. *Keil's Anatomy.*

The Blood, distributed to all Parts of the Body by two Kinds of Arteries, the Aorta, and Pulmonary Artery, returns by three Kinds of Veins, called by Anatomists *Vena Cava*, *Vena Porta*, and the *Pulmonary Vein*.

The *Vena Cava* carries back, to the Right Auricle of the Heart, the Blood conveyed by the Aorta to all the Parts of the Body, except what goes by the Coronary Arteries of the Heart: It receives all this Blood from the arterial Ramifications, in Part directly, and in Part indirectly.

The *Vena Porta* receives the Blood carried to the floating Viscera of the Abdomen, by the Coeliac Artery, and the two Mesenteric Arteries; and conveys it to the Hepatic Vein, and from thence to the *Vena Cava*.

The Pulmonary Vein conveys to the Pulmonary Sinus, or Left Auricle of the Heart, the Blood carried to the Lungs by the Pulmonary Artery.

To these three Veins two others might be added: Those which belong particularly to the Heart, and to its Auricles, and the Sinuses of the Dura Mater.

In describing the general Course of the Veins, we may either begin by their Extremities in all the Parts of the Body, and end by the Trunks carried all the Way to the Heart, according to the Course of the Blood; or we may begin by the great Trunks, and end by the Ramifications, and Capillary Extremities, according to their several Divisions and Subdivisions.

This last Method is most convenient, and makes it a very easy Matter to pursue the first, whenever we think it proper to do it; and, for these Reasons, I have chosen to follow it, in this Description.

We commonly talk of the *Vena Cava* in general, as if it were but one Vein at its Origin, or had but one common Trunk; whereas it goes out from the Right Auricle of the Heart, by two large separate Trunks, in a Direction almost perpendicularly opposite to each other, one running upward, called *Vena Cava superior*; the other downward, called *Vena Cava inferior*.

It may, however, be said, that these two Veins have a Sort of Continuity, or a small Portion of a common Trunk, fixed to the Edges of the Right Auricle, as if three Quarters of the Circumference of a large strait Tube were cut off, and the Edges of a small Bladder applied to the Edges of the Opening, thus made in the Tube.

The Right Auricle may, also, be looked upon as a muscular Trunk common to these two large Veins, and may be called the Sinus of the *Vena Cava*; but, in this respect, the Name of *Sinus Pulmonaris* agrees still better to the Left Auricle.

The superior *Vena Cava* is distributed, principally, to the Thorax, Head, and upper Extremities, and but very little to the Parts below the Diaphragm.

The inferior *Vena Cava* is distributed, principally, to the Abdomen and lower Extremities, and but very little to the Parts above the Diaphragm.

The Antients called the superior *Vena Cava*, *Ascendens*; and the inferior, *Descendens*; having regard only to the great Tubes, and to their Division into Trunks and Branches. Several Moderns have retained those Names, but in a contrary Signification, to accommodate them to the Motion of the Blood, which descends by the *Cava Superior*, and ascends by the *Cava Inferior*.

But to avoid the Mistakes that may happen in Reports made of Wounds, or other Diseases, and of what is observed in opening dead Bodies, and in other Cases of these Kinds, it is best to retain the Distinction of *Vena Cava superior* and *inferior*.

The Trunk of each of these two Veins sends off, much in the same manner with the Arteries, a certain Number of principal or capital Branches, which are afterwards ramified in different manners. Each Trunk terminates afterwards by a Bifurcation, or a Division into two subordinate Trunks, each of which gives off other principal Branches, ending in a great Number of small Trunks, Branches, and Ramifications.

They have, also, this common to them with the Arteries, that the greatest Part of the capital Branches are in Pairs; as well as the subordinate Trunks. The Ramifications of each subaltern Trunk, taken by itself, are in uneven Numbers; but they make even Numbers with those of the other like Trunk. The *Vena Azygos*, and some other small Veins, are Exceptions from this Rule.

Before I go on to the particular Description of each of these Veins, many of which have proper Names, I shall give a general Idea of their Distribution, and an Enumeration of their principal Ramifications. But I shall say nothing of the Coronary Veins of the Heart, because they are not immediately joined to any other Vein. I begin by the superior *Vena Cava*.

VENA CAVA SUPERIOR.

The superior *Vena Cava* runs up from the Right Auricle of the Heart, almost in a direct Course, for about two Fingers-breadth, lying within the Pericardium, in the Right Side of the Trunk of the Aorta, but a little more anteriorly.

As it goes out of the Pericardium, it is inclined a little to the Left Hand, and then runs up about an Inch, that is, as high as the Cartilage of the first true Rib, and a little higher than the Curvature of the Aorta. At this Place it terminates by a Bifurcation, or Division into two large Branches, or subordinate Trunks; one of which runs toward the Left Hand, the other towards the Right.

These two Branches are named *Subclaviae*, as lying behind, and, in some measure, under, the *Clavicula*, both in the same manner. They are of unequal Lengths, because the Trunk of the *Vena Cava* does not lie in the Middle of the Thorax, but toward the Right Side, where the Left Subclavian arises as well as the Right, and is, consequently, longest.

The Trunk of the superior Cava, from where it leaves the Pericardium to the Bifurcation, sends out anteriorly several small Branches, which sometimes arise separately, and sometimes by small common Trunks: These Branches are, the *Vena Mediastina*, *Pericardica*, *Diaphragmatica superior*, *Thymica*, *Mammaria Interna*, and *Trachealis*, the last of which go out sometimes behind the Bifurcation.

All these small Branches from the Trunk of the *Cava superior* are termed *Dextrae*; and their Fellows on the other Side,

called *Sinistrae*, do not arise from the Trunk, because of its lateral Situation, but from the Left *Subclavia*.

Posteriorly, a little above the Pericardium, the Trunk of the superior Cava sends out a capital Branch, called *Vena Azygos*, or *Vena sine Pari*, which runs down on the Right Side of the Bodies of the Vertebrae Dorsi, almost to the Diaphragm; giving off the greatest Part of the *Venae Intercostales*, and *Lumbares Superiores*.

The two *Subclaviae* run laterally, or toward each Side, and terminate as they go out of the Thorax, between the first Rib and Clavicula, immediately before the anterior Insertion of the *Musculus Scalenus*.

The Right Subclavian, which is the shortest of the two, commonly sends out four capital Branches; the *Jugularis externa* and *interna*, the *Vertebralis*, and *Axillaris*, which last is rather a Continuation than a Branch of the Subclavian.

The Left Subclavian, being longer than the Right, gives off, first of all, the small Veins on the Left Side, answering those on the Right Side, that come from the Trunk of the superior Cava; as the *Mediastina*, *Pericardica*, *Diaphragmatica superior*, *Thymica*, *Mammaria Interna*, and *Trachealis*.

Next to these small Veins, called *Sinistrae*, it detaches another small Branch, called *Intercostalis Superior Sinistra*, and then four large Branches, like those on the Right Subclavian, as the *Jugularis Externa* and *Interna*, *Vertebralis*, and *Axillaris*, which are all termed *Sinistrae*.

The external Jugular Veins are distributed principally to the outer Parts of the Throat, Neck, and Head; and send a small Vein to the Arm, named *Cephalica*, which assists in forming a large one of the same Name.

The internal Jugular Veins go to the internal Parts of the Neck and Head, communicating with the Sinuses of the Dura Mater, and in several Places, with the external Jugular Veins.

The Vertebral Veins pass through the Holes in the transverse Apophyses of the Vertebrae of the Neck, sending Branches to the Neck and Occiput, they form the *Sinus Venales* of these Vertebrae, and communicate with the Sinuses of the Dura Mater.

The Axillary Veins are Continuations of the *Subclaviae*, from where these leave the Thorax, to the Axillae: They produce the *Mammariae Internae*, *Thoracicae*, *Scapulares*, or *Humerales*, and a Branch to each Arm, which, together with that from the external *Jugularis*, forms the *Vena Cephalica*.

Afterwards the Axillary Vein terminates in the principal Vein of the Arm, called *Basilica*; which, together with the *Cephalica*, is distributed, by numerous Ramifications, to all the Parts of the Arm, fore Arm, and Hand.

VENA CAVA INFERIOR.

The Portion of the inferior *Vena Cava* contained in the Pericardium is very small, being scarcely the twelfth Part of an Inch on the fore Part, and not above a Quarter of an Inch on the back Part. From thence it immediately perforates the Diaphragm; to which it gives the *Venae Diaphragmaticae Inferiores*, or *Phrenicae*.

It passes next behind the Liver, through the great Sinus of that Viscus, to which it furnishes several Branches, termed *Venae Hepaticae*.

In this Course it inclines a little toward the *Spina Dorsi* and *Aorta Inferior*, the Trunk and Ramifications of which it afterwards accompanies in the Abdomen, all the Way to the *Os Sacrum*; the *Arteria Coeliaca*, and the two *Mesentericae*, only excepted.

Thus the inferior Cava sends out on each Side, in the same manner with the Aorta, the *Venae Adiposae Renales*, *Spermaticae*, *Lumbares*, and *Sacrae*. Having reached to the *Os Sacrum*, it loses the Name of Cava; and, terminating by a Bifurcation, like that of the descending Aorta, it forms the two *Venae Iliacae*.

These Iliac Veins having given off the Hypogastricae, with all their Ramifications, to the Viscera of the Pelvis, and to some other external and internal neighbouring Parts, go out of the Abdomen, under the *Ligamentum Fallopii*, and there take the Name of *Venae Crurales*.

Each Crural Vein sends off numerous Ramifications to all the lower Extremities; besides the *Vena Saphena*, which goes out near the Origin of the *Cruralis*, and, running along this whole Extremity, detaches many Ramifications, all the Way to the Foot.

VENA AZYGOS and VENAE INTERCOSTALES.

The *Vena Azygos*, or *sine Pari*, is very considerable, and arises posteriorly from the superior Cava, a little above the Pericardium.

It is immediately afterwards bent backward over the Origin of the Right Lung, forming an Arch which furrounds the great Pulmonary Vessels on that Side, as the Arch of the Aorta does those

those of the Left Side; with this Difference only, that the Curvature of the *Azygos* is almost directly backward; whereas that of the Aorta is oblique. From thence it runs down on the Right Side of the *Vertebrae Dorsi*, on one Side of the Aorta, and before the Intercostal Arteries; and, getting behind the Diaphragm, it terminates by a very sensible Anastomosis; sometimes with the *Vena Renalis*, sometimes with a neighbouring Lumbar Vein, sometimes immediately with the Trunk of the *Cava Inferior*, and sometimes otherwise.

I have seen this Vein extremely large, resembling the Trunk of the inferior Cava, from the Diaphragm, to the Origin of the *Renales*, the true Cava being through all this Space very narrow, or of the Size of an ordinary *Azygos*.

The *Vena Azygos* sends out, first of all, two or three small Veins from the Top of the Arch, one of which goes to the *Aspera Arteria*; the others partly to the *Aspera Arteria*, and, partly, to the Bronchia, by the Name of *Venae Bronchiales*, accompanying the Ramifications of the Bronchial Artery.

Afterwards the *Azygos* detaches from the Extremity of the Arch, a small Trunk common to two or three small Veins, called *Intercostrales Superiores Dextrae*, which bring back the Blood from the first three Series of Intercostal Muscles, and from the neighbouring Part of the Pleura.

These Intercostal Veins send Branches through the Intercostal Muscles to the *Serratus Superior Posticus*, and to the *Serratus Major*, and afterwards they run along the Interstices between the Ribs, communicating with the *Venae Mammariae*.

They, also, send small Branches backward to the Vertebral Muscles, and Canal of the Spine, where they communicate with the Venal Circles, or Sinuses, which bring back the Blood from the *Medulla Spinalis*.

As the *Azygos* runs down, it sends off the inferior Intercostal Veins on the Right Side, one going to each Series of Intercostal Muscles: These Veins run along the lower Edges of the Ribs, and perforate the Muscles by Branches, which go to the posterior and external Part of the Thorax.

They communicate with the *Venae Thoracicae*, and most commonly with the *Mammaria Interna*; and, lastly, more or less with each other, by perpendicular Branches, near the posterior Extremities of the Ribs.

The *Azygos* sends off, likewise, the Left Intercostal Veins, but seldom the whole Number; for the superior Veins come often from the Left Subclavian. The inferior Intercostal Veins, to the Number of six or seven, sometimes more, sometimes fewer, come often from the Trunk of the *Azygos*; and running between the Aorta and *Vertebrae*, to the Substance of which they give small capillary Twigs, they send off almost the same Ramifications with the Veins on the Right Side, and likewise some to the *Oesophagus*.

Sometimes these Intercostal Veins come from a small common Trunk, which goes out from that of the *Azygos*, and, passing between the Aorta and *Vertebrae*, is bent downward along the Left Side of the *Vertebrae*: In which Course it detaches the Intercostals laterally. This small Trunk is in some Subjects bifurcated upwards and downward, as it sends off the Intercostals; and, in others, there are two small common Trunks.

Lastly, There is sometimes an entire *Azygos* on the Left Side, which proceeding from the Arch of the ordinary *Azygos*, is afterwards distributed in the same manner as the other, on the Right Side: But this Disposition, likewise, varies very much.

The *Azygos*, having reached below the last Rib, sends off a large Branch, which, bending outward, perforates the Muscles of the Abdomen, is ramified between their different Planes, and communicates with the like Ramifications of the last, or last two Intercostal Veins.

Sometimes it sends off the *Vena Diaphragmatica Inferior*, and, also, gives downward to the first, or first two transverse Apophyses of the *Vertebrae Lumbares*, a Branch which forms the first *Venae Lumbares Dextrae*.

These Communications between the last Intercostal, and first Lumbar Veins, are very irregular, being sometimes by a Series of opposite Angles, sometimes by *Arculae*, and sometimes by a reticular Texture. Sometimes the Extremity of the *Vena Azygos* communicates either mediately, or immediately, with the *Vena Adiposa*, and even with the *Vena Spermatica*.

VENAE PECTORALES INTERNAE.

The *Pectorales Internae* are small Veins disposed in Pairs, towards the Right and Left Hand, behind the *Sternum*, and Parts near it, including the *Diaphragmatica Superiores*, or *Pericardio-diaphragmatica*, *Mediastinae*, *Mammariae Internae*, *Thymicae*, *Pericardicae*, and *Gutturales*, or *Tracheales*.

All these small Veins are divided into Right and Left; and these are both distributed much in the same manner; but they differ in their Origin, because of the Inequality in the Bifurcation of the *Cava Superior*.

The Right *Vena Mediastina* goes out anteriorly from the Trunk of the superior Cava, a little above the Origin of the *Azygos*; the Left comes from the *Subclavia*.

The Right superior *Diaphragmatica*, or *Pericardica Diaphragmatica*, comes anteriorly from the Root of the Bifurcation near the *Mediastina*; and is distributed by several Branches to the upper, fore, and back Parts of the *Pericardium*, communicating with those of the Left *Diaphragmatica*, and accompanying the Nerve of the same Name. The Left superior *Diaphragmatica* comes from the Left *Subclavian*, a little below the Origin of the *Mammaria*.

The Right internal *Mammaria* arises anteriorly from the *Vena Cava*, a little below the Angle of the Bifurcation: It runs along the nearest internal or posterior Edge of the *Sternum*; and on the cartilaginous Extremities of the Right Ribs, together with the Artery of the same Name. Having reached near the Diaphragm, it sends it a Branch, which runs toward the tendinous Plane, and communicates with the common diaphragmatic Veins.

Afterwards this Mammary Vein gives small Branches to the *Mediastinum*; and others, between the Ribs, to the Integuments; of which those that pass between, and under, the Cartilages of the last true Ribs, run down on the inner or posterior Side of the *Musculi Recti Abdominis*, being ramified among their fleshy Fibres, and communicating, really, with the Epigastric Veins; by several small Twigs.

The Left internal *Mammaria* arises anteriorly from the Left *Subclavian*, opposite to the Cartilage, or anterior Extremity of the first true Rib.

The Right *Vena Thymica*, when it arises separately, goes out from the Bifurcation; and when it is wanting, the *Thymus*, from whence it takes its Name, is furnished by the *Gutturalis*, or some other neighbouring Vein: This Vein often reaches no lower than the inferior Part of the *Thymus*; and the Left Vein of the same Name comes from the Left *Subclavian*, almost opposite to the *Sternum*.

The Right *Pericardica* seems to go out rather from the Origin of the Right *Subclavian*, than from the Trunk of the superior Cava; but in this there are many Varieties. It goes to the upper Side of the *Pericardium*, and other neighbouring Parts. The Left *Pericardica* comes sometimes from the Left *Subclavian*, before the *Mammaria*; and sometimes from the *Mammaria*, or *Diaphragmatica Superior*, on the same Side.

The Right *Gutturalis*, or *Trachealis*, goes out from the upper Part of the Bifurcation, above the *Mammaria* of the same Side, sometimes more backward, and sometimes from the *Subclavia*: It is distributed to the *Glandulae Thyroidae*, *Trachea Arteria*, *Musculi Sterno-hyoidae*, *Thymus*, and *Glandulae Bronchiales*: It communicates by lateral Branches, more or less contorted, with the internal Jugular Vein, and sometimes by another Branch, with a small Vein, which the internal Jugular sends to the *Glandula Thyroides*. The Left *Gutturalis* comes from the upper or posterior Part of the Left *Subclavian*, near its Origin.

The smallest internal Pectoral Veins do not always arise separately, but have sometimes a small common Trunk, especially on the Right Side; and, of all these small Veins, the *Mammaria Interna* is the most considerable.

VENAE SUBCLAVIAE.

The Right *Subclavian Vein* is very short, and its Course very oblique; so that it appears to arise higher than the Left Vein: It sends off, first of all, four large Branches, the *Vertebralis*, which is the first and most posterior; the *Jugularis Interna* and *Externa*, and the *Axillaris*.

The Left *Subclavian* seems to ascend but very little, after the Bifurcation; because it runs farther, and more transversely, than the Right: And in this Course it covers the Origin of three large Arteries, which come from the Curvature of the Aorta: It sends off four large Branches, besides the small Pectoral Veins, and receives the *Ductus Thoracicus*.

It, also, gives off, before its principal Division, a small Trunk for the Left superior Intercostals, which are sometimes six in Number, and communicate with the inferior Intercostals, and with a Branch of the *Vena Azygos*. This small common Intercostal Trunk furnishes, also, the Left *Bronchialis*.

Each *Subclavian Vein*, near the Middle of the *Clavicula*, sends off a Branch, called *Cephalica*, which descends near the Surface of the Body, between the *Deltoides* and *Pectoralis Major*, and reaches the Arm.

VENAE JUGULARES EXTERNAE.

Each external Jugular Vein arises from the *Subclavian*, on the same Side; sometimes from the *Axillaris*, and sometimes from the Union of these two Veins. The Right and Left do not always arise in the same manner; for sometimes the Right comes from the *Subclavian*, and the Left from the internal Jugular,

gular, on the same Side: They run up between the *Musculus Cutaneus*, and *Sterno-mastoideus*, being covered by the former, and crossing over the latter.

Sometimes they are double from their very Origins; and when they are single, each of them divides afterwards into two, one anterior, and the other posterior, or rather superior. The anterior Vein goes to the Throat and Face, running up toward the Angle of the lower Jaw; and the posterior goes to the Temples and Occiput.

VENA JUGULARIS EXTERNA ANTERIOR.

The anterior external Jugular Vein is often a Branch of the *Jugularis Interna*; and sometimes arises from the Communications of the two *Jugulares*, in such a manner as that it cannot be said to belong more to the one than to the other. Sometimes, but very rarely, it comes from the *Vena Axillaris*.

It runs up toward the lateral Part of the lower Jaw, between the Angle and the Chin, like a *Vena Maxillaris*; and sends several Branches forwards, backwards, and inwards.

Posteriorly it gives, 1. A large Branch on the Side of the upper Part of the Larynx, which communicates with the *Jugularis Interna*; and, likewise, with a large short Branch of the posterior external Jugular. 2. A small Branch which has the same Communication, but which is not always to be found. 3. Another small Branch, a little below the lower Jaw, which communicates with the posterior external Jugular.

Anteriorly it sends several Branches to the Muscles of the Larynx, *Sterno-hyoidæi*, *Thyro-hyoidæi*, and to the Integuments; and below the Larynx, it sends communicating Branches to the anterior external Jugular of the other Side.

A little higher, opposite to the *Cartilago Thyroides*, it gives off a transverse Branch, which runs on the anterior and lower Part of the *Musculi Sterno-mastoidei*; and communicates with the Jugular of the other Side, though not always by a Vein of the same Kind.

The superior and inferior transverse Branches communicate on each Side, by Branches more or less perpendicular; and send a small Branch to the *Musculus Quadratus* of the Chin, to the *Musculus Cutaneus*, and Integuments.

It sends another large Branch anteriorly towards the Symphysis of the lower Jaw, which, after having supplied the Maxillary Glands, is distributed to the Digastric Muscle, to the Chin and under Lip.

Interiorly at the same Place, it sends out a large Branch, which furnishes the *Glandulæ Sublinguales*, runs down toward the *Cornua* of the *Os Hyoides*, to communicate with some Branches of the *Jugularis Interna*, and sends several Branches to the Tongue, called *Venæ Raninæ*: It gives off, also, a small Branch, which running upon the *Musculus Labiorum Triangularis*, to the Commissure of the Lips, is distributed to the neighbouring Parts.

The same Branch which gives out the *Venæ Raninæ*, detaches another to the lateral Parts of the *Septum Palati*, which is distributed to the *Amygdalæ*, and to the Uvula; and sends Branches forward to the Membrane, which lines the Arch of the Palate. Another Branch goes out from it to the *Pterygoidæus Internus*, *Peristaphylini*, and *Cephalo-pharyngæi*.

Afterwards the Trunk of the anterior external Jugular Vein runs up on the *Musculus Triangularis*, where it receives the Name of *Vena Triangularis*, in a winding Course, from the Angle of the lower Jaw to the great or internal Angle of the Orbit, sending Branches on each Side to the Muscles and Integuments.

These Branches communicate with each other, especially one which passes under the *Zygoma*, behind the *Os Male*, to the inferior Orbital or *Spheno-maxillary* Fissure; and another small Branch, which runs along the inferior Portion of the orbital Muscle, to the small or external Angle of the Eye, where it communicates with the Temporal and Frontal Ramifications.

It is here to be observed, that, under the Angle of the lower Jaw, there is a great Variety of Communications between the external and internal jugular Veins; and, also, a great Variety in the Distribution of these Veins.

Almost all the Ramifications, which, at this Place, go from the external jugular Vein, to be distributed on the upper Part of the Throat, and on the Face, in some Subjects, arise, in other Subjects, from the internal Jugular; and, sometimes, one Part of them comes from the external Jugular, the rest from the internal.

The Trunk of the *Vena Angularis*, having reached the Bones of the Nose, sends out a Branch through the lateral Cartilages of the Nose, which is distributed to the *Nares*; and another, which runs down, in a winding Course, to the upper Lip.

At the great, or inner Angle of the Eye, the same Trunk sends off several other Branches; the first of which goes to the Root of the Nose, and communicating with its Fellow, from

the other Side, gives several small Veins to the Holes of the *Osse Nasi*.

The second Branch runs up on the Forehead, by the Name of *Vena Frontalis*, antiently *Præparata*; and is distributed to each Side, communicating with its Fellow, when any such Vein is found.

The third Branch enters the Orbit, in a winding Course, on one Side of the cartilaginous Puddle, and communicates with the Sinuses of the *Dura Mater*, by the orbital Sinus of the Eye.

The fourth Branch goes along the *Musculus Superciliaris*, and the upper Part of the *Orbicularis*, to the small, or external Angle of the Eye, to communicate with the *Vena Temporalis*; and with that Vein which runs along the lower Part of the orbicular Muscle, with which it forms a kind of Circle.

VENA JUGULARIS EXTERNA POSTERIOR, SIVE SUPERIOR.

The posterior, or superior external jugular Vein, runs up toward the parotid Gland, and lower anterior Part of the Eye, giving out several considerable Branches toward each Side.

At its Origin it sends out, posteriorly, a principal Branch, with its Ramifications, to the Muscles which cover the *Scapula*, and Joint of the *Humerus*, commonly called *Vena Muscularis*, and which might be named *Superhumeralis*.

A little higher, it gives off the *Vena Cervicalis*, which goes to the vertebral Muscles of the Neck; this Vein communicates with the *Humeralis*, by several *Aræolæ*, or venous Meshes, and they are both ramified in different manners.

These Ramifications and Communications are, in Part, covered by the *Musculus Trapezius*, and communicate, also, with some Branches of the *Vena Occipitalis*, and with a Branch of the superior intercostal Vein, which perforates the first intercostal Muscle.

Near the cervical Vein, but a little more outward, it gives off, sometimes, the small *Vena Cephalica*, which runs down between the *Pectoralis major* and *Deltoides*, and unites with the *Vena Cephalica* of the Arm.

Backward it detaches the *Vena Occipitalis*, which is distributed on the Occiput, and, sometimes, comes from the *Vena Vertebralis*, or *Axillaris*. It, also, sends out a small Vein, which enters the *Cranium* by the posterior mastoid Hole, and terminates in one of the lateral Sinuses of the *Dura Mater*. This Branch comes, sometimes, from another Vein.

Having reached as far as the parotid Gland, it forms Communications with the anterior external Jugular, under the Angle of the lower Jaw, and then passes through the parotid Gland, between that Angle and the Condyle, giving off a large Branch which communicates with another Branch common to the internal and anterior external Jugulars.

Sometimes there are several Branches, which, having run a very little Way, unite together, and represent the short large Branch, forming *Aræolæ*, or Meshes, through which the Nerves pass.

Afterwards, it passes before the Ear, taking the Name of *Vena Temporalis*, which is distributed to the Temples, and lateral Parts of the Head, towards the Occiput and Forehead. Sometimes the temporal Vein has two Origins, whereof one is from the *Jugularis interna*.

The temporal Vein of one Side communicates above, with its Fellow on the other Side; before, with the *Vena Frontalis*; and behind, with the *Vena Occipitalis*. Opposite to the Ear it gives out a large Branch, one Ramification of which runs under the lower Edge of the *Zygoma*; and, then returning, communicates with another Ramification from the same Jugular, a little below the Condyle of the lower Jaw, forming a kind of Island irregularly round.

Behind this Condyle, it gives Branches to the Temporal Muscle, to the neighbouring Parts of the upper Jaw, and to the Inside of the lower Jaw, almost in the same manner as is done by the Arteries.

Only one of these Branches runs from without inward, between the Condylode and Coronode Apophyses, to be distributed to the *Musculus Temporalis* and *Pterygoidæi*, sending off a Ramification to the Masseter, in its Passage.

VENA JUGULARIS INTERNA.

The internal Jugular Vein is the largest of all those that go to the Head, though not so large as it seems to be when injected.

It runs up behind the *Sterno-mastoideus*, and *Omo-hyoidæus*, which it crosses, along the Sides of the *Vertebra* of the Neck, by the Edge of the *Longus Colli*, to the *Fossula* in the *Foramen Lacerum* of the *Basis Cranii*.

The first Branches which it sends off, are small, and go to the *Thyroide* Glands: About two Fingers-breadth, higher up, it detaches a middle-sized Branch, which runs laterally toward the Larynx, and may be named *Vena Gutturalis*.

This guttural Vein divides, principally, into three Branches, the lowest of which goes to the *Thyroides* Gland, and neighbouring Muscles; the middle Branch to the *Larynx*, and *Musculi Thyroidæ*, and the third runs upward, to the great Communication between the two *Jugulares*. In this, however, there is some Variety, and I have seen the Left guttural Vein go out from the *Axillaris*.

About the same Distance upward, almost opposite to the *Os Hyoides*, the internal Jugular gives another Branch, which sends Ramifications to the Muscles belonging to that Bone, and others, which communicate with the foregoing Branch: This other Branch runs upward toward the Parotid Gland, and Angle of the lower Jaw, where it sends communicating Branches forward and backward, to the two external Jugulars.

It is at this Place, also, that the internal Jugular sometimes produces the *Vena Maxillaris Interna*, and all its Ramifications.

The internal Jugular sends another Branch backward, which is distributed to the *Occiput*, where it communicates with a Branch of the *Vertebralis*, and through the posterior *Mastoide* Hole, with the lateral *Sinus* of the *Dura Mater*: This Communication is sometimes by an *Anastomosis*, with a Branch of the external Jugular, or of the *Cervicalis*, which goes thither.

Afterwards it reaches the *Foramen Lacerum* of the *Basis Cranii*, bending a little, and sending off small Twigs to the *Pharynx*, and neighbouring Muscles.

VENA VERTEBRALIS.

The vertebral Vein arises posteriorly from the *Subclavia*, or *Axillaris*, sometimes by two Stems, sometimes by one, which soon afterwards divides into two.

The first and principal Stem gives out a Branch called *Vena Cervicalis*, which is distributed to the neighbouring Muscles, and afterwards runs up through the Holes of the transverse Apophyses of the *Vertebrae Colli*. This cervical Branch comes sometimes from the *Axillaris*.

The other Stem of the vertebral Vein runs up on the Side of the *Vertebrae*, and, having reached the fourth, or, sometimes, higher, it runs in between the transverse Apophyses of that *Vertebra*, and of the fifth, to join the first or principal Stem.

Thus the vertebral Vein accompanies the Artery of the same Name, sometimes in one Trunk, sometimes in several Stems, through all the Holes of the transverse Apophyses of the *Vertebrae Colli*, all the way to the great *Foramen Occipitale*, communicating with the occipital Veins, and small occipital Sinuses of the *Dura Mater*.

In its Passage it gives off one Branch, which enters by the posterior *condyloide* Hole of the *Os Occipitis*, and communicates with the lateral *Sinus* of the *Dura Mater*; but it is not always to be met with.

As these Veins run through the Holes in the transverse Apophyses, they send Branches forward to the anterior Muscles of the Neck, and to the small interior Muscles of the Head.

Other Branches go, also, outward, and backward, to the *Musculi Transversales*, and *Vertebrales Colli*, and inward to the great Canal of the spinal Marrow, where they form Sinuses, which communicate with those on the other Side.

These vertebral Sinuses are pretty numerous, and placed one above another, all the way to the *Occiput*; the lower communicate with the upper, and at the great Foramen of the *Os Occipitis* there is a Communication between them and the occipital Sinuses of the *Dura Mater*.

VENA AXILLARIS.

The Subclavian Vein, having sent off the Branches already described, goes out of the Thorax, and passes before the anterior Portion of the *Musculus Scalenus*, and between the first Rib and the Clavicle, to the *Axilla*: Through this Course it takes the Name of *Vena Axillaris*, and gives off several Branches, the principal of which are, the *Venæ Musculares*, *Thoracicae*, and *Vena Cephalica*, which is sometimes double.

The first Veins which it sends off, are the *Musculares*, distributed to the middle Portion of the *Musculus Trapezius*, to the *Angularis*, *Infraspinatus* and *Subscapularis*; and as some of these Branches go to the Shoulder exteriorly, others interiorly, the *Venæ Scapulares* are distinguished into external and internal.

A little before the *Axillaris* reaches the *Axilla*, it sends out the *Venæ Thoracicae*, one of which is superior, called, also, *Mammaria Externa*, and the other inferior: It likewise sends Ramifications to the *Musculus Subscapularis*, *Teres major*, *Teres minor*, *Supraspinatus*, *Latissimus Dorsi*, *Serratus major*, *Pectoralis minor*, *Pectoralis major*, and to the Glands of the *Axilla*; and, sometimes, gives a communicating Branch to the *Vena Basilica*.

The *Axillaris*, having reached the Side of the Head of the *Os Humeri*, produces a very considerable Branch, named *Vena Cephalica*; and afterwards runs along the Arm, by the Name of

Vena Basilica, which, however, appears, sometimes, to be rather a Branch, than a Continuation, of the Trunk of the *Axillaris*; in which Case, the *Cephalica* and *Basilica* might be look'd upon as two principal Branches of the axillary Vein.

VENA CEPHALICA.

The cephalic Vein, which is a Branch of the *Axillaris*, at a small Distance from its Origin, joins the small *Cephalica*, which runs down from the *Subclavia*, or *Jugularis externa*, having, till then, run near the Surface of the Body between the *Deltoides* and *Pectoralis major*, and, sometimes, these two Veins communicate before their Union.

The great *Cephalica* runs down between the Tendons of the last-mentioned Muscles, and along the outer Edge of the external Portion of the *Biceps*, communicating several times with the *Vena Basilica*, and sending small Ramifications, on each Side, to the neighbouring Muscles, Fat, and Skin. Some Branches go out from its upper Part, which, lower down, unite again with the Trunk.

A little below the external Condyle of the *Os Humeri* it detaches a Branch backward, which runs up between the *Musculus Brachialis* and the upper Portion of the *Supinator Longus*; and afterwards bends back between the *Os Humeri* and *Anticonæus Externus*, where it communicates with some Branches of the *Basilica*.

Having reached very near the Fold of the Arm, it is divided into two principal Branches, one long, the other short: The long Branch is named *Radialis Externa*, and the short one may be called *Mediana Cephalica*, to distinguish it from another *Mediana*, which is a short Branch of the *Basilica*, and therefore ought to be called *Vena Mediana Basilica*.

The external radial Vein runs along the *Radius* between the Muscles and Integuments, giving off Branches toward both Sides, which communicate with other Branches of the same Vein, and with some from the *Basilica*, forming *Areolæ*, much in the same manner as the *Saphena* does in the lower Extremity.

The *Mediana Cephalica* runs down obliquely toward the middle of the Fold of the Arm, under the Integuments, and over the Tendon of the *Biceps*, where it joins a short Branch of the same Kind from the *Basilica*, which I have already named *Mediana Basilica*. These two *Medianæ* unite in an Angle, the Apex of which is turned downward.

From this angular Union, or *Anastomosis*, a considerable Branch goes out, which runs down on the fore Arm, uniting on one Side with the *Vena Cephalica*, and communicating, on the other, with the *Basilica*, by several irregular *Areolæ*. The Name of *Mediana* is given to this large Branch, as well as to the two other short ones, by the Union of which it is formed; but, that they may not be confounded, this large Branch may be termed *Mediana major*, or *media*, the Names already given to the other two being retained.

From this Union of the two lateral *Medianæ*, and, sometimes, from the Origin of the *Mediana Media*, which is the true *Mediana* of *Riolanus*, a Branch goes out, which runs down on the Inside of the fore Arm, opposite to the interosseous Ligament, and is called *Vena Cubiti Profunda*. It goes to the neighbouring Muscles, and communicates with the other Veins of the fore Arms. The *Mediana Cephalica* sometimes sends down a long Branch, called *Radialis Interna*, which lies almost parallel to the *Radialis Externa*.

Afterwards, the *Cephalica*, having reached the Extremity of the *Radius*, is distributed, by numerous *Areolæ*, almost in the same Course with the radial Artery.

A particular Branch goes out from it, which runs more or less superficially between the Thumb and *Metacarpus*, by the Name of *Cephalica Pollicis*. The *Areolæ* furnish the interosseous Muscles and Integuments, and communicate with a small Branch from the *Basilica*, called, by the Antients, *Salvatella*.

VENA BASILICA.

The Antients termed the basilic Vein of the Right Arm the Vein of the Liver, or *Vena Hepatica Brachii*; and that of the Left Arm the Vein of the Spleen, or *Vena Splenica Brachii*: It has sometimes a double Origin, by a Branch of Communication with the Trunk of the *Axillaris*.

It sends off, first of all, under the Head of the *Os Humeri*, a pretty large Branch, which passes almost transversely round the Neck of that Bone, from within backward, and from behind outward, running up on the *Scapula*, where it is ramified on the *Deltoides*, and communicates with the *Venæ Scapulares externæ*. This Branch may be named *Vena Subhumeralis*, or *Articularis*, as the Artery which lies in the same Place, they both having much the same Course.

This articular Vein sends down two principal Branches, one of which runs along the Inside of the Bone, to which, and to the

V E N

the *Pericæstum*, it gives small Veins: The other turns forward, toward the middle of the Arm, between the Bone and the *Biceps*, and communicates with the *Cephalica*.

Below the Neck of the *Os Humeri*, near the Hollow of the *Axilla*, and behind the Tendon of the *Pectoralis major*, the *Basilica* sends out a considerable Branch, which runs down on the Side of the brachial Artery, and furnishes the neighbouring Muscles on both Sides. This Vein is named *Profunda Brachii*, or *Profunda superior*.

Immediately afterwards, the *Basilica* detaches two or three small Veins, which run down very closely joined to the brachial Artery, surrounding it, at different Distances, by small Twigs, which communicate with each other: These Veins might be named *Venæ Satellites Arteriæ Brachiales*.

These small Veins, which often arise from the *Profunda Superior*, communicate with the *Basilica* and *Cephalica*; and, having reached the Fold of the Arm, they divide like the Artery; and the same Divisions are continued along the whole fore Arm, through all which Space they accompany and surround the arterial Branches, in the manner already said.

Afterwards the *Basilica* continues its Course along the Inside of the *Os Humeri*, between the Muscles and Integuments, forming many Communications with the *Vena Profunda*, *Satellites*, and *Cephalica*, and supplying the Muscles and Integuments.

Having reached the inner Condyle, and having sent off obliquely, in the Fold of the Arm, the *Mediana Basilica*, it runs along the *Ulna*, between the Integuments and Muscles, a little toward the Outside, by the Name of *Cubitalis Externa*, still communicating with the *Profunda*, *Satellites*, and *Cephalica*.

Having detached the *Mediana Basilica*, it sends out another Branch, which runs down along the Inside of the fore Arm near the *Ulna*, and communicates with the *Mediana major*. This Branch may be named *Cubitalis Interna*.

The *Basilica*, having, at length, reached the Extremity of the *Ulna*, sends several Branches to the convex Side of the *Carpus*; one of which, named *Salvatella*, goes to that Side of the little Finger next the Ring Finger, having first communicated with the *Cephalica*, by means of the venal *Areolæ*, conspicuous on the Back of the Hand: In the other Fingers this Vein follows nearly the same Course with the Artery.

In general, the external or superficial Veins of the fore Arm are larger than the internal, but they are accompanied only by small Arteries; whereas the deep Veins accompany large Arteries.

VENA CAVA INFERIOR.

The inferior *Vena Cava*, having run down about a quarter of an Inch from the Right Auricle of the Heart, within the *Pericardium*, as has been already said, pierces that Membrane, and the tendinous Portion of the Diaphragm, which adhere very closely to each other.

At this Place it gives off the *Venæ Diaphragmaticæ*, or *Phrenicæ*, which are distributed to the Diaphragm, and appear principally on its lower Side, one toward the Right Hand, and one toward the Left: The right Vein is more backward, and lower, than the left; the left is distributed partly to the *Pericardium*, and partly to the Diaphragm; and sometimes they send Ramifications to the *Capitulæ Renales*, much in the same manner as the *Arteriæ Phrenicæ*.

The inferior *Cava*, having perforated the Diaphragm, passes through the posterior Part of the great Fissure of the Liver, penetrating a little into the Substance of that *Viscus*, between the great Lobe and the *Lobulus Spigelii*, being, however, covered but very little, on the back Side, by the Substance of the Liver, till it reaches the *Lobulus*.

In its Passage it sends off, commonly, three large Branches, called *Venæ Hepaticæ*, which are ramified in the Liver. Sometimes there are only two, and sometimes four.

Besides these large Branches, it sends out some other small ones, either before, or immediately after, it goes out of the Liver; which, according to some Anatomists, answer to the Branches of the hepatic Artery, as the large Branches do to those of the *Venæ Portæ*.

In the *Fœtus*, as the *Vena Cava* passes by the Liver, it gives off the *Ductus Venosus*, which communicates with the *Sinus* of the *Vena Porta*, and, in Adults, is changed to a flat Ligament.

After its Passage through the Liver, the *Vena Cava* turns from before backward, and from right to left, toward the *Spina Dorsæ*, placing itself on the right Side of the *Aorta*, which it accompanies from thence downward.

Having got as low as the *Arteriæ Renales*, it gives off the Veins of the same Name, termed, formerly, *Venæ Emulgentes*, and which are the largest of all the Veins that go from the *Cava Inferior*, from the Liver to the Bifurcation.

The right renal Vein is the shortest, and runs down a little

V E N

obliquely, because of the Situation of the Kidney: The left Vein, which is the longest, crosses on the fore Side of the Trunk of the *Aorta*, immediately above the superior mesenteric Artery; and both Veins accompany the renal Arteries.

They send up the *Venæ Capitulæ*, which go to the *Glandulæ Renales*; and downward, the *Venæ Adiposæ*, which go to the pinguious Covering of the Kidneys; and, ordinarily, the left renal Vein furnishes the left spermatic Vein: Afterward, they run to the *Sinus*, or Cavity of the Kidneys, in the Substance of which they are distributed, by numerous Ramifications.

A little below the renal Veins, the Trunk of the *Cava* sends out anteriorly, toward the right Side, the right *Vena Spermatica*. The left spermatic Vein comes, commonly, though not always, from the left *Renalis*; both Veins accompany the spermatic Arteries to the Parts to be mentioned hereafter.

In their Passage they send several small Branches, on each Side, to the *Peritonæum* and *Mesentery*; where they seem to be joined, by *Anastomoses*, with the *Venæ Mesaraicæ*, and, consequently, with the *Venæ Portæ*.

They sometimes send a considerable Branch over the iliac Muscle, which, afterwards, dividing into two, one Branch runs up to the *Membrana Adiposa* of the Kidneys, the other runs down on the last-mentioned Muscle.

About the same Height with the spermatic Vein, the inferior *Cava* sends off posteriorly, in some Subjects, a Branch which runs upward, and communicates with the *Vena Azygos*. Sometimes this Branch goes out from one or other of the *Renales*, and appears to be a true Continuation of the Extremity of the *Azygos*.

The *Cava* sends, also, off posteriorly, the *Venæ Lumbares*, which commonly arise in Pairs, in the same manner as the Arteries of the same Name go out from the *Aorta*. These may be divided into superior and inferior Veins.

Their Origins vary in different manners: Sometimes the *Cava* gives off a Branch to each Side below the first *Vertebra* of the Loins, which, like a common Trunk, furnishes the lumbar Veins: This Branch communicates with the *Azygos*.

Sometimes a considerable Branch goes out from the lower Extremity of the *Cava*, near the Bifurcation, principally on the right Side; which, afterwards, running up between the Bodies and transverse *Apophyses* of the *Vertebræ*, detaches the *Venæ Lumbares*, and communicates with the *Azygos*.

Sometimes a like Branch comes from the Beginning of the left *Vena Iliaca*, and, running upon that Side in the same manner, produces the *Lumbares*. This Branch, also, communicates with the *Azygos*, and with the superior or descending *Ramus Lumbaris*.

The *Venæ Lumbares*, on one Side, communicate, by transverse Branches, with those of the other Side, and, also, with each other, by Branches more or less longitudinal. The first and second often go from the *Azygos*, and thereby they communicate with the intercostal Veins.

The lumbar Veins send small Capillaries, in their Passage, to the Substance of the Bodies of the *Vertebræ*; and they are distributed to the Muscles of the Abdomen, *Quadratus Lumborum*, *Psoas*, and *Iliacus*. They send Branches, also, to the neighbouring vertebral Muscles, and to the Canal of the Spine; and communicate with the venous Sinuses, in the same manner as the Intercostals.

The inferior *Cava*, having reached as low as the last *Vertebra* of the Loins, and near the Bifurcation of the *Aorta*, runs in behind the right iliac Artery, and there is divided into two subaltern Trunks, called the right and left iliac Veins.

The Extremity of the Trunk of the *Vena Cava* passes, in some Subjects, behind the Origin of the right iliac Artery; in others, it is the left iliac Vein which passes there, and, consequently, crosses the right iliac Artery: Afterward, the left iliac Vein accompanies the inside of the left Artery, till it goes out of the Abdomen: Therefore the iliac Veins lie on the Insides of the Arteries at this Place.

From this Bifurcation of the *Vena Cava*, and, often, from the Origin of the left *Iliaca*, the *Vena Sacra* goes out, and accompanies the Artery of the same Name in its Distribution to the *Os Sacrum*, to the Nerves which lie there, and to the Membranes which cover both Sides of that Bone.

VENÆ ILIACÆ.

Each original iliac Vein is divided, on the Side of the *Os Sacrum*, much after the same manner as the Arteries, into two large Trunks, or secondary iliac Veins: This second Bifurcation is about a Finger's-breadth below that of the iliac Arteries.

One of these Trunks is named *Vena Iliaca Externa*, or anterior; the other *Interna*, or posterior. The external Vein is, also, named, simply, *Iliaca*; and the internal, *Hypogastrica*. The external Vein seems to be the true Continuation of the Trunk,

Trunk, and the *Hypogastrica* only a Branch. I here speak of adult Bodies; because, in the *Fœtus*, there is a considerable Variation.

These Veins follow nearly the Course and Distribution of the iliac Arteries, except that the hypogastric Vein does not send off the *Vena Umbilicalis*. The external iliac Veins lie more or less on the inside of the Arteries, in the manner already said; but the hypogastric Veins, in the Bottom of the *Pelvis*, lie almost behind the Arteries, on the same Side.

From the common Trunk of the iliac Veins, and, sometimes, from the Origin of the *Iliaca Externa*, a particular Branch goes out, which is distributed to the *Musculus Psoas*, *Iliacus*, and *Quadratus Lumborum*; and, afterwards, sends a Branch on the fore Side of the last transverse *Apophysis* of the Loins, to communicate with the last lumbar Vein.

The external Iliac, a little before it leaves the Abdomen, near the *Ligamentum Fallopii*, lying upon the *Psoas* and iliac Muscles, gives off almost the same Branches with the Artery of the same Name, and follows the same Course: The principal Branches are these:

A little before it goes out of the Abdomen, it sends off, from the Outside, a small Branch, which runs up along the *Crista* of the *Os Ilium*, and gives Branches, on each Side, to the lateral and posterior lower Portions of the *Musculi Abdominis*, and to the *Musculus Iliacus*.

From the inside, before it leaves the Abdomen, it sends off the *Vena Epigastrica*, which, having furnished some small Ramifications to the neighbouring conglobated Glands, runs up along the inside of the *Musculi Recti*, on which it is ramified both ways; as, also, on the broad Muscles of the Abdomen, by other small Branches, which penetrate, from within, outwards.

Afterwards, the *Vena Epigastrica* runs upward, and joins the Ramifications of the *Mammaria*, by an equal Number, accompanying the epigastric Artery; from the inside of the epigastric Vein a Branch is, sometimes, detached to the *Musculus Obturator Internus*, where it joins another Branch, named *Vena Obturatric*.

Before the iliac Vein gets from under the *Ligamentum Fallopii*, it sends several small Ramifications to the neighbouring lymphatic Glands; and, immediately afterwards, losing the Name of *Iliaca*, it takes that of the *Cruralis*.

VENA HYPOGASTRICA.

The hypogastric, or internal iliac Vein, runs behind the Artery of the same Name, making the same kind of Arch, from which the following Branches go out.

From the posterior, or convex Part of the Arch, it gives a Branch to the superior lateral Part of the *Os Sacrum*, which is distributed to the *Musculus Sacer*, or *Transverso-spinalis Lumborum*, and other Muscles thereabouts, and to the Cavity of the Bone, which it enters through the first great Hole.

A little lower, on the same Side, it sends out another, which is distributed much in the same manner with the former, and enters the second Hole.

From the external lateral Part of the same Arch, a little anteriorly, it sends out a large Branch, which runs behind the great sciatic *Sinus*, and is distributed to the *Musculi Glutæi*, *Pyriformis*, and *Gemelli*.

Lower down, the same lateral Part of the hypogastric Vein gives out another large Branch, which, having run a little way, detaches several Ramifications; and, afterward, reaching the *Foramen Ovale* of the *Os Innominatum*, perforates the obturator Muscles, communicates with the crural Vein, and is distributed to the *Musculus Pectineus*, *Triceps*, and neighbouring Parts. This Vein is termed *Obturatrix*, from its passing through the Muscles of that Name.

Among the Branches sent off by the *Vena Obturatric*, before it perforates the Muscles, one is situated exteriorly, which runs toward the sciatic *Sinus* to the *Musculus Iliacus*, the superior Part of the *Obturator Internus*, and to the *Os Ilium*; near its Symphysis with the *Os Ischium*.

Interiorly, the same obturator Vein sends off another Branch, which is distributed to the Ureters, Bladder, and internal Parts of Generation in both Sexes. It communicates with the spermatic Veins, and is more considerable in Women than in Men.

Lastly, The hypogastric Vein runs backward, and goes out of the *Pelvis*, above the Ligament which lies between the inferior lateral Part of the *Os Sacrum*, and Spine of the *Ischium*; and, as it goes out, it is ramified, principally, upward and downward.

It sends a large Branch upward, to the lower Part of the *Os Sacrum*, and two, or more, downward; which, running behind the same Ligament, are distributed to the Buttocks, *Anus*, neighbouring Portion of the *Musculus Pectineus*, and to the external Parts of Generation, nearly in the same manner with the Artery which accompanies them.

The Veins that go to the *Anus*, are termed *Hæmorrhoidales*

Externæ; and they that go to the Parts of Generation, *Pudicæ Internæ*. The external *Hæmorrhoidales* communicate with the internal Veins of the same Name, which come from the small *Vena Mesaraica*, one of the Branches of the *Vena Portæ*, as we shall see hereafter.

VENA CRURALIS.

The crural Vein goes out under the *Ligamentum Fallopii*, on the inside of the crural Artery, and immediately gives small Branches to the inguinal Glands, the *Musculus Pectineus*, and Parts of Generation: These last are named *Pudicæ Externæ*, and evidently communicate with the internal Veins of the same Name.

About an Inch below, where it leaves the Abdomen, the crural Vein produces a large Branch, which runs down anteriorly between the Integuments and the *Sartorius*, following the Direction of that Muscle, almost all the way to the inside of the Thigh.

This Branch, having afterwards got beyond the Condyles of the *Os Femoris*, runs down between the Integuments and inner Angle of the *Tibia*, to the fore Part of the inner Ankle, and is distributed to the Foot: All this large Branch is named *Vena Saphena*, or *Saphena major*.

After the Origin of the *Saphena*, as the Trunk of the crural Vein runs down, it sinks in between the Muscles, and is distributed to all the inner or deep Parts of the lower Extremity, accompanying the crural Artery to the very Extremity of the Foot, being all along more considerable than the Artery, both for Capacity, and Ramifications, a Thing very common in the Veins.

As the *Saphena* is a Vein of very large Extent, I shall here describe it all together, and afterwards return to the *Vena Cruralis*.

VENA SAPHENA.

The *Vena Saphena*, in its Passage from the Inguen to the Foot, is covered only by the Skin and Fat; immediately after its Rise, it gives small Veins to the inferior inguinal Glands; and then it gives out others more anteriorly, which, running under the Integuments, communicate with each other by numerous *Aræolæ*, or Meshes: Sometimes these Communications come all from the Ramifications of one Branch.

The *Saphena*, having run down on the Thigh, as low as the Middle of the *Sartorius*, sends off to the same Side several Branches, which communicate with each other, and with the superior Branches already mentioned; and, as they run down, they communicate again with the Trunk of the *Saphena*.

These two Sorts of Communications furnish a third collateral Kind; from which, also, particular Branches are detached, which communicate with each other at different Distances all the Way to the Knee.

Between these upper and lower Branches, the *Saphena* sends backward a particular Branch, which, after being distributed to the Integuments which cover the *Gracilis internus* and *Triceps*, turns backward; and, a little below the Ham, runs in among the Muscles situated there, and communicates with another Branch, which may be termed *Saphena minor*.

Afterwards the Trunk of the great *Saphena* runs down on the Inside of the *Tibia*, lying always near the Skin; and, at the upper Part of that Bone, it sends Branches forward, outward, and backward.

The anterior Branches go to the Integuments on the upper Part of the Leg; the posterior, to those which cover the *Gastrocnemii*, and communicate with the little *Saphena*; and the external Branches are, also, distributed to the Fat and Integuments; and, having reached as low as the Middle of the *Tibia*, it sends a communicating Branch to the Trunk of the great *Saphena*.

From this Communication, a Branch goes out anteriorly, which runs along the Integuments of the *Tibia* all the Way to the outer Ankle, having in its Passage communicated again with the great *Saphena*.

As the *Saphena* runs down on the Inside of the *Tibia*, it sends out a Branch near the Middle of that Bone, which runs up behind the Tendons of the *Sartorius*, *Gracilis Internus*, and *Semi-nervosus*, then between the *Tibia* and upper End of the *Soleus*, and is joined by an Anastomosis with the Crural Vein.

It, also, detaches to the fore Part of the *Tibia* some Branches irregularly transverse, which, having been distributed to the *Periosteum* and Bone, communicate with other Branches already mentioned.

At the lower Part of the *Tibia*, the *Saphena* produces a considerable Branch, which runs obliquely forward over the Joint of the *Tarsus* toward the outer Ankle, sending off several Ramifications, which communicate with each other, and with the Trunk of the *Saphena*.

Lastly,

VEN

Lastly, the Extremity of this Trunk passes on the fore Side of the inner Ankle, and runs irregularly under the Skin, along the Interstice between the first two metatarsal Bones toward the great Toe, where this Vein terminates.

Having got below the inner Ankle, it sends a Branch outward and forward, which runs under, and, in some measure, accompanies the anterior Tibial Artery. Interiorly it sends another Branch, almost from the same Place, which passes under the Foot, communicating with the external Tibial Vein by irregular Arches, from which Veins are sent to the Toes.

Lastly, before the *Saphena* terminates at the great Toe, it detaches a kind of transverse Arch over the *Metatarsus*, which communicates by several Branches with that Arch which lies on the Joint of the Tarsus, and sends others to the Toes. This Arch gives off, also, another Branch, which runs up behind the outer Ankle, and communicates with the *Vena Tibialis externa*.

CONTINUATION OF THE VENA CRURALIS.

The Crural Vein having sent off the *Saphena*, and the small Branches for the *Pectineus*, as has been said, runs down on the Thigh behind the Crural Artery. Opposite to the little Trochanter, it produces two large short Branches, or one which afterwards divides into two, whereof one is anterior, the other posterior.

The anterior Branch runs more or less transversely forward, to be distributed to the *Vastus Internus*, lower Part of the *Pectineus*, and of the second *Triceps*, and to the other two Muscles of the same Name, running in between them as it goes from one to the other.

The posterior Branch, runs more or less transversely backward, and furnishes the *Glutæi*, *Vastus Externus*, and Beginning of the Biceps.

A little below these two Branches, about the upper Extremity of the *Vastus Internus*, the Crural Vein produces a Branch, which runs down on the Side of the Trunk, covering the Crural Artery, almost as low as the Ham, where it is again united to the Trunk by an Anastomosis; and sometimes it is continued separate a little Way down on the Leg. It has the Name of *Vena Sciatica*, from the Sciatic Nerve which it accompanies.

On the Outside of this Anastomosis, the Crural Vein gives off a Branch, which runs backward between the Biceps and neighbouring Muscles, and so downward on the back Side of the Leg a little exteriorly, and very near the Skin, all the Way to the outer Ankle. This Vein is termed *Saphena minor*, or *externa*.

SAPHENA MINOR.

The little *Saphena*, having got near the Integuments in its Course downward, gives out a Branch, which runs backward, and communicates with the great *Saphena* about the Middle of the back Side of the Thigh.

Immediately above and below the Ham, this Vein sends out other Branches, which, also, communicate with the *Saphena major*; and, having run down about one third Part of the back Side of the Tibia, it sends off another Branch, which is afterwards reunited to the Trunk.

About the Beginning of the *Tendo Achillis*, the little *Saphena* runs outward in the Integuments, toward the outer Ankle, where it terminates in cutaneous Ramifications sent to every Side.

VENA POPLITEA.

The Crural Vein having detached the little *Saphena*, runs down between the Biceps and the other Flexors of the Leg, closely accompanied by the Crural Artery, between which and the inner Condyle of the *Os Femoris* it is situated.

A little above the Ham, it takes the Name of *Vena Poplitea*, and, as it runs down betwixt the two Condyles, it gives Branches to the Flexor Muscles above-mentioned, to the lower and posterior Parts of both *Vasti*, and to the Fat which lies above the Interstice of the two Condyles.

It, also, gives off several other Branches, one of which runs up laterally between the outer Condyle and the Biceps, and then turning forward, is ramified in the same manner with the Artery. Another Branch goes backward, sending Ramifications to the Beginning of the *Gastrocnemii*; after which, it runs down on the back Side of these Muscles, to the *Tendo Achillis*.

Near the internal Condyle, the *Poplitea* sends some lateral Branches to the Extremities of the neighbouring Muscles, especially those of the *Semi-nervosus*, and *Semi-membranosus*. Lastly, it sends a Branch toward the external Condyle, which having run for a small Space on the *Peroneus Longus*, goes back again into the Trunk.

The *Vena Poplitea* runs down immediately behind the Muscle of the same Name, at the lower Part of which it sends

VEN

off several Ramifications to each Side, which divide and unite again in different Ways and Degrees, and afterwards it loses its Name, being divided into three considerable Branches, called *Tibialis anterior*, *Tibialis posterior*, and *Peronea*, of which the *Tibialis posterior* is most frequently a Continuation of the Trunk, and the other two like Branches.

VENA TIBIALIS ANTERIOR.

The anterior Tibial Vein, having distributed some small Branches from its very Beginning, to the Muscles behind the Heads of the two Bones of the Leg, perforates the interosseous Ligament from behind, forward, and runs between the superior Portions of the *Musculus Tibialis Anticus*, and *Extensor Digitorum communis*.

As soon as it pierces the interosseous Ligament, it distributes small superficial Branches to the Head of the Tibia and Fibula, which run to the Joint of the Knee, and communicate with the lateral Branches of the *Vena Poplitea*.

Afterwards it divides into two or three Branches, which run down together on the fore Side of the interosseous Ligament in Company with the anterior Tibial Artery, which they surround at different Distances, by small communicating Circles.

These Branches, having reached the lower Extremity of the Leg, unite in one, which afterwards divides into several, the Ramifications of which are distributed to the Foot.

A particular Branch goes out from the reunited Portion, which at the lower Part of the Leg, perforates the interosseous Ligament from before backward, and communicates with the *Vena Tibialis posterior*.

VENA TIBIALIS POSTERIOR.

The posterior Tibial Vein gives off, from its Beginning, a Branch toward the Inside, which is distributed to the *Gastrocnemii* and *Soleus*. This Vein is named *Suralis*.

Afterward the posterior *Tibialis* runs down between the *Soleus* and *Tibialis posterior*, giving Branches to each of them. It is divided in the same manner as the *Tibialis anterior*, into two or three Branches, which as they run, surround the corresponding Artery, by small communicating Circles formed at different Distances.

It continues this Course in Company with the Artery as low as the outer Ankle, furnishing the *Musculus Tibialis posterior*, and the long Flexors of the Toes. At the lower Part of the Leg, it communicates with a transverse Branch of the *Saphena*, and with the anterior Tibial Vein, in the manner already said.

Lastly, it passes on the Inside of the *Os Calcis*, under the Sole of the Foot, where it forms the *Venæ Plantares*, by dividing into several transverse Arches, which communicate with each other, and with the *Saphena*, and send Ramifications to the Toes, nearly in the same manner as the *Arteria Plantaris*.

VENA PERONÆA.

The *Vena Peronea* is, also, double, and sometimes triple. It runs down on the Inside of the Fibula, almost in the same Direction with the *Arteria Peronea*, which it, also, surrounds at different Distances, by communicating Branches, after the manner of the *Tibialis posterior*.

It runs down as low as the outer Ankle, communicating several times with the *Tibialis posterior*, and sending Ramifications to the neighbouring Portions of the *Musculi Peronei*, and long Flexors of the Toes.

The last of these Communications makes the *Venæ Plantares* in some Subjects, to appear rather to come from this Vein, than from the *Tibialis posterior*, from which they commonly rise.

VENA PORTÆ.

The *Vena Portæ* is a large Vein; the Trunk, which is situated principally between the Eminences on the lower or concave Side of the Liver, called *Portæ* by Anatomists; and from thence this Vein has got the general Name of *Vena Portæ*, or *Vena Portarum*.

It may be considered as made up of two large Veins, joined almost endwise by their Trunks; from each of which, the Branches and Ramifications go out in contrary or opposite Directions. One of these Trunks adheres to the Liver, and is ramified in that Viscus, its Branches accompanying the whole Distribution of the Hepatic Artery.

The other Trunk is without the Liver, and sends its Branches to the Viscera, supplied by the rest of the *Arteria Cœliaca*, and by the two *Mesentericæ*, that is, to the Stomach, Intestines, Pancreas, Spleen, Mesentery, and Omentum.

The first Portion of this Vein may be termed *Vena Portæ Hepatica*, superior, or minor, the Trunk of which is commonly known by the Name of *Sinus Vena Portarum*. The other Portion may be called *Vena Portæ Ventralis*, inferior, or major; and this is what I am now to describe.

V E N

The large Trunk of the *Vena Portæ Inferior*, or *Ventralis*, is situated under the lower or concave Side of the Liver, and joined by an Anastomosis to the Sinus of the *Vena Portæ Hepatica*, between the Middle and Right Extremity of that Sinus, and consequently at a good Distance from the Left Extremity. From thence it runs down a little obliquely from Right to Left, behind or under the Trunk of the *Arteria Hepatica*, bending behind the Beginning of the *Duodenum*, and under the Head of the *Pancreas*, its Length being about five Fingers Breadth.

Having reached to the Head of the *Pancreas*, this Trunk loses the general Name of *Vena Portæ*, and terminates in three large principal Branches, which are distributed by numerous Ramifications to the Viscera already named. The first Branch is termed *Vena Mesaraica*, or *Mesaraica major*; the second, *Splenica*; and the third, *Hæmorrhoidalis interna*, or *Mesaraica minor*.

The *Vena Mesaraica major* appears to be a Continuation of the Trunk of the *Vena Portæ inferior*. The *Splenica* is a capital Branch of that Trunk; and the *Hæmorrhoidalis Interna* has sometimes a common Origin with the *Splenica*, and sometimes is no more than a Branch of that Vein. In some Subjects the *Mesaraica major*, and *Splenica*, appear to arise by an equal Bifurcation of the Trunk of the inferior *Vena Portæ*, and in others, the *Hæmorrhoidalis* arises from the very Angle of that Bifurcation.

The inferior *Vena Portæ*, before the Formation of these three Branches, sends off from the Trunk several small Ramifications, which are commonly the *Vena Cystica*, *Hepatica minor*, *Pylorica*, *Duodenalis*, and sometimes the *Gastrica recta*, and *Coronaria Ventriculi*.

All these small Veins sometimes arise separately; and in other Subjects, some of them go out by small common Trunks. It sometimes happens, that several of them do not come immediately from the Trunk of the *Vena Portæ*, but from one of its great Branches.

The Cystic Veins run along the *Vesicula Fellea* from its Neck to the Bottom; and as they are often no more than two in Number, they are called *Cystica Gemellæ*, a Name given, also, to the Arteries which accompany them. They go out from the Right Side of the great Trunk near its Beginning, sometimes separately, sometimes by a small and very short common Trunk.

The small Hepatic Vein is commonly a Branch of one of the Cysticæ, or of their common Trunk.

The *Vena Pylorica* arises from the great Trunk, almost opposite to the Origin of the *Cystica*, and sometimes is only a Branch of the Right *Gastrica*. It passes over the *Pylorus* to the short Arch of the Stomach, where it is joined by Anastomosis with the *Coronaria Ventriculi*.

The Duodenal Vein, commonly called *Vena Intestinalis*, goes out from the great Trunk near the *Cystica*, and sometimes from the small common Trunk of these Veins. It is distributed principally to the *Intestinum Duodenum*, and sends, also, some Ramifications to the *Pancreas*. There is another Vein called, also, *Duodenalis*, which is a Branch of the *Gastrica* of the same Side.

The *Vena Gastrica*, or *Gastro-epiploica Dextra*, and the *Coronaria Ventriculi*, come more seldom from the Trunk of the *Vena Portæ*, than from its great Branches, with which I therefore choose to describe them.

V E N A M E S A R A I C A M A J O R .

The inferior *Vena Portæ*, having given off the *Splenica*, changes its Name to that of *Mesaraica*, or *Mesaraica major*, which often appears to be rather a Continuation of the Trunk, than one of the great Branches.

It bends towards the superior Mesenteric Artery, sending off two Veins; and, afterwards running up over that Artery, it accompanies it in those Portions of the Mesentery and Mesocolon, which belong to the small Intestines, the *Cæcum*, and Right Portion of the Colon. As it runs down, it forms an oblique Arch, almost like that of the Artery, which is, also, ramified on both the convex and concave Sides, but not so regularly.

The first particular Branch from this Trunk is called by *Riolanus*, *Vena Colica*. It goes out from the anterior Part of the Trunk, before it joins the Artery, and runs directly to the Middle of the Colon, where it divides to the Right and Left, and forms Arches. On the Left-hand it communicates with the superior or ascending Branch of the *Hæmorrhoidalis*; and, on the Right, with the second Branch of the *Mesaraica*.

This second Branch is a little under the first, or *Colica anterior*, and something more toward the Right-hand. It may be named *Gastro-colica*, and is soon divided into two Branches, one superior, the other inferior.

The superior Branch of the *Vena Gastro-colica*, sends small Veins to the Head of the *Pancreas*, and forms the *Vena Gastrica*, or *Gastro-epiploica dextra*, which goes from the *Pylorus*

V E N

to the great Curvature of the Stomach, and communicates with the *Gastrica Sinistra*. In its Passage it supplies the Stomach and Omentum, and communicates with the *Pylorica*, *Coronaria Ventriculi*, &c. and sometimes it forms the *Pylorica*.

The inferior Branch of the *Vena Gastro-colica*, which may be called *Colica dextra*, goes to the Right Portion of the Colon; and from thence to the upper Part of that Intestine, where it is divided archwise, and communicates with the Right Branch of the *Colica anterior*, and with a Branch of the *Vena Cæcalis*, as we shall see hereafter.

The Trunk of the great Mesaraic Vein sends out sometimes, opposite to the *Gastrica*, a particular Branch to the Omentum, called *Epiploica dextra*. But almost immediately before it ascends over the Mesenteric Artery, it produces two large Branches very near each other, which pass behind and under the Artery, being distributed to the *Jejunum*, and Part of the *Ileum*, by numerous Ramifications, which form Arches and Areolæ like those of the Artery.

Afterwards the Trunk of the *Mesaraica* passes over the superior Mesenteric Artery, to which it adheres very closely, and from the convex Side of its Arch sends out several Branches almost in the same manner with the Artery; but with this Difference, that oftentimes the Branches do not arise immediately from the Vein in so great Numbers; and each of them sends out many more Ramifications.

From the concave Side of the Mesaraic Vein, a little below the Origin of the second Branch from the convex Side, arises a Branch called by *Riolanus*, *Vena Cæcalis*, which runs to the Beginning of the Colon, crossing one of the Branches of the superior Mesenteric Artery.

This Cæcal Vein divides by two Arches, the uppermost of which communicates with the lower Branch of the *Vena Gastro-colica*; the other, after having sent Ramifications to the *Intestinum Cæcum*, and *Appendicula Vermiformis*, communicates below, with the Extremity of the great Mesaraic Vein.

V E N A S P L E N I C A .

The Splenic Vein is one of the three great Branches of the *Vena Portæ*, and may be said, in some measure, to be a subordinate Trunk of that Vein. It runs transversely from the Right to the Left, first under the Duodenum, and then along the lower Side of the *Pancreas*, near the posterior Edge.

In this Course it gives off several Veins, viz. the *Vena Coronaria*, *Ventriculi*, *Pancreatica*, *Gastrica*, or *Gastro-epiploica Sinistra*, and *Epiploica Sinistra*. It, also, often gives Origin to the *Hæmorrhoidalis Interna*, the third capital Branch of the *Vena Portæ*.

It terminates afterwards by a winding Course, being divided into several Branches that go to the Spleen; one of which produces the small Veins, called by the Antients *Vasa Brevia*.

The *Coronaria Ventriculi*, so called, because it surrounds, more or less, the upper Orifice of the Stomach, runs along the small Arch of that Viscus toward the *Pylorus*, where it joins and becomes continuous with the *Vena Pylorica*. In its Passage it gives several Ramifications to the Sides of the Stomach, which there form numerous Arcolæ, and communicate with the Veins of the great Arch.

It arises pretty often from the Beginning of the *Splenica*, and sometimes from the Left Side of the Extremity of the great Trunk of the *Vena Portæ*, behind the Hepatic Artery; and, in that case, it is the most considerable of all the small Veins that go out from the great Trunk.

The *Vena Pancreatica* are several small Branches sent by the *Splenica* to the *Pancreas*, along its lower Side. There are other small Pancreatic Veins, which do not arise from the *Splenica*, as has been said in the Description of the *Gastro-colica*, one of the Branches of the great Mesaraic Trunk.

The Left Gastric, or *Gastro-epiploic* Vein, goes out from the *Splenica* at the Left Extremity of the *Pancreas*; from whence it runs to the great Extremity of the Stomach, and along the great Arch, till it meets the *Gastrica dextra*, which is continuous with the *Sinistra*.

In its Passage, it gives several Branches to both Sides of the Stomach, which are distributed by numerous Ramifications, form many Areolæ; and communicate with the Branches of the *Coronaria Ventriculi*.

At a small Distance from its Origin, this Gastric Vein sends out a Branch, which is distributed to the Omentum; and on this Account it has been called *Gastro-epiploica*. This Branch seems to communicate with the *Hæmorrhoidalis interna*.

The *Vena Epiploica Sinistra* arises at the small Extremity of the *Pancreas*, and is ramified on the Omentum all the Way to the Colon, where it communicates with the *Hæmorrhoidalis interna*. When this Vein is wanting, the Branch of the Left *Gastrica* supplies its Place. It sometimes comes from the most anterior Branch, which the *Splenica* sends to the Spleen.

Lastly,

VEN

Lastly, The *Vena Splenica* reaches the Fissure of the Spleen, which it enters, through its whole Length, by several Branches, almost in the same manner as the splenic Artery. It is from the most posterior of these Branches that the Veins are sent off to the great Extremity of the Stomach, formerly known by the Name of *Vasa Brevia*, which communicate with the *Coronaria Ventriculi* and *Gastrica Sinistra*.

VENA HÆMORRHOIDALIS INTERNA, SIVE MESARAICA MINOR.

The internal hæmorrhoidal Vein is one of the three great Branches of the *Vena Portæ*, coming ordinarily from the Beginning of the *Vena Splenica*, and sometimes from the Extremity or Angle of the Bifurcation of the great Trunk of the *Vena Portæ*.

At a small Distance from its Beginning, it gives to the *Duodenum* a second *Vena Duodenalis*, which is sometimes more considerable than the first, or that which comes from the great Trunk of the *Vena Portæ*.

Afterwards it is divided into two Branches, one superior, or ascending; the other inferior, or descending: The first runs to the upper Part of the Arch of the Colon, where, after many Ramifications, it communicates with a Branch of the great *Mesaraica*, with the Ramifications of the *Gastro-epiploica sinistra*, and with those of the neighbouring *Epiploica*.

The inferior Branch runs down on the left Portion of the Colon, on the lower Incurvations of that Intestine, and on the *Rectum*, all the way to the *Anus*. In this Course it supplies the *Mesocolon*, and forms Arches, which send out numerous small Ramifications, which surround these Intestines: It seems, also, to communicate, by some capillary Twigs, with the left spermatic Vein.

This Vein has been named *Hæmorrhoidalis*, from the Tumors often found at its Extremity next the *Anus*, which are called *Hæmorrhoides*. The Word *Interna* is added to distinguish this Vein, from the *Hæmorrhoidalis externa*, which comes from the *Vena Hypogastrica*, and with which this Vein communicates by capillary Ramifications. The Name of *Mesaraica minor* agrees to it very well, because of its Situation, with respect to the inferior mesenteric Artery, which is, also, less than the superior.

Winflow.
VENA MEDINENSIS. See DRACUNCULI.

VENÆ SECTIO. See PHLEBOTOMIA.

VENATIO. Hunting. This, considered as an Exercise, is, perhaps, the best that can possibly be contrived, for strengthening the general Habit, and procuring Health and Vigor. The Season of the Year, the Time of the Day destined for this Amusement, and the Motion necessary on this Occasion, are all admirably adapted to the Restoration and long Continuance of Health: It is, besides, of no small Importance, to have the Mind recreated, at the time the Body is exercised; for this admirably assists the due Circulation of the Fluids through the minute Canals destined for their Conveyance: And, I believe, there are few People not utterly abandoned to Idleness and Debauchery, of some Kind or other, who do not perceive a spontaneous Flow of Spirits, when they ride on Horseback at or about the rising of the Sun, when they respire the purest Air, when Variety of perpetually changing Scenes present themselves, and when the Mind is agreeably agitated concerning the Event of the Chase.

— *Vocat ingenti Clamore Cithæron,
Taygetique Canes, Domitrixque Epidaurus Equorum,
Et Vox Assensu Nemorum ingeminata remugit.* Virgil.

I am sensible, that, by saying thus much in favour of Hunting, I may, possibly, expose myself to the Ridicule of those who esteem it meritorious to laugh at every thing laudable and manly. But I presume I may, without Offence, remind these, that it is more prudent to make use of the most delightful Means of preserving entire, the vital, animal, and, in consequence of this, even the intellectual Faculties, than to undermine the Pillars of Health, by Indolence, Taverns, Brothels, and Physic.

VENEN Sinensium. Martin. Atl. Sinens. *Lusitanis Jambos*.

This is a thorny Tree, bigger than the Lemon-tree, and which bears white Flowers, of a very pleasant Smell. The Fruit is as big as a Man's Head, with a Rind like that of a Quince, and a reddish Pulp, which has the Taste of Grapes before they are quite ripe. This Fruit, hung up in a House, or under Covert, will keep good for a Year.

The Tree grows in the Province of *Fokien* in *China*. They extract a very fragrant Water from the Flowers, and from the expressed Juice of the Fruit they prepare a Liquor which serves them for Drink. *Raii Hist. Plant.*

VENENUM. Poison.

Quick Poisons, when, by Ingestion, or Application, they become the Causes of Diseases, either through their own proper Force, or by first inducing a Corruption of the infected Parts,

VEN

indicate, 1. A Removal of the *poisonous Cause*. 2. A Correction of the *Poison* already received, or unavoidably to be received. Or, 3. An Expulsion of it from the Body. 4. A Mitigation of the Symptoms. And, 5. A fortifying of the Body against the Force of any future Ingestion, or Application of the *Poison*.

The Cause which propagates the *Poison*, and communicates it to the Body, or which mixes its *Miasmata* (contagious Taint) with the Atmosphere, or conveys them, when applied to the Body, within the same, if sensible, and known, is easily removed,

1. By taking out of the way the poisonous Matter, either, (a) First, by Combustion, in kindling large and clear Fires; or (b) by correcting the Air, the Vehicle of those *Miasmata*, which is generally best effected by the thick Vapours that proceed from the kindling or heating of such Things as have a Virtue opposite to the known *Poison*. Thus, for Instance, in the Pestilence, against the caustic, alkaline, and putrid Exhalations, proper Remedies are, Fumes of Vinegar, Spirit of Salt, and Gunpowder; against *poisonous acid* Exhalations, the dispersed Odours of oleous alkaline Spirits are a good Preservative. Another way (γ) is, by altering, dissipating, renewing the Air by a Wind procured by Art, especially if such Wind could, at the same time, by the Method of *Hippocrates*, be transmitted through great Fires, kindled up for the Purpose. The last Means (δ), to be mentioned under this Head, is, by flying the Contagion, or removing our Habitation to the other Side of some high Mountain.

2. The Cause is removed by expelling or correcting the *poisonous Matter*, which, either by Ingestion, or Application, infects the Body.

The *Poison* itself, when known to be present, is corrected by the Application of such Things as render unactive those Qualities by which it injures the Body.

These Qualities, (1.) in many *Poisons*, are scarce hitherto known, but only by their deleterious Faculty, which hardly discovers itself but by the Death of the infected Subject. The same noxious Qualities, (2.) in other *Poisons*, manifest themselves by their surprising, and hardly explicable Effects; (3.) in some *Poisons* by Effects which occur in other known Diseases; and (4.) in some others these Qualities are understood *a priori*, as they call it, being very easily foreseen from a Knowledge of the Nature of the *Poison*.

The first Sort of these *Poisons* just mentioned, and which are said to be *hurtful to the whole Substance*, indicate such Remedies as are exactly opposite to them, and as little understood, with regard to the Reason of their Effects, as the *Poisons* themselves: These Remedies go by the Names of *Antidota*, *Antidoti*, *Alexicaca*, *Alexipharmaca*, and *Theriaca*; and being known only by Experience, are to be learnt from the Accounts of *Poisons*.

The second Kind of *Poisons*, which are said to be pernicious from an occult Quality, require Remedies, equally unaccountable, called *Specifics*, scarce to be found, unless by mere Chance: The best Account we have of these Medicines, also, is to be met with in the History of particular *Poisons*.

The third Sort of *Poisons*, which, before they kill, produce such morbid Effects as corrupt the Fabric of the Body after the manner of some known Diseases, require such Remedies as are observed to be effectual for the Cure of such Diseases as distinguish themselves by the like Effects.

Poisons of the fourth Kind, which are known as applied, or to be applied to the Body, necessarily require such Medicines as are of present and ready Efficacy in subduing the known Malignity: Those Medicines, for the most part, owe their Virtue to an opposite Malignity, which would render them quite pernicious to the Body, if it were not for the *Poison* before received.

Hence we see, that the Nature and Properties of *Poisons* are learnt from natural and medicinal History, in Conjunction with the Knowledge of Mechanics and Chymistry, not omitting Anatomy, which represents to our View the Effects of *Poisons*. From the Knowledge acquir'd by these Studies, are we furnish'd with Indications, in such Cases.

From these Indications, thus supplied, we come to know the Matter, Preparation, Dose, Application, and Management, of the Corrective.

Primary, and almost general, or universal Antidotes, against all Sorts of *Poisons*, and, for that Reason, highly useful, where it is known that *Poison* is given, but not what particular *Poison* are, principally, pure Water, a very little hotter than our Blood in its healthy State, plentifully, speedily, and for a good while together, received by the Mouth, injected in Clysters, and properly applied; a mild Lixivium, composed of common Water, and *Venice Soap*, used in the same Manner, Quantity, and Time, with the Water before-mentioned; or pure Water, rendered sapogaceous with Oxymel, and used as before; mild, recent Oils, expressed

expressed from smooth, fat, and farinaceous Seeds, speedily, copiously, for a long time together, swallowed, injected, applied; or the Oils of fresh-kill'd Animals, boil'd with all the Speed possible, in Plenty of Water, and used in like manner; Vinegar, also, which is of general Use in many sudden Cases; and, in the last Place, Opium. As for an universal Prophylactic, or Preservative, against all Sorts of *Poisons*, none has been hitherto discovered; and it is even inconsistent with the Nature of Things.

In exhibiting a special, or singular Antidote, the highest Prudence is requir'd: For since every particular Antidote is endow'd with a peculiar Virtue of correcting this or that *Poison* only, they have, for the most part, as much Violence, or rather more, than the Thing they are to subdue: When these two Things, therefore, the *Poison* and the Antidote, enter into Conflict within the Body, they destroy one another, and, being render'd unactive, cannot do much Mischief; but if Antidotes are found alone, or in a separate State from the Matter on which they are to act, they often prove equally noxious with the *Poisons* against which they are exhibited.

All these Antidotes, whether universal or singular, may and ought to be prepared, applied, and directed, in such a manner, that they may be enabled, speedily, constantly, and without Diminution of Strength, to make their way to the Places where the *Poison* is lodged, and there subdue it. The Physician, therefore, ought, on all Occasions, to have ready present to his Mind a general List, comprehending all the Diversities of Applications, of which the primary are, Suffumigations of the Air, dry or moist Vapours for the Lungs, Potions, Clysters, Epi-thems, Baths, Fomentations, Injections for the Uterus, Bladder, Fauces, and other Parts.

Poison received is expelled out of the Body, 1. By diminishing the Resistance at the Place by which it may, with most Safety, be discharged, where it does least Mischief, where it is nearest to an Outlet, where it is least hurtful to the vital *Viscera*; for then it will, either by the vital Forces, or the Strength of the Medicines, be propelled to the Place required, and thence be discharged. This, in former Times, was effected by what was then esteemed very strange, and unaccountable; but is now, through the Industry of M. Redi, easily understood, the Suction of the *Marfi* and *Psylli* (two Nations famous for extracting *Poisons* by Suction with the Mouth); but is now performed by means of large and strong Cupping-glasses, applied with much Flame, and often renewed; by warm, and highly-emollient Fomentations; by Leeches, Scarifications, Frictions, Heatings, Plaisters. 2. By magnetic Attraction, in which a certain Substance attracts *Poison* by a singular Virtue, and relieves the Patient; as we find it recorded of the Flesh of the venomous Beast, the Stone of the Ceraustes, and of other Serpents, and the like. 3. By such Medicines as are very potent Diluents and Movers: Of this Nature are quick Emetics, and Cathartics, very strong Sudorifics, and, perhaps, diuretic Diluents. Hence, *Diascordium*, *Mithridate*, *Theriaca*, *Orvietan*, and *Opiates*, are of Service, though not entirely to be depended on, either as universal Therapeutics, or Prophylactics. 4. By a Separation of the affected Part, with as much Speed as possible, to prevent the Spreading of the Infection; and this is best effected by a Cautey of a hot Iron.

Those severe Symptoms, which are the sensible Effects of *Poisons*, are, according to the Doctrine of Pathology, easily enough reduced under proper Classes, and, in that Case, may be cured, as if they were each of them some single Disease.

The Body is fortified against the Application of *Poisons*, 1. By a free Use of Antidotes universal and singular, which may sometimes be safe, when the Nature of the *Poison*, against which they are given as Preservatives, is foreknown. 2. By anointing the Part of the Body which is exposed, with oleous Lenitives. 3. By preserving all the Parts of the Body in equal Perpiration. But, as yet, we are acquainted with no universal Prophylactic, as we observed before, tho' there are several extolled as such.

What has been spoken, hitherto, of *Poisons*, is applicable, also, to the Pestilence, and other contagious Disorders; and may, probably, be best understood from the following, perhaps, not ill-composed Synopsis of *Poisons* and Antidotes.

First, then, some *Poisons* are manifestly to be reduced under Acrids, but such as have a peculiar Acrimony, which is phlogistic, caustic, effective of a Gangrene, and septic: The chief of these are, Cobalt, yellow and red Arsenic, white Arsenic Sublimate, Realgar, *Lapis Armenus*, *Lapis Lazuli*: These, by Application, either internal or external, inflame, corrode, excite Pains, burning Heats, Drynesses, first, in the Parts first injur'd; and, soon after, in the whole Body. Hence, they create very acute inflammatory Disorders in the Mouth, Fauces, Oesophagus, Stomach, and Intestines; excite Nausea, Vomiting, Dysentery, Cholera Morbus, and the Ileus; and produce a Paleness, and Lividness; whence proceed Vertigos, Convul-

sions, and Death; or, if this be escaped, a Wanness of Colour, Palsies, and Contractions. Remedies, here indicated, are, warm, acidish, honey'd Water, most speedily, copiously, and for a long time used, in Potions, Clysters, and Baths. If the *Poison* can be expelled by Stool and Vomiting, it is so much the better, and the Remedy is to be the oftener repeated. Fat Broths, Milk, Oil, oleous Substances, Butter, are of Service here; and, after that, we must, for a long time, employ relaxing, soft, fat, acidulated Substances, both by Ingestion, and in Baths.

Among Vegetables of this Quality, the principal are, *Aconitum*, *Anacardium*, *Anemone*, *Apium Rissus*, (the Herb which excites the *Rifus Sardonicus*) *Apocynum*, *Arum*, *Azedarach*, *Cataputia*, *Chamaelaea triccocos*, *Chamaeleon niger*, *Clematidis*, *Colchicum*, *Corona Imperialis*, *Cyclamen*, *Dracontium*, *Elatarium*, *Esula*, *Euphorbium*, *Flos Africanus*, *Grana Nubia*, *Helleborus albus*, *niger*, *viridis*, *Hermodactyli*, *Hyacinthi*, *Laureola*, *Mezeræum*, *Mel venenatum*, *Napellus*, *Nigella Sylvestris*, *Oleander*, *Ranunculi*, *Ricinus*, *Scammonium*, oleous Seeds by long Corruption become acrimoniously rancid, *Tithymali*, *Thapsia*: The Effects of these Simples are like those of the Substances before-mentioned, and the Indications are exactly the same.

There are, 2. Other violent and acrimonious *Poisons*, but which are, at the same time, of a sort of viscid Quality, by which they stick in the Stomach, and thence affect the Brain and Nerves after a singular manner. Of this Kind are, the *Chrysomela*, the *Cicuta major*, the *Cicuta minor*, *Petroselinum similis*, the *Cicuta aquatica*, *Gesneri*, *Crocus*, *Datura*, *Hyoscyamus*, *Nux Vomica*, *Oenanthe Apii Folio Succo viroso*, *Opium*, *Solanum*, *Melanocerasos*. The Effects of these are, Vertigo, *Scotomia*, *Delirium*, Madness, Nausea, Vomiting, Dysentery, terrible Convulsions, Apoplexy, and Death. The Indications here are, the most speedy Exhibition of a very quick Emetic, an immediate Ingestion of vast Quantities of aqueous, oleous, honey'd, acidulated Liquors, by Potion, Clysters, Baths, and continually repeated. The Disorder being mitigated, and repressed, Sweating is strongly to be provoked by theriacal Medicines, and the same is to be frequently repeated; and this must be followed by a soft and thin Diet.

In the third Place (3.) There are acrid *Poisons*, which have a manifest Acidity; for Instance, (a) Spirit of Salt, Spirit of Nitre, Aqua-regia, Aqua-fortis, Spirit of Sulphur, Spirit of Vitriol. (b) The same Acids, united with metallic Bodies, and by that means extremely powerful, as are, for Example, a Solution of Gold, and of its Crystal; a Solution of Silver, its Vitriol, and Lapis Infernalis; a Solution of Copper, and the Salt thence proceeding; a Solution of Quicksilver in Spirit of Nitre, in Spirit of Salt, in Aqua-fortis, in Aqua-regia, or its Calcination with Oil of Vitriol, red, white, green Precipitate, corrosive and sweet Sublimate, Calx, Turpeth; an Impregnation of Antimony with Aqua-regia, and the escharotic Calx hence produced: These Kinds of *Poisons* produce abominable Tastes in the Mouth, acid Fetors, Inflammations, gangrenous Eschars, Nausea, Vomiting, Dysentery, Cholera Morbus, most severe Gripes, Cardialgia, Ileus, Colic, Tumors of the Glands, a cadaverous Smell, Salivation, Syncope, and Death. In these Cases are required Dilutions by aqueous Liquors; Obtundents, as Oils; Alteratives, as saponaceous or highly alkaline Lixivia; the strongest Absorbents of Acids; and, lastly, when the Violence of the Disorder is abated, the frequent Use of Oil, fat Broth, and the like Emulsions.

Fourthly, (4.) There are *Poisons* manifestly acrid, which are known to be alkaline: Such are the Ashes of burnt Vegetables; the Alkali thence produced; the same render'd igneous with the Calx of burnt Stone; Eggs, Humours, Flesh quite putrefy'd; the Salts thence separated; the same render'd igneous by Sublimation with a fixed Alkali, Lime, Lapis Calaminaris, Chalk, Iron, and the like. The Symptoms proceeding from those *Poisons*, are, a very quick, violent, and igneous Inflammation, Erosion, Gangrene, very burning Pains in all Parts, unquenchable Thirst, Convulsions, very high Fevers, a cadaverous Smell, an intimate Dissolution of the Humours, a Putrefaction of the same, and of the Viscera, and, lastly, Death. The Cure is effected by aqueous relaxing Diluents, oleous Obtundents, pinguious and earthy Substances, by Inversion, or Alteration, by means of diluted, volatile, and easily moveable Acids. After these the Diet must for a long time consist of acidulous, oleous, and emollient Foods.

Some *Poisons* there are, (5.) Which are frequently mortal, by their singular Acrimony; yet so as that this Acrimony shall scarce manifest itself otherwise than by its deleterious Effects on the human Body: Such are Copper, burnt Calx of Copper, Calx of Copper by Corrosives, *Flos Aëris*, *Squama Aëris*, *Crocus* of Antimony, Calx of the same prepared by burning, and the Glass made of it; the pure Flower of Antimony, prepared by Fire alone, or by the Help of Sal Ammoniac, and

VEN

and then washed. By these Kinds of Poisons are excited a Nausea, Vomiting, Dysentery, Cholera Morbus, excessive Purgation, severe Pains in the Viscera, Spasms, Tetanus, Syncope, dreadful Anxiety, and Death. The Cure is performed by an immediate Ingestion of Diluents, Emollients, Obtundents, Acids, and honied Substances, above, and below, and the same externally applied; and the Use of them continued in this manner for a long time together: After these, Opiates and oleous Substances are of Service.

Among acrid Poisons may be reckoned (6.) Those which are merely mechanical, as the Diamond, Mountain Crystal, Filings of Iron, Filings of Brass, feathered Alum, pounded Glass, and the like. These prick the Nerves, and wound the Vessels, and, by so doing, excite Convulsions and Hæmorrhages, whence proceed Ulcers, and the like Mischiefs. In these Cases the Indication is a speedy and copious Use of Oil and Butter.

In the seventh Place (7.) There are Poisons which kill in a quick or slow manner, by Constriction, Incrustation, Obstruction, or Exsiccation: Of this Nature are, perhaps, Quicklime, and Lime slak'd; also, Gypsum, Lead in the Ore, the Filings, Scales, Calx, Glass, of the same; White-lead, Red-lead, Litharge, the Ashes of burnt Tin, Earth of Sinope, the Seed of Psyllium, the Sponge of the Cynosbatus, Funguses, Agaric, Mistleto: These Substances conglutinate, and cause a Constriction and Strangulation; by which means they excite terrible Disorders, which, after long and miserable Languishing, terminate in Death. Remedies here indicated as necessary, are Emetics, Cathartics, Diluents, spirituous Acids, spirituous oily Alcalis, with all manner of saponaceous Things, to be immediately, and for a long Time, used.

Eighthly, (8.) There are some Poisons of an heteroclite Sort, directly destructive of all the vital Functions, whose Efficacies and Effects have not as yet been well explained; these prove mortal, whether inwardly taken, or outwardly applied, or by a Stroke inflicted. Under this Class are to be reduced Cantharides, the Spider, Tarantula, Asp, Viper, Cerastes, Prestes, Seeps, Scorpion, mad Dog, Toad, Buprestis, Stellio or Lizard, Salamander, Lepus Marinus, Passinaca Marina, and the like: The Poisons of these Animals produce various, surprising, and scarce explicable Effects, which end at last in Death. Indications on this Head are, if the Poison be taken inwardly, to evacuate the same immediately by Vomiting; to dilute it, in an extraordinary measure, by aqueous Ingestions; to mollify it, in an high degree, by relaxing, emollient, and oleous Remedies; and to resist the Putrefaction by spirituous and saline Acids. If the Poisons are communicated by external Stroke, Bite, or Application, Extraction of the same is indicated at the Place affected by means of Suction, Scarification, Cauterizing, Mollifying, Fomenting; also, Sweat is to be powerfully provoked by penetrating diluent Antidotes, which resist Putrefaction; and the Force of the Venom is to be weaken'd by acid saline Medicines, or by specific Antidotes.

In the last Place (9.) There are Substances which suffocate in a Moment under the Form of an Exhalation. Such are, the confined Vapour of Coals, subterraneous Air long confined, Exhalations of Wine under Fermentation, the volatile Farina of a poisonous Fungus, the Fume of Sulphur, and many others of the like Nature, which are best passed over in Silence. These Poisons appear, from what has been said, to apply themselves to the Lungs or Nerves, and will scarce admit of a Cure.

The more remote Causes of Diseases, which come under the Cognisance of the Senses, are easily altered or removed; for they indicate a Change in the Non-naturals.

But if these Causes are less manifest, yet, as they discover themselves by their sensible Effects, they indicate, by these very Phenomena, proper Remedies.

The Course of those Phenomena carefully observed, directs us to the Use of proper Means, Seasons, Order, Manner, and Way, either for the Correction or Expulsion of the proximate Cause of the Disease in the human Body.

The accurate Observation of the same Phenomena teaches us what is wanting, and what Supplements are necessary.

As, also, what Motions are to be excited, continued, suppressed, diminished, with a View to the same End.

An orderly, therefore, and exact Knowledge of Effects in such Cases, directs us in the best manner how to correct or remove the Cause.

Hence we, also, learn, that there are but two Ways as yet known, by which we arrive at the Knowledge of the Cause, and these are what we call the *methodic*, and the *specific*.

The *methodic* Way, in order to attain to the Knowledge of the proximate Cause, that the same may be removed, makes Use of the following Means and Assistances. First, (1.) It is very careful and exact in examining and digesting into Order the Phenomenon before-mentioned, and attentive in observing the Course of Nature. Secondly, (2.) If it observes a Failure of the vital Powers, under the Operation of such Remedies as

VEN

are required for subduing of the Disease, it comes in to their Relief, by the Administration of Cardiacs, or by a Removal of the Impediments which obstruct the Operation of the Medicines designed to evacuate the morbid Matter. But, in the third Place, (3.) When it observes the vital Actions too much exalted; and by that means more likely to perplex Matters, and intangle rather than disengage the Cause of the Disease, it has recourse to moderating means, till their Impetus is restrained; and their Forces reduced within the Bounds required. This Intention is answered by aqueous Diluents, gentle Relaxants, soft glutinous Remedies, such as evacuate the material Cause of the immoderate Exaltation, Opiates, Anodynes. And, lastly, (4.) By neither doing nor changing any thing but what appears necessary from the clearest Indications.

The *specific* Way, as it is called, removes the Cause of the Disease, by a simple Application of something which is known to be effectual for the Purpose, merely by Use, without attending to the four methodical means just mentioned. In this Case you have only to inquire the Name of the Disease, and then administer the *Specific*. Thus it is, for Example, in the Cure of an intermittent Fever by the *Peruvian Bark*, of Pain by Opium, and of every particular Poison, by its known, particular, proper, corrective, attractive, or expulsive Antidote. *Boerhaav. Institut. Med.*

VENER. Mercury. *Rulandus.*

VENEREA LUES. See LUES VENEREA.

VENERIS OESTRUM. See CLITORIS.

VENETICUS, *Venetus*, ἐνέτιος. An Epithet importing a glaucous or faint Sky-colour. Hence *Oculi Veneti* are Eyes affected with a Cataract. *Castellus.*

VENOSA ARTERIA. The same as VENA PULMONALIS. See PULMO.

VENTER, *κοιλία*, is taken in several Senses. With the more modern Anatomists it signifies, in the most extensive Acceptation, a remarkable Cavity, in which any one of the principal Viscera is contained. In this respect the whole Body is divided into three Ventes, the lowermost, commonly call'd the *Abdomen*; the middle *Venter*, call'd the *Thorax*; and the highest, or the Cavity of the Head. *Hippocrates* sometimes uses the Word *κοιλία*, in a more restrained Sense, for the *Abdomen*, and the Cavity of the *Thorax*; and, sometimes, by way of Distinction, he calls the latter ἡ ἄνω κοιλία, the upper *Venter*; and the *Abdomen* ἡ κάτω κοιλία, the lower *Venter*. See 7 *Aph.* 38. with *Galen*, 1 *Com.* and *Lib. 1. de Morb.* But the Term *Venter*, *κοιλία*, is most frequently to be understood, in a still stricter Sense, for the *Abdomen*, or Region between the Diaphragm and Pudenda. Instances of this are needless, as being every-where to be met with. And, in the last, and strictest Acceptation, it is sometimes restrained to the *Ventriculus*, or Stomach, and sometimes to the Intestines: As where we find *Hippocrates* speaking of the Laxness or Afriiction of the *Venter*, *κοιλία*, which are Affections chiefly regarding the Intestines, and, particularly, the great Intestines; whence some, as *Galen*, *Com. 4. in R. V. I. A.* and *Com. in 7 Aph.* 38. tells us, give the Name of *Venter*, *κοιλία*, to the *Colon Intestinum*. The Greek *κοιλία* (*Cœlie*), in a Passage 4 *Epidem.* signifies no more than the Excrements of the Belly; and the *Latin Venter* will bear the same Sense.

With the Chymists, *Venter* is the same as *Terra*, Earth; and *Venter equi* is *Fimus equinus*, Horse-dung. *Theat. Chym.* Vol. 1. p. 201, 378. *Rulandus. Castellus.*

VENTININA. A *Paracelsic* Term to signify the Art of Divining, or knowing by the Winds, the Courses and Dispositions of the Heavens and Stars, with respect to their good or bad Effects upon Mankind.

VENTOSÆ, from *Ventus*, Wind, Cupping-glasses applied without Scarification, so called. *Ventosa* is, also, an Epithet of a Disease, called, by *Avicenna*, *Spina ventosa*, or *Spina ventositas*, being a carious Affection of the Bones, attended with a Putridness. *M. A. Severinus* has an entire Book on this Subject, in his *Treatise de Padarthrocace*. See Os.

Ventofitas, Ventosity, is a Word often put for *Flatulentia*, Flatulence. *Castellus.*

VENTRALIS *Dispositio*, *κοιλιακή διάθεσις*. The *Cæliaca Passio*.

VENTRES, in the Language of some Authors, the same as *Cavitates*, Cavities. *Blancard.*

VENTRICULATIO, in *Cælius Aurelianus*, *Lib. 3. Acut. Cap. 17.* is supposed to be the same as that he calls *Ventriculosa Passio*, *Lib. 4. Chron. Cap. 3.* that is, the *κοιλιακή* of the Greeks, or *Cæliaca Passio*.

VENTRICOSUS, VENTRICULOSUS, is either one with a great Belly, and the same with *μεγαλόκοιλος* (*megalocœlus*) or one labouring under the *Passio Cæliaca*.

VENTRICULUS. The Stomach. See COELIA, and INTESTINA.

VENTRILOQUUS, ἐγγαστριμύθος, a Ventriloquist. See ÆSCULAPIUS.

VENTUS.

V E R

VENTUS. The Wind. The Knowledge of the Nature, Properties, and Virtues of the Winds, is often inculcated by *Hippocrates* as necessary for a Physician. *Ventus* is, also, a Word frequently occurring in the Works of the Chymists: Thus *Ventus albus* is Mercury; *Ventus rubens* is red Orpiment; *Ventus citrinus* is Sulphur; and *Ventus Hermetis*, in *Libavius*, is the Philosophers Stone. *Castellus*.

VENULA, φλεβίον, a Diminutive of *Vena*, a Vein, is a small Vein. The Term φλεβίον, in 6 *Epid. Sect. 6. Aph. 2.* signifies an Artery. See *Galen, Com. in Locum.*

V E N U S.

Tho' the Word *Venus* was originally the Name of a heathen Goddess, celebrated as the Queen of Beauty and Love, yet it afterwards came to signify what we commonly call Venery; an Action which may either promote or destroy Health, according as it is regulated: For it is certain, from Experience, that too great a Retention of the Semen induces a Torpor and languid State of the Body, and often lays a Foundation for terrible nervous Disorders. And whereas the Semen is, as it were, the Flower, and choicest Part of the Blood, and nervous Fluid, so Venery ought to be only moderately used, lest too great an Evacuation of this Substance should prove prejudicial to Health. An Ejection of the Semen requires a sound and vigorous Habit of Body, because it exhausts the Strength, and weakens the Person. Hence *Pythagoras*, when ask'd when Coition was to be used, wisely answer'd, "When you have an Inclination to render "yourself weaker." For this Reason, weak Persons, those who are either too young or too old, and those lately recover'd from a Disease, ought to abstain from Venery: Nor should Persons indulge themselves in Venery after strong Application of Mind, or long Watchings; because these Things have a Tendency to weaken the Body. As Venery only agrees with robust and vigorous Constitutions, so the Use of it is principally beneficial to Health after the Stomach is empty, and Perspiration duly performed, especially if the Person has slept well, us'd the Bath, and taken Aliments of a nutritive Quality, and easy Digestion. It is, also, to be observed, that Venery is more salutary in the Spring, than at any other Season of the Year. All these Things are of such a Nature, as to increase the Strength and Vigour of the Body, and, consequently, favour Venery, or, at least, prevent the bad Effects it might otherwise have. The Person who would often engage in Venery, ought to guard against all Surfeits, Hunger, Labours, excessive Study, Venesections, Watchings, Purges; and every thing which can in the least impair and destroy the Strength. Venery, according to *Celsus*, is beneficial, when it is neither succeeded by Languor nor Pain, but, instead of oppressing, augments the Strength. But it is by no means to be used after Meals, Labour, or Watching. But as Moderation, in every thing, contributes to Health; so, likewise, does temperate Venery: And every one ought carefully to consider what his Constitution can bear. For a very robust Person may safely indulge himself in a Degree of Venery which would remarkably weaken one who has a worse Constitution. Venery, according to *Celsus*, is to be abstained from in the Summer; because, at that time, it is subject to throw the Humours into too violent Commotions. It is, also, found, from Experience, that immoderate Venery weakens the Force and Tone of the Solids, and brings on Colics and Cardialgias. It is, also, certain, from Experience, that Venery both alleviates and removes various Disorders incident to Women: For the male Semen, consisting of a fine elastic Lymph, rarefies and expands not only the Eggs, but, also, the Blood and Juices in the Vessels of the Uterus, the Fibres of which it likewise strengthens. Hence the Reason is obvious, why Venery, or Coition, cures Women, rendered cachectic by a Suppression of the Menfes, and generally restores that salutary Evacuation. "For, says *Hippocrates*, in his Book *de Genitura*, Coition "warms the Blood, and renders the menstrual Discharge "easier." For a Defect of the Menfes frequently happens on account of the Narrowness and Contraction of the Vessels of the Uterus. *Hoffman*.

VER. *Cap.* the Spring. Diseases most incident to this Season of the Year, are Lippitudes, Pustules, Hæmorrhages, Abscesses, Melancholy, Madness, Epilepsies, Quinsies, cold Rheums in the Head, and Distillations: Those Diseases, also, which affect the Joints and Nerves, and have their Paroxysms and Remissions, begin and repeat their Attacks chiefly at this Season. *Celsus, Lib. 2. Cap. 1.*

The most healthy Season of the Year is the Spring; next to that the Winter; the Summer is more dangerous; but the most dangerous of all the four, by many Degrees, is the Autumn. *Ibid. in Init.*

In Spring we must somewhat diminish the Quantity of Food used in Winter, and increase that of our Drink, which, however, must be more diluted, or smaller, than before: We are to eat more freely of Flesh and Greens, and we are to pass from boiled to roast Meat, by Degrees: Venery may

most safely be indulged in this Season. *Ibid. Lib. 1. Cap. 3.*

VERATRUM.

The Characters are;

The Leaves are fibrous, and complicated, as it were, into Folds: The Flowers are roseaceous, hexapetalous, naked, furnished with six Stamina, and collected into Spikes: The Ovary grows in the Placenta, and consists of three Pods, each furnished with its Tube, and becomes a Fruit, consisting of three Sheaths, collected into an Head, and full of oblong Seeds, much like Grains of Wheat, marginated, and surrounded with a foliaceous Wing.

Boerhaave mentions two Sorts of Veratrum; which are,

1. Veratrum; flore subviridi. *Tourn. Inst. 272. Boerb. Ind. alt. 206. Helleborus albus, Elleborus. Offic. Helleborus albus. Ger. 356. Emac. 440. Raii Hist. 1. 168. Helleborus albus flore subviridi. C. B. P. 186. Helleborus albus flore ex viridi albescente. J. B. 3. 634. Helleborus albus vulgaris. Park. Theat. 217. Parad. 346. WHITE HELLEBORE.*

The Roots of white Hellebore are thick at the Head, of a white Colour on the Inside, and very full of Fibres all round, of an hot nauseous Taste; from which spring many large nervous Leaves, of a long oval Form, and a bright-green Colour, encompassing the Stalk, which grows to be two or three Feet high, having smaller and narrower Leaves growing on it, and branching out into several Spikes of imperfect Flowers, each cut into six Segments of greenish, and, in some Plants, of darkish-purple Leaves, succeeded by triangular Seed: It grows in the mountainous Parts of *Switzerland, Austria, and Stiria*; and flowers in *June and July*.

The Roots of this Hellebore, which are the only Parts in Use, are a strong Cathartic, working upwards and downwards with great Violence; and, therefore, but rarely used inwardly now-a-days, though frequently given by the Antients, especially to strong robust Bodies, and in Distempers that needed forcible Evacuations. It is more used as a Sternutatory; it causing violent Sneezing, and, therefore, to be used with Caution, and mixed with milder Ingredients: They are of Service outwardly, in all Distempers of the Skin, as Tetter, Scabs, Itch, and other Deformities thereof.

The only Official Preparation is the *Electuarium ex Helleboro. Miller's Bot. Off.*

The Root of white Hellebore, which is the only Part used in Medicine, purges so violently, both upwards and downwards, that it is rarely used internally; but the black Hellebore takes its Place. However, as *Tragus* says, if it be macerated four-and-twenty Hours in Wine or Oxymel, and afterwards dried, it may be given to the Weight of half a Dram, in Wine, to mad and melancholy Persons. Both Hellebores, says *Gesner*, tempered with Vinegar and Honey, and boiled to a Syrup, are an harmless Medicine, and says, he has often found them, so used, very serviceable in most phlegmatic Disorders, especially of the Head and Thorax, as the Asthma, Dyspnœa, and Epilepsy; for they purge admirably, both by Stool and Urine, and by Diaphoresis, without Perturbation.

In the Use of white Hellebore, says *C. Hoffman*, two things are principally to be regarded; the first is, that the Disease be very obstinate; the other, that the Patient be very strong; for which Reasons, this Root is not to be exhibited to old Persons, or Children; nor to Women of a tender Constitution: A third Requisite might be added, which is, that nothing ought to be done with it till after a careful Preparation, both of the Body and of the Hellebore.

The most antient Way of exhibiting it was with Radish, and this was done three Ways; the first was, by thrusting a Radish through the Root of the Hellebore, and suffering it to remain therein four-and-twenty Hours; after which they threw away the Root, and gave the Radish; or, secondly, they infused the Radish, after it was pulled out of the Root of the Hellebore, in Oxymel, and only gave the Patient the Oxymel; or, lastly, left the Radish in the Root only for a Night, and the next Morning, throwing away the Hellebore, infused it in Oxymel, and gave the Infusion to the Patient. The best Way of preparing it, according to *Parkinson*, is to infuse it in the Juice of a Quince; or put it in a Quince, and so bake it in an Oven, or under the Ashes: For if the Patient be in danger of Suffocation from taking of Hellebore, eating of Quinces, or the Juice or Syrup of Quinces, are a present Remedy. The Root boiled in Vinegar, and held for some time in the Mouth, eases the Tooth-ach: Boiled in a Lixivium, and the Head washed with it, it kills and absterges Lice and Scurf, and has the same Effect, if mixed with some Ointment: It cures the Itch, Tetter, and creeping Ulcers: And, given in Food, is mortal to many Kinds of Animals, as Moles, Mice, Lizards, Birds, and others. The Powder, snuffed up the Nostrils, causes Sneezing, whence it is called in *English Sneezewort*.

The *Spaniards* have a Method of preparing a Poison of the Juice of the Roots, fermented in an earthen Pot, with which they

they poison their Arrows, in order to make the Wounds they inflict with them incurable. What is remarkable in this Poison, is, that, being drank, it is harmless, or, at least, not deadly; but is so only when infused into a Wound, and mixed with the Blood; but the same is true of the Poison of the Viper, which, taken inwardly, is succeeded by no pernicious Symptom, but conveyed to the Blood, through the Orifice of a Wound, or a Puncture, immediately excites most formidable Symptoms, which, if not remedied, will, in a short time, destroy the Patient.

Both Kinds of Hellebore were highly celebrated by the Antients, for curing Maniacs; and at present they are never used but in great and difficult Cases, as the Epilepsy, Vertigo, Mania, Dropsy, Sciatica, Convulsions, and the like. *Raii Hist. Plant.*

2. *Veratrum*; flore atro-rubente. *T. 272. Helleborus, albus, flore atro-rubente. C. B. P. 186. Boerb. Ind. alt. Plant. Vol. 1.*

The Leaves, Roots, Stalks, or Flowers of white Hellebore, applied to the Skin of a living Person, excoriate the Part, and produce an Exulceration: They, also, burn the Tongue. The true *Veratrum* of *Hippocrates* is celebrated on many Accounts. This Plant has a caustic and burning Juice, which attracted into the Nostrils, after the manner of Snuff, excites an invincible Sneezing; whence it appears to be a Ptarmic in the highest Degree. Taken into the Stomach it purges upwards and downwards, with severe Gripings. *Hippocrates* says, that it purges the most remote Parts of the Blood, and, therefore, before its Administration, he caused his Patients to bathe; and ordered them to drink Oil and Honey for some Days; by which means all the Parts being relaxed, he then administered *Veratrum*, and directed Gestation, either on Horseback, or in a Ship: When the Medicine began to work, he ordered his Patients Rest. The same Effect would indeed, in some measure, follow from a right Use of our *Veratrum*: But *Salmasius*, writing of the *Veratrum*, says, that its Leaves are very finely jagged, which makes me doubt whether it be the same with ours. White Hellebore is much stronger than black Hellebore, and sometimes excites Convulsions, unless exhibited with great Prudence: Hence it is never given in Substance but to Persons of the most robust Constitutions; and in melancholy and maniac Cases; and then with great Caution: It is, also, exhibited in Quartan Fevers; in which an Ounce of the Decoction, taken inwardly, has often had surprising Effects. It is a Plant, however, more adapted to Horses than Men; though used as a Sternutatory in soporose Diseases, as the Apoplexy and Lethargy. *Hist. Plant. adscript. Boerhaav.*

Hippocrates purged with white Hellebore, in an immoderate Flux of the Menstrues, before the Use of Astringents and Sweeteners: He, also, used white Hellebore as a Vomit; and gave it to those that were melancholy, or mad.

He, also, gave it in Fluxions, which fell upon the Nose, the Ears, or the Mouth, or caused obstinate Pains of the Head; an unusual Lassitude and Heaviness; a Weakness of the Knees, or Swelling of the whole Body: He gave it, also, to phthical Patients, with a Decoction of Lentils.

He gave white Hellebore, in a Leucophlegmatia, and in the Cholera Morbus.

To some he directed it fasting; but to most, after Supper. *Le Clerc* thinks, because the Hellebore being mixed with the Aliment in the Stomach, would lose a Part of its Stimulus. Sometimes he gave the Herb *Sesamoides*, and Hellebore, together.

In some Cases he gave the *μαλθακὸς ἐλλέβορος*. This *Le Clerc* thinks was some particular Preparation of Hellebore, which took off, in some degree, the Violence of its Operation.

Celsus, Lib. 3. Cap. 26. recommends white Hellebore in an Apoplexy.

It is said by some, that the Use of Hellebore was first discovered by a Man of *Anticyra*, who made an Experiment with it upon *Hercules*, who was mad; and who was cured by it.

Herophylus had a great Esteem for white Hellebore.

Aretæus sometimes purged with Hellebore, and was extremely fond of it.

He says it is not only a Vomit, but, also, the most efficacious and powerful Purge of all others: This good Service it does, he says, is not owing to the great Discharge of Humours it makes; for in the Cholera Morbus, there is the same Sort of Evacuation; nor is it owing to the violent Efforts it causes; for Sailing upon the Sea causes more violent Efforts: But it is owing to a particular Virtue in it, which cannot be enough admired; for though sometimes it purges but little, yet it, nevertheless, cures. In old Disorders, where all other Remedies have failed, Hellebore has succeeded. To those that breathe difficultly, it renders Respiration easy: To such as are pale it gives Colour; and makes those plump that were before lean.

Alexander prefers the *Armenian Stone* to Hellebore, as a Purge, in Melancholy; because it does it safely and effectually, without any ill Consequence, or Danger, which the other rough Medicine too often occasions.

This Medicine, so famous amongst the Antients, was grown into utter Disuse, till *Asclepiodotus* revived it, about the Year 500, and did many wonderful Cures with it, in the most obstinate Cases and Diseases.

Copon gives a very extraordinary Receipt, to feed a Chicken with white Hellebore, and after eight Days to kill it, and make Broth of it, which, he tells us, is a very good gentle Purge.

Gilbertus Anglicus orders Hellebore, Sena, and Spurge, to be distilled with Wine, for a Purge in a Vertigo.

VERATRUM NIGRUM. See *ASTRANTIA NIGRA*. It is, also, a Name for several Sorts of *HELLEBORUS*; which see.

VERBASCULUM CYANOIDES. A Name in *Boerhaave* for the *Cyanus*; *montanus*; *latifolius*.

VERBASCULUM SALVIFOLIUM. A Name for the *Phlomis*; *fruticosa*; *folio subrotundo, brevioris*; *flore luteo*.

VERBASCULUM is, also, a Name for several Sorts of *PRIMUMULA VERIS*; which see.

VERBASCUM.

The Characters are;

The Leaves are alternate, and hoary, or of a smutty Green, and large: The Flower is monopetalous, rotated, pentapetaloid, disposed in a long Spike, and growing very closely to a Stalk, shorter than the Pedicle: The Fruit is ovated, acuminate, and divided by an Interclosure into two Capsules, or Cells.

Boerhaave mentions eleven Sorts of *Verbascum*; which are,

1. *Verbascum*; *mae*; *latifolium*; *luteum.* *C. B. P. 239. Raii Hist. 2. 1094. Synop. 3. 287. Tourn. Inst. 146. Boerb. Ind. alt. 227. Verbascum, Tapsus Barbatus. Offic. Verbascum vulgare flore luteo magno, folio maximo. J. B. 3. 871. Verbascum album vulgare sive Tapsus Barbatus communis. Park. Theat. 60. Tapsus Barbatus. Ger. 629. Emac. 773. MULLEIN.*

The Stalk of Mullein is round and hoary, arising, usually, single, about as tall as a Man: The lower Leaves are large, about a Foot long, and three or four Inches broad, sharp-pointed at the End, slightly indented about the Edges, covered with an hoary Down, or Wooliness: Those which grow upon the Stalk, have their middle Ribs affixed to it for half their Length, which make the Stalk appear winged: The Flowers grow in a long Thyrsus, set thick and close together, each consisting of one Leaf, cut into five Segments, of a yellow Colour, with as many woolly Stamina, having purple Apices: The Seed-vessels are oblong and pointed, opening in two, when ripe, and shewing the small brownish Seed: The Root is generally single, with many Fibres, but not very large, for the Tallness and Bigness of such a Plant. It grows in Highways, and by Hedge-sides; and flowers in July. The Leaves are used.

They are accounted pectoral, and good for Coughs, Spitting of Blood, and other Affections of the Breast: They are, likewise, good for Gripping and Colic Pains, arising from sharp Humours. Outwardly used, in Fomentations or Fumigations, they are reckoned a Specific against the Pains and Swelling of the Hemorrhoids, or Piles. *Miller's Bot. Off.*

The Leaves of Mullein are of an herby Taste, a little saltish and styptic; the Smell like Elder; and give a pretty deep Tincture of Red to the blue Paper: The Flowers give it a deeper: They are, also, styptic, but sweet. It is likely that the Salt of this Plant, in some measure, resembles that of Coral. That of the white Mullein contains a great deal of Acid, and a little Sal Ammoniac; but is united with a great Quantity of Sulphur and Earth; so that it is very lenifying and vulnerary. The Decoction of this Plant is given to drink for the Colic, Dysentery, and Looseness. *Tragus* made use of the Root, boiled in Red-wine. *Matthioli* made a Gargarism for the Throat, with a Decoction of its Leaves and Flowers, and prescribed it for a violent Cough. Mullein is boiled in Cows-milk, for the Tenesmus and Hemorrhoids: The Patient must drink two Glasses of it every Day: Take it in a Glyster, and bathe the Fundament with it: Some add to it the Leaves of Oak and wild Tansey. To stop the Flux of the Piles, and cure the Dysentery, the white Mullein must be boiled in the Water which the Smiths use to quench their Iron in. For the Gout and Inflammation of the Piles, the Juice of the white Mullein is prepared after the following manner:

Bruise the Leaves and Flowers of this Plant; let them rot in wooden Tubs, well covered and plastered: After three Months Digestion, collect the Juice, and express the Faeces, and keep it in Bottles well stopped.

Some leave the Flowers only to rot in Bottles. *Tragus* would have them exposed to the powerful Heat of the Sun: Some bury them in a great Dunghill. It is affirmed that Aloes, dissolved in the Juice of Mullein, and thicken'd to the Consistence of an Extract, do not irritate the Piles, nor cause any Hæmorrhage; but it is more safe to correct it, by dissolving it in Water, and separating the resinous Part that remains upon the grey Paper, by Filtration, and causes the Irritations and Hæmorrhages. They evaporate, afterwards, the filtrated Solution to the Consistence of an Extract. *Tragus* and *Matthioli* say, that the distilled Water of the Flowers of the white Mullein is good for Burns; for the Gout, St. Anthony's Fire, and all cutaneous Diseases. This last Author prescribed for the Piles, a Cataplasm made with the Leaves of Mullein, and Leeks, together with some Yolks of Eggs, and Crums of Bread. *Martyn's Tournefort*.

2. *Verbascum*; *foemina*; *flore luteo*, magno. *C. B. P.* 239.
3. *Verbascum*; *foemina*; *flore albo*. *C. B. P.* 239.
4. *Verbascum*; *mas*; *angustioribus foliis*; *floribus pallidis*. *C. B. P.* 239.

5. *Verbascum*; *Lychnitis*; *flore albo*; *parvo*. *C. B. P.* 240. *Tourn. Inst.* 147. *Boerb. Ind. alt.* 228. *Verbascum album*. *Offic. Verbascum mas foliis longioribus*. *Park. Theat.* 60. *Verbascum flore albo parvo*. *J. B.* 3. 873. *Raii Hist.* 2. 1095. *Synop.* 3. 287. *Verbascum Lychnitis Matthioli*. *Ger. Emac.* 775. **MULLEIN WITH WHITE FLOWERS.**

It grows by the Sides of Paths in several Parts, and propagates itself yearly from shedding its Seed. The first Year it bears no Stalk, but only Leaves scattered on the Ground: When the Stalk is grown it perishes. The Virtues are the same with those of the common and black Mullein. *Ray. Dale*.

6. *Verbascum*; *nigrum*; *folio Papaveris corniculati*. *C. B. P.* 240.

7. *Verbascum*; *nigrum*; *flore ex luteo purpurascence*. *C. B. P.* 240. *Tourn. Inst.* 147. *Boerb. Ind. alt.* 228. *Verbascum nigrum*. *Offic. Ger.* 631. *Emac.* 775. *Verbascum nigrum vulgare*. *Park. Theat.* 61. *Verbascum nigrum flore parvo apicibus purpureis*. *J. B.* 3. 873. *Raii Hist.* 2. 1095. *Synop.* 3. 288. **BLACK MULLEIN.**

This has a Root and Stalk, like those of the common Mullein; only the Stalk is less hairy: The Leaves, also, are less, more rare, and placed alternately: They, also, resemble those of Sage; but are much larger, and fetid.

It grows in several Places in *Cambridgeshire*. And *J. Bauhine* tells us, that it is very frequently to be met with, about *Basil* and *Pompelgard*, on the upper *Rhine*. It flowers in *July* and *August*, and the Root, Leaves, and Flowers are used. The Root is astringent, and of Service in a Looseness. The Leaves and Flowers have the same Virtues with those of the common Mullein. *Ray. Dale*.

8. *Verbascum*; *Blattariae foliis*; *nigrum*; *amplioribus foliis alutis apicibus purpurascens*. *Flor.* 2. 98.

9. *Verbascum*; *foliis nigris*; *amplis*; *flosculis albis*; *apicibus purpureis*; *perenne*.

10. *Verbascum*; *humile*; *Alpinum*; *villosum*; *Borraginis folio & flore*. *H. L.* 619. *T.* 147. *Sanicula, Alpina, foliis Borraginis, villosa*. *C. B. P.* 243. *Auricula Ursi, Myconi, pilosa, caerulea*. *J. B.* 3. App. 869.

11. *Verbascum*; *Orientalis*; *Sophiae folio*. *T. Cor.* 8. *Boer. Ind. alt. Plant. Vol.* 1.

The first, second, third, and fourth Species are reckoned among emollient Herbs. The Leaves bruised, and applied to any Part affected with Pain, remove the same: They are of a demulcent Quality; for which Reason they are an Ingredient in Decoctions, Clysters, and Cataplasms, in all Disorders where Acrimony offends; being of great Service by their insipid, viscous, emollient, and smegmatic Juice. Of the Flowers, with a Solution of Oil of Olives, is prepared Oil of *Verbascum*, which is very good to consolidate Wounds, and to mitigate Pains; and taken inwardly it is a Laxative. The Flowers are made into a Conserve, which is excellent against all Hæmorrhages, Spitting of Blood from Contusions, bloody Urine, immoderate Fluxes of the Menfes, or Lochia, the Tenesmus, Dysentery, and the Falling down of the Uterus and Anus. The Decoction of the Leaves is effectual in the Colic, Diarrhœa, and Dysentery; and a Decoction of the Flowers makes a good Gargarism in the Quinsy, and a violent Cough: The Leaves boiled in Milk, are effectual in the Tenesmus and Hæmorrhoids. The Juice of this Plant is of great Efficacy in the Gout. The Decoction of the Leaves in Water is used in Clysters, as an Emollient for the Hæmorrhoids; and may, also, be injected into the Uterus, for the Purpose of mollifying. The Plant, in short, is emollient, aperient, and relaxing; and therefore enters the Composition of all emollient Clysters and Cataplasms. Outwardly the Leaves and Flowers are useful Topics, in mitigating all Kinds of Pain, particularly in Tumors of the Anus, and in the Hæmorrhoids. *Hist. Plant. adscript. Boerhaav.*

VERBASCUM SYLVESTRE. A Name for the *Polemis*; *fruticosa*; *Salvia folio latiore & rotundiore*; and for the *Pblemis*; *fruticosa*; *Salvia folio longiore & angustiore*.

VERBASCUM TURCICUM. A Name for the *Primula veris*; *Constantinopolitana*; *flore albo*.

VERBENA.

The Characters are;

The Calyx is long, tubulous, and quinquefid; the Flower, also, quinquefid. The Seeds fill the whole Pericarpium: And the Flowers grow in Heads, or Spikes, and not in Whorles.

Boerhaave mentions eight Sorts of *Verbena*; which are,

1. *Verbena*; *Americana*; *altissima*; *Urticæ foliis angustioribus*; *spicis brevioribus*; *floribus caeruleis*. *Flor.* 2. 80. *M. H.* 3. 408.

2. *Verbena*; *Americana*; *altissima*; *Urticæ foliis angustioribus*; *spicis brevioribus*; *floribus purpureis*. *Flor.* 2. 81.

3. *Verbena*; *Americana*; *altissima*; *Urticæ foliis angustioribus*; *floribus albis*. *Flor.* 2. 81.

4. *Verbena*; *Canadensis*; *folio Urticæ*. *Zanon.* 203. *H. R. Par. Flor.* 2. 81. *M. H.* 3. 408.

5. *Verbena*; *Lusitanica*; *latifolia*; *procerior*. *T.* 200.

6. *Verbena*; *communis*; *flore caerulea*. *C. B. P.* 269. *Boerb. Ind. alt.* 187. *Tourn. Inst.* 200. *Verbena*. *Offic. Verbena communis*. *Ger.* 580. *Emac.* 718. *Verbena vulgaris*. *J. B.* 3. 443. *Raii Hist.* 1. 535. *Synop.* 3. 236. *Verbena mas fructu recta & vulgaris*. *Park. Theat.* 678. **VERVAIN.**

The Root of Vervain is white, slender, and full of Fibres, and spreading much about: The Stalk is square and firm, somewhat hairy, and often of a purplish-brown Colour: The Leaves are long, narrow, and sharp-pointed, cut into several Laciniae, somewhat rough and wrinkled, growing two at a Joint: The Flower grows towards the Top, in slender Spikes, being small, and of a whitish-purple Colour, of one Leaf, cut into five Segments; the two uppermost supplying the Place of the Galea; and the three lower, that of the Labella: It being reckoned among the verticillate Plants, having four small longish Seeds, set together in a small Calyx. It grows in Highways near Towns and Villages; and flowers in *July*.

The whole Herb is used, being accounted cephalic, and good against Diseases from cold and phlegmatic Causes: It opens Obstructions of the Liver and Spleen; helps the Jaundice and Gout; and, applied outwardly, is reckoned vulnerary, and good for sore, watery, inflamed Eyes. *Miller's Bot. Off.*

This Plant yields, by the chymical Analysis, several acrid Liquors, a great deal of Oil, and a pretty deal of volatile concrete Salt and Earth: Thus it may contain some Sal Ammoniac, united with a great deal of Sulphur. Vervain is vulnerary, deterfive, aperitive, and febrifugous. For the Green-sickness, drink a Night's Infusion of it in Wine. *Casalspinus* recommends the Powder of it for the Dropsy. The Extract or Juice of Vervain cures intermitting Fevers: A Tea of it is good for the Vapours: The distilled Water, or depurated Juice, cleanses the Eyes, and clears the Sight. A Gargarism of it is good for the Diseases of the Throat. The Cataplasm of its Leaves, bruised with Rye-meal, and the Whites of Eggs, is resolving: The Juice and Infusion of its Tops in Oil cure Wounds. *Martyn's Tournefort*.

The Antients ascribe very many Virtues to Vervain, which are summed up by *Schroder*, as follows: Vervain is cephalic and vulnerary; its principal Uses are in Pains, and other Affections of the Head, from cold Humours, in Affections of the Eyes and Breast, in old Coughs, and the like: In Obstructions of the Liver and Spleen, the Jaundice, Gripes of the Belly, and the Dysentery: It is an excellent Lithontriptic, restrains libidinous Desires, cures a tertian Fever, mitigates the Pain of the Gout, cures Wounds, and facilitates the Birth: Externally it is effectual in the Head-ach, Tooth-ach, Alopecia, Melancholy, Lippitude, Weakness or Redness of the Eyes: In the Quinsy and Hoarseness, a Cataplasm thereof being applied round the Neck: In a Tumor of the Glands of the Fauces, being used in a Gargarism: In Pains of the Spleen, being applied with Hogs Fat; also, in mitigating the Gout, in Abstriction of Wounds, and Absterfion of putrid Ulcers, in the Falling down of the Anus, the Mariscæ; and the like.

Vervain being endued with so many Virtues, it is no Wonder that it was thought by the Antients, to deserve the Name of *ἱερὰ βότανα* (*Hiera Botane*), the *Holy Herb*. For a Tumor of the Spleen, pound Vervain with the Whites of Eggs, and Barley, or wheat Meal, and make them into a Cataplasm, which being wrapt in a thin Linen Cloth, apply to the Part affected upon the Tumor, where it attracts, as it were, the thinner Part of the Blood: Some add Betony. This is a popular Remedy. *Chefneau*.

Vervain, applied upon the Head, or laid under the Pillow, or made into a Plaister, with very strong Vinegar, and Oil of Roses, eases the Pain of the Head proceeding from Wine. *D. Scame. Raii Hist. Plant.*

The

The Root of Vervain is accounted by some as an effectual Amulet against strumous Tumors; and hung about the Neck, by some old Women, as an efficacious Medicine for those Purposes. *Dale.*

7. *Verbena*; *tenuifolia*. *C. B. P.* 269. *M. H.* 3. 419. *Verbenaca supina*. *J. B.* 3. 444. *Dod.* p. 250.

8. *Verbena*; *nodiflora*. *C. B. Prodr.* 125. *l. & Descr.* *Boerb. Ind. alt. Plant. Vol. 1.*

It is called *Verbena*, from *Verrere*, to sweep, because it formerly served to sweep the Altar; and *Peristereum*, from *περιστερα* (*Peristera*) a Dove, because the Doves are delighted with it. There is no Herb so much commended by the Antients as this for vulnerary Purposes, because it expels heterogeneous Particles, whence it is called *Herba Vulneraria*, or a Species of *Siderites*: There is no Plant on which the Poets have more exercised their Talent of Fiction; and none more used in Sacrifices, whence it was called the *Holy Herb*, and *Mensa Jovis*, or *Jupiter's Table*, with which they strewed as well as swept their Altars: Whence the Servant in *Terence* says, *Tolle Verbenam ab Ara*, "Take off the Vervain from the Altar." There is, also, no Plant of which the Magi have related more ridiculous Fables; for Instance, they say, that if any Person describe a Circle about it, and then pluck it with his Left Hand, before he has seen either Sun or Moon, he shall be prosperous in whatever he undertakes; but if he pulls it with his Right Hand, all Things shall happen cross, and contrary to his Desires. These Superstitions are not yet quite eradicated from the Minds of Men; for there are Authors who still say, that Children, by chewing this Herb, will breed their Teeth without Pain; and it is said to be effectual against Convulsions and Inchantments.

Vervain is aperitive, deterfive, depurating, corroborating, and a Febrifuge. The Leaves infused in Wine, are serviceable in the Chlorosis and Jaundice. The Powder of the Leaves is good for the Dropsy; and the Juice cures intermittent Fevers. An Infusion of the Leaves, after the manner of Tea, is good in the hysterick Passion: The Leaves bruised, and applied in the Form of a Cataplasm, are a very good Resolvent in Pains of the Sides, and the Pleurisy. The distilled Water, as well as the Juice, cure Inflammations of the Eyes, and all Sorts of Wounds, increase Milk in Women who give Suck, break and expel the Stone in the Kidneys and Bladder, and give Relief under a flatulent Colic. *Hist. Plant. adscript. Boerhaav.*

VERBENACA RECTA. A Name for the *Verbena*; *communis*; *flore caerulea*.

VERBENACA SUPINA. A Name for the *Verbena*; *tenuifolia*.

VERBERA, *Plagæ*, *Percussiones*. Blows, Stripes, Percussions. They are reckoned among the Causes of Diseases; and sometimes find a Place among Remedies. Thus we are assured by *Rolsinkins*, that a certain Empiric cured mad and melancholy Persons, merely by the Use of Whips and Cudgels.

VERBESINA. See *BIDENS*.

VERDETUM is a green Colour, produced from the Vapour of strong Vinegar, poured on Copper-Plates.

VEREDARI, *Vermes*, Worms. The same as *CUTAMBULI*; which see.

VERETRUM. The same as *PENIS*.

VERGILIÆ. See *PLEIAS*.

VERMES. Worms.

Worms are living Animals, of various Figures, Structures, and Bulks, which are formed in the Intestines, from the Seeds of some Insects, taken with the Aliments. These Animals are nourished and enlarged by a certain putrid Juice, and greatly weaken and injure the Body, and its several Functions.

Tho' Persons at no Period of Life are absolutely free from Worms, yet they are most incident to Infants, and Children between Ab lactation and the fourteenth Year of their Age.

We find from Experience, that, in the human Body, there are various Species of Worms, which, by the antient, as well as modern Physicians, are divided into three principal Kinds: The first are round, smooth, and hardly a Span in Length, by which Marks they are distinguished from other Worms. These have their principal Seat in the superior small Parts of the *Jejunum* and the *Ileum*; thence proceeding, sometimes, to the Stomach, they go as far as the Mouth, or are vomited up: These are generally the Worms which, according to *Hildanus*, in *Cap. 1. Obs. 57.* are principally form'd in Children, and are sometimes found conglomerated in a large Ball, and securely lodg'd in the *Ileum*, whose Membranes they often corrode, so as to penetrate into the Cavity of the Abdomen.

The second Species are those which, on account of their broad Figure, like a Bandage, are call'd Long Worms, or *Tæniæ*. They are so long, as to exceed two, and, sometimes, ten Feet in Length: *Platerus*, in Adults; observed them forty Feet long. See *M. N. C. An. 3. Obs. 29.* and *Bartholin.*

Hist. Anatom. Cent. 3. Obs. 14. These generally possess the whole Tract of the Intestines, but especially the *Ileum*, and are frequently observed without Heads and Tails; for they are not evacuated whole, but in Pieces resembling the Seeds of Gourds, or Cucumbers, which, according to *Spigelius*, in *Cap. 15.* are nothing but the middle gross Nodes of the Worms remaining, after their lateral and membranaceous Parts are consumed by the Putrefaction.

The third Species of Worms are the *Ascarides*, or small slender Animals, which, lodging in the large Intestines, especially the *Rectum*, generally so vellicate it, as to produce a *Tenesmus*. They are, also, frequently discharged, in incredible Numbers, with the Excrements.

Worms in the Intestines are known, if Children start in their Sleep, and are affrighted when waked out of it; if there is an Itching of the Nostrils, a fetid Breath, a Thirst, a Discharge of the *Saliva*, a Paleness of the Countenance, with intermediate Flushings, Coldness of the Extremities, a turbid Urine, an Inflation of the Belly, sometimes an excessive, and at other Times a languid Appetite, irregular Fluxes, and other Symptoms of a like Nature: But as these Signs are common to other Diseases, so there can be no better, nor more infallible Criterion, than the Worms themselves, discharged by Stool.

The Symptoms familiar to Patients of this Kind, are generally very different, according to the Parts where the Worms are lodg'd; but they are frequently so very violent, and sometimes such Convulsions of the Limbs are excited, that the Country People often think the Patient bewitched: But, more particularly, if the Worms are lodged in the Stomach, they produce Nauseas, Cardialgias, Syncope, Tossings of the Body, Grindings of the Teeth, Deliriums, and even Death itself, at last. When they are lodged in the small Intestines, they excite Gripes, biting Pains about the Navel, a voracious Appetite, a Swelling of the Belly, and Fluxes; and when they are lodged in the *Intestinum Rectum*, they produce uneasy Titillations, Corrosion, and an almost perpetual Tenesmus.

Worms are frequently accompanied with putrid, anomalous, and slow Fevers, like those of the quotidian Kind; but these Animals more frequently accompany or follow other Disorders, such as the Measles, and Small Pox; and not only increase the Symptoms, and impair the Strength, but, also, render the Diagnostic, Prognostic, and Method of Cure, highly difficult.

At certain Seasons of the Year, especially in the Autumn, when, under a moist and unequal State of the Air, catarrhal Fevers, Measles, and Small Pox, rage epidemically, Worms are generally most copiously generated; because, at that time, the Strength of the Solids being impaired, more peccant and viscid Humidity, disposed to Corruption, is accumulated in the Body; by which means, the verminous Seed receives more Nourishment and Supply. This is, also, the Reason why Infants, Children, and Women, especially if habituated to a sedentary Life, and a bad Regimen, are more terribly afflicted with Worms than young Persons, Adults, and Men; whose Solids being stronger, and their Circulation brisker, do not so easily generate peccant and viscid Juices.

As for the Causes, certain Aliments favour the Generation of Worms; and these are such as partly produce peccant and pituitous Juices; and partly such as contain the Eggs and Seeds of Insects, which are, with them, conveyed into the Body: Of this Kind are Milk-meats, Cheese, ripe Fruits, Sweet-meats prepared with Sugar and Honey, Pulse, farinaceous Substances, and others of the same Kind; which, above other Substances, contain in them the hurtful Eggs of Animals; without which there can be no Generation of Animalcules in Nature. This is sufficiently proved by the Experiments of *Rhedi* and *Malpighi*; who, in the middle of Summer, put Things subject to Corruption, such as Fishes and Fleshes, into different Vessels, one of which was close shut, and the other left open: In a short time they found the Substances left in the Vessel, to which the Flies and Insects had free Access, full of Worms; whereas, in the Vessel which was shut, they found not so much as one Worm. *Malpighi*, also, informs us, that tho' he frequently buried Pieces of Fleh under the Ground, and suffered them to remain there for a long time, yet he never found Animalcules in them. Now if it is so, the Reason seems plain, why Infants, living upon Milk alone, are not afflicted with Worms till they begin to eat other Aliments contaminated by the Seeds and Eggs of Animals and Insects.

The Symptoms, as we have already observed, differ, according to the Vigor or Tenderness of the Patients, and according to the different Nature of the corrupted Matter, and the Worms. I have, however, often observed, that if exanthematic Fevers, Purples, Measles, or Small Pox, are accompanied with Worms, these Animals not only generally disturb the calm and regular Progress of such Disorders, but, also, induce a Coldness of the Extremities, a Weakness and Inequality of the Pulse, Deliriums, and, often, Death. But this

this happens more frequently in Children than in Adults and young Persons. Round Worms, of a variegated Colour, are almost always a bad Sign; for they often ascend to the Stomach, and, by lancing its Orifices, and sometimes perforating it, produce epileptic Fits, Danger of Suffocation, and even sudden Death. The *Tania*, or long Worms, produce chronical Disorders, and sometimes prove mortal, before it is discovered that the Patient is afflicted with them. The *Ascarides* are less dangerous; because, being lodged in the large Intestines, which are not possessed of such a quick Sense as the others, they do less Harm by their Corrosion. The Symptoms of Patients afflicted with Worms are observed to be increased about Noon, and towards the Evening; because, at these times, the Worms more strongly corrode and bite the nervous Canal of the Intestines, which they find free from Aliments. If dead Worms are evacuated by Stool, they portend Danger, on account of the Putrefaction they discover; but it is otherwise, if they are killed and expelled by Medicines. In violent Disorders, Worms coming from the Mouth indicate that the Patient will die, especially if his Breathing is frequent and cold: Nor do they absolutely predict the Death of the Patient; because there are various Examples of Fevers of all Kinds terminated by the Expulsion of Worms. Thus in *M. N. C. Vol. 3. in Append. Obs. 4.* we are informed, that a tertian and continual Fever were cured by a Discharge of many Worms from the Mouth.

THE CURE.

Tho' Infants afflicted with Worms are in great Danger, yet we are never to despair, provided Remedies proportioned to the Diversity of Symptoms, Constitutions, and Circumstances, are exhibited seasonably, and in a proper Order. But in scarce any Disease are so different and active Medicines extolled, and used by Physicians, as in Disorders where Worms are to be expelled, or killed; for which Reason, I shall briefly shew what Caution, Prudence, and Circumspection, the Physician ought to use in exhibiting them.

First, then, among the Anthelmintics are generally reckon'd Acids; such as the Juices of Citrons, Oranges, Lemons, Currants, Barberries, and Pomgranates, Phlegm and Spirit of Vitriol, Cream of Tartar, Wine, especially tartish Rhenish Wine, and Vinegar: All these may be commodiously exhibited, where Heat, preternatural Warmth, and febrile Commotions, are complicated; for they not only correct the Heat, but, also, excellently resist the Putrefaction, and avert the dangerous Malignity of the Symptoms.

Among the Anthelmintics are, also, reckoned Bitters; such as Wormwood, the lesser Centaury, Scordium, Marsh Trefoil, Rue, and still more, Bitters possessed of a purgative Quality; such as Aloes, Rhubarb, Colocynthida, and the Troches of Alhandal prepared of it. Tho' these Medicines are not absolutely destructive of Worms, since Animals are not only generated in Rhubarb and Wormwood, but, also, according to *Hildanus, Cent. 1. Obs. 160.* in the Gall-bladder; yet it cannot be denied, that Bitters are very effectual against these Animals; because, by their balsamic Quality, they partly correct the crude and viscid Matter with which they are nourish'd; and, by stimulating the Fibres of the Intestines, they sometimes evacuate the corrupted Humours, together with the Worms: They, also, partly correct the Inactivity of the Bile, which, in Children, and moist Patients, is frequently the immediate Cause of Worms.

Among Anthelmintics, great Efficacy is ascribed to oleous Substances, which seems to be confirmed by an Experiment of *Rhedi*; who tells us, that Flies, and other Insects, remained alive after they were immersed in various Liquors; but that such as were immersed in Oil died, and did not recover Life, tho' they were exposed to the Solar Rays. I willingly grant, that all this is consonant to Truth; and that oleous Substances, such as Olive-oil, Rape-oil, and Oil of sweet Almonds, may, with great Success, be exhibited. But it is to be observed, that they are by no means to be exhibited with an Intention to kill the Worms; since a very large Quantity of Oil would be requisite, to reach all the Worms in the whole Volume of the Intestines. Oleous Substances, therefore, are much rather to be exhibited in violent Symptoms arising from Worms; because they relax the spasmodically-constricted Coats of the Intestines, and, as it were, defend and line them with a Mucilage, that afterwards more acrid and purgative Medicines may be exhibited with more Safety. Thus, in order to kill Worms, and mitigate the Symptoms, I have, with Success, in Children, prescribed two or three Spoonfuls, or even an Ounce or two, of the Oil of sweet Almonds, to be taken at Bed-time, or early in the Morning, exhibiting, a few Hours after, Pills prepared of the *Extractum Panchymagogum Crollii*, Resin of Jalap, and *Mercurius Dulcis*.

Saline Substances are greatly celebrated as Anthelmintics, both because they are fatal to the tender Structure of these Animals, and because by stimulating the Intestines, they promote their Discharge, especially if dissolved in a sufficient Quantity of Water. This principally holds with respect to the neutral bitter Salts, especially that of *Glauber*; *Epsom*, *Sedlitz*, *Egra*, and the *Caroline* Salt, which when taken in a proper Vehicle, and used for a considerable time, produce an excellent Effect, especially if Children and young Persons labour under that Species of Worms they call *Tania*, and the broad Kind, because these are not so happily exterminated by Purgatives, which produce Spasms, as by Salts, and saline Springs. Hence the *Sedlitz* Waters, which abound with bitter Salt, are justly extolled for killing Worms. And the same anthelmintic Virtue is ascribed to the saline Springs at *Hall*, by the common People, who now-and-then give their Children large Draughts of that Water against Worms. Nor can we condemn the Practice of the People on the Sea-coast, who, for the same Purpose, drink Sea-water, or, if they are rich, the Broth of recent Oysters, with the Addition of Lemon-juice and Pepper, by which means they expel the Worms, and prevent a Consumption, and various other Disorders incident to Children. It is certain, that Salts, especially of the vitriolic Kind, have long been justly celebrated as Anthelmintics; and the *Pyrmont* Waters, which partake of a subtle Vitriol of *Mars*, are so effectual for the Cure of *Tania*, and turbinated or spiral Worms, that the Patients are in a short time totally freed from all the Symptoms.

If any Disorder admits of Specifics, these are certainly required in killing and eliminating Worms. For these Purposes then, the best Specifics are, among Gums, *Asa-foetida*, *Sagapenum*, *Opopanax*, and *Myrrh*. Among Herbs, *Tansey*, *Scordium*, and *Wormwood*. Among bulbous Roots, the various Kinds of Onions, and *Garlick*. Among Fruits, bitter Almonds, and their expressed Oil. Wormseed, the Seeds of the *Caiputia*, and others of a like Nature. All which by their sulphureous and fetid Smell, are so peculiarly hurtful to Worms as to kill them. And these Specifics are so necessary, that unless they are, in a due Dose, mixed with the above-mentioned Medicines, the desired Effect is rarely produced.

There still remains another not less efficacious Specific taken from the Mineral Kingdom, which is *Quicksilver*; which being in a peculiar manner fatal to Worms, destroys their vital Motion, tho' the Method in which it produces this Effect, cannot be accurately deduced from mechanical Principles. There have already been various Methods of exhibiting this Anthelmintic, which we shall briefly consider. *Helmont* was the first who made an Experiment with this Medicine, whilst he boiled it either in pure Water, or some distilled Water, and with great Success gave the Water thus impregnated with the subtle Particles of the Mercury, to Patients afflicted with Worms. *Henricus Meibomius* followed another Method; for he let *Rhenish* Wine, poured upon *Quicksilver*, stand in a gentle Digestion without any boiling, for twenty-four Hours, and he found his Medicine produce more speedy Effects than the former. The Chymists rather approve of *Mercurius Dulcis* duly prepared: A few Grains of which, according to the State of the Patient, they exhibit with some Purgative, such as sulphurated Scammony, Resin of Jalap, and the *Extractum Panchymagogum Crollii*, made up in the Form of Pills; and this Method they have found attended with Success; or they exhibited it mixed with *Coralline*, either with or without a Purgative. Others, as *Harris*, falling on a safer Method, successfully exhibited *Æthiops Mineral*, prepared of an accurate Mixture of Sulphur and *Quicksilver*. But I intimately mix in a Mortar the well depurated *Quicksilver* with Sugar-candy, and premising the things requisite, I have found, that under a good Regimen, this Preparation was far more efficacious than any others, especially if the Patients, in order to prevent a Relapse, abstain from Flesh, Fish, Milk-meats, sweet Substances, Cheese, and other hurtful Aliments, and use for Drink a Decoction of pure Water, and calcined Hartshorn.

Among other Medicines I have with Success used the following Pills against Worms:

Take of *Asa-foetida*, Extract of *Rhubarb*, *Tansey*, depurated *Aloes*, the best *Myrrh*, and *Mercurius Dulcis*, each one Scruple; and of the Extracts of *Saffron*, and *Castor*, each four Grains; reduce to a Mass: From every Scruple of which make fifteen Pills: By taking five, six, or eight of which, according to the Age, and other Circumstances of the Patient, I have known many thoroughly cured, though before they were miserably tormented.

They who abhor Pills, may have them exhibited in a Syrup, or twice a Day a proper Dose of the following Medicine may be exhibited:

Take

Take of the Liquor of the *Terra foliata Tartari*, one Ounce; and of the Extracts of Rhubarb, Tansey, and Wormwood, each half a Dram: Mix all together.

Nor have I seen less happy Effects produced by the following Powder:

Take of recent white Mechoacan, Wormseed, Coralline, Rhubarb, *Mercurius Dulcis*, Scordium, calcined Hartshorn, and purified Nitre, each half a Dram; and of Camphire, six Grains: Make into a Powder, which is to be distributed into Doses, according to the Age of the Patient; or reduce it to an Electuary.

But it is to be observed, that acrid Purgatives, or hot Remedies, are never to be used where there is a febrile Heat, unless we intend to augment it. We are, also, to abstain from Mercurials, and all drastic Medicines, when the Duodenum is full of a caustic and acrid Bile; for by these means I have not only known the Symptoms augmented, but, also, Inflammations of the Intestines brought on.

Before expelling the Worms from the small Intestines, by Purgatives and Specifics, it is expedient to inject a Clyster of Milk and Honey, that the Worms, being allured by the Sweetness, may quit their Lodgings, and descend more easily to the small Intestines.

If Ascarides are lodged in the Rectum, detergent milky Clysters, in which Tansey, Garlick, or the Leaves of Scordium, have been boiled, produce an excellent Effect; as do, also, the Clysters of Brine, prepared by boiling in it Horehound, the Lesser Centaury, and Scordium, adding to it a sufficient Quantity of the compound Electuary of Hiera.

Emetics are, also, proper, if, after Purging, the Worms are not duly evacuated, because if they are lodged in the Intestinum Cæcum, the Purge cannot always reach them.

Anthelmintics are, also, commodiously exhibited in Electuaries or Syrups, such as that of Succory with Rhubarb. This is sufficiently known to Nurses, who to Children afflicted with Worm, give about a Scruple of Wormseed mixed with Honey in Milk, before the Changes of the growing or decreasing Moon. Nor is this Practice without Success, provided the Wormseed is not rotten.

Sometimes Topics may be usefully joined with internal Medicines: The best Topics are, Epithems prepared of Wormwood, Bulls-galls, Aloes, Coloquintida, the Juice of the Lesser Centaury, and Oil of the Flowers of Spike, and applied to the epigastric and umbilical Regions. The Ointment of Sow-bread, also, answers the same End.

But the Physician ought, above all things, to be certain of the Presence of Worms by infallible Signs, if he intends to exhibit Medicines for killing and evacuating them, lest the Patient labouring, perhaps, under another Disease, arising from a different Cause, should receive more Harm than Good, from his Prescriptions. *F. Hoffman.*

VERMICATA, a Word used by some, who mean by it the same as *Lentiginos*.

VERMICELLI, *Vermicelli*, *Tagliarini*, *Millefanti*; in French, *Vermichel*.

It is a Paste made with the finest Flour and Water, and reduced into Threads of the Figure of Worms, by means of Syringes bored full of small Holes. These Threads, or Filaments, are afterwards dry'd and kept; they are generally white, tho' they are, also, prepared of a yellow Colour, by mixing Saffron, or Yolks of Eggs, in the Paste; sometimes they add Sugar, to make them the more agreeable. This Composition is principally prepared in Italy, where it is much more in Use than in France. They eat it in their Soup.

They reduce this Paste of *Vermicelli* to several other Forms; for they flatten and widen it to the Thinness of a Ribband, two Inches broad. This is what the *Italians* call *Vagne*; they make it into Sticks of the Bigness of a Quill, which they call *Meaton*; and into small Grains of the Bigness of Mustard-seed, which the *Italians* call *Semoule*, that is to say, *fine Flour*; they reduce it, also, into the Form of Beads, and this is what the *Italians* call *Patres*.

Vermicelli ought to be chosen new, well dry'd, and of a beautiful Colour; the white is most in Use. It is a Pectoral, and of a sweetening, restorative, and strengthening Quality.

All the Names of the *Vermicelli* are *Italian*, because this Sort of Paste was invented in Italy; and it takes the Name of *Vermicelli*, that is to say, small Worms, because it is reduced into Filaments resembling those Animals. *Lemery des Drogues.*

VERMICULANS, *σκαλινίζων*, vermiculating, an Epithet of a sort of creeping Pulse. See PULSUS.

VERMICULARIS. A Name for the *Sedum*; *minus*; *terrefolium*; *album*.

VERMICULARIS CRUSTA. The interior villous, and gyrous, or rugous Coat of the Intestines. *Blancard.*

VERMICULATUM. Something in a Plant, which appears red, and glittering like a Rose.

VERMICULUM. Elixir, Tincture. *Rulandus.*

VERMICULUS. A small Worm.

VERMIFORMIS, *σκαλινμοειδής*, Vermiform, or Worm-like, is an Epithet of a Process in the Cerebellum, called *Processus vermiformis*. See CEREBRUM.

Vermiformis Appendicula. See APPENDICULA, and COELIA.

VERMIFUGA. The same as ANTHELMINTICA; which see.

VERMILION, Cinnabar, or Minium. *Rulandus.*

VERMINA, *Verminatio*, *Verminosus*, *σπασμός*, the Gripes. *Vermina*, in *Festus*, are the griping Pains of the Intestines: Pain is, also, called *Verminatio*. See STROPHOS. *Verminosus* is properly spoken of the Matter in which Worms are generated.

VERMIS Cerebri. The Worm of the Brain, that is; the Epidemical Hungarian Fever.

VERNACULUS. The same as ENDEMIUS; which see.

VERNICE. Dry, guttous Vernix. *Rulandus.*

VERNIMBOCK. A sort of Wood, like *Brasil* Wood; used in Dying; and suspected to be what we call *Redwood*. It takes its Name from *Fernambuca*, a Town of the Portuguese, in *Brasil*, whence it is exported. *Raii Hist. Plant.*

VERNISIUM. The same as,

VERNIX, otherwise *Sandaraca*, *Sandarache*, and *Gummi Juniperinum*. *Vernix*, *Varnish*, is, also, a Name given to a certain liquid Composition, which induces a Crust over Wood, which preserves it from Putrefaction. Thus, a Vernix is prepared of Lacca, Mastich, Copal, Succinum, either simple or mixed, and boiled and dissolved in Alcohol of Wine, Oil of Turpentine, or Linseed-oil. *Blancard.*

VERONICA.

The Characters are;

The Leaves, for the most part, grow opposite by Pairs; the Calyx is monophyllous, quinquefid, and expands in form of a Star. The Flower is monopetalous, generally quadrifid, and expands in a circular Order. When the Flower decays, the Ovary becomes a membranaceous Fruit, divided into two Cells, which are shaped like an Heart, and full of Seeds, sometimes small, sometimes of a good Largeness and Thickness.

Boerhaave mentions twenty-six Sorts of *Veronica*; which are,

1. *Veronica*; major; latifolia; erecta. *M. H. 2. 317. It. 2.*

2. *Veronica*; maxima; latifolia; erecta; cœrulea spica longissima.

3. *Veronica*; spicata; longifolia. *T. 143. Lysimachia, spicata, cœrulea. C. B. P. 246. Pseudo-lysimachium, cœruleum. Dod.*

4. *Veronica*; spicata; angustifolia. *C. B. P. 246.*

5. *Veronica*; spicata; angustifolia; flore incanato. *Flor. 2. 104.*

6. *Veronica*; mas; supina; & vulgatissima. *C. B. P. Raii Hist. 1. 851. Synop. 3. 281. Boerb. Ind. A. 224. Veronica mas, Betonica Pauli. Offic. Veronica mas vulgaris supina. Park. Theat. 550. Veronica vulgatio folio rotundiore. J. B. 3. 282. Veronica vera & major. Ger. 502. Emac. 626. MALE SPEEDWELL.*

This is a low creeping Plant, whose Stalks generally lie on the Ground, shooting out Fibres at the lower Joints. The Leaves grow by Pairs, on short Foot-stalks; they are oval, about an Inch long, hairy, and crenated about the Edges, of a pale-green Colour. The Flowers grow on the upper Part of the Stalks among the Leaves, in short Spikes, each of one small bluish purple Leaf, cut into four Parts; to each of which succeeds a Seed-vessel, in Shape of that of Shepherd's-pouch, full of very small Seeds. The Root is a Bush of Fibres; grows in Woods and shady Places, and flowers in June. The whole Herb is used.

This is reckoned among the vulnerary Plants, both used inwardly and outwardly; it is, likewise, pectoral, and good for Coughs and Consumptions; and is helpful against the Stone and Strangury, as, also, against pestilential Fevers. *Miller's Bot. Off.*

The Leaves of Speedwell are bitter, and give a pretty deep-red Colour to the blue Paper, which gives us Reason to believe, that their Salt very much resembles that of Coral; but that of the Speedwell is charged with a great deal more Acid than the ordinary Salt of Coral, and is joined besides with a great deal of Sulphur: For,

By the chymical Analysis, we obtain from this Plant a great deal of Earth, Acid, and Oil.

These Principles render the Speedwell sudorific, vulnerary, detergent, diuretic, and proper to discharge the Lungs of glutinous and purulent Matter. *Tragus* affirms, that in malignant Fevers, two Ounces of the Spirit of Speedwell, mixed with a little Treacle, provoke Sweat copiously. This Spirit is made by distilling Speedwell infused in Wine for some Days.

Take two Ounces and an half of the distilled Water, infuse in it one Dram of the Leaves, and as much of the middle Bark of *Solanum Scandens*, *five Dulcamara* Pin. and give it as an excellent Remedy for Ulcers in the Lungs, Stone, and Vapours.

The Syrup and Extract of Speedwell purify the Blood, and are good for cutaneous Diseases; but the affected Parts must be washed at the same time with the Water of Speedwell, in which some Vitriol has been dissolved. The frequent Use of Clysters, made with one Pound of the Decoction of this Plant, an Ounce of Butter, and as much Sugar, are wonderfully praised for the Colic. Some boil Speedwell and Chamomile in Milk, and afterward add some Sugar. Speedwell is used now-a-days after the manner of Tea. It is mixed, also, with the vulnerary Plants in Broths, Potions, and Ptisans. *Martyn's Tournefort*.

Veronica is an excellent Vulnerary and Sudorific; its principal Uses are in Erosions and Obstructions of the Lungs and Spleen, whence it is of extraordinary Service in the Colic, Phthisis, Scabies, Pruritus, Pestilence, and Wounds. Externally it is much celebrated for absterging Wounds, in Hardness of the Spleen, and the Colic. *Schroder*.

Taken inwardly, it is good against the Cough, and other pulmonary Disorders, and against the Pestilence and contagious Diseases; outwardly, it is effectual in Wounds, Ulcers, Itch, and cutaneous Diseases.

A Decoction of *Veronica*, taken in a good large Dose, freed a Woman from a Stone in the Left Kidney, with which she had been afflicted sixteen Years; the Stone was first protruded into the Ureters, through which it was convey'd to the Bladder, whence by the continued Use of the same Decoction, it was at last ejected by the urinary Passage. *Eph. Germ.*

Veronica is of singular Use in Barrenness. A Lady of the first Rank, after seven Years Barrenness, took, by my Advice, the Powder of *Veronica* in the Water of the same, for many Days together, and very soon after conceived. After this, she advised some others, who were thought barren, to use the same Remedy, which had the desired Success upon ten or twelve of them. The Syrup of *Veronica* is an admirable Remedy in Ulcers of the Lungs. *C. Hoffman*.

The most illustrious *Guntherus* had for some Years laboured under an incurable Ulcer of the Legs, attended with periodical Pains, for which he found no better or speedier Help than Linen Cloths dipt in Water of *Veronica*, and applied to the Place; for the Inflammation, and other Symptoms, usually consequent, immediately ceased.

The Herb is, also, very remarkable for its vulnerary Virtue: A Fistula of the Thorax, which had eluded the Force of Bathing, Fomentation, and all other Kinds of Remedies, was at length perfectly healed by the internal Use of the Water of *Veronica* alone. *Eph. Germ.*

The Extract of *Veronica*, mixed with the Extract of Juniper, is a most efficacious Medicine in Obstructions of the Viscera, and pectoral Diseases; I have often try'd it with extraordinary Success. It expels the morbid Matter by Urine; but Laxatives and Aperitives are first to be premised. *D. Tancred Robinson e Fabr. Hildano*.

I must ingenuously confess, says *S. Pauli*, that after I had in vain try'd various Medicines against the crusty Scabies of Children, I have at last, in Imitation of the Example before related, (of *Guntherus*) directed the Parents to apply Linen Cloths dipt in the Water of *Veronica*, and first compressed to prevent their dropping, to the Arms, and Calves of the Legs of the Children, and by that means have perfectly cured them; but I advised, that the Nurse should, at the same time, drink the Decoction of Fumitory boiled in Whey.

Crato had an extraordinary Esteem for this Herb in the Colic, Stone, and the Pestilence itself; and he prefers the mere simple Decoction of *Veronica* far before all other more generous Medicines for the Stone. *S. Pauli*.

The Use of a Clyster, prepared only of a Decoction of *Veronica* and Sugar, is of more Efficacy than any thing taken at the Mouth. In the Decoction, let there be mixed some Fat of a Sheep's Kidney, or some Fat of a Rabbit, or of a Capon, in order to give it a Lubricity; if these are wanting, a little fresh Butter may be added. *Idem*.

I can safely affirm, that many Persons labouring under the tormenting Pain of the Colic, or Stone in the Kidneys, have often received more Benefit and Relief from the Use of a

simple Clyster, prepared of Cows Milk, and Sugar, in which, after the Example of *Crato*, I have only boiled *Veronica*, or the Flowers of Chamomile, not the *Roman*, but the common, and more temperate Species, than from those prepared with a greater Apparatus; as, for Instance, with Pennyroyal, Origanum, Rue, Calamint, and other Ingredients, which often exagitate the Humours. *Idem*.

Veronica is commended for subduing Phlegm, for deterring the first Passages, for pulmonary Diseases, the Scurvy, Phthisis, and Stone, being boiled with Liquorice. Infused in Water, it impregnates it with the Smell, Taste, and all the Virtues of the Chinese Tea, and has the same Effects. It relaxes with a moderate Astringent, whence it is recommended in a Scurvy proceeding from Relaxation; thus it is proper, also, in a Pissing or Spitting of Blood, because it has an astringent and somewhat of an aromatic Virtue; it heats, dries, strengthens, and resists Putrefaction.

The thirteenth, fourteenth, fifteenth, and sixteenth Species are scarce inferior to any in Virtues; they are very succulent and bitterish, their expressed Juice absterges and deterges in manner of Soap, and liquefies, not by its aromatic, but saponaceous Quality. Thus it purges Water, and renders the Blood aqueous without Acrimony; and by this means opens, dilutes, and is a Demulcent. Hence it becomes of Service in all Obstructions, and in all Sorts of Scurvy; and, where-ever Opening is required, without inducing a great Heat. For the same Reason it affords us an excellent Remedy against the Stone and Gravel in the Kidneys, and is of Service in the Jaundice, Stoppages of the Liver, and all inveterate Obstructions.

This Plant is very penetrating; for, if it be tasted, it penetrates the whole Mouth, as if it were set on Fire. It affords not much Salt, but a very copious Humour; and has the Virtue, also, of resolving Humours. The Decoction of the Herb in Whey, daily drank, cures the Scurvy, as we are assured by *Eugalenus* and *Sennertus*, and resolves scorbutic Tumors; it is good, also, against the Scabies. The Juice drank

or a long time together, is effectual against the Gout; for let the Patient take but two or three Ounces every Day for a Month together, and all the morbid Matter will be discharged out of the Blood by Urine. The Juice may be preserved a long time in Winter, if to the Quantity of one Ounce you put four Drops of the Spirit of Sulphur by the Bell. It incides viscid Phlegm molesting the Lungs, and is good in Coughs, Colic, Nephritis, Pthtisis, and the Itch; it is excellent in Clysters for the Colic. The Infusion of it in Wine is effectual in the Chlorosis; and the Powder, according to *Cæsalpinus*, cures the Dropsy. The Juice cures intermittent Fevers; the distilled Water depurates the Eyes; and a Gargarism, prepared of a Decoction of the Leaves, cures the Quinsy.

Franeus has written a whole Book of the Virtues of this Plant. The Use of it, after the manner of Tea, is effectual in Obstructions of the Spleen, Pancreas, and Mesentery; it is of excellent Use in the Head-ach and Vertigo, is of Service in the Fluor Albus, and all cutaneous Diseases, as well as a Cancer. I have cured an hundred Diseases with this Plant; for it has the Virtue of dissolving pituitous, viscid, oleous, and almost all other Kinds of Humours. *Hist. Plant. adscript. Boerhaav.*

An Infusion of *Veronica* is recommended by *Heister* to be used warm, as a Resolvent in an *Epiphora*, or *Oculus Lacrymans*; he observes further, in his Note at the Bottom of the Page, that this Infusion of *Veronica* is highly commended by *Schobinger*, a Disciple of *M. St. Yves*, for an incipient *Fistula Lacrymalis*, in his *Treatise de Fist. Lacr.*

Besides the foregoing Sorts of *Veronica*, *Dale* mentions the following;

CHAMÆDRYS SPURIA ANGUSTIFOLIA. Offic. J. B. 3. 285. Raii *Hist.* 1. 847. *Chamædrys spuria major angustifolia.* C. B. Pin. 249. *Veronica supina.* Ger. 503. Emac. 628. *Veronica Teucrii facie.* Park. Theat. 551. *Veronica supina facie Teucrii, pratensis.* Tourn. Inst. 144. **GERMANDER-SPEEDWELL.**

It grows in the Gardens of Botanists, and flowers in June. The Herb is in Use; it agrees in Virtues with the *Veronica*; *mas*; *supina*; & *vulgatissima*; or male Speedwell. An Infusion of its Leaves, is called the *Europeæ.* *Dale.*

VERONICA AQUATICA FOLIO SUBROTUNDO. See **SAMOLUS VALERANDI.**

VERONICA FOEMINA. A Name for the *Linaria*; *hirsuta folio, subrotundo; flore ex herbido flavescente.*

VERRES. A Male Swine. *Verres sylvaticus*, the same as **APER**, a wild Boar.

VERRICULARIS, *μυρβανερσίδης*, a Coat of the Eye so called. See **AMPHIBLESTROIDES**, and **OCULUS.**

VERRISTA, a Name given by *Paracelsus*, to what he calls his *Summum Arcanum*, in Conjunction with his *Granagranâ*, in the Cure of an Epilepsy; but he no-where tells us what they are. *Traët. de Caduc. Matric.*

VERRUCA. A Wart.

A Wart begins in the *Cutis*, and seems to be either an Efflorescence of the Serum of the Blood, which hardening in the Surface of the Skin, makes a dry Tumor, or else some small Luxuriancy of the little Arteries of the *Cutis*, which thrust out themselves, making a petty Sarcoma, which we call a *soft Wart*. According to the Variety of the Tumor, it is sometimes whole with a smooth Surface, sometimes chapt and uneven. According to the manner of their Production, sometimes they arise by a general Exsudation out of the *Cutis*, with a broad Basis, and are called *Verruæ sessiles*; sometimes a few Capillaries putting out together do, after they have grown to a small Length, enlarge themselves into a greater Compass, and make the pensile Tumor we call *Acrochordon*.

There need no Signs to be given of Warts, they being so apparent.

Warts often fall away of themselves.

The Medicines commended in the Cure of Warts are many. Those which are most easy to be had in the Country are, the green Rinds of Willows beaten, the Juice of Marigolds, Celandine, all the Sparges, a Garden-snail sprinkled with Salt. If you rub them with any of these, they will fall off. Oil of Vitriol, or of Sulphur, will certainly destroy them. I have seen some burn them out, by running an hot Needle into the Roots of them. There are other ways, as by rubbing them with raw Beef, and burying it. But when any great one falls into my Hands, I make a speedier Riddance of it by Ligature, or Caustic. Where it is capable of being tied, I make a Ligature; in others, where it is not, the Caustic-stone alone will do it.

A young Lady, having been long vexed with an unseemly overgrown Wart upon one of her fore Fingers, desired my Help. I rubbed the chapt Head of it with a Caustic-stone, till it was soft and black; then scraped it off, and rubbed the remaining Root with some of the same, till I judged it was cra-

dicated; then washed out the Salts, and dressed it with *Unguentum Basilicæ*, with a few Drops of Oil of Turpentine, which made, Separation of the Eschar, and cured it.

In another young Person, where they were small in the Basis, I tied some of them close by the Roots with a Silk; others I snipt off with a Pair of Scissars, not regarding the Dropping of the Blood upon the neighbouring Parts, which is thought to infect them, and beget others. Then I rubbed the Roots of them all with a Caustic-stone, and digested the Sloughs out as abovesaid, and they cicatrized of themselves.

Yet you ought to be cautious how you meddle with those growing upon the Knuckles; for Warts there, being, for the most part, near the Tendons, cannot well be extirpated without offending them; and so are consequently subject to Fluxions, and to corrupt the Cartilages, or Bone.

This was the Case of a Lady of Quality, aged about fifty Years, of a plethoric Body, who had a Wart upon the first Joint of one of her fore Fingers. It was imprudently undertaken by some Pretender to Surgery, and treated as ill; so that, after many Months Endeavours, he was dismissed, and a more knowing Surgeon entertained, who found much Difficulty in the Cure, yet made shift to cicatrize it; but it swelled again, and discharged Part of its Matter by the Side of that Nail. Upon Sight whereof I was consulted, and saw a thin Ichor weeping through the old Cicatrix, at an Opening not bigger than a small Pin-hole. The Lady importuning me to undertake the Cure, I sprinkled the Orifice with Precipitate, whereby I crufted in the Matter to thin the Skin, which the next Day I opened, and, by Search of a Probe, felt the Cartilages rotted. I informed the Patient of the Necessity of making an Incision proportionably large, in order to the Exfoliation, and withal represented the Difficulty; and, offered to her Consideration, the more certain and speedy way, by cutting off that Joint. She with little Demur consented to it. All things being immediately prepared, I chopt off that Joint, dressed it up with *Pulvis Galeni*, and afterwards digested it, and cured it, as hath been shewed in such like Extirpations. *Wiseman's Surgery.*

Warts are known to be small brownish Excrecences in the Skin, and are incident to most Parts of the Body; but most frequently affect the Face and Hands. In their Shape and Size there is a surprising Variety; some are large and depressed, others slender; some again resemble the Figure of a Pear hanging by its Stem. And, indeed, it is not so much on account of any Pain or Danger from them, that they are usually extirpated, as because they are a kind of Deformity and Defecation; and most remarkably so, when conspicuous on the Face, Neck, and Hands, of fair and fine Women. And here, tho' there are various Kinds of Remedies, some sympathetic, and others superstitious and insignificant, which are used by Women, and even by some professing Medicine, for the Removal of Warts; yet, after all, the most expeditious Cure is to be expected from the Hands of the Surgeon.

We, therefore, think it most proper briefly to describe the principal Means, which Surgery employs in extirpating this Kind of cutaneous Defecation. And the Method, which deserves to be first mentioned is, by *Ligature*, or *Vincture*; this is performed upon such of these Excrecences as are slender about the Root, and, in a manner, pendent; by firmly tying about them an Horse's Hair, or a Silken or Linen Thread. The Warts being deprived of the Juices which nourish them, through a Constriction of the Vessels by the Ligature, gradually wither and fall away.

Another Method of Cure is, by the Surgeon's Instrument, in which the Wart is taken up with an Hook, or Forceps, and then very nicely separated with the Scissars. The Wound is treated for some time with an Application of the *Lapis infernalis*, or some other corroding Medicine, that if any Part of a Root should remain, from which a new Tubercle might arise, it might be consumed and destroyed.

If the Warts are of a larger than ordinary Size, recourse must be had to Corrosives. And, that these Medicines may the sooner work their Effect, and consume the prominent Part, it will be convenient, first, to cut off the hard Top of the Tubercle with a Penknife, Razor, or a sharp Pair of Scissars; which done, the Wound is to be every now-and-then treated with Applications of Oil of Tartar *per Deliquium*, or some acid Spirit, of which the mildest is Spirit of Salt. If these prove too weak for the Purpose, it will be proper to substitute some stronger Medicine in their room; for Instance, Spirit, or Oil of Vitriol, Aqua-fortis, or Butter of Antimony. On the other hand, the softer and tenderer Sorts of Warts are sometimes removed only by often rubbing them with the yellow Juice of the *Chelidonium majus*, or the Milk of the *Esula*. But, by way of Caution, the greatest Circumspection is required in the Use of Corrosives about the Eyelids or Eyes, that nothing thereof may enter the Eye, and by that means induce Blindness;

Blindfolds: Care, also, is to be taken, that the Parts adjacent to the Tubercle be not injured by the Corrosive. For this End it will be convenient enough to surround the *Wart* with a waxen Ring, or a perforated Plaster, in which the *Wart* may appear as an Eminence, and thus be corroded with Safety to the covered Parts. The Corrosive may be applied several times in a Day; and, by the same Method, other Tubercles, and the like Kinds of cutaneous Defections, may be removed.

A fourth Method of extirpating *Warts* is, by the Application of a red-hot Iron adapted to the Size of the Tubercle, in such a manner, as to penetrate to the very Bottom of its Root. If there be any other violent Means of extirpating *Warts*, certainly there can be nothing more violent than red-hot Iron, which, tho' it excites indeed a very acute Pain, yet the same is but for a Moment. To the cauterized Place must be applied some Portion of Basilicum, or digestive Ointment, and over that a cooling Plaster; such as, for Instance, the *Emplastrum de Spermate Ranarum*. It can hardly be expressed how happily this Method of Cure succeeds in most Parts of the Body, except the Eyes; for these Excrescences, thus removed, are sure never to return.

There is a fifth Method, which is peculiar to Stage-quacks, and consists in, first, well rubbing and chafing the Tubercle with some emollient Ointment, and afterwards taking it between the Nails of the Thumb and fore Finger, and with great Violence pulling or tearing it off. But as this way of Cure is very troublesome, so it has been found in many Cases to be quite useless. For this Method, by Avulsion, thus practised by these Strollers, seldom succeeds so well, but that the *Wart* pululates afresh, and grows again out of the Place affected, as from a Root left behind.

In the last place, it ought not wholly to be omitted, that sometimes may be observed, especially in the Face, on the Lips, and near the Eyes, a kind of livid and bluish *Warts*, which in their Tendency, are next to a Carcinoma, or Cancer; for which Reason it is much safer to let them alone, than endeavour their Extirpation. For no sooner are they irritated by the Hand of the Surgeon, than they degenerate into a Carcinoma; and, after an Erosion of the Face and Eyes, in a miserable manner destroy the Patient. *Heister Chirurg.*

Of WARTS, and other Tubercles of that Kind, growing on the PENIS.

Tubercles, of what Kind soever, infesting the Penis, are almost constantly the Product of some Venereal Distemper: Their Seat is not always in one Place, but sometimes in the Prepuce, sometimes in the Corona Glandis, and sometimes in the Glans itself. Many of them appear like fungous or spongy Flesh, increase very fast, and now-and-then excite Pains. Remedies best adapted to their Extirpation are gentle Corrosives, such as Powder of Savine, either by itself, or mixed with red Precipitate, and burnt Alum, and twice or thrice sprinkled on the Parts, or worked up with Unguentum Basilicum, or Mundificativum, and then applied. If the Tubercles are harder than ordinary, there seems to be no better Way than gently touching or rubbing them with the Lapis Infernalis, till they quite disappear. If the Root of the prominent Part be but slender, it will be convenient to use the Scissars, or a Ligature, in the manner as was directed for the Extirpation of Warts, and all other Kinds of Tubercles. But if the Tubercles will not conveniently admit of a Ligature, on account of the Width of their Root or Base, and their Extremity be remarkably hard, the prominent Parts are to be all cut off with the Scissars, and after suffering the Blood to flow for some time, the Wound is to be cleansed and fomented with warm Wine; and the Root is to be every Day rubbed with the Lapis Infernalis, till it appears to be quite extirpated. *Scultetus* indeed is said, *Obs. 65.* to have used a red-hot Iron in the Extirpation of these Kinds of Tubercles of the Penis. And *Fabricius ab Aquapendente*, and some others, advise the same: But to me this Method of Cure seems too cruel. We are not, however, to omit this one necessary Observation, that not external Means only, but internal Medicines, and these in the first and principal Place, are to be employed, in order to expel the virulent Venereal Matter; for otherwise, by what outward Means soever the Tubercles are removed, they generally return in a short Time. *Heister Chirurg.*

VERRUCARIA. A Name for the *HELIOTROPIUM*; because it removes Warts; and, also, for a Species of *TITHYMALUS*, by whose lacteous Juice Warts are extirpated. *Blancard.*

VERSIO Chymica is a Change wrought by Chymistry, of manifest Forms into occult ones, which is done by a Corruption of the specific Form, and the Generation of a more general one; that is, by a Conversion of decomposed Elements into compounded ones; and of impure into pure. *Theat. Chym. Vol. I.*

VERTEBRÆ, ὀστέονα. The Vertebrae.

VERTEBRALES MUSCULI. The Vertebral Muscles, that is, the Muscles which assist in moving the *Vertebrae*. Among these are reckoned the *Longus Colli*, *Transversalis Colli major*, *Transversalis Gracilis sive Collateralis Colli*, *Semi-spinalis sive Transverso-spinalis Colli*, *Spinales Colli parvi sive Inter-spinales*, *Transversales Colli minores sive Inter-transversales*, *Obliquus major*, *Rectus minor*, *Sacro-lumbaris*, *Longissimus Dorsi*, *Spinalis Dorsi major*, *Spinales Dorsi minores*, *Transversalis Dorsi major*, *Transversales Dorsi minores*, *Semi-spinalis sive Transverso-spinalis Dorsi*, *Semi-spinalis sive Transverso-spinalis Lumborum*, *Sacer Veterum*, *Spinales & Transversales Lumborum*, *Quadratus Lumborum sive Lumbaris externus*, and the *Coccygai*; which see, under the respective Articles of their Names.

VERTEX. See *CORYPHE*.

VERTIBULUM, from *verto*, to turn, is the round or globous Head of a Bone, which, in Articulation, is inserted into the Sinus, or Cavity, of another Bone adapted to it.

VERTICELLI marini, ὀστέονα θαλάσσια, are tuberosus Zoophytes, which are, also, called *Vertibula*, and *Tethya*.

VERTICILLUM, in Botany, is the Whorle, or Circle of Flowers or Leaves, which surrounds the Stalks or Branches of Plants, so called from its Resemblance to the *Verticillum*, or Whorle of a Spindle. See the Article *BOTANY*.

VERTICILLUM and **VERTICULUM**, are, also, Names for the Vertebrae.

VERTICILLUM Ani, in *M. Aurel. Severinus*, is a Tubercle on the Extremity of the Anus, resembling the *Verticillum*, or Whorle on a Spindle. *Castellus.*

VERTIGO, σίρως, the Vertigo, is a Disease in which the Head seems to turn round. When a Mist, also, seems to be cast before the Eyes, it is called *Scotidinos*, *ὀφθαλμὸς*, or *Scotidinos*, *ὀφθαλμὸς*. *Galen, Com. 4. in Lib. de R. V. I. A.* *Erolian* expounds *σίρως*, by *ὀφθαλμὸς*, as *ὀφθαλμὸς* *δοκίμῃ* *τὰ* *ὀφθαλμὰ*, "An Obtenebration, in such a manner that Objects seem to turn round." The Cause of this Affection is, by *Galen*, in the forecited Place, ascribed to a disorderly Motion of the Spirits, which are generated and reside in the Brain; or of those which ascend thither from the lower Parts. *Castellus.*

This, according to *Willis*, is a Disorder in which visible Objects seem continually to turn round, whilst the Patients are affected with a Perturbation or Confusion of the animal Spirits in the Brain, which hinders their Influx into the Nerves. Hence it is, that the visive and locomotive Faculties often fail to such a Degree, that the Patient is ready to drop down, and complains of Darknes. *Etmuller* divides it into three Kinds; the first of which is a simple Vertigo, in which there is only a transient and short-continued Gyration of Objects. The second is a dark Vertigo, or Scotomia, when the Eyes are darkened, or so affected, as if several Colours were before them: And the third is, the Vertigo Caduca, in which the Patient presently falls down.

A Vertigo may be produced by every Cause which can distend, press, and contract the Arteries; such as sudden Fear, Surprise, Ebriety, and Voracity, by which the regular Influx and Reflux of the Animal Spirits into the Optic Nerves, and Retina, are prevented. Sometimes, also, it may be produced by an Acid, or any other peccant Humour, lodged in the Stomach, and vellicating its Nerves, which communicate with the Retina; for which Reason the hypochondriac and hysteric Passions may produce a Vertigo.

With respect to the Prognostics. If a Vertigo is recent, if it happens seldom, and the Patient is young, the Cure is easy: But if it is original and confirmed; if it happens frequently, or is apoplectic or epileptic; if it seizes old Persons, and is accompanied with great Dimness of Sight, and Inability to stand, the Cure is difficult. According to *Etmuller*, a severe and long-continued Vertigo, in old Persons, foretels an Apoplexy; and in such as are young, an Epilepsy. Sometimes a Vertigo afflicts the fore Part, and at others the back Part of the Head. The former Species is more easily cured than the later, which is very dangerous.

With respect to the Cure, the Regimen in general ought to be the same with that in an Apoplexy, or Epilepsy. If the Patient is plethoric, a due Quantity of Blood is to be taken away; and if a Nausea, Loss of Appetite, or any other Disorder of the Stomach remain, an Emetic is to be prescribed; then Cathartics and Specifics are to be ordered. According to *Mayerne*, Calamus Aromaticus, in whatever Form, is good for a Vertigo, and esteemed a Secret for that Disorder. The same Author informs us, that a German Physician cured a great many of Vertigos, by Pills made of Sugar of Lead, and *Cypressi Turpentine*; four or five Grains of which were to be taken for a Dose; and their Use persisted in for some Days. *Glisson*, as *Bates* informs us, after all other Medicines had failed,

failed, was cured of a severe Vertigo, of three Weeks Continuance, by shaving his Head, and applying to it a Plaister, made of the Flowers of Sulphur, and Whites of Eggs. Some order a Caustic, or a Seton, to be applied to the back Part of the Neck; a Caustery to the Bregma; and Bates's Epileptic Electuary, or Fuller's Peruvian Epileptic Electuary, to be used internally. Willis informs us, that, after he had in vain tried all other Medicines, he with Success prescribed the following Powder.

Take of the Powder of the Roots of Male Piony, two Ounces; of the Flowers of Male Piony, one Ounce; of Peacocks Dung, of the whitest Kind, half a Pound; and of white Sugar, two Ounces: Reduce to a Powder, the Dose of which is to be about the Quantity of a Spoonful, twice a Day, drinking after it a Draught of a Decoction of Sage and Rosemary, impregnated with Coffee.

VERTO, in Dornæus, Rulandus, and Johnson, is the fourth Part of a Pound.

VERVA, in Scribonius Largus, N° 16. is the Name of an Amulet of Ivory, to be worn on the Arm for the Epilepsy.

VERUCLA is the same as the preceding. Rhodius, in Scrib. Largum, N° 16.

VERVEX. A castrated Sheep.

VERUTA Sectio, ἡ ἐκείνη διαίρεσις, from Veru, ὁ ἐκείνός, a Spit, is a Chirurgical Operation, or Section; so called, and directed by P. Ægineta, Lib. 6. Cap. 8. in the Cure of a Distichiasis, to be performed with a σκελίον ἀναρρακίδον, a Knife adapted to Sutures.

VESANIA, according to Blancard, is a Species of Madness proceeding from Love.

VESANUS, according to Paracelsus, Tract. 1. de Morb. Ament. Cap. 5. is one who has contracted Madness from a bad Regimen, or improper Medicines: But Insanus, he says, is the proper Denomination of one mad from the Birth; or whose Madness is hereditary. Castellus.

VESICA. The Bladder. See CALCULUS, and RENES.

VESICARIA is a Name for the Alcea Veneta; and, also, for the Alkekengi; either because its Fruit and Seed are contain'd in Bladders, or because they are good for the Stone in the Bladder. Blancard.

VESICATIO. A Vefication, or raising of Vesicles, a Symptom succeeding Combustions by Fire or Water. The Effects of a vesicatory Remedy are, also, called Vescatio. Castellus.

VESICATORIUM. A Vesicatory. See CANTHARIDES.

VESICULA. A Vesicle, or little Bladder; a Diminutive of Vesica; it is often appropriated to the Gall-bladder.

VESICULÆ SEMINALES.

The Vesiculæ Seminales are soft, whitish, knotted Bodies, about three or four Fingers-breadth in Length, one in Breadth, and about three times as broad as thick, situated obliquely between the Rectum and lower part of the Bladder, in such a manner, as that their superior Extremities are at a Distance from each other, and their lower Extremities united between those of the Vasa Deferentia; of which they imitate both the Obliquity and the Incurvation.

They are irregularly round on the upper Part, and their Breadth decreases gradually from thence: By the Union of their lower Extremities they form a kind of Fork, the Branches of which are broad, and bent like Rams Horns: These Extremities are very narrow, and form a small Neck, which runs behind the Bladder, toward its Orifice, and continues its Course in the Groove of the Prostate, through the Substance of the contiguous Portion of the Urethra, till its Extremities pierce the Caruncula.

The inner Substance of the Vesiculæ is plaited, and in a manner distinguished into several Capsulæ, by contorted Folds: Their external Surface is covered by a fine Membrane, which serves for a Border and Frænum to the Folds, and is a true Continuation of the Cellular Substance of the Peritonæum. The Vesiculæ may easily be unfolded, and all their Contortions straitened; and, by this means, they become much longer than in their natural State.

Their inner Surface is villous and glandular, and continually furnishes a particular Fluid, which exalts, refines, and perfects the Semen, which they receive from the Vasa Deferentia, and of which they are the Reservatories for a certain time. Winslow's Anatomy.

VESPA. Ofic. Mer. Pin. 196. Raii Insect. 250. Jonst. de Insect. 17. Aldrov. de Insect. 198. Mouff. Insect. 41. Charlt. Exer. 37. THE WASP.

The whole Insect is used, and is supposed to open Obstructions of the Kidneys and Bladder, to break the Stone; and is thought by some to agree in Virtues with the Asellus, or Woodlouse. Dale.

VESPA ICHNEUMON.

This is a Fly, with a slender Body, four Wings, and arm'd with a Sting.

It has been observed of the Grana Radicum Breynii, or the Coccus Polonicus, [see the Article KNAWE]; and of the Grana Kermes, or Coccus Baphicus Ofic. [See CHERMES]; that they are Nests of Insects, and not generated of the Plants in which they are found. But since we omitted, under those Articles, to inform the Reader to what Tribe of Insects they ought to be reduced, it is here thought proper to observe, that both of them arise from Eggs deposited, by the Parent Insect, in a Wound they make in the Plant, so as to raise a Tumor: From this Tumor, matured by the Heat of the Sun, arise Insects with six Legs, which are, by degrees, metamorphosed into Wasps, called Ichneumones. This I am induced to believe by two Reasons: The first is, that Breynius himself observes, that Animals of this Tribe are found in the Places where these Cocci grow. Secondly, The Wasps of this Tribe lay their Eggs not only in the Bark of Trees, and the Roots and Stalks, but in the Bodies of Animals, as appears from a Multitude of Observations in Authors, who have written of Insects. We have an Example in Goedartius's Metamorphosis of Insects, in the Eruca Brasicaria, or Caterpillar, which infests Cabbages, where writing of this Sort of Insects, the Author says, that, "After they had lain four Days without Motion, you may see forty or more Worms breaking out of the Skin, on both Sides of every single Insect, which afterwards became so many small Flies." Ray, in his History of Insects, takes notice of the same; and I myself have made the like Observation on the Caterpillar, and other Insects, which become Nests not only of Ichneumon Wasps, but, also, of other Flies.

Some think the Worms hermaphrodite: Of this Opinion was Cheston, because he could never discover any Difference of Sex in them, or observe them joined in Copulation. The Minuteness of the Animalcula might, indeed, be an Hindrance to any Observation of those Parts and Actions; whereas, in Earthworms, House-snails, and the Limax, which are, also, Hermaphrodite, the Manner of their Generation, as being larger Animals, is plain and evident.

Garidellus, in his Histoire des Plantes qui naissent en Provence, has written largely of the Coccus Baphicus, but not so accurately as there was Reason to expect, from a Person who had such Opportunities of making Observations. What the very learned Breynius has written of the Matter, in his Hist. Nat. Cocci Radic. Tinct. I shall relate in his own Words, observing first, that the Coccus Polonicus is to be ranked with the Coccus Radicum; as we are assured by Breynius himself, who, in the Conclusion of his Work, writes thus:

"The Coccus Radicum is an Insect, destitute of Wings, furnished with six Feet, of no distinct Sex, as far as it appears; which, fastening itself to the Tops of the Roots of the Polygonum, and being deprived of local Motion and Sense, under the Appearance of a spherical Grain, seems to acquire the Nature of Vegetables, and increases in Bulk; out of which, after a determinate Time, there comes forth another Worm, or Insect, different from the former, though resembling it in many Properties: This Worm receives no Nourishment, nor Increase, nor appears of a distinct Sex, but brings Eggs to Perfection within itself; and, after a certain Time, is covered with a Down; and, being again deprived of local Motion, is contracted, and expels its Seeds or Eggs, from which, after another determinate Time, by Virtue of the Sun's Heat, are hatched, or produced Worms like those first-mentioned."

Now, though I have not the least Doubt of the Veracity of Breynius, and the Truth of his Observations, yet, since he confesses, that Multitudes of the Ichneumon Wasps, are to be found near the Nests of these Animals, I cannot but suspect, that they owe their Original to them. Garidellus, also, owns that after the Hexaped, or six-legged Insects, perish, these small Flies are produced in the Grains of Chermes. Dale.

VESPERNA, the fourth Meal, or fourth time of Eating, in a Day, and next after the Merenda, or Afternoon's Collation. Castellus.

VESPERTILIO. Ofic. Aldrov. Ornith. 1. 571. Bellonides Oyse. 147. Gesn. de Avib. 694. Jonst. de Avib. 34. Charlt. Exer. 80. Raii Synop. A. 243. Sloan. Hist. Jam. 2. 330. Andira. Pis. (Ed. 1658.) 290. Andira acu. Marceg. 213. Andbura. De Laet. Ind. Occid. 615. THE BAT, or FLITTER-MOUSE.

It appears in Summer Evenings; but in the Winter lies hid in Rocks and Caverns. The Flesh and Blood of this Animal are used; the first of which, being prepared, is good for a Scirrhus, and the Gout; and the Blood cures an Alopecia. Dale from Galen.

Ray justly observes, that this Animal is, by some, erroneously reckoned among Birds, because of its Wings and Flight, since it has neither Feathers nor Beak, nor lays Eggs. *Dale.*

VESTIBULUM. A Part belonging to the Ear, so called. See **AURIS**.

VETERINARIA, *ἡντιατρικὴ*, is that Part of Medicine which treats of the Diseases incident to Horses and Cattle.

VETERNUM. The *Anasarca*. *Junius in Nomenclat.*

VETERNUS. The same as **LETHARGUS**.

VETONICA. The same as **BETONICA**: Betony. It is, also, a Name of the *Caryophyllus altilis major*.

VETTADAGOU, H. M. is a low, bacciferous, Indian Shrub, bearing a whitish, pentapetalous, and scentless Flower, and a round black-purple Berry, containing five solid triangular Seeds, which are first white, then reddish, and at last blackish. It is an Evergreen, and bears Fruit twice in the Year, that is, in *March* and *September*.

Of the Leaves bruised, and boiled in Oil of Sesamum, is prepared a Liquid, which, applied to the Abdomen, is said to give Relief under difficult Labour; and to expel the Secundines, when retained.

The *Kal Vettadagou*, H. M. very much resembles the preceding, only its Leaves are lesser and rounder; the Flowers are red, and the Berries of an Orange-colour, and have an acid Taste. *Raii Hist. Plant.*

VETTI TALL. See **AMVETTI**.

VEXATA, in the Language of *Celsus*, are Contusions or Collisions. Of the Cure of *Vexata* he treats, *Lib. 7. Cap. 1.* See **CONTUSIO**.

UHEBEHASON *Theveti*. J. B. Arbor Brassicæ Folio excellissima Americana. C. B.

This is a Tree of surprising Talness, with Branches stooping one under another, and Leaves like Cabbage-leaves. The Branches are loaded with Fruit, a Foot in Length. The Tree yields, also, a red Gum. When *Thevet* was in *America*, he observed this Tree at the Distance of six Miles, when he looked upon it, he says, as something artificial, and not as a natural Product.

Innumerable Multitudes of Bees have their Aliment from the Fruit, and their Nests in the Holes or Cavities of the Tree, where they raise their Combs, and prepare their Honey. He describes two Sorts of these Bees; the first are of the Size of our ordinary Bees, and make a very good Honey, and a yellow Wax; the other Sort of Bees is less by half, and makes a Honey which excels in Goodness, but a Wax as black as a Charcoal. The Fruit *Uhebaso*, though coveted by the Bees, is not eatable by human Creatures, because it is not easily brought to Maturity. *Raii Hist. Plant.*

VIA. This Word, which imports a Path, or Way, has no peculiar Sense in Medicine, except that the Stomach, Intestines, and their Appendages, are called the *Prima Via*.

VIBEX. A livid, or black Mark, on the Skin, from a Contusion. It is the same as an **ECCHYMOSIS**.

VIBRISSÆ, or **VIBRISCI**. The Hairs which grow in the Nostrils.

VIBURNUM.

The Characters are;

The Flower is monopetalous, rotated, quinquefid, furnished with five Stamina, growing on the Inside of the lowest Part of the Flower, disposed in Umbellæ, and growing on the Ovary. The Ovary has its upper Margin surrounded with a quinquefid Calyx; is furnished with an erect, and, in a manner, triglobular Tube, and becomes a soft succulent Berry, which is compressed, striated, and full of a single stony Seed.

Boerhaave mentions nine Sorts of *Viburnum*; which are,

1. *Viburnum*. *Offic. Parkinson. Theat.* 1448. *Raii Hist.* 2. 1590. *Synop.* 3. 460. *Tourn. Inst.* 407. *Boerh. Ind. a.* 2. 224. *Viburnum vulgo*. C. B. P. 429. *Lantana*, *sive Viburnum*. *Ger.* 1305. *Emac.* 1490. *Lantana vulgo*, *aliis Viburnum*. J. B. I. 557. THE WAYFARING TREE.

Matthioli, who has given the best Figure of this Tree, affirms, that its Leaves are astringent, and good to strengthen the Gums; that its Fruit, reduced to Powder, stop a Looseness; and that Birdlime is made of its Roots macerated in the Ground, and bruised. *Martyn's Tournefort.*

This is an arborecent Shrub, sometimes pretty large, though rather spreading than tall, and consisting of a fungous and medullous Wood. From the Root, close to the Ground, shoot scattering spriggy Branches, an Inch in Thickness, and two Cubits, or more, in Length, covered with a reddish Bafe, sprinkled with a farinaceous Powder, and consisting of but little Wood, and that green, but of a very large white medullary Substance. The Leaves much resemble those of the *Alnus*, or, rather, of the *Sorbus Alpina*, and are opposite, broad, somewhat long, and thick, crenated, hairy, and sprinkled with a white Powder, especially in the lower Part, which, for that

Reason, is whiter than the rest, and of an astringent Taste. The Flowers grow in Umbellæ, smell like Elder-flowers, and are white, caducous, and consisting of five Petals moderately reflexed outwards, in the midst of which arise five long whitish Stamina. The Flowers are succeeded by Berries, which are first green, then red, and, when ripe, black, flattish, sweet, and viscous, and not very grateful, at least, says *J. Baubine*, to my Palate, tho' many in the Country feed on them, and, in order to hasten their Maturity, strew them upon Hay, or Straw, Layer upon Layer, alternately. The Berries contain a broad, compressed, and striated Seed, cover'd with a stony Cortex, or Shell.

It grows frequently in Hedges, especially in a clayey and uncultivated Soil; and flowers in the Summer, earlier or later, according to the Weather, and the Temper and Condition of the Soil. The Berries are generally red in *July*, and ripe in the End of *August*, or Beginning of *September*, as we are told by *J. Baubine*.

The Leaves and Berries are drying, and astringent; whence they are commended for Inflammations of the Tonsils and Throat, the Falling-down of the *Columella*, the Loosening of the Teeth, and Fluxes of the Belly. The Leaves, boiled in a Lixivium, blacken the Hair, and repel an *Alopecia*. Of the Bark of the Roots, macerated under Ground, and now-and-then boiled, and pounded for a long time together, is prepared a Birdlime, which is none of the worst for Fowling. *Matthiol. Dodon.* We doubt, with *J. Baubine*, that *Matthioli* has ascribed many Things to the *Viburnum*, which belong to the *Rhus*; because he once thought them, with *Ruellius*, the same.

Of the small Branches is prepared a very good Water for the Eyes. *Camerarius.*

Our Country People, says *Ruellius*, call it *Viurna*, and use it for binding of Faggots, because of its invincible Toughness. It is applied to the same Uses where-ever it grows, whence skilful Botanists take it to be the *Spiræa* of *Theophrastus*.

It is called *Viburnum à viendo*, "from binding; for *Viburnum* is not a Name given by the Antients to any particular Shrub, but is appropriated, by the Moderns, to the above described, because of the Flexibility or Pliancy of its Branches; whence it is, also, called *Lantana*. *Hist. Plant. adscript. Boerhaav.*

2. *Viburnum*, *Americanum*; odoratum; *Urticæ foliis latioribus*; spinosum; floribus miniatis. P. B. *Prodr.*

3. *Viburnum*; *Americanum*; odoratum; foliis *Urticæ*; floribus miniatis. H. L. *App.* 698. *Camará*. Pifo 177. & *Camará-Tinga*. Id. Ib.

4. *Viburnum*; *Americanum*; odoratum; folio parvo, orbiculato; floribus & baccis foliolis interceptis. C. P. B. *Prodr.*

5. *Viburnum*; Cisti foeminae, five *Salviæ foliis mucronatis*; *Americanum*; odoratum; minus; floribus incarnatis. P. B. *Prodr.*

6. *Viburnum*; *Americanum*; *Salviæ foliis obtusis*; floribus albis. P. B. *Prodr.*

7. *Viburnum*; *Americanum*; Cisti foeminae, seu *Salviæ foliis mucronatis*; floribus luteis. Par. Bat. *Prodr.*

8. *Viburnum*; *Americanum*; folio *Urticæ latissimo*; floribus aureis in globum congestis. H. R. D.

9. *Viburnum*; *Americanum*; folio *Urticæ*; floribus ex auro & roseo mistis. H. R. D. *Boerh. Ind. alt. Plant.*

VICIA.

The Characters are;

The Pod is full of roundish, or angulated Seeds; the Leaves are numerous, pinnated, and generally conjugated, by Pairs, to a Rib, which ends in a Tendril.

Boerhaave mentions twenty-two Sorts of *Vicia*, which are;

1. *Vicia*; supina; latissima; folio non ferrato. T. 397. *Faba sylvestris, fruticosa rotunda atro*. C. B. 338. *Bona sylvestris*. Dod. p. 516. *Aracus, fabaceus*, & *Faba kairina*, cui semina minora. J. B. 2. 286.

2. *Vicia*; fativa vulgaris; semine nigro. C. B. P. 344. *Tourn. Inst.* 396. *Boerh. Ind. A.* 2. 43. *Vicia*. *Offic. Ger.* 1052. *Emac.* 1227. *Raii Hist.* 1. 900. *Synop.* 3. 320. *Vicia vulgaris sativa*, Park. *Theat.* 1072. J. B. 2. 310. *Aphaca, Vicia*, Chab. 146. COMMON TARE.

The Stalks of Tares are angular, weak, and leaning, beset alternately at the Joints with long Leaves, having a Tendril at their End, made of ten or a dozen small roundish Pinnæ, a little hollowed in with a Spinula at the End: They are sometimes a little hairy. The Flowers grow usually two together, upright, and less than Pea-blossoms, of a purplish Colour; after which follow small flattish Pods, containing three or four small round black Seeds, less than Pease. Tares are sown in the Fields, flowering in *May*, the Seed being ripe in *August* and *September*.

Tares are rarely used in Medicines, though the Vulgar boil them in Milk, and give the Decoction to drive out the Small Pox, and Measles. *Miller's Bot. Off.*

Common

Common Tares are heating, drying, cleansing, absterfive, and astringent: They agree in Virtues with the APHACA, which see.

3. Vicia; fativa; alba. C. B. P. 344. Tourn. Inst. 397. Boerh. Ind. A. 2. 43. Vicia alba. Offic. Vicia alba semine. J. B. 2. 311. Raii Hist. 1. 900. Park. Theat. 1072. WHITE TARE.

This Species is distinguished by a remarkable Variety in its Leaves, some of which are almost round, others long and narrow; the Flower is single or double, with many purple Spots, and growing on a short Pedicle; the Pods, also, are different from the common Tare, being full of Seeds; sometimes nine in a Pod, which are altogether white, or purplish, or various, or of a pale green, resembling, in Shape and Colour, green Pease, to which they are equal, also, in Bigness, but distinguished from them in that they are not blackish in the Part where they are connected to the Pod, as Pease are.

The Vicia Indica fructu albo of Gerard differs not from the common Vicia, except that it is taller, and bears a larger and rounder Grain, which, in Colour, Shape, and Size, is equal and like to the common white Pea. Raii Hist. Plant.

It agrees in Virtue with the common Tare, but is not used in the Shops.

4. Vicia; vulgaris; acutiori folio; semine parvo, nigro. See ARACUS.

5. Vicia; flore albo; filiqua longa, glabra. Ind. 160.

6. Vicia; folio, & filiqua latis, filiqua hirsuta. Ind. 160.

7. Vicia; flore purpureo; filiquis brevibus, crassis, pendentibus. M. H. Descr. 2. 62.

8. Vicia; folio magno, atroviridi, apice aculeato; filiqua singulari, quasi articulata, semine nigrescente cinereo.

9. Vicia; arvensis; folio supremo emarginato, aculeato; flore & semine, albo.

10. Vicia; Orientalis; flore suave rubente; filiquis brevissimis. Nissole.

The twelve following Species of Vicia have Flowers growing thicker together, and in Spikes.

1. Vicia; Orientalis; flore maximo, pallescente, macula lutea notato. T. C. 270.

2. Vicia; perennis; maxima dumetorum; flore obscure rubente. M. H. 2. 61.

3. Vicia; luteo flore; sylvestris. J. B. 2. 313.

4. Vicia; multiflora. C. B. P. 345.

5. Vicia; Bengalenis hirsuta, incana; filiqua Pisi. H. L.

6. Vicia; angustifolia; purpureo-violacea; filiqua lata, glabra. Magnol. Botan.

7. Vicia; multiflora; Cassubica; frutescens; filiqua lentis. Breyn. Prodr.

8. Vicia; major; folio cordato; flore rubro; fructu albo, Pisi minoris instar. M. H. 2. 63.

9. Vicia; segetum; singularibus filiquis glabris. C. B. P. 345.

10. Vicia; minima; cum filiquis glabris. T. 397.

11. Vicia; maxima; tetraphylla, vel pentaphylla. H. G. 229.

12. Vicia; maritima; flore albo oblongo. Bobart. Boerh. Ind. alt. Plant.

Vicia, according to Varro de R. R. is derived à Vinciendo, from binding; because, by its Tendrils, like the Vitis, or Vine, it climbs, and binds itself about other Plants. But we are rather of Opinion, with Vossius, in Etymolog. that Vicia comes from the Greek; for those of Asia call this Plant *Bisor*, (*Bicion*) as we are told by Galen, Lib. 1. de Alim. Fac. Cap. penult. Raii Hist. Plant.

This Plant affords good Fodder for Cattle; for its Seed supplies the Place of Oats; and the Herb serves instead of Grass. Men have, also, eaten the Grain, in Times of Scarcity, and found themselves never the worse for it. The Meal of Tares is like the Meal of the Seed of Fenugreek. Hist. Plant. ascript. Boerhaav.

VICIA LUTEA. See APHACA.

VICIE SIMILIS. A Name for the Lathyrus; ἀμύλατος; supra & infra terram filiquas gerens.

VICINITRAHA, or VICINITRACTUS. Castellus informs us, that Felicianus makes Use of the first; and Ingrassias of the second, to express an Erysipelas. But this must have happened through a gross Blunder, with respect to the Derivation of the Word Erysipelas.

VICTICELLÆ, or VITICELLÆ LIQUOR, in Paracelsus, is a Sort of Wine.

VICTORIALIS. See ALLIUM.

VICTORIATUS DENARIUS, in Marcellus Empiricus, is half a Dram. As a Coin, it is half a Denarius.

VICTORIOLA. A Name for the Laurus Alexandrina. Blancard. See RUSCUS; latifolius; fructu folio insidente.

VICTUS. Imports the same as DIÆTA.

VIGILÆ. See Pervigilium, under the Article PYRELOS.

VIGO (Johannes de). A celebrated Surgeon of Genoa, about the Year 1517. There are some Compositions called by his Name. Thus the Emplastrum de Ranis cum Mercurio is called the Emplastrum de Vigo cum Mercurio; and without the Mercury, Emplastrum de Vigo simplex. Some Troches are, also, called Trochisci de Minio Vigonis. See CORRODENTIA. The Emplastrum de Minio Vigonis is thus prepared:

Take of Turpentine, ten Ounces; of Hogs Lard, seven Ounces; of the Suets of Mutton, and Beef, and of Oil of Roses, each half a Pint; of the Oil of Myrtle, of the Ointment of Poplar, and of Cerufs, each four Ounces; of the Litharges of Gold, and Silver, each three Ounces and a half; of red Lead, three Ounces; of the Fat of Fowls, two Ounces; and of white Wax, eight Ounces: Make into a Plaister, according to Art.

After the Litharges, the red Lead, and the Cerufs, are reduced to a fine Powder, they are to be mixed, in a Bason, with the Oils, the Fats, and the Ointment of Poplar: To these add two Pints of common Water, and boil the Mixture, constantly stirring it with a wooden Spatula, till it has acquired the Consistence of a Plaister, and the Water is quite consumed, which is known when it ceases to boil: Then melt in it the eight Ounces of white Wax, broken in small Pieces, and the Turpentine, to make a Plaister, to be kept for Use. This Plaister is of a drying, cicatrizing, and resolvent Nature. Lemery, Pharmacopée universelle.

VIGOR, with respect to Diseases, is the same as ACME.

VILLI. Small Hairs, or Fibres, or the Nap of Cloth. Hence, from the Similitude, the shaggy Fibres on the Inside of the Intestines, and many other Parts of the Body, are called Villi.

VILTRUM. The same as FILTRUM. Viltrum Philosophorum is an Alembic.

VINCA PERVINCA. See PERVINCA.

VINCETOXICUM. See ASCLEPIAS.

VINCULUM. A Bandage. Vinculum Softrati is a Species of Bandage described by Galen, in his Treatise of Bandages, Number 81.

VINDICIANUS. Marcellus Empiricus, in Cap. 16. gives a Remedy for a Cough, which he ascribes to Vindicianus. Rub, says he, live Sulphur, mix it with very old Hogs Lard, and make them up into Pills, of such a Size, that they may be easily swallowed: Give three the first Day, two the second, and one the third. This Medicine, he informs us, is excellent for Horses, as well as for Men.

VINUM. Wine.

The Principles, or Elements, of which Wine is composed, are, first, An inflammable Spirit: Secondly, A Phlegm: Thirdly, An acid tartareous Salt: And, fourthly, A certain sulphureous and oleous Substance.

Wines, therefore, differ from each other, with respect to Taste, Smell, and Virtues, according to the Mixture and Proportion of these Elements. Such Wines as contain a large Quantity of inflammable Spirit, soon intoxicate, and heat the Body; but Wines in which the phlegmatic or tartareous acidulated Parts predominate, are of a laxative and diuretic Quality; nor do they easily affect the Head. Wines which contain a great deal of an oleous and sulphureous Substance, such as old Wines, are of a deep yellow Colour, of a strong Taste, and Smell; and as they are not easily transpired, so they remain long in the Blood, and dry the Body.

There is, also, another essential Element, or Principle, in Wines, which is a certain sweet, oleous, temperate, and viscid Substance, discoverable in Wines which are not sufficiently fermented, or gently boiled; and such a Principle is, particularly, observed in strong Sack, Frontignac, and Hungarian Wine. This Principle not only renders Wines grateful to the Taste, but, also, of a nutritive and demulcent Quality.

Tho' all Wines may be resolved into their constituent Principles, that is, a Spirit, an Oil, a Phlegm, a sweet Substance, and an acid tartareous Part; yet they differ in this, that some contain a sweet and subtil Sulphur, whereas others have a coarser Sulphur, which is not so grateful to the Taste.

Thus Rhenish and Hungarian Wines contain a far more grateful Spirit, and a more sweet and subtil Sulphur than the Wines of France, Turin, and Meissen, in which the Spirit and Sulphur is somewhat harsh, and disagreeable to Nature. Hence it is, that the Smell, only, of old and generous Rhenish Wine, surprisngly refreshes the Strength; which Effect is not to be expected from other Wines. The tartareous Principle of Wines is, also, different; since some contain a large Quantity of coarse Tartar, such as the Provencal Wines; and others a more subtil Tartar, such as the Rhenish Wines. Some Wines, such as those

those of the *Mefelle*, contain a tartareous nitrous Salt, of a somewhat bitterish Taste, on which Circumstance depends their laxative and diuretic Quality.

In order to such an Analysis of Wines as may discover their Principles, a due and careful Distillation is of great Importance.

Three Pints of the best Rhenish Wine, distilled in a glass Cucurbit, yielded thirteen Ounces of Spirit, with which, however, was mixed almost half that Quantity of Phlegm.

Three Pints of Franconian Wine yielded eight Ounces of Spirit, of the like Nature with the former. A Pint and three quarters of strong Hungarian Wine, subjected to Distillation in a Cucurbit, yielded eight Ounces and a half of a Spirit far stronger than the former; so that there was hardly a third Part of Phlegm mixed with it.

From a Pint and six Ounces of Burgundian Wine, subjected to Distillation in the same manner with the others, I obtained eight Ounces of Spirit, mixed with half that Quantity of Phlegm. Hence it is obvious, that Hungarian Wine is far more spirituous than Burgundian Wine, which is more spirituous than Rhenish Wine, which is more generous than Franconian Wine.

After abstracting the Spirit from the Wine, by Distillation, what remains in the Cucurbit acquires a deeper Colour, and is of an highly acid Taste; only with this Difference, that the Remainder of the Hungarian Wine is of a somewhat sweetish acid Taste, that of the Burgundian of an astringent acid Taste, that of the old Rhenish Wine of a more acid Taste, and that of the Franconian Wine most acid of all.

When the Spirit, abstracted from the Rhenish Wine, is again poured to the Part remaining after Distillation, or the acid tartareous Phlegm, its penetrating acid Taste is, by this means, greatly corrected, and lessened; but its former Taste and Smell of Rhenish Wine does not return, because the specific Taste of any thing depends upon a particular Mixture and Texture of the Parts, which are dissolved and destroyed by the Distillation. And because, by the new and mutual Confusion of the Liquors, the Particles are not so united as they were before, hence, also, the Taste is changed.

Since a vinous Spirit corrects and infringes Acidity; and since Hungarian and Burgundian Wines contain more Spirit than any other Kinds of Wines, we may justly conclude, that these Wines are proper for those whose Stomachs generate large Quantities of Acids; such as old Persons, those subject to hypochondriac Disorders, and Quartan Fevers: And that they are principally beneficial, when Chylification is over, and many acid Crudities of the digested Aliments remain in the Stomach.

As the Remainder of the Burgundian Wine is an acid and austere astringent Phlegm, we may justly conclude, that this Wine is proper for corroborating the Tone of the Stomach and Intestines; and that the Use of it is more expedient when the Body is preternaturally soluble, than when the Patient is costive.

The Colours of Wines depend on the sulphureous oleous Principle, which, by the intestine fermentative Motion, is intimately resolved and mixed with the Parts of the Wine: The deeper the Colour, therefore, of Wine is, the larger Quantity of Oil they contain. When, therefore, the Spirit is abstracted from the Wine, the spirituous, aqueous, and acid Parts, are carried off, and there is left in the Vessel a thick Mass, of a darkish and very deep Colour; to which, if a considerable Quantity of Water is poured, it is immediately tinged with the same Colour the Wine had in its natural State; which is a sure Proof that the Wine derived its Colour from the thick, sulphureous, and oleous Mass, which remains in the Vessel after Distillation.

Red Wines receive their Colour from the red Pellicles of the Grapes, upon which they stand long infused; the Acid, therefore, which is in Musts, also, extracts and exalts the Colour which is contained in these Pellicles; for which Reason, that Colour is purely adventitious. All red Wines are possessed of an astringent Taste and Virtue, because they stand long infused not only with the red Pellicles of the Grapes, but, also, with their small Stones, which are of a manifestly astringent Taste. Hence they extract the astringent Principle from these two Substances, and receive it into themselves.

Red Wines, especially of the Burgundian Kind, when distilled, and afterwards reduced to a thick Consistence, by Evaporation, in a proper Glass, are of a deep-red Colour, and a strongly-astringent Taste; and a Portion of the Wine, thus inspissated, when poured into a considerable Quantity of Water, not only tinges it with a red Colour, but, also, gives it an astringent Taste.

When to red Wine, or the Extract of it which remains after Evaporation, there is poured a sufficient Quantity of the Oil of Tartar per Deliquium, the grateful red Colour of the Wine is destroyed, and changed into one of a brownish Kind; the Mixture becomes turbid, and deposits a certain Sediment at the Bottom; a certain Proof that the beautiful redish Colour does,

in a great measure, proceed from the Acid exalting the red Colour.

The yellow Colour of Rhenish Wines, also, proceeds from a sulphureous and oleous Principle; and as the Sulphurs, which are, as it were, the Matrixes of Colours, are exalted, by the Admixture of alkaline Salts; so the like happens in Rhenish and French Wines, the yellow Colour of which is changed into brown, by the Affusion of a sufficient Quantity of Oil of Tartar per Deliquium, or urinous Spirit of *Sal Ammoniac*.

When an alkaline Liquor is mixed with Wines of a considerably acid Taste, the Colour is not only changed, but, also, a gentle Effervescence excited; and the Acid of the Wine, meeting with the alkaline Salt, passes into a neutral tartareous Salt, such as tartarised Tartar, or the *Terra foliata Tartari*, which is generally prepared of Wine Vinegar, and the Salt of Tartar.

Since neutral Salts, consisting of a subtil Acid, and an alkaline Salt, such as the dry *Terra foliata Tartari*, or the *Arcanum Tartari*, which is only the *Terra foliata Tartari* dissolved, are of a remarkably abstergent, aperient, and resolvent Quality, and promote the Excretions by Stool and Urine, they are, therefore, highly beneficial in removing chronic Disorders. And since from the best Rhenish Wine, mixed with Oil of Tartar per Deliquium, the same Salt may be extemporaneously prepared, it is obvious, that Rhenish Wine may, by this simple means, be rendered highly medicinal.

The Acid remaining after the Abstraction and Evaporation of Rhenish Wine, if mixed with Oil of Tartar per Deliquium, produces so violent an Ebullition, that the Froth comes over the Lips of a pretty high Vessel; the Mixture becomes of a deep-brown Colour; and, a few Hours after, the Froth subsides and vanishes; and a Liquor highly similar to the *Arcanum Tartari*, both in its saline Taste, Colour, and Virtues, subsides to the Bottom. The Reason why, during the Effervescence, so great a Quantity of Froth is raised, seems to be this, that the Extract of Wine, besides an Acid, contains a large Quantity of Sulphur, and a viscid Principle: Hence the Affusion of the Alkali excites a great Effervescence, from which arise numerous vaporous and aereo-ethereal Particles, which, being sheathed up in the viscid Principle, cannot fly freely off into the Air, but raise the viscid Particles into Bubbles.

The Countries lying between the fortieth and fiftieth Degrees of Elevation of the Pole, such as Hungary, Spain, Portugal, Italy, France, a great Part of Germany, Austria, Transylvania, and a great Part of Greece, produce the best Wines; because, in these Parts, the Influence of the Sun is greater than in others.

It is, also, certain, from Experience, that mountainous steep Places, with Rivers at their Roots, produce the best Wines; for, besides the Influence of the Sun, the Goodness of Wines, in a great measure, depends on the fine and subtil Nourishment of the Grapes. Now because the Mountains are exposed to the Night Dews, which abound about the Rivers, and contain a subtil Water intermix'd with an ethereal Principle, it is not to be wondered at, if Dew should be the best Nourishment for the finest Vines. But Dew alone is not sufficient for the Nourishment of Vines, which, also, requires Rains.

The Nature of the Soil, also, contributes much to the Production of good Wine; for we observe, that the best Wines grow not in fat, clayey, gross, and black Soils; but rather in such as are stony, sandy, or chalky; which Kinds of Earths, though apparently barren, are yet very proper for Vines; because they long retain the solar Rays, which, by cherishing the Roots, make the Nourishment pass through all the Pores of the Plant. Besides, the Waters, passing through such Earths, are attenuated, and strained, and their grosser Parts separated, and retained; so that the nutritive Juice of the Plant must be the more pure and subtil. The Causes of the different Tastes, Salubrity, and Insalubrity of Wines, are, without doubt, placed in the different Nature of the Soil; since Tracts of Ground, lying on the same Mountain, with equal Aspects to the Sun, and bearing Vines of the same Species, yet yield Wines greatly different, with respect to Salubrity, Taste, and a penetrating Quality. The superior Virtues of the *Tokay* Wine, are, by the Inhabitants of that Part of the Country, ascribed to the Gold there produced, but more justly to the large Quantity of corroborating Sulphur contained in the Earth; since neither Gold, nor any other Metal, can contribute to the Fruitfulness of the Earth, much less to exalt the Juices of Vegetables, or render them more salutary. But the Reason why all the Hungarian Wines are more salutary than others, depends on the Subtlety and Fineness of the Nourishment with which the Vines are nourished, and the large Quantity of the aereal and ethereal Principle, which is intimately mixed with their Juices, and which renders both Aliments and Medicines far more salubrious than they would otherwise be.

The more subtil and light Waters are, and the more they abound with an aereo-ethereal Matter, the more wholesome they are. Medicinal Waters are only efficacious in curing Diseases, on account of the Salts, together with the spirituous ethereal Element, which they contain; and if, by Heat, and the free Access of the Air, they are deprived of these, their salutary Virtue immediately is forthwith rendered languid, and destroyed. In like manner, an aereo-elastic Spirit, in the Wines, impels and promotes the Motion not only of the Solids, but, also, of the Fluids, and stimulates the moving Fibres to gentle Contractions; so that the Circulation of the Blood and Humours, together with the Work of Secretion and Excretion, so necessary to Life, are facilitated, and promoted: And, for this Reason, because the Hungarian Wines consist of highly subtil and spirituous Parts, they excellently restore the Strength, and, by promoting a gentle *Diaphoresis*, eliminate the crude and superfluous Juices from the Body. But we shall, for the Reader's Satisfaction, enumerate the most considerable Wines in *Europe*, and specify their medicinal Virtues and Qualities.

Italy, then, affords generous and delicious Wines; among which, we shall first mention that Wine produced at the Foot of Mount *Vesuvius*, call'd, by some, *Lachryma Christi*, and, by others, the *Virgin Wine*, because it flows spontaneously, like Tears, from the best Grapes, before they are trod. This is a strong Wine, of a splendid red Colour, a grateful Smell, a sweetish Taste, and a salutary Quality; for it soon proves a safe and effectual Diuretic, on account of its Thinness.

Alban Wine, so call'd from its growing at the City *Alba*, is beneficial, as well for those who are, as those who are not found, since it gently promotes Perspiration and Urine. This Wine is of two Kinds, Red, and White.

Among the best Wines we may, also, reckon the *Tuscan Muscadel*, or the Wine of *Monte Fiascone*. This Wine is highly palatable, and grateful to the Taste.

The Red Wine of *Monte Bolzano*, and the Moscadel Wine of *Perusa*, are both highly celebrated, and yearly exported in great Quantities, from these two Cities.

The *Punic Wine* was sufficiently known to the Antients: It is produced on the rocky Mountain called *Pforce*, situated in *Capo d'Ischia*, in the *Adriatic Gulph*. This is a sweet Wine, of a fragrant Smell, and does not soon affect the Head, and Operations of the Mind. *Pliny* affirms, that, by the Use of this Wine alone, *Livia Augusta* lived to be eighty-two Years of Age.

Near *Vincentia* there is an excellent Wine produced, called *Marciminian Wine*, which is said to be less hurtful to gouty Patients than any other Wine whatever.

In the District of *Aquila* is produced a noble Wine, called *Rofazer*, from a City of that Name in the *Julian Forum*.

The *Vernacean Wine*, so called from a red Mountain, known, at present, by the Name of *Vernacia*, is a rich and generous Wine, and sufficiently known, not only in *Italy*, but through *France* and *Britain*.

The *Rhetian Wines*, produced in the *Telinian Valley*, are, also, very rich, and delicious; so that *Augustus* is said to have delighted in them. They are red, like Blood, sweet, and leave a somewhat austere Taste on the Tongue.

Though the Wines in *Italy* are generally sweet, yet there are austere Wines prepared in the northerly Parts; and these are used with great Success, in hot Weather, as, also, in hot Diseases, in order to extinguish the excessive Heat.

In *Greece*, the Wines of *Crete* and *Cyprus*, formerly known by the Name *Punic*, are every-where greatly esteemed.

Among the *French Wines*, *Champaign* is generally held in most Esteem: It is grateful to the Stomach, friendly to the Nerves and Head, and soon passes off by Urine. It is of a delicious Taste, on account of the Admixture of a subtil and spirituous Acid.

Next to this are the *Burgundian Wines*. These are generous, in Colour resembling the Eye of a Partridge, of a grateful Taste, less volatile, and better able to bear an Admixture of Water, than *Champaign*.

Paris Wine, especially if made of ripe Grapes, is thin, but grateful to the Taste, and not proper for being mixed with Water.

In *Bordeaux* is produced *Claret*, which is a Wine of a somewhat austere Taste, does not affect the Head, and Operations of the Mind, and excellently corroborates the Tone of the Stomach and Intestines. The best *Bordeaux Wine* is that call'd *Pontac*.

The *Orleans Wines*, both of the red and white Kinds, are very generous, and beneficial to the Stomach; but they generally affect the Head.

The white Wines of *Poitou* are, also, well known, and greatly resemble *Rhenish Wines*, only they are more crude.

Among the best of the *French Wines* we may, also, reckon *Frontignac*, and *Muscadine*, which is red, highly generous, of a sweetish subaustere Taste, and, on account of its Richness, requires an Admixture of Water.

Among the good *French Wines*, we may, also, reckon *Hermitage*, produced between *Valence* and *St. Valiere*. This is a redish subaustere Wine, resembling the Taste of *Myrtle-berries*.

Spain, also, furnishes excellent Vines, which, on account of the due Maturity of their Grapes, yield excellent Wines.

Canary, at present brought from the *Canary Islands*, especially the *Great Canaries*, is produced of the most rich and generous Kind about *Palma*.

Malmsey Wine is expressed from large round Grapes, of the best Kind; and lasts so long, that it may be transported to any Part of the World.

Malaga Wine, or *Sack*, is fatter than *Canary*. The *Perisfont Wine* grows, principally, near the Town *Gualdaclazar*, on the Vines long ago transplanted by *Petrus Simon* from *Germany to Spain*; for a Transplantation from one Climate to another will produce Fruit different in Taste, Sweetness, and other Qualities, according to the different Influence of the Sun, Nature of the Soil, and other Circumstances.

The Country near *Henes*, of *Andalusia*, is very fertile in Wine, which, however, is somewhat austere, and soon becomes acid in warm Places. Of the same Kind are the Wines produced about *Madrid*.

Alicant Wine, produced in *Valencia*, is red, but thick, grateful to the Palate, but hurtful to the Stomach. What we commonly call *Tent*, is not unlike this Wine.

Wine, in general, is possessed of many Virtues, both for the Purposes of Prevention, and Cure: By means of this Liquor, moderately and duly used, Longevity is procured, and the Body preserved robust, and in good Plight: Besides, Wine has a happy Influence, not only on the Body, but, also, on the Mind, whose Powers and Faculties it invigorates beyond all other Liquors, or Medicines, hitherto known. For, as *Gryllus, de Sap. dult. Lib. i.* informs us, the *Greeks*, on account of the Excellence of their Wines, were the glorious Sources from which Learning diffused itself through all the other Parts of the World; but that they lost, at once, their Genius, and Reputation for Literature and Science, when the *Turks* extirpated their Vines: And it is certain, from Experience, that the *Italians*, *French*, and *Germans*, in whose Countries good Wines are produced, are more ingenious and acute, than the Inhabitants of other northern Nations, who use Malt Liquors. The Heathens were so sensible of the happy Influences of Wine, that they placed *Pallas* and *Bacchus* in one Temple, in order to intimate that Prudence was increased by Wine. And the antient Poets have represented their Gods as wiser than Mortals, for no other Reason than that they used Nectar for their Drink, and Ambrosia for their Food. The Fire of the Poets, and all the happy Flights of *Homer*, *Ennius*, *Horace*, and *Ovid*, are the glorious Effects of Wine. Nor is this all; for this Liquor banishes Cowardice, eradicates a dastardly Turn of Mind, and inspires the Soul with Courage, Intrepidity, and Alacrity. Besides, Wine is an universal Preservative of Health, and long Life; for such as is the Circulation of the Blood, such the State of the Health will be. Now it is certain, from Experience, that when the Humours are gross, and their Circulation slow, from a want of due Force in the Heart, or any other Cause, the animal Functions, and, consequently, Health, are greatly impaired. But these Misfortunes are prevented by Wine, the due Use of which augments the Heat of the Body, renders the Pulse stronger, and quicker, forces the Blood from the Centre to the Circumference, increases the Transpiration, promotes a Discharge of Urine, renders the Face red, and the Veins turgid, and, in a Word, refreshes the whole Body and Mind.

The Antients were so sensible of all this, that they recommended Drunkenness, not of the intense and habitual, but of the rare and moderate Kind; for excessive drinking of Wine, like the Abuse of other Remedies, instead of good, produces bad Effects: And this Liquor is at proper Intervals only to be drank in greater Quantities than ordinary, with a View to rouse the Spirits, and animate the Soul, depurate the Blood, and remove Obstructions. Nor, for these Reasons, is it to be doubted, but Wine is an excellent Preservative against hypochondriac Disorders, Weakness of the Stomach, Cachexies, Suppressions of the Hemorrhoids, Tumors and Obstructions of the Liver and Spleen, the Stone in the Kidneys and Bladder, the Gout proceeding from a cold Cause, catarrhus and other Defluxions, Rheumatisms, Lassitude and Heaviness of Body, Loss of Memory, Dulness of Hearing, Dimness of Sight, Weakness of Sensation and Motion from a Fault of the Spirits and Nerves, Impotence in Men, and Sterility in Women: So that we

may justly affirm, that if Mankind knew what salutary Virtues were implanted in Wine, they would not be subject to so many Disorders, nor stand in need of so many Drugs and Physicians.

Having already considered the preservative Effects of Wine, we now come to inquire in what particular Disorders the Use of it is proper.

In malignant Fevers, then, nothing is more excellent than Wine. The Malignity of these Disorders is known from a Defect of Motion and Strength, and from a want of a due spirituous Quality in the Blood, arising from a slow Circulation of the same; all which indicate a certain Disposition of the Fluids to Putrefaction. It is, therefore, expedient, in all these Disorders, to restore the Strength, rouse the Spirits, increase the Circulation of the Blood, and promote Perspiration. These are the Designs of all Alexipharmics. But all these Intentions are answered by Wine, as is obvious, not only from the Authorities of practical Writers, but, also, from Experience: For I myself have known many cured of malignant Disorders, only by the moderate Use of Wine.

In those Disorders where the peccant Matter is to be expelled to the Surface of the Body, such as the Measles, Small Pox, and *Petechia*, when Nature is weak, and the Motion of the Heart insufficient for the Expulsion, or when, through Weakness, there is a Retrocession of the Eruptions, Wine is highly proper; but we are to abstain from its Use, when these Disorders are accompanied with an excessive Heat, an Ebullition of the Humours, and a quick Pulse.

In continual Fevers, *Hippocrates*, in *Lib. 2. de Morb. acut. Sect. 61.* recommends White-wine, both alone, and mix'd with Water. Numberless Practitioners are of the same Opinion. Thus *Forestus*, *Lib. Observat. 1. Obs. 1.* recommends fine small Rhenish White-wine; and *Helmont*, *de Feb. Cap. 12.* tells us, "that they who moderately use Wine in continual Fevers, easily recover, preserve their Strength, and sooner recover their former State and Condition."

Wine is still more proper in Intermittents, which generally arise from Crudities, an Obstruction of the Evacuations, and especially a Suppression of Transpiration. This Liqueur is to be exhibited pretty liberally, on the Days of Intermission; but sparingly, or not at all, during the Paroxysm, unless in the Decline of the Disease, and when the Body is disposed to sweat.

The Reason why Wine ought not to be prohibited in almost all Fevers, is this: A Fever is an intense Commotion of Blood, excited in order to remove and expel what threatens the Destruction of the Body. Now it is sufficiently obvious, that where this Motion is intense, and too strong, Wine is to be sparingly used; but if this Motion is so weak and languid, that Nature seems ready to sink, it is to be quickened by a proper Dose of White-wine, in order to restore languid Nature.

In Syncope, and Loss of Strength, nothing is more excellent than Wine. *Galen*, in *Lib. 3. de Medic. Facult.* orders those afflicted with a Syncope to drink Wine which is thin, of a yellow Colour, and old, rather than such as is new, or of a middle Age: Because the first not only restores the Strength, and recruits the Spirits; but, also, by its Smell, or when applied to the Heart and Wrists, far surpasses all other Cordials, and Analeptics.

In Nauseas, Weakness, Indigestion, and Inflation of the Stomach, nothing is more beneficial than Wine. Hence *St. Paul*, as we see in *1 Timothy v. 23.* advises *Timothy* to use Wine for a certain Disorder of his Stomach. *Galen*, in *Lib. 4. de Sanitate tuenda, Cap. 6.* tells us, that the Wines which are yellow or white, fragrant and thin, are excellent Stomachics, especially if they are gently astringent; and such are the Rhenish Wines, which, on account of their subtil, acid, spirituous, and astringent Principle, are highly beneficial, in exciting the Appetite, strengthening the Stomach, and promoting the Digestion of the Aliments.

In a *Fames Canina*, or preternatural Voracity, *Hippocrates*, in *Sect. 6. Aphor. 21.* recommends the drinking of Wine; and his Advice is founded on Reason: But that Author did not, in this Passage, mean every Wine, but only such as is generous, pure, and old. For the Cause of this Disorder is an acid corrosive Humour in the Stomach, which, by such Wine, is excellently corrected, just as the corrosive Nature of Spirit of Nitre, or Vitriol, is corrected by the Admixture of Spirit of Wine; or as the Acidity of Tartar, so long as it is in Conjunction with the Wine, is so corrected, as to prove grateful to the Palate.

In order to allay Thirst, nothing is more effectual than Wine mixed with Water; for, by this means, it far sooner extinguishes Thirst, than if Water had been exhibited alone; since Thirst arises from an Obstruction and Constriction of those Glands which discharge the Saliva into the Fauces, for moistening them, and the Oesophagus; but these Glands are better opened by Wine and Water, than by pure Water; for which

Reason, *Hippocrates*, in acute Fevers, was not afraid to prescribe a Mixture of Water and Wine.

In Vomitings, of the idiopathic Kind, or such as accompany Fevers as a Symptom, thin Wine is preferable to all other Liqueurs.

In Colics, especially those arising from Flatulencies, or viscid Crudities, nothing is more beneficial than old Rhenish Wine. For this Purpose, *Hippocrates*, *Lib. 2. Epidem. 6.* recommends rich Wine, because it renders crude Matter fit for Concoction, attenuates what is thick, and dissolves Flatulencies. *Crato*, also, in *Conf. 169.* recommends Rhenish Wine in Colics, but forbids the Use of *Moravian* and *Austrian* Wines; as, also, the *Malmsey* Wines, which are sweet, thick, and turbid.

In Diarrhoeas, and Dysenteries, which appear as the Symptoms of acute Distempers, small Rhenish-wine, either alone, or mixed with a Pisan, produces excellent Effects, since it is possessed of a subastringent Quality, by which the Tone of the Intestines, and their relaxed glandular Coats, are greatly strengthened: And as, in these Disorders, it is highly expedient to move the Humours from the Centre to the Circumference, to augment Perspiration, and provoke Urine, hence Wine is excellent, because it produces such Effects. Red Wines, on account of their greater Astringency, are generally recommended; and, if they are good, they may be used for that Purpose.

In Obstructions of the Liver and Spleen, in the Jaundice, and Cachexy, Wine produces excellent Effects. *Solenander*, a celebrated Practitioner, recommends a Mixture of chalybeate Water with a Wine which is white, pure, ripe, not strong, but pellucid, such as the Rhenish and Moselle Wines, as highly grateful to the Liver; and asserts, that, by their astringent Quality, they corroborate the Viscera. But sweet Wines, because they increase the Quantity of the Blood, are greatly condemned, not only by *Hippocrates*, *Lib. 2. de Morb.* but, also, by *Guarionius*, in *Conf. 117.*

In Dropsies, *Hippocrates*, in *Lib. de intern. Affect.* extols austere Wines; and aqueous Wines, in *Lib. 3. Epidem. Sect. 37.* And *Epiphan. Ferdinand. Hist. Med.* informs us, that Persons labouring under an Ascites have been cured by the Use of *Malmsey* Wine alone.

It is justly to be doubted, whether Wine is proper in hypochondriac Disorders; for I have frequently observed in Practice, that the Symptoms were exasperated by acid Wines, especially of the rough Kind. The Reason why hypochondriac Patients cannot bear Wines inclining to Acidity, seems to be this: On account of the slow peristaltic Motion of the Intestines, their Contents are not promoted, hypochondriac Patients being generally costive, but become stagnant; and, by their Continuance, contract an Acrimony. Hence Wine, in such Patients, is by the Stagnation of the Fæces, converted into a strong Vinegar, which stimulates the nervous Parts to Spasms. But, since hypochondriac Patients require a Reinforcement of Strength, and call for additional Force and Heat in their Stomach, Wine is not to be absolutely denied them. Hence *Brunnerus*, in *Conf. 9.* in hypochondriac Disorders, prefers old Rhenish, or good Hungarian Wines, moderately used at Meals. But those afflicted with Disorders of this Kind, ought to abstain from red, austere, and sweet Wines, and from the excessive Use of all.

In a Scurvy, which generates a large Quantity of fixed tartareous Salts, Rhenish Wine is excellent, because it is diuretic. Hence *Sachsus*, in *Tract. de Vite Vinifera*, informs us, that Rhenish Wines are highly beneficial in a Scurvy, because they, by Urine, evacuate the tartareous Sordes; and that, in scorbutic Patients, he has observed an Evacuation of thick Urine, abounding with Tartar, procured by Rhenish Wine. *Reisner*, in *Lib. de Scorb.* recommends strong, generous, and unmixed Wines, for scorbutic Patients; but orders them to be drank in a small Quantity; and, if the Patient's Heat is increased, to be diluted with Water mixed with Raisins.

In the Stone of the Kidneys, sweet, generous, and oleous Wines are by *Crato*, in *Conf. 53.* justly condemned, because the Stone is generally formed by a Redundance of Blood obstructing the abdominal Viscera and Kidneys, and producing, first, an Inflammation, and then an Ulceration of the Kidneys, and then the Stone. But that a Plethora is augmented by sweet Wines, we have already observed. The Stone is, also, generated in the Kidneys, by turbid and austere Wines, such as those of *Numburgen* in Germany. But Rhenish Wines are good against the Stone, because they are highly diuretic. *Schulzius*, in *Conf. 111.* recommends the *Neccarine* Wines. *Unzerus de Nephrit. Cap. 23.* extols rich Wines, moderately drank, after due Evacuation of the Body. *Montanus*, in *Conf. 229.* greatly recommends pure, ripe, and rich Wines of a white Colour, in nephritic Disorders. A Strangury, according to *Hippocrates*, in *Sect. 7. Aph. 28.* is removed by drinking Wine; but this Aphorism is to be understood principally of generous Wine, because the Disorder treated of generally

rally arises from a Suppression of Transpiration, which is restored by Wine of this Kind.

It is a Question of great Moment, Whether Wine is proper in arthritic and gouty Disorders? It is a common Persuasion, that these Diseases are produced by Wine, and that they are only to be cured by drinking Water, and abstaining from Wine. It is certain, that these Disorders arise from a subtle Tartar, which lacerates the Membranes. Hence Wines, which contain a large Quantity of Tartar, seem to be prejudicial in them. But these tartareous Diseases proceed from an Obstruction of the Emunctories, and a Viscidity and Density of the Humours. But Wine excellently conveys the morbid Matter through the Kidneys, which are the proper Emunctories of the Tartar. Hence, there is no Reason why Wines should not be admitted, especially since the Gout generally derives its Origin from a Weakness of the Stomach, a Defect of a spirituous Quality in the Blood, and a slow Circulation of the Humours. Hence, Wine exhibited with a proper Regimen, and by the Direction of a Physician, may prove a Preservative against the Gout, if it is used out of the Paroxysm. But as there are great Differences, not only between Wines, but, also, between Constitutions, so the Physician ought to be very circumspect. Generous Wines that are not acid, such as the *Hungarian Wines*, agree with some Patients. *Crato*, in *Consil.* 253. orders gouty Patients to drink a little *Hungarian*, or *Malmsey Wines*, at Meals. And *Solenander*, in *Consil.* recommends the moderate Use of Wine for gouty Patients, on account of the Weakness of their Stomachs. The same Author in *Sect.* 4. *Consil.* 24. speaks in the following manner: "We are to observe what the State of the Stomach, and of the rest of the Body, can bear. Nor is absolute Abstinence to be enjoined Patients of every Temperament, Constitution, Age, and Method of Life, because there are great Varieties of Patients. If Wine, especially of the gently astringent Kind, is drank moderately, and at a proper Time, its Use will be beneficial, instead of hurtful. Thus we see, that by the Exhibition of a little Wine in the Decline of the Paroxysm, gouty Pains are alleviated, because by the Heat and Spirits excited, the peccant Humour is dissolved; only the Patient must abstain from Wine in the Beginning of the Paroxysm."

Nor must we forget a singular Method of Cure, used by *Hippocrates* in the very Beginning of sciatic Pains, and a fixed and wandering Gout. His Words on this Occasion, are found in *Tract. de intern. Affect.* and are so memorable, that we shall here translate them: "From any Disorder of the Kidneys arises a proportionable Disorder of the larger Veins: But the Veins, when full of Blood, are indisposed by the Approach of any thing foreign to them. If the Disorder is in the Right Kidney, a Pain begins to reach to the Acetabulum of the Coxendix: The longer this Disorder has lasted, and the farther it has proceeded, the more intense Pain descends to the inferior Parts. And when this Pain has reached the external Malleolus of the Foot, and the Joint of the great Toe, it is again convey'd to the Head; and, when it has there formed an Ulcer, the Head seems as if it would burst, and the Eyes, and all the Body, are filled with Phlegm." A little after he speaks in the following Manner: "If you are called in the Beginning of such a Disorder, you must order a great Quantity of diluted *Mendeian White-wine* every Day; and let the Patient be intoxicated till the Blood bursts from his Nose; and, when the Blood once begins to flow, there is some Discharge of it made, for at least thirteen Days. But, when these thirteen Days are past, the Patient is no longer to be intoxicated; nor is such an Attempt to be made after the Blood begins to flow; but let him at Meals drink a little more Wine than usual, that the Blood may continue to flow." *Hippocrates* deduces these Disorders from a Plethora, which is confirmed by Experience; and this Plethora he endeavours to remove by an Hæmorrhage from the Nose, which he excites by copious drinking of Wine. But, whether it would not be more expedient to lessen the Plethora by Venesection, or procuring an Evacuation of Blood from the hæmorrhoidal Veins, I leave it to others to judge.

Having thus considered the Efficacy of Wine for the Cure of internal Disorders, we shall now treat of the Injuries arising from its preposterous Use in some Disorders. It is, therefore, certain from Reason and Experience, that in all Disorders, where a great Quantity of Blood is congested, as in Inflammations, and most Disorders of the Head, especially an Head-ach arising from an hot Cause, a Phrenitis, Madness, Vertigos, Epilepsies, Lethargies, and all drowsy Disorders, Wines of every Kind are prejudicial; for since in these Disorders the Blood is impetuously convey'd to the Part affected, and congested there, it must circulate slowly. Hence Wine, which by its Spirit ascends to the Head, and produces a greater Rarefaction of the Blood, which it forces more copiously and im-

petuously from the Heart, to the Part obstructed, must produce an Exasperation of these Disorders. *Hippocrates*, also, in *Lib. 2. de Morbis*, in a painful Repletion of the Brain, orders Abstinence from Wine; and, in the same Part asserts, that apoplectic Patients, ought totally to abstain from Wine; and in *Lib. 4. de Morb.* he tells us, that in a Sphacelus of the Brain, and a Lethargy, the Patient is totally to abstain from Wine. A phrenitic Patient, says he, should be warmed with warming Liquors, and Potions; but Wine must not be used for this Purpose. And, in his Book *de Insomniis*, he tells us, that mad Persons ought not to drink Wine.

Wine is, also, hurtful in a Cough and Phthisis, because the Aspera Arteria cannot bear its acrid stimulating Quality. But since sweet Wine assists Expectoration, the moderate Use of it is not injurious; nor when the Cough is on the Decline, is old *Rhenish Wine* to be prohibited, but rather prescribed.

Tirellus, in *Hist. Vini*, tells us, that Wines support the Sound, recover the Sick, revive the languid, and perform Miracles. Extracts, Quintessences, Stones, Boluses, and Pills, are to be despised in Comparison of Wines, which are the true Support of the innate Heat; and ought, therefore, to be celebrated with Praises, proportioned to the Advantages Mankind reap from them. *F. Hoffman*.

In *Spanish Wine*, of that Kind which in our Country (*Holland*) we call *Sireese Sek*, and very excellent of the Sort, I discovered the like saline Figures, as I had before observed in the *French Wine*, represented *Tab. I. Fig. S*, [See under *Acetum*] and others besides, which were of a kind of oblong Form, *Fig. T*. The Number of these, however, was very small, in Comparison of what appeared in the *French Wine*, or *Vinegar*. But I did not doubt of discovering more saline Figures, had this Wine been as thin as the *French*; for I perceived Multitudes of minute Particles subsiding in the Wine, of whose Figures I could have no exact View, because of the thick Matter which surrounded them. However, after I had kept the Wine three Days in my Repository, without a Cover, I perceived great Numbers of very minute Particles, some of which uniting together by their mutual Connexion, resembled the dry small Branches of some Tree; others floated about promiscuously, as soon as the Wine was stirred. These last did not appear to me at first of any Figure; but afterwards I found, upon a more accurate Inspection, that they were endowed with certain Forms and Shapes; and, indeed, the same as those of the saline Particles, which I had observed before in the *Vinegar*. Among them were many representing little Planes, partly inflected roundwise, but of such Minuteness, that, as far as I could judge by my Eyes, ten Millions of them together were not so big as a Grain of Sand. Of these saline Atoms, which presented themselves to my View, many were large and flat, others thick and sharp-pointed, and these had not yet attained their due Perfection. The Contemplation of these Figures confirmed me in the Opinion which I had entertained of the Formation of the acute, or sharp-pointed Atoms of Salts; and convinced me, that all the acute saline Parts of Wine, as well as *Vinegar*, were at first but as so many little thin Planes, and that, by an Inflection of the few Angles, they assumed the Form of those saline Figures, which I had before observed in the *Wine* and *Vinegar*. For Example, the *French Wine*, and what we call *Sek*, exhibited to my View the little thin plane Figures, represented *Tab. I. Fig. a b c d, e f g h*: The Sides of one of these Figures have a Roundness with an Irregularity, while the Sides of the other are those of a Plane; and these are all represented bigger than the Life, that their Position may the better appear, and that you may conceive how the Angles *d* and *z* are incurvated in the manner as is represented in the Figure *i k l*; and how the Angles *a* and *b* unite, and form an acute Angle at *i*, in the same Figure, and how, from a like Incurvation of the other two Angles *c* and *d*, there results a perfect saline Figure. But where these little Planes are but short, they have but two Angles incurvated, and assume the Forms represented by the Figures *q* or *r*, or those of *V* and *W*, *Tab. I.* relating to the *Wine of Orleans*, under the Article *Acetum*. I had as clear a View of the Figures represented *i k l, m n o p*, as I should have of half a Sheet of Paper rolled up at the two adjacent, or all the four Corners, and reduced to an acute Angle *i*, or two acute Angles *m, o*, with an interjacent Plane, tho' a Figure so exquisitely perfect, as that of these saline Particles, cannot be ascribed to Paper, or any thing of that Kind, however modelled: I could, also, plainly and fully discern, not only the Angles, but the interjacent Cavity, which seemed to resemble the Cavity in a Paper rolled up, in the manner before-mentioned.

These Experiments gave me Occasion of considering whether or no these saline Atoms, existing in Planes, changed their Figure when pressed in the Mouth, and passed from a Plane to a Body furnished with two acute Angles; and because they are hollow, by the Curvity of their Angles, picked the sensible

Parts of the Mouth, and lacerated them with their Edges, and so produced those uneasy Sensations on the Tongue and Palate, which we call an *Acid*, or the *Sense of an Acid*.

I placed some *Moselle* Wine in an open Vessel, and letting it stand in my Summer-room for some Days, I afterwards discerned swimming in it Multitudes of saline Figures, of the same Kind as those I had before observed in the Wine, Vinegar, and *Sek*, with only this Difference, that in many of them I not only observed a Cavity and Thickness, but could clearly perceive, that they consisted of from seven to ten Scales, lying one upon another, which I took care to delineate at first myself in a coarse manner, and afterwards had them delineated by a skilful Painter, as they were exposed to his View through a Microscope, and are represented *Tab. I. Fig. s.* I saw, also, swimming saline Figures of different Sorts, from which again arose those half-form'd Figures, represented by the Figures in the Table under *t.* In the Wine of *Orleans*, I perceived some of these little Figures, but not in so great Numbers as in the *Moselle* Wine. I observed, also, some saline Particles, which were perforated by others, as in the Figures *u*; and, besides these, a few saline Planes, some of which had their Sides incurvated, or circumvolved, as you see in Figure *w.* There were, also, among them a few, which had their shorter Sides, as it were, gradually indented, as in the Figures under *x.* I took Notice, also, of a few, which made no more than half of the Figure *s*, as you see them under the Letter *y* in the Table, and a few others, which were flat at their Extremitities, as you see under *z.* But what I highly wondered at was, that in the open Vessel reposit in my Summer-room, I could discover none of the smallest of these little Figures after four-and-twenty Hours; but after another four-and-twenty Hours, I discerned saline Figures, which were less than any before observed, and whose Position, on account of their extreme Minuteness, I could not come to the Knowledge of, as they were besides, hidden under the Covert of some gross Matter in the Wine.

I took *Rhenish* Wine, commonly called *Hochmar*, one Year old, well tasted and generous, before its Fermentation was quite ceased, and placing it aside in an open Vessel, after three Hours, I discovered in it the like saline Figures, which terminated at both Ends in an acute Angle, and had many of them an Eminence, in manner of a Back, or the Keel of a Boat turned upwards, being in other Parts very pellucid. These you see represented *Tab. I. Fig. 1.* The same Figures I had before observed in the *French* Wine. But after I had reposit the same Wine for two Days, I perceived some much larger Figures, with different Circumferences, some having two, others three or four, and others innumerable Circumferences, so closely united, that it was very difficult to determine how far these Circumferences extended, which were many of them so beautiful to the Eye, that nothing in the Sea, whether Coral, or Shells, though the fairest that can be seen, deserves to be compared with them; these you see under Number 2. Among these Figures were very many pellucid ones, which were destitute of any visible Circumference, except a few, which consisted of various minute Figures, of the same Position with those others. I discovered, also, Numbers of Figures, whose both Extremities were obtuse: The one Figure had more of a Plane, or was more obtuse than another; others there were which had only one blunt, or obtuse End, as under Number 3. In another Place I saw swimming in the Wine saline Figures, which had not only Circumferences, but were furnished with Steps or Furrows, as you see them represented under Number 4. Besides the Figures aforesaid, there was a great Number of lesser saline Figures, of different Sizes, and not only furnished with Peripheries, or Circumferences, after the manner of the Figures just mentioned; but constituted of various Forms, some of them exactly resembling a well-made Wine-hoghead, others a *Rhenish* Wine-vessel, which the *Dutch* call *Rhijns-wijnvoeder*, others a long Vessel, which they call *Lange-toest*, as in Figures 5. Some of them were of such Minuteness, that I was obliged to use the utmost Diligence to discover them; and when I had marked the Places, whence the more subtle Part of the Wine was almost exhaled, I, besides, observed lying various Kinds of ramous or branched Figures, some of which seemed to proceed from some saline Figure; and, when I had attentively contemplated those ramous Figures, I found they consisted only of the most minute saline Figures connected to one another, and some of them very irregularly disposed, being often united by the Ends of their Branches to the largest saline Figures, in the manner represented under Numbers 6, 7, 8, 9.

In the Beginning of December 1684. I tried Experiments upon that Kind of *Rhenish* Wine, which we call *Hochmar*, of the Growth of the Year 1678. if we may believe our Wine-merchants, who import this Sort of Wine from *Germany*, after I had made the Inspections into the like Wine, of which I have given an Account. In this Wine I discovered at first but

very few saline Particles; but after I had kept the same Wine three or four Days in my Repository uncovered, I perceived a far greater Number of saline Particles, but in much less Abundance than I had before discovered in the same Wine, when but one Year old. I was very well pleased, however, that I could observe very distinctly, as I thought, most of the largest Particles to consist of a Multitude of minute ones, an hundred of which I imagined, if I could have numbered them, might enter the Composition of one large Particle. These I have represented as well as I could, *Fig. 10.* But, after further Consideration, and close Observations, I concluded, that the larger saline Particles were first concentered, and that afterwards, the lesser ones, which were big enough to come within my Cognizance, became united with the larger by Appulsion; since no small Particles appeared in the Wine about these saline Parts, nor any thing like unto Salt, whereas in the rest of my Observations (for I made a Dozen Experiments upon these Wines, neglecting the rest) I had found saline Particles almost of the same Magnitude, very shining, Multitudes of small saline Particles lying near them. I discovered, also, sometimes a small saline Figure, which seemed to be no more than half the Figure mentioned, and is here delineated under Number 11. Near these were many remarkable small Figures, shining and pellucid, whose Apices, or Points, were not so acute as those of the large Figures; they are represented under 12. I, also, saw some few saline Figures larger than the last-mentioned, which in their Middle contained another Figure, No. 13. Beyond these, in the same Place, appeared some small pellucid saline Figures, whose Extremities were plane, (not pointed) No. 14. There were, moreover, some very few small Figures, representing the dry Sprags, or small Branches of Trees, as was before observed in the same Wine but one Year old; which ramous Figures consisted of many minute saline Figures united, as in the other. These Experiments shewed me the Reason, not only why *Rhenish* Wine included in a large Vessel, filled full, and well stopped, will keep many Years without losing its Strength, but why, also, in Process of Time, it loses its *Rhenish* or acidish Taste, and acquires a milder and sweeter one; which is, because the saline Particles in this Wine come together, and are coagulated; and partly subside to the Bottom, partly adhere to the Sides of the Vessel; and these coagulated Parts we call the Tartar of Wine. Hence it follows, that the older the *Rhenish* Wine is, the fewer saline Particles it contains. In *French* Wines the contrary happens, because the saline Particles, as far as I have observed, in a full and well-closed Vessel, are less concentrated, especially in the Wines imported from *Bordeaux*, for which Reason they never become milder or sweeter; but in those Wines, which are imported from *Nantes*, the Salts are more congregated, tho' their Sweetness, however, goes off at the same time.

In *Rhenish* Wine sold for *Rhingen*, (tho' I understood afterwards, that it was only *Palatine*) of the Growth of the Year 1683. and of a very grateful Taste, I observed at first very few saline Figures; but after I had set it aside in an open Vessel for four-and-twenty Hours, I discovered Multitudes of saline Figures acuminate about both Ends, as in No. 15. many of which had an oblique and transverse Eminence, others were very pellucid. There was, also, so vast and inconceivable a Number of saline Figures of the same Position, that they could by no means be observed by Help of that Microscope, through which all these Figures appeared of the same Size as you see them delineated. I, also, met with great Quantities of saline Figures, which appeared at first Sight, like handsome and well fabricated Wine-hogheads; but, upon a more accurate Inspection, I discovered that two of their Sides were incurvated, as under No. 16. From these Observations I learned, that the saline Figures, which I had discovered in the preceding Wines, and which I said were like Wine-hogheads, were of one and the same Position with these Figures, and that I had not view'd them on the convolved Side, nor made so exquisite an Observation of them, as I did of these. Besides these saline Figures, which I observed to be flat at one or both Ends, all the rest resembled the Figures, No. 16, 17. With these I saw small saline Figures, represented No. 15. with both their sharp or acute Ends rolled up, as in No. 17. I observed other saline Figures, which had only one Side incurvated, as No. 18. Sometimes I took Notice of a small saline Figure, resembling a Pyramid on a quadrilateral Base, or a Diamond cut in that Form, No. 19. but there were so few of these Figures, that sometimes I could perceive no more than one or two in a Drop of Wine. With these I could sometimes perceive an oblong saline Figure, furnished in the Middle with another Figure, of the Form just mentioned, as you see represented, also, No. 19. I met with the same Figures in other Wines, but did not judge them worth recording. Besides these, I often met with saline Figures, whose Angles, or Apices, about the Contortion, or Incurvation, were not closed, and which had a conspicuous Aperture

Aperture reaching lengthwise, N^o 20. tho' many others, which were clofer, seem'd only to have a Mark, distinguish'd by its Eminence, or Elevation. Sometimes I could, also, discern some little, long, and narrow Figures, as represented N^o 21. About these last I began to exercise my Speculations, whether they were only the Rudiments, or Materials, of some larger Figure to be formed, the Cause of whose Imperfection consisted only in the want of sufficient Matter to complete those saline Particles; for I saw but a few of them swimming in the Wine, but the greatest Part lay at the Bottom, when the Wine was in part evaporated: Besides all the saline Particles before-mentioned, I discovered, in all the Kinds of Wine, an infinite Number of minute and delicate Particles, to which I could ascribe no other Figure than that of Globules; and their Numbers were so great, as to make one believe, that the whole Substance of the Wine, except the saline Atoms, consisted of Globules; and I am persuaded, that they contribute, chiefly, to the Sweetness of the Wine.

I drew a small Quantity of that *Rhenish-wine* which our People call *Rijn-hawwer Cavelwijn*, from a full Hoghead, which had fermented almost during the whole Summer, and had been drawn off the Lees for some Weeks, retaining a good laudable Taste: I placed this Wine in an open Vessel, in four different Places of my Summer-room, and in little less than an Hour discovered in it Multitudes of saline Figures; but, after almost sixteen Hours, I discerned many Figures of a great Thickness, having a Cavity like a Cockboat, such as I had before related that I had seen in Vinegar, [see ACETUM] and are here represented N^o 22. I could observe, also, different Sorts of saline Figures, which, about their Centre, represented other small, darkish, and oblong Figures, some of which had two, others three, and others four Circumferences, N^o 23. Others, again, were marked with a Line, or Seam, thro' the Centre, N^o 24. I saw, besides, several saline Figures, with only one Apex, the other End being obtuse; the Cause of which seemed to be, that their constituent Particles were not yet complete, as we said before, and, consequently, neither the Figures themselves of this Sort, which were only pellucid, and are here represented N^o 25. I perceived, also, a few saline Figures, resembling those under N^o 26. And when I inspected the thinner Parts of the Wine, which had almost evaporated, I discovered innumerable Multitudes of saline Particles, most of which had two acute Angles, but were so extremely minute, that I cannot but think ten Millions of them, in Conjunction, to be less than a Grain of Sand. I, also, perceived other Figures swimming about, in the Shape of a well-fabricated Wine-hoghead, as I mentioned before; but tho' I examined these last saline Particles with all the Accuracy I was capable of, I could never distinguish them by Parts, or Lines; they were, also, thinner than all the rest, and pellucid: I saw, afterwards, many oblong, quadrilateral, saline Particles, which were, also, thin, in the highest Degree, and pellucid, as well as extremely minute; and are here represented N^o 29. but a little too big; the Reason of which was, that, with the same Microscope, which distinctly exhibited to View the Figures under N^o 22, 23, 24, 25, 26, and 28. I could not discover those which you see under N^o 27, 29. and this is the Cause that the Proportion could not be observed. I perceived, also, about the thinner Parts of the Wine, various ramous saline Figures, which were again composed of other saline Figures, so extremely minute, that I distinguish'd the Shapes of but very few of them; others, of the like ramous Kind, consisted of such irregular Figures, that I could distinguish them by no Position.

I made the same Experiments, as before, upon another Sort of Wine, which our People call *Cerence-wijn*; and I observed most of its saline Figures to agree with those represented under N^o 30. some of them appearing, as it were, convolved, others very thin and pellucid; others, again, when the Wine had been suffered to rest for some time, were become so thick, as to shew a darkish or brownish Periphery round about, as in Fig. N^o 31. others there were which made but half N^o 30, 31. and are represented N^o 32. I began, also, to examine that Kind of French-wine which we call *Coteau*, and discovered in it Multitudes of saline Figures, like those N^o 30, 31, 32. besides others whose Sides were convolved, as N^o 33. and others like Planes, whose longest Sides were right Lines, and both their Extremities round, N^o 34. some, also, had one acute Angle, as N^o 35. I discerned, also, many saline Figures, resembling, in a very lively manner, a flat-bottom'd Boat turn'd over, N^o 36. in others, of the same Structure, there appear'd, as it were, a Cavern; near the forement'ed I could discern various minute longish Figures, as N^o 37. which I supposed, had there been more Matter, would have assumed the Figure N^o 34. Besides these, I saw some saline Figures in the Form of N^o 38.

I made a full Examination and Inspection, also, into that Sort of French-wine which our People call *Tousscan-wijn*, which was rich, and, at the same time, very sweet, tho' many

among us believe the Sweetness of this Wine, which it acquires after four Years, not to be natural, but artificial, and procured by means of Sulphur, or the Wine called *Hogeland*, or Honey, or Syrup of Sugarcandy. I observed in this Wine all the saline Figures which I had discovered in the Wine called *Coteau*, but in this of *Tousscan* there were not so many saline Particles as in the other; and there was, besides, some Difference, in that I could discern in this Wine of *Tousscan*, at several Times, saline Figures cut, as it were, into Steps, or Degrees, as you see represented N^o 39.

I took, for further Examination, some *Tousscan* Wine, accounted the purest, and observed in it all the saline Figures which I said I had discovered in the *Coteau* and the *Tousscan*; but I judged the Number of the Figures contained in this last, called the *acidish Tousscan*, to be twenty-five times as great as those in the sweet *Tousscan*, but lesser: Besides, I could see in this last, or *acidish Tousscan*, the saline Figures floating, after a few Hours; but in the sweet *Tousscan* the saline Particles were slow in Appearance.

In the Wine called *Citerne* I saw all the saline Figures which I had observed in the *Tousscan* and the *Coteau*, and those very numerous.

I made Inspections, also, into *Hogeland* Wine, of the richest Sort, and found but very few Figures floating in it, tho' I had set it aside for three Days and Nights; but these Figures were much larger than those in the *Coteau* and the sweet *Tousscan*; and resembled those under N^o 30, 31, 33, 36.

I made an Infusion of Tartar of Rhenish-wine, pulverized in pure Water; and, when the Water was become limpid, I observed in it many of the saline Figures, which I said I had discovered in Wine-vinegar; among them some very clear Figures armed with two acute Angles, as in N^o 40. but most of them were irregular; the Reason of which, in my Opinion, was, the want of a Mixture of sweet or oily Matter, and because the saline Parts, especially where was little or no Water, separated and fell off on all Sides.

After this, I took under Examination some Tartar, as it was said to be, of French-wine, in the same manner as was described before; and discovered in it, also, some saline Figures, which agreed with those of the Wine; but the other Figures were even more irregular than those observed in the Rhenish-wine.

I took some of the purest Wine of *Orleans*, and with every Drop, as near as I could conjecture, mixed a Bit of Crabs-eye, of the Thickness of the Back of a Knife, because the Powder of the same hinders a clear View, when put in the Wine: After three Hours I examined it, and could see nothing at all, as I may say, in the Wine, which had any Resemblance to such saline Figures as I had seen in the Wine which had no Crabs-eyes mixed with it: I perceived, also, innumerable saline Particles with an oblong quadrangular Base, and the Sides ascending pyramidically, and ending in a kind of Ridge, or Back; in others I could only see a plain Figure. See both represented N^o 41. Some were Hexahedra, or Figures with six Sides, N^o 42. There were, also, various saline Figures, which had two oblique Sides, N^o 43. and a few quadrilateral Figures, containing within them a smaller quadrilateral one, as represented N^o 44. but others of these Figures had very short, and, in some measure, irregular Sides: I, also, happened on some saline Particles of the Figure N^o 45. in these last Particles I could perceive no Gibbosity, or Eminence; which was owing, I suppose, to their extreme Shortness; and when I took a View of a Bit of the Crabs-eyes, I observed in, perhaps, fifty Places, a Multitude of slender Tubes, proceeding, or torned, as it were, out of an Angle, or Apex, shining like Crystal, and one longer than another, tho' all nearly of the same Thickness, N^o 46.

In the same Quantity of Wine I infused white Chalk, and disposed it at four Places together in my Summer-room: When I had stayed about a Quarter of an Hour, I inspected the Wine, and observed in it a vast Multitude of the above-mentioned saline Figures, but much inferior in Bigness to those in the Wine with the Crabs-eyes: But when I had left the Wine with the Chalk for twelve or fourteen Hours, I found all the aforesaid saline Figures not only larger, but I perceived in various Places a great Multitude of little Tubes, emerging, as it were, from a Point of the Chalk, and like those represented N^o 46. but larger, and one thicker than another: And as the Wine which had contained the Crabs-eyes was covered with a Sort of Cuticle, the Cause of which I supposed to be a Kind of Coagulation of the Sweetness of the Wine, the contrary happened in the Wine with the Chalk, which was fine, and so continued.

Some time after I infused in the Wine before-mentioned, commonly called *Rijn-kawer*, *Kavel-wijn*, some Bits of Crabs-eyes, and after twelve or fifteen Minutes I found in it some few saline Figures: But when I had let this Wine stand for some Hours, I observed in it not only a vast Number of all the saline Figures

Figures represented under N^o 41, 42, 43, 44, 45, 46. but perceived, also, that the Figures which offered themselves to my first Inspection were increased in Magnitude, tho' I could discern none of those Figures which are found in the Wine in which no Crabs-eyes are infused.

Now since it so plainly appears, from every one of these Experiments, that none of the before-mentioned Rhenish or French Wines produces any saline Figures which have any Affinity or Similitude to the Salt of the Gout commonly called *Calc*; we may, with more Safety, and greater Certainty, affirm, that the Salt of Wine is not instrumental in generating the Gout: And the same is affirmed by daily Experience. For we may everywhere observe Persons, who are great Drinkers of French and Rhenish Wines, and yet are never infested with the Gout. On the other Hand, we see many who never tasted either French or Rhenish Wine, all their Lives, miserably afflicted with arthritic Pains and Disorders. From this Coagulation, or Transmutation of saline Figures in Wine, we, also, confirm those Arguments by which we would prove, that, in a well-constituted Body, none of the saline Particles of Wine penetrate into the Mass of Blood, especially since we hold, and are well assured, that our Stomach and Intestines were made for no other Ends than, in the first Place, for Contrition of the Aliments: Secondly, For Coagulation of the grosser Parts: And, thirdly, For the Distribution of the most subtil Part of the Aliments, after they have undergone the Operations of Contrition and Coagulation, into all Parts, for the common Nourishment of the Body.

And tho' I am sensible that Men of Judgment and Learning are more inclined to embrace and approve a single, good, and useful Experiment, than fond of applauding a whole Volume of well-written Speculations, or Ratiocinations, because these last are the work of the Brain alone; yet I have presumed frequently to interpose my own Thoughts and Reasonings on the Subject, from a Persuasion, if I might have Liberty to judge, that I could draw more Light from my own Observations, than it was possible for those, who had never seen or heard of such Experiments or Matters. *Leeuwenhoeck. Oper.*

VINUM AMARUM PRO OENOPOLIS.

Bitter Wine for Vintners.

Take Tops of Centory, twelve Handfuls; Gentian-root sliced, one Pound; Juniper-berries, one Pound and an half; Sevil Orange outer Peels, and their Juice, Number twelve; Lemon-peels, and Juice, Number six: Steep in a Bag, for fourteen or twenty Days, in white Port Wine, twenty Gallons; Canary, four Gallons.

Our common Taverns do not make a Bitter by much so good as this; and nothing can be more grateful, wholesome, or easier made. But this is to be said, in general, against that Whetting, as it is usually called, in a Morning, which some accustom themselves to; for tho' one Glass, when the Stomach has, by Debauch, or any other Accident from Distemper, been pall'd, or weaken'd, is of Service, by warming its Fibres, and giving them a due Tensity, in which, principally, consists a good Appetite, and Digestion; yet, when the Stomach is, perhaps, already too warm, from a high Diet, and frequent Tippling, this Practice helps to destroy the true Sense and Springiness of the Stomach, and, in Process of Time, will disable it from doing its proper Offices. After a great Debauch, indeed, there is somewhat to be said in Favour of the *English Proverb*, *A Hair of the same Dog*; because the undigested Remains at the Stomach, and the Quantity of slimy Juice which drains into it, during Sleep in the Night, cannot better be got off, than by raising it with a small Glass or two next Morning; but that ought not to be carried any farther.

VINUM ARTHRITICUM.

Wine against the Gout.

Take Sarsaparilla, and Guaiacum, of each an Ounce; Mistletoe of the Oak, six Drams; Germander, Ground Pine, and dried Sage, of each three Ounces; Cowslip-flowers, Flowers of Rosemary, and of Lilies of the Valley, of each half an Ounce; St. John's-wort, six Drams; White-wine, five Quarts.

These are ordered to stand in Maceration three or four Days, and then the Wine to be strained for Use, and two Ounces drank twice a Day, for forty Days together. Its Title denotes its principal Intention to be against the Gout; besides which, it is, also, recommended for all nervous Weaknesses, and Decays from cold pituitous Humours, and the Rheums of Age, and said to warm and invigorate the whole nervous System.

VINUM ARTHRITICUM ALTERUM.

Another Wine against the Gout.

Take Guaiacum, two Ounces; yellow Sanders, one Ounce; Cinnamon, *Spanish Angelica-root*, *Calamus Aromaticus*, of each two Drams; the outer Peels of Oranges dried, one Ounce; Flowers of Rosemary, Lavender, and Tops of Marjoram, of each half an Ounce; Germander, Sage, and Ground-pine, picked from all the Stalks, and dried, of each two Ounces; the lesser Cardamoms, two Drams: Bruise all into a gross Powder, and infuse in three Gallons of Mountain-wine, for two or three Weeks; and then strain, and bottle close, for Use.

This is an admirable warm Restorative in all nervous Decays, and cannot miss of Success, if continued for some time: For about two Ounces, or a common Wine-glass, taken two or three times a Day, will raise the most languishing Constitution, and preserve it against all Disorders of the Head and Joints, arising from nervous Decays. In most hydropic Habits, also, Medicines of this Kind are of great Service, as they not only help to absorb and evacuate all superfluous Humidities, but, also, to fortify the Solids, so as to prevent, by a brisk Circulation and Digestion, their future Increase.

VINUM ARTHRITICUM PURGANS.

A purging Wine, against the Gout.

Take China, and Sarsaparilla, of each two Ounces; Poly-pody, three Ounces; Rhubarb, and Sena, of each one Ounce; Hog-lice, six Drams: Cloves, one Dram; White-wine, three Quarts: Infuse, and strain, *f. a.*

This is not a very judicious Prescription: For the China and Sarsaparilla are of no Use in it, whatsoever their Virtues may be elsewhere, which are much suspected; because the cathartic Ingredients carry them downwards without having any Effect, the Bowels not being a proper Scene of Action for Alteratives, and Things of that Tribe.

VINUM ARTHRITICUM PURGANS ALTERUM.

Another purging Wine against the Gout.

Take Turpeth, Hermodactyls, of each two Ounces; Jalap, and black Hellebore, of each one Ounce; Cinnamon, two Drams; Ginger, half an Ounce; Lavender-flowers, one Ounce: Infuse in two Quarts of strong White-wine, in a Vessel well stopp'd for fourteen Days; then strain for Use.

This is a most pleasant and excellent Purge for all Distempers that have their Seat in the remote Parts, and nervous Cells. It is best to be taken over Night, in such small Doses as will not work off before Morning; because all of this Intention ought to pass into the Blood, and exert themselves much beyond the first Passages, else they can do little good: By sleeping, therefore, upon them, they better soak thro' the Lacteals, and, as it were, transpire into the most minute Recesses, where they are most fitted for Operation. The Patient may begin with three or four Spoonfuls, and increase the Quantity at Discretion; but it ought to be often repeated: For the Matter to be worked upon hereby is too remote, and closely lodged, to give way to a little Force: And a frequent Repetition hereof cannot but greatly cut off, as well as take away the Supply of those Humours which lodge upon the Joints, and do so much Mischief. So that, with Care, that dreadful Affliction, the Gout, may herewith be, in a great measure, kept off. And, in these Cases, Medicines of this Intention operate with much more Efficacy and Certainty upon the destined Humours, than when they are given in dry Forms; because the Subtlety of the Menstruum, by which their Virtues are extracted, conduces prodigiously to convey them to the proper Scene of Action, which they could never so well arrive at by any other Management.

VINUM BENEDICTUM.

The Blessed Wine.

Take of *Crocus Metallorum*, one Ounce; Mace, one Dram; Canary, one Pint and an half: Let them stand several Days in Infusion, and pour off the Wine, as it is used.

This has been a celebrated Emetic, but is now almost out of Use, for its Roughness. Its Dose is from two Drams to one Ounce. If its Use is at all justifiable, it is in apoplectic Cases, where some Violence is wanting, and the Shock upon the Nerves cannot

cannot be too great; and for such Purposes it is yet somewhat retained in the present Practice.

VINUM CHALYBEATUM.

Steel Wine.

Take Filings of Steel, one Ounce; Saffron, in Powder, two Drams; Mountain-wine, one Pint: Let them stand in Infusion three Days; frequently shaking them, and then filtre and keep for Use.

This is an admirably good Medicine in the Green Sickness, where Chalybeates are proper; it, also, wonderfully conduces, with Bitters, to remove all ill Habits that proceed from obstructed Viscera; and nothing is preferable to it in the Jaundice. It may be taken from two to four Ounces, once or twice a Day, when the Stomach is most empty: And the more Exercise is used with it, the more Good will it do.

Another STEEL WINE.

Take of the Filings of Iron, eight Ounces; Roots of Eryngo, Elecampane, of each one Ounce and an half; yellow Sanders, one Ounce; Rasplings of Ivory, red Coral, in Powder, of each six Drams; Cloves, Mace, Cinnamon, Ginger, of each three Drams; Ceterach, Flowers of Rosemary, of Broom, Epithymum, of each two Pugils; White-wine, three Quarts: Digest all together six or eight Days, and then filtre for Use.

It is good in all Uterine Obstructions; as, also, in Cachexies, and Foulnesses of the Liver and Spleen; but as, at the best, it is no elegant Composition; we shall therefore, in its room, substitute the following *Steel Wine*, which is, also, easier made.

Take Filings of Steel, four Ounces; Rue, Pennyroyal, of each two Handfuls; Peony, and Cassiumunair Roots, of each one Ounce; Saffron, two Drams: Infuse in two Quarts of Sherry, for fourteen Days, and then filter for Use.

This makes not an irksome Remedy, farther than what the rusty Taste of the Steel will give it; and it wonderfully promotes the menstrual Discharges; and of all that obstructs and raises Disorders in the Womb: For which Reason many Kinds of Fits and Convulsions are removed by it; and after a continued Use of it some time, it so cleanses the Organs of Generation, and fortifies the Tone of the Blood, that it wonderfully disposes to Conception; but then it is by all means to be left off, lest it destroys what it has been so instrumental in procuring. The Quantity of two or three Ounces, twice every Day, is sufficient, if continued some Weeks.

VINUM CHALYBEATUM RESTAURATIVUM.

Restorative Steel Wine.

Take clean Filings of Needles, two Ounces; the Juice of eight four Oranges: Let them stand twenty-four Hours, then add White-wine, two Quarts; Cinnamon, half an Ounce; Cloves, two Drams; Mace, four Scruples: After some Days Digestion cold, strain, and filtre for Use.

This is a very serviceable Composition for many Purposes, and will infallibly cure a Green Sickness, or any Tendency of the Constitution that Way; which is manifest from a pale Complexion, Debility, or Listlessness to Action, and short Breath. In hypochondriacal Melancholy, and all Affections of the Spleen, it will do much good; and, after Fevers, or any Distemper that spoils the Juices, this will greatly again restore them to their due Warmth and Vigour; and is much better than any of the mineral Steel Waters, how much soever they stand recommended in all such Cases: For the Spices, in this, warm and strengthen the Fibres of the Stomach, which otherwise would not so well receive and bear the Twitches and Corrugations of the Iron, without Ejection by Vomiting. It may be given from two to three Ounces, every Morning and Afternoon, when the Stomach is most empty.

VINUM CHALYBEATUM RESTAURATIVUM ALTERUM.

Another Restorative Steel Wine.

Take Filings of Iron, two Ounces; squeeze upon them the Juice of three or four Seville Oranges, and one Lemon: After twenty-four Hours standing together, and being sometimes stirred, pour upon the Mixture, in a Glass Bottle, two Quarts of White Port Wine, and one Pint of Canary; in which infuse the Ingredients of the Viper-wine, in proper Proportion, or so much of the Viper-

wine itself, without the Sweets. After fourteen Days strain for Use.

This is a noble Medicine to recruit with, after the Constitution has been almost torn to-pieces with the Fury of a Fever, or any acute Diseases; and particularly for Women who have much suffered in Child-bed, and are reduced almost to a Consumption: For this will not only promote the necessary Cleanings, but, also, raise the Blood with new Warmth and Nourishment. This indeed is an expensive Medicine; but, then, it may be considered, that its wonderful Efficacy makes some Amends; for two Ounces, twice in a Day, will certainly, in a little time, be attended with Amendment, in the most languishing Circumstances.

VINUM ENULATUM.

Elecampane Wine.

Take green Elecampane-root, white Sugar, and Currants cut small, of each four Ounces: Infuse them fourteen Days cold, in two Quarts of White Port.

This is an easy Liquor both to make and take, and will do Service in such who have weak Lungs, which are often subject to be stuffed with Phlegm, which it deterges, and prevents Ulcerations, and such Injuries as would bring on a Consumption. All asthmatic Persons, therefore, would do well to use this in Plenty, especially in the Winter-time, when the external Cold lessening the Quantity of perspirable Matter, by the Pores of the Skin, causes a much greater Pressure of the Fluids upon the Viscera, of which the Lungs have their Share, and, therefore, stand in need of such gentle Fortifiers and Cleaners as this makes. The Elecampane has, also, that deterfive Power by which it keeps open other Viscera; whence they better perform their Offices, and leave less Force to protrude upon the Lungs. It is therefore of Use in all Cachexies, and Tendencies towards a Dropsy. Some, also, will have there to be a Property in this of destroying Worms. Drink a Glass of it twice a Day.

VINUM HIPPOCRATICUM. See CLARETUM.

VINUM HYDROPICUM.

Wine against the Dropsy.

Take blue Flower-de-Luce Root, one Ounce; Elecampane, and Squills prepared, of each half an Ounce; Horehound, one Handful; Bark of Elder-roots, and Dwarf-elder, of each one Ounce; Sena, one Ounce and an half; Agaric, two Drams; Ginger, one Dram; White-wine, two Quarts: Infuse all for fourteen Days, and then strain for Use.

Or thus:

Take Ashes of Broom, and Juniper, of each one Ounce; Rhenish Wine, three Pints: Mix, and make a Lixivium; to which add, blue Flower-de-Luce Roots, one Ounce and an half; the inner Bark of Elder-root, and Dwarf-elder, of each one Ounce; Bark of Bitter-sweet, half an Ounce; Rhubarb, two Drams; Mechoacan, half an Ounce; Sena, one Ounce; Caraway-seeds, six Drams; Bark of Sassafras, and Winter Cinnamon, of each four Scruples: Infuse warm for twelve Hours; then strain, and add white Sugar, four Ounces; Damask Rose-leaves, two Handfuls: After due Infusion, strain again for Use.

If the Sena be left out, it is a better Diuretic; for the less it goes off by Stool, the more will it get into the Blood, and discharge its ferous Parts by Urine. It is therefore designed for hydropic Constitutions, and will do Service where there is a Tendency that Way, if begun with in time, and closely followed. The Dose is three Ounces every Morning fasting.

VINUM ICTERICUM.

Wine against the Jaundice.

Take Turmeric, in gross Powder, two Ounces; Saffron, two Scruples; Cochineal, four Scruples; Millepedes, No 320; Canary, one Quart: Infuse all for six or seven Days; then strain for Use.

It is very good for what its Title expresses, and may be drank two Ounces, three or four times in a Day; but the following we recommend as the most efficacious.

VINUM MILLEPEDUM.

Hog-lice Wine.

Take Hog-lice, half a Pound: Put them alive into one Quart of White Port Wine; and after some Days Infusion,

VIN

tion, strain and press out very hard: Then put Saffron, two Drams; Salt of Steel, one Dram; and Salt of Amber, two Scruples; and after three or four Days strain, and filtre for Use.

This is an admirable Medicine against the Jaundice, Dropsy, or any cachectic Habit: It greatly deterges all the Viscera, and throws off a great deal of superfluous Humours by Urine. It may be given twice a Day, two Ounces at a time.

Another VINUM MILLEPEDUM.

Take four Ounces, or a Quarter of a Pint of Millepedes alive: Infuse them in one Quart of White-wine, with one Dram of *English* Saffron; shake them often, and let them stand two or three Weeks, then filtre the Wine for Use.

It is an admirable Cleanser of all the Viscera; and gives Place to nothing in a Jaundice; or any Obstructions of the Kidneys, or Urinary Passages: Which makes it a great Pity, that it is not more in Use; for there is hardly any chronic Distemper wherein it will not do Service; and even in scrophulous and strumous Swellings, a Course of it will greatly waste them, if not quite carry them away: And in Defluxions of Rheum upon the Eyes, it will do Wonders, by turning downwards those hot Salts, by their natural Outlets, the Kidneys, which had forced their Way through the Glands about the Eyes. It may be given from half an Ounce to two Ounces in a Dose.

VINUM MIRABILE.

The Wonderful Wine.

Take Cloves, Mace, Nutmegs, Cubebs, Cardamoms, Galangals, Cochineal, Saffron, of each one Dram: Infuse in one Quart of *Canary*, and Spirit of Cinnamon, four Ounces, for fourteen Days; then strain for Use.

This makes a better Cordial than the *Aqua Mirabilis* of the College, without Distillation; which will yet be much higher, if Ambergrise, or Musk be added. A Dram of it now-and-then, in moist cold Constitutions, is of good Service; for it warms, and prevents the Blood from running into those Rheums, and pituitous Juices, which stuff up the principal Parts of the Machine, and obstruct them in their Offices; occasioning Lethargies, Apoplexies, Palsies, Rheumatisms, and all that Train which are the frequent Attendants upon a declining Age, when the Vigour of Youth begins to wear off. But in cholerick and sanguine Constitutions, such Cardiacs as these are highly to be condemned, because they inflame the Blood, and do much Mischief that way; the contrary Regimen, such as Acids and Diluters, being there more necessary.

VINUM PECTORALE.

Pectoral Wine.

Take Juice of Liquorice, one Ounce; Saffron, one Scruple; Seeds of Coriander, Caraway, Anise, of each two Drams; Salt of Tartar, half an Ounce; Pennyroyal, and Hyssop-waters, of each four Ounces; *Canary*, one Quart: Let them all digest cold for some Days: Then strain for Use.

This assists in Expectoration, and helps to deterge and cleanse the Glands of the Bronchia, and neighbouring Parts: This may be drank two or three times a Day, or almost at Pleasure: Warm is the best.

VINUM SCELOTYREICUM.

Wine against the Scurvy.

Take Sorrel, Brook-lime, and Water-creffes, Garden Scurvy-grass, of each three Handfuls; Roots of Elecampane, blue Flower-de-Luce, Horse-radish, of each one Ounce and an half; Seeds of Scurvy-grass, one Ounce; White-wine, two Quarts: Let all digest two Days together, and then press out hard for Settling and Use.

A Wine Glass of it may be drank twice a Day, for some Weeks together, and will do good in any scorbutic Disposition: These kind of Medicines, used in the Spring, may be a Means to prevent many from falling into Fevers in the Summer-time, because they rince the principal Emunctories, and wash off such beginning Obstructions, as lay a Foundation for Fevers.

VINUM SCILLITICUM. See SCILLA.

VIN

VINUM SCORBUTICUM.

Wine against the Scurvy.

Take Garden Scurvy-grass (gathered dry and unbruised) one Handful; Horse-radish Root scraped, half an Ounce; Winters-bark, grossly powder'd, two Drams; Arum-water, and White-wine, of each one Pint: Infuse them cold for three Days.

The Whole makes a warm biting Medicine, and a good Antiscorbutic: It helps to dissolve sily and viscid Humours, which entangle the Salts, and stick with them in the secretory Orifices, whereby they are eroded; especially the small ones upon the Skin. It quickens the Motions of the Fluids, and promotes the thinner Secretion; whence, in Dropsies, and all Cachexies from sluggish watry Humours, it will be of good Service. It may be drank at Discretion.

VINUM STOMACHICUM.

Stomach Wine.

Take Roots of *Virginia* Snake-weed, and Gentian, of each three Drams; Galangal, Cloves, Cubebs, Mace, Nutmegs, Saffron, of each one Dram; Cochineal, half a Dram; *Canary*, three Pints: Infuse for some Days, and then strain for Use.

This is a warm Composition, and may be of Service to cold Stomachs, and such as are troubled with Wind and Flatulencies: But it is too hot for many, and will be subject to breed Choler, and adust Humours; wherefore we prefer the following Stomach Wine.

Take of Gentian-root, half an Ounce, Galangal, Calamus Aromaticus, *Spanish* Angelica-root, of each two Drams; Centory-tops, one Ounce; the outer Peel of three *Seville* Oranges, with their Juice; Saffron, one Dram: Infuse in two Quarts of Sherry for fourteen Days, shaking the Vessel often; then strain and filtre for Use.

This is a most grateful Stomachic, and greatly mends a bad Appetite: It is a wonderful Help to cold Constitutions, and such as are inclining to Dropsies and Cachexies from Corpulency. The acid Juice of the Oranges mightily takes off both the Heat and Taste of the Bitters; and the Whole is worth every one's keeping in Readiness by them, to use upon Occasion, in any sudden Disorders of the Stomach, from Intemperance, or any other Cause. It may be drank twice or three times a Day: When the Stomach is most empty it is the best.

VINUM VIPERINUM.

Viper Wine.

Take of dried Vipers, cut into Pieces, N^o six: Digest them three Days, with a gentle Heat, in one Quart of *Canary*, and then strain out the Wine for Use.

Another VINUM VIPERINUM.

Take live Female Vipers in the Spring-time, N^o six: Put them alive into three Quarts of *Canary*; and let them stand close stopp'd, without any Heat, for six Months.

It is a wonderful Restorative, and greatly invigorates the whole Constitution, so as to provoke much to Venery, as well as other Actions of Vigour; but it much more contributes to this latter Purpose, if it be warmed with some Aromatics, especially the Sweetens, as Musk and Ambergrise. It is almost an infallible Remedy in cutaneous Eruptions, and even in a confirmed Leprosy.

Another VIPER WINE.

Take Vipers, N^o twelve; fine picked Flowers of Lavender, and Rosemary, green, of each four Ounces; six Nutmegs; Satyrion-root, half a Pound, sliced small; Gum-Benjamin, and Storax, of each two Ounces; Musk, and Ambergrise, of each half a Dram: Put all together, the Vipers alive, and the rest as fresh as can be got, into six Quarts of *Canary*; and after three or four Months Maceration, and sometimes in the Warmth of the Sun, but close covered: Strain the Wine, and let it settle fine, which decant for Use.

This is, perhaps, as stimulating a Restorative as Medicine can produce; and, in the last Decays of Life, will still supply the vital Lamp with some Recruits. It is an admirable Remedy for those who have been almost wore out with Venereal Engagements;

Engagements, especially if their Pleasures have been purchased at the Expence of a few Salivations, or a frequent Use of Mercurial Medicines; and it will revive any Constitution that is not quite mouldered into Rotteness. But they much best deserve such a Restorative, who by acute Diseases, as malignant Fevers, Small Pox, or the like, have been so broke, or shattered, in their Constitutions, as hardly to be within a Possibility of Recovery: For in such, it will to Admiration, repair the decay'd Juices, and fill again the Veins with a warm, generous, nutritive Blood. In scrophulous Habits, also, which are frequently leaning towards Consumptions, it will do great Service. And where young Persons are not so early happy in their conjugal Embraces as some wish to be, and it be suspected from a Coldness, or Insufficiency upon that Account on either Side, the Use of this cannot fail to render their Intercourse prolific: But the Use of it is warily to be indulged, lest with it be kindled an Heat, which reasonable Coition cannot assuage. And let such, also, who indulge themselves too lavishly in those Enjoyments, be careful how they prompt with such Helps, lest they run off their Strength and Life too precipitately; for the best Constitutions in the World wear out, and sink under the frequent Repetition of such Profusion; as the frequent straining any elastic Body whatsoever will weaken more and more its Spring, till it is quite lost, notwithstanding all the Helps of Art to preserve it.

VIOLA.

The Characters are;

The Leaves are alternate; the Calyx is quinquefid, expanded, firm, and has its Segments reflexed backwards. The Flower is pentapetalous, and anomalous, as consisting of a dipetalous Standard, two Wings, and a Tail representing a Keel; it is furnished with five Stamina. The Ovary in the Bottom of the Calyx, becomes a conic, triangular Fruit, which bursts asunder into three Keels, unfolding themselves into a Circle, and full of Multitudes of round Seeds.

Boerhaave mentions eighteen Sorts of *Viola*; which are,

1. *Viola Martia*; purpurea; flore simplici,odoro. C. B. P. 199. Tourn. Inst. 419. Boerb. Ind. A. 243. *Viola*. Offic. *Viola Martia purpurea*. J. B. 2. 542. Raii Hist. 2. 1049. Synop. 3. 364. *Viola nigra sive purpurea*. Ger. 699. Emac. 850. *Viola simplex Martia*. Park. Parad. 282. PURPLE VIOLETS.

The ordinary purple Violet has a thick fibrous Root, sending forth long, creeping Strings, which again take Root, and increase. The Leaves grow on pretty long Foot-stalks, somewhat hairy, and in Shape of an Heart inverted, being hollowed next the Stalk, and indented about the Edges. The Flowers stand on slender Foot-stalks, of an irregular Form, consisting of five sweet-smelling purple Leaves, with an Hood, or Heel, of the same Colour. The Seed-vessels are long, of an hexagonal Figure, when ripe, bursting into three Parts, containing Rows of round brown Seed.

Violets are found frequently wild in the Hedges, flowering in March, though what are made use of in the Shops, are cultivated in Gardens. The Flowers, which are principally used, are one of the Four cordial Flowers.

They are cooling, moistening, and laxative, good in Affections of the Breast and Lungs, helping Coughs, and pleuritic Pains. The Syrup is given to Children to open and cool their Bodies. The Leaves are cooling and opening, and frequently put into Clysters, as well as into Ointments, against Inflammations. The Seed is reckoned good for the Stone and Gravel.

Official Preparations are only the *Syrupus Violarum*. Miller's Bot. Off.

The Root of this Plant is a little saltish, glutinous, and detestive; neither it, nor the Leaves, which are insipid, and pretty glutinous, give any Tincture of Red to the blue Paper; the fresh Seeds give it a little, and are saltier than the Roots. There is a glutinous Sap in the Violets, which clogs the other Principles, and hinders their Motion: For,

By the chymical Analysis, we obtain from this Plant several acid Liquors, a great deal of Oil, a pretty deal of volatile, concrete, and fixed lixivial Salt.

Thus it is no Wonder, that it should lenify by its Phlegm and Oil, and be diuretic and laxative, by the Mixture of the other Principles. The Salt of the Violet partakes of the Nature of the Sal Ammoniac, in that it is composed of an urinous Part. The Infusion of two Ounces of the Root of this Plant purges upwards and downwards. Some prescribe it to three Ounces, and add twenty Grains of Salt of Wormwood, to draw a strong Tincture from it. The Leaves are emollient and laxative; they are continually used in Clysters, Fomentations, and Cataplasms. The Flowers loosen the Belly: Poterius affirms, that a Dram of their Powder purges well enough: There are three Sorts of Syrup prepared with these Flowers;

the simple, which has a very fine Colour, provided it does not boil; the Compound, which is the Invention of Mesue; and, the Purgative, of which M. Lemery has given the Description: The Simple and the Compound are very good for the Diseases of the Breast, occasioned by acrid and saltish Humours.

The Purgative Syrup of Violets is good, also, for the same Diseases, when it is necessary to purge; for the Seeds and Em-palements of the Flowers, which are used to make this Syrup, are very purgative; the Roots, also, might be added. Ettmuller relates, that Timæus prepared an excellent laxative Conserve with Violets, by giving the Consistence of a Conserve to Manna, with the Juice of these Flowers: This Conserve keeps the Belly open, if taken from two Drams to half an Ounce.

There is an excellent Sort of Cordial made after the following Manner, which is very good for those that are usually bound:

In six Pounds of the Juice of Flowers of Violets not picked, dilute over a clear gentle Fire, one Pound and an half of Manna; strain it all thro' a Cloth; and add a Pint of very good Spirit of Wine: Take a Spoonful or two of it Morning and Evening, if it is necessary.

The following Emulsion is prepared for the Nephritic Colic, and Retention of Urine:

Grind an Ounce, or an Ounce and half of Violet-seeds in a Marble Mortar, adding, by Degrees, six Ounces of the Water of Dogs-grass: Strain the Emulsion through a Cloth, and dilute in it one Ounce of Syrup of Violets. Martijn's Tournefort.

In the sweet-scented Violet, as well as in many other Plants, there are several Parts, which have their distinct Virtues: For the Root, Umbilicus, and Seed, are of a cathartic Quality; and three Ounces of the Root cut in Slices, and put into boiling Water just removed from the Fire, or infused a Night in Wine, communicate to them a purgative Virtue. The Seed pulverized, and a Dram and half thereof mixed in any Liquor, has the same Effect. The Umbilicus is much weaker, and communicates the same Quality to the Water in which it is infused; from whence they prepare what they call *Syrup of Violets by Infusion*. They purge bilious and serous Humours, which are not very stubborn.

The Leaves abound in a coldish and watry Substance; whence they mitigate a Phlegmon, and cool the immoderate Heat affecting the Stomach or Eyes; and, eaten among Greens, loosen the Belly.

The fresh Flowers refrigerate, moisten, mollify, and render the Belly soluble; they are in the Number of the Four celebrated cordial Flowers, and a Pectoral. Their principal Uses are in mitigating the violent Heat in Fevers, and the Pain of the Head thence proceeding, in Coughs, Asperities of the Throat, and the Pleurisy. The Syrup of the Flowers is very frequently prescribed to allay Thirst in Fevers, and gently to loosen the Belly.

The Seed of Violets is an excellent Lithontriptic, and was one of the Secrets of Dr. Butler, formerly a very celebrated Physician of Cambridge.

Dioscorides and Pliny assert, that the purple Part of the Flower, taken in Water, cures the Quinsey, and the Epilepsy, especially in Children. As to the Epilepsy, says P. Renalmsus, we are taught by Experience, that it is an Imposition; but he had better, and with more Decency, have said, that the Writings of the Antients have not been transmitted to us without Corruptions. Raii Hist. Plant.

Viola tricolor major & vulgaris. Park. Theat. 756. *Jacea.* Schrod. Pharm. 4. 84. *Jacea tricolor sive Trinitatis Flos.* J. B. 3. 546. HEARTS-EASE.

This does not creep so much as the common Violets, but grows more erect, having roundish crenated Leaves set alternately on the Stalks, with two smaller and more jagged one, set on by them, without Foot-stalks. Among these arise the Flowers on long Stalks, in Shape of the common Violet; but, having the Leaves more erect and open, but differ from them in their Colour, some having the two upper Leaves of a full Yellow, with a purple Spot on each; the two Middle of a paler Yellow, with a deep Yellow in each; and the lower Leaf of a Velvet-purple, in some Plants, having more of the Yellow, in others more of the Purple, the many Varieties rendering it very beautiful. The Seed-vessel is longer than the Purple Violet, but full of the like Seed: It is found wild sometimes in the Borders of Fields, and is frequently planted in Gardens, flowering a good Part of the Summer.

The Leaves only are used, though but seldom: Yet they are accounted mucilaginous and vulnerary, good to take off the Gripes in Children, and to prevent Fits arising from thence. *Miller's Bot. Off.*

It grows in the Northern Parts of England among the Corn, and by Walls, and Banks of Hedges, spontaneously; but the Beauty and Variety of its Flowers have occasioned its being transplanted and cultivated in Gardens. It is supposed to have the same Virtues with the common purple Violet. *Ray. Dale.*

Dr. Baynard says, that many have been cured of Madness by the Use of the *Viola Tricolor*.

12. Eadem (II.); flore albo, & luteo.
13. Eadem (II.); flore pallide cœruleo, purpureo, & luteo. *Flos Trinitatis, major, violaceus.* H. Eyft. Æst. o. 12. F. 6. F. 2.

14. Eadem (II.); flore violaceo, holoserico, purpureo, & aureo.

15. Eadem (II.); flore magno, duplo majore, coloris unius, purpureo, holoserico.

16. Eadem (II.); flore pallido. *Flos Trinitatis, pallidus, major.* H. Eyft. Æst. o. 12. F. 6. F. 3.

17. Eadem (II.); flore ex aureo & pallido.

18. Viola; bicolor; arvensis. C. B. P. 200. M. H. 2. 476. *Jacea, bicolor, frugum & hortorum vitium.* J. B. 3. 548. *Boerh. Ind. alt. Plant.*

Viola is by Diminution from the Greek, *ἰων*, (*Ion*) the *Spiritus lenis*, being converted into the Letter *V*, as in abundance of Instances. *Ray.*

The first six Species are officinal, pectoral, and cordial, and proper in Coughs, Dryness of the Tongue, and Asperities of the Fauces, as, also, in Catarrhs, Phthisis, and the Pleurisy. The Flowers have an anodyne, demulcent, and antiphlogistic Virtue; they are infused in the purest Rain-water, from whence, by often repeating the same, is prepare the incomparable what they call *Syrupus Violarum sine Coctione*, "Syrup of Violets without boiling," by adding four times the Weight of Sugar. This Syrup is very palatable, gently opening, corrects every thing acrimonious, and loosens the Belly. The Leaves have much the same Virtues as those of *Acanthus*. The Flowers, which are ranked with the Four Cardiac Sorts, as well on account of their grateful Smell, or pleasing volatile Spice, as the fine Viscosity of their Particles, which dissolve and lenify whatever is earthy and rigid, are to be gathered in the Morning while the Dew is upon them. The Leaves are emollient and laxative, and used in Fomentations, Cataplasms, and Clysters. The Seeds are seldom used, except in Obstructions of the Kidneys, and the nephritic Colic. The Root purges upwards and downwards; the Calyces, which have a nauseating Quality, are to be rejected, unless you would have a pretty laxative Medicine; for then the Calyces are to be taken with the Flowers; the Seeds are potent Hydragogues. *Hist. Plant. adscript. Boerhaav.*

VIOLA AQUATICA, aquatilis, or palustris. Names given to the HOTTONIA; which see.

VIOLA HYEMALIS, A Name for the *Hesperis; hortensis; flore; purpureo;* and for the *Hesperis; hortensis; flore candido.*

VIOLA INDICA, scandens. A Name for the *Acriviola,* and for the *Acriviola; maxima; odorata.*

VIOLA LUNARIA, or LUNARIS. Names given to several Sorts of LUNARIA; which see.

VIOLA MARIANA. Offic. Ger. 362. Emac. 447. *Viola Mariana flore purpureo.* Park. Parad. 354. *Viola Mariana Dodonæi, quibusdam Medium.* J. B. 2. 804. *Campanula hortensis folio & flore oblongo.* C. B. P. 94. Raii Hist. 1. 732. *Boerh. Ind. A. 249. Tourn. Inst. 109. COVENTRY BELLS.*

In foreign Countries this grows in Hedges, and on mountainous Places; but, with us, is only cultivated in Gardens. The Root, which is seldom used in Medicine, is, as a Food, esteemed refrigerating, drying, and astringent. *Dale.*

VIOLA MATRONALIS. A Name for several Sorts of *Hesperis;* which see.

VIPERA. The Viper, or, as it is commonly called by the Vulgar, the Adder.

With respect to the Virtues of this Animal, one of the first, whom we find in Antiquity to have made use of the Flesh of this Creature to medicinal Purposes was, I think, *Antonius Musa*, the famous Physician to *Octavius Cæsar*; of whom *Pliny* tells us, that when he met with incurable Ulcers, he ordered the eating of Vipers; and, by this means, they were quickly healed.

It is not improbable, that he might have learned this from the great Greek Physician *Craterus*, mentioned often by *Cicero*, in his Epistles to *Atticus*; who, as *Porphyrius* relates, very happily cured a very miserable Slave, whose Skin in a strange manner fell off from his Bones, by advising him to feed upon Vipers, dressed after the manner of Fish.

Be this as it will, in *Galen's* time, the profitable Qualities of the Viper were very commonly known, himself relating very remarkable Stories of the Cures of the *Elephantiasis*, or *Lepa*, done by the Viper-wine.

Aræteus, who most probably lived about the same Time with *Galen*, and, of all the Antients, has most accurately described the *Elephantiasis*, commends, as *Craterus* did, the eating of Vipers, instead of Fish, in the same Diseases. And to this Purpose I remember, that as *Lopez*, in his Relations of the Kingdom of Congo, in Africa, takes notice how greedily the Negroes eat Adders, roasting them, and esteeming them as the most delicious Food; so *Dampier*, also, informs us, that the Natives of *Tonquin*, in the *East-Indies*, treat their Friends with Arrack, in which Snakes and Scorpions have been infused, accounting this, not only a great Cordial, but, also, an Antidote against the Leprosy, and all other Sorts of Poison.

The Physicians in Italy and France, very commonly prescribe the Broth and Jelly of Vipers Flesh, for much the same Uses, that is, to invigorate and purify the Mass of Blood exhausted with Diseases, or tainted with some vicious and obstinate Ferment.

From all this it appears, that the main Efficacy of the viperine Flesh is, to quicken the Circulation of the Blood, promote its due Mixture, and by this means cleanse and scour the Glands of those stagnating Juices, which, turning to Acidity, are the Origin of many, at least, of those troublesome Distempers in the Surface of the Body, which go under the Names of *scrophulous*, and *leprous*.

These good Effects are owing to that penetrating, strong Salt, with which the Substance of these Creatures does, in a very great Proportion, abound; and the Reason of this is from the Food they live on, which we have observed before to be Lizards, and Moles, whose Nature every one knows to be such as must necessarily, when they are dissolved in the Stomach, supply the Blood with a great Quantity of active and volatile Parts. And herein lies the Difference between the Flesh of Vipers, and that of other innocent Serpents, which, feeding upon Grass and Herbs, do not recommend themselves to us by any of those Properties, which are in so eminent a Degree found in the former.

Whoever reflects on what has been said on this Head, will very readily acknowledge, that our Physicians deal too cautiously or sparingly with a Remedy, which may be applied to very good Purposes, when they prescribe a few Grains of the Powder of dried Vipers, or make up a small Quantity of their Flesh into Troches; whereas, if Service be really to be done this way, the Patient ought to eat frequently of Viper-jelly, or Broth; or rather, as the ancient Manner was, to boil Vipers, and eat them like Fish; if this Food will not go down, (tho' really very good and delicious Fare) to make use at least of Wine, in which Vipers have for a long time been infused, by which I know a very obstinate *Lepa* has been removed; or, lastly, in some Cases, especially where Wine is not convenient, to take good Quantities of their volatile Salt, in which alone the Virtue of the before-named Medicines principally reside.

As for the Teeth, they are of two Sorts, the great, or poisonous Fangs, and the small.

The great, being fixed in the first Bone of the upper Jaw, are crooked and bent, like the *Dentes canini*, in most carnivorous Animals. They are manifestly hollow from their Root a considerable Way, not to the very Apex, or Point, (which is solid and sharp, the better to pierce the Skin) but to a small Distance from it, as is plainly seen by splitting the Tooth thro' the Middle. This Cavity ends at the convex Part in a visible Slit, very well resembling the Nip or Cut of a Pen, which is the Emisary or Outlet to the Poison.

Galen has given us a considerable Hint of this Make of the Tooth: For, the Mountebanks, (he says) used to suffer themselves to be bit with Vipers, having, first, with some Pastes, stoppt the Holes of their Teeth, that the Venem being thus kept

kept in, the Spectators might think they did by their Antidote, secure themselves from its dangerous Effects.

The Reason why these Teeth are crooked is, that the Point of the Tooth, when the Viper bites, may be perpendicular to the Part to be wounded; for the Head being raised back, in the Time of Biting, and the Tooth erected, if this were strait, it would not, by reason of its oblique Situation to the Part, enter with so much Force, nor so deep into the Flesh.

As for the Number of the poisonous Fangs, I have observed, that there are, for the most part, besides one, two, or three on each Side, fixed perpendicularly to the first Bone of the upper Jaw, some others which are young, and of a smaller Size, adhering to the same Bone: Their Points are harden'd, and they have their Fissures formed as in the other; but their Roots are soft and mucilaginous, like the Roots of the Teeth in Infants; and so they lie always depressed at the Bottoms of the former.

They drop off from the Bone at the least Touch; and therefore, some Anatomists have imagined them to be fastened to Muscles or Tendons; which would have rendered them altogether useless: For they are made to supply the Place of the greater, when they fall away, or are pulled out by Accident, and in order to do this, they do by degrees harden, and rise more and more, till at last they stand upright, and come to a perpendicular Situation in the Bone.

They are not all of the same Growth; for in some we can only discern the Shape of a Tooth, without any Hardness, in others the Point, and in the next somewhat more is harden'd, and so on, to the greatest Fang.

Their Number is very uncertain; there being sometimes six or seven in each Side of the Jaw, sometimes fewer.

These seem to have occasioned the Disputes among the Antients, concerning the Number of the viperine Teeth.

The poisonous Fangs have small Holes at the internal Part of their Root, through which the Vessels pass, which carry their Nourishment.

It is remarkable, that Nature has provided young Vipers with poisonous Teeth, grown to their Perfection, that so they may kill their Prey as soon as they come into the World.

The second Kind of Teeth, or the small, are hooked, and bent, as well as the former, but without any Slit or Opening: Of these there are four Rows, two on each Side of the Mouth: They are fixed in the third Bone of the upper Jaw, and in the second in the lower.

Their Use is to hold the Prey fast, while Execution is done by the Bite; left, in struggling to get away, it should pull out the Fangs.

The Instruments that emit the Venom being thus described; we come next to those which serve to prepare and contain it.

This Liquor is separated from the Blood by a Gland on each Side of the Head, placed in the anterior and lateral Part of the *Os Sincipitis*, just behind the Orbit of the Eye: It lies immediately under that Muscle which helps to depress the Fangs, so that by the Action of this it is pressed; which is an admirable Contrivance, to forward the Secretion of the Juice out of it.

It is a conglomerated Gland, composed of many smaller ones, contained in a common Membrane: Each of these sends off an excretory Vessel, all which do afterwards unite and form one Duct, which running towards the Roots of the Fangs, discharges the yellow Liquor into a Bag.

This Bag is fixed to the Basis of the first Bone of the upper Jaw, and, also, to the Extremity of the second, covering the Fangs near the Root. To the upper Part of this Vesicula there is joined another, in the anterior Part of which there is a Passage for the poisonous Teeth.

This consists of muscular Fibres, both longitudinal and circular; by means of which it can contract itself when the Fangs are erected; and by this Contraction the Venom is pressed into the Hole at the Root of the Tooth, and forced out at the Fissure near the Point.

That this is so done, I have frequently observed with the naked Eye, having cut off the Head of a Viper, and immediately pinching the Neck, to make it open the Mouth wide; for by this means the Venom was squirted out as from a Syringe.

When the Viper lies quiet, with its Mouth shut, the Fangs are depressed and covered with the external Bag; when it intends to bite, it opens the Mouth very wide, at the same time the lower Extremity of the second of the common Bones is moved forwards by proper Muscles, and turns, as it were, upon a fixed Centre, thus pushing forward the upper and lower Jaws, whose Extremes are united. By this means the lower Part of the first Bone of the upper Jaw is thrust forwards, the other Extremity turning in the Cavity of its Articulation, where it is fastened by Ligaments. The Fangs being, by this Mechanism, erected, the Bags which covered them, by the

Contraction of their longitudinal Fibres, are pulled back; and the Action of the circular ones does, at the same time, straiten the internal Bag, and force the Juice into the Teeth.

Besides this, when the Viper bites, it strikes in the Fangs to the very Root; and thus the *Vesicula* are still more squeezed, for the Discharge of the Liquor.

It is worthy our Observation, that the Viper can move the Jaw-bones on one Side, without moving those on the other; for they are not joined together at the Extremes, as in other Animals; which Contrivance is very beneficial to it in the swallowing its Prey; in that, while the Teeth on one Side stand unmoved, and fixed in the Flesh to hold it, those on the other Side are brought forward, to draw it in farther; then they keep it fast till the former Jaws advance again in their Turn: Thus they act successively, and force the Animal entire (there being no *Dentes Incisivi*, or *Molares*, to divide it) into the *Oesophagus*, whose muscular Fibres are very weak, and can help but little in the Business.

The Symptoms which follow upon the Bite of a Viper, when it fastens either one or both its greater Teeth, in any Part of the Body, are an acute Pain in the Place wounded, with a Swelling, at first red, but afterwards livid, which, by degrees, spreads farther to the neighbouring Parts with great Faintness, and a quick, though low, and sometimes interrupted Pulse, great Sickness at the Stomach, with bilious convulsive Vomiting, cold Sweats, and sometimes Pains about the Navel; and if the Cure be not speedy, Death itself, unless the Strength of Nature prove sufficient to overcome these Disorders; and though it does, the Swelling still continues inflamed for some time; nay, in some Cases more considerably upon the abating of the other Symptoms, than at the Beginning; and often, from the small Wound, runs a sanious Liquor, and little Pustules are raised about it; the Colour of the whole Skin is changed yellow, as if the Patient had the Jaundice.

These Mischiefs, although different Climates, Season of the Year more or less hot, the greater or lesser Rage of the Viper, the Beast itself, of a larger or smaller Size, and, consequently, able to communicate more or less Venom, and the like Circumstances, may variously heighten or abate them; yet usually discover themselves much after the same manner in all; unless the Bite happen not to be accompanied with the Effusion of that Liquor, which is the main Instrument and Cause of this violent and shocking Disturbance.

But before I proceed to inquire into the Nature and Manner of acting of this Juice, it may be worth the while to take notice, that this is not made on Purpose to be deadly and destructive to Mankind; but that the true Design of it is (tho' Authors have not regarded it) to perform an Office and Service of so great Moment to the Preservation of the Individual, that without it this Creature could not subsist.

For Vipers live principally upon Lizards, Frogs, Toads, Mice, Moles, and the like Animals, which they do not chew, but swallow down whole, and they lie in the Stomach; or if that be not big enough to receive them, partly in that, and partly in the *Oesophagus*, which is membranous, and capable of great Distention, till by the salival Juices of those Parts, together with the Help of the Fibres of the Stomach, and the Contraction of the Muscles of the Abdomen, they are gradually dissolved into a fluid Substance, fit for the Nourishment of their Bodies, which is the Work of many Days: This is one Reason why these Creatures can live so long without taking any fresh Food, which I have known them to do three or four Months; as another is, that their Blood is a grosser and more viscid Fluid than that of most other Animals; so that there is but a very little Expence of it, by Transpiration, and, consequently, less need of Recruit; this not only Microscopes discover, but Reason teaches; because there is but very little muscular Force in the Stomach to comminute the Food; and make a Chyle of fine Parts; and therefore the Blood must accordingly be of a tough and clammy Consistence. Besides, the Heart of a Viper has properly but one Ventricle, and the Circulation of the Blood is performed after the same manner as it is in a Frog and Tortoise, in which not above one Third of it passes through the Lungs; upon which Account its Communion in them by the Air is proportionably lesser than in other Animals. Now such a manner of Feeding as this, does necessarily require, that the Prey should, upon the first Catching, be immediately killed, otherwise it were by no means fit to be let into the Stomach; for we are not to think, that the Force of this Part would be alone sufficient to destroy it, the Subtlety of a living Creature (besides the Consideration of the Weakness of the Fibres) being in a great measure able to elude that, as indeed we do every Day find live Animals in the Stomachs of others: And therefore to do this, is the proper Use both of the Teeth, and their Poison; for which being designed and adapted, it is no Wonder if the Viper, this same way by which it destroys its Prey, proves sometimes mischievous to any other Creature besides,

besides, when it happens to be enraged, or by any Provocation stirred up to bite.

This venomous Juice itself is of so inconsiderable a Quantity, that it is no more than one good Drop that does the Execution; and for this Reason Authors have contented themselves with Trials of the Bite upon several Animals, never assaying to examine the Texture and Make of the Liquor itself; for which Purpose I have oftentimes, by holding a Viper advantageously, and enraging it till it struck out its Teeth, made it to bite upon somewhat solid, so as to void its Poison, which carefully putting upon a Glass Plate, I have with a Microscope, as nicely as I could, viewed its Parts and Composition.

Upon the first Sight I could discover nothing, but a Parcel of small Salts nimbly floating in the Liquor; but in a very short time the Appearance was changed, and these saline Particles were now shot out, as it were, into Crystals of an incredible Tenuity and Sharpness, with something like Knots here-and-there, from which they seemed to proceed, so that the whole Texture did in a manner represent a Spider's Web, tho' infinitely finer, and more minute; and yet withal so rigid were these pellucid Spicula, or Darts, that they remained unaltered upon my Glass for several Months.

I have made several Trials with this Juice, in order to find out under what Tribe of Salts these Crystals are to be ranged; and not without some Difficulty, by reason of the minute Quantity of the Liquor, and the Hazard of Experiments of this Nature, have plainly seen that it does, as an Acid, turn the blue Tincture of Heliotropium to a red Colour.

I did not succeed so well in mixing it with Syrup of Violets, and yet it did really seem to induce in this a reddish Hue; but I am very certain it did not at all change it to a greenish Colour, as it would have done, if any ways alcalious.

This may suffice, in their own Way of arguing, to convince those Gentlemen, who, without the Assistance of any Experiments, merely to serve an Hypothesis, which they have too fondly taken up, have with great Assurance told the World, that the Viperine Venom is an Alkali, and consequently to be cured by acid Remedies. But it is by far more easy to spin out a false Notion into precarious Reasonings, than to make faithful Experiments, and fairly improve them by just and necessary Consequences.

To proceed, this Discovery agrees very well with a Relation communicated by an ingenious Person to Dr. *Tyson*; which does so much illustrate this Matter, that I shall transcribe it in his own Words, out of the *Philosophical Transactions*: He says then, that being in the *Indies*, there came to him an *Indian*, with several Sorts of Serpents, offering to shew him some Experiments about the Force of their Poison: Having therefore, first pulled out a large one, the *Indian* told him this would do no Harm; and making a Ligature on his Arm, as in letting Blood, he exposed it naked to the Serpent, being first irritated to make him bite it; the Blood that came out of the Wound, made by his Teeth, he gathered with his Finger, and laid it on his Thigh, till he had got near a Spoonful: After this he takes out another, called *Cobra de Capelo*, which was lesser, and enlarges much upon the Greatness of his Poison. To shew an Instance of it, grasping it about the Neck, he expresses some of the Liquor in the Bags of the Gums, about the Quantity of half a Grain, and this he puts to the coagulated Blood on his Thigh, which immediately put it into a great Fermentation, and working like Barm, changed it into a yellowish Liquor.

This, I say, does well enough accord with what we have been advancing, concerning the Nature of this Juice: For *Boyle* hath long since proved by Experiments, that there is nothing of Acid in human Blood; and *Pitcairn* has demonstrated, that the acid Substances of Vegetables, taken into the Stomach, are, by the Action of this Part, the Lungs and Heart, when they come into the Blood-vessels, turned to alcalious; so that the arterial Fluid must necessarily be considered as an Alkali; and therefore, according to the known Principles of Chymistry, its Mixture with such a Liquor as we have discovered the viperine Sanies to be, will always exhibit some such Appearance as this now related.

But not to engage any farther in this Sort of Controversies, we may, perhaps, from the foregoing Observations, receive some Light, in order to understand the Nature and Reason of all those Symptoms which attend the Bite of this Creature: For the pungent Salts of this Venom, when with Force thrown into the Wound, will not only, as so many Stimuli, irritate and fret the sensible Membranes, whereupon there necessarily follows a greater Afflux than ordinary of the animal Juices that Way, (as is manifest from the *Bellinian Doctrine de Stimulis*) so that the wounded Part must be swelled, inflamed, and livid; but, also, these Spicula, being mixed with the Blood, will so disjoin and disunite the Parts of it, that its Mixture must be quite altered; and from the various Cohesion of its Globules

will arise such different Degrees of Fluidity and Impulse towards the Parts, from what this Liquor had before, that its very Nature will be changed.

It is worth the while, in the next Place, to consider the Cure of this Mischief, which, without all Doubt, ought to be by such external Management of the Wound as may immediately destroy the infused Venom.

Boyle experienced an hot Iron, held as near the Place as the Patient could possibly endure it very effectual to this Purpose: But the same Method did not answer Expectation, in the famous Case related by *Charas*.

An extraordinary Virtue against this and other venomous Bites, is ascribed to the Snake-stones brought from the *East-Indies*, one of which is to be presently applied to the Part, and let stick till it drop off: These are said to be taken out of the Head of the Serpent, called by the *Portuguese*, *Cobra de Capelo*, and to suck the Poison out of the Wound. *Redi* made Trials with several of them, but found no Service from any: Yet *Baglivi* tells us, of a terrible Bite of a Scorpion cured this Way. Monsieur *Charas's* Pigeons all died, though these were immediately clapped on, and stuck close to the Wound: But *Havers* saw a good Effect of one upon a Dog, who, though feverishly bitten, suffered no Harm; nor any farther Mark of the Poison, than a livid Circle round the Place.

In plain Truth, as these celebrated Stones do not seem to be what it is pretended they are, but rather factitious Bodies, compounded, it may be, of calcined Bones, and some testaceous Matters mixt together; so, by reason of their spongy and porous Texture, they do very readily adhere to any moistened Part of the Flesh, and imbibe whatsoever Humidity they meet with: This their Quality any one may experience, by holding one of them to the Roof of his Mouth: And it is upon this score that, when put into Water, Bubbles are raised by the Air in their Interstices, which some have too fondly thought to be the Effects of their throwing out the Venom they had sucked in.

Their Make being thus, some Part at least of the poisonous Juice may easily be drawn out of the Wound, by such an Application; and yet so much of it may sometimes happen to remain in the Flesh, as may make the Bite however to prove mortal. And thus it fared with a Pigeon, to the Thigh of which, first bitten by a Viper, I applied one of the Stones; for though it stuck fast to the Wound, and thus saved the Life for about four Hours (whereas others usually died in about half an Hour), yet, after this, the Mortification of the Part prevailed to that Degree as to become fatal to the tender Creature.

But our Viper-catchers have a Remedy far beyond all these, in which they place so great Confidence, as to be no more afraid of a Bite than of a common Puncture, immediately curing themselves by the Application of their Specific.

This, though they keep as a great Secret, I have, however, upon strict Inquiry, found out to be no other than the *Axungia Viperina* presently rubbed into the Wound. And to convince myself of its good Effects, I enraged a Viper to bite a young Dog in the Nose; both the Teeth were struck deep in; he howled bitterly, and the Part began to swell. I diligently applied some of the *Axungia* I had ready at hand, and he was very well the next Day.

But because some Gentlemen who saw this Experiment were apt to impute the Cure rather to the Dog's Spit (he licking the Wound) than to the Virtue of the Fat, we made him to be bit again in the Tongue, forbearing the Use of our Remedy, and he died within four or five Hours.

At another Time I made the like Trial with the same Success.

As this *Axungia* consists of clammy and viscid Parts, which are withal more penetrating and active than most other oily Substances, so these, without all Doubt, involve, and, as it were, sheath the volatile Salts of the venomous Liquor, and thus prevent their shooting out into those crystalline Spicula, which we have observed to be the main Instruments of that deadly Mischief which attends the Bite.

By this means it comes to pass, that this Cure, if rightly managed, is so easy and certain, as not to need the Help of any internal Medicines to forward it; but these however must take Place where, through want of the other, the Poison is spread farther, and has tainted the whole Mass of Blood.

Nor yet is it necessary, even in this Case, to fatigue the Patient with a Farrago of Theriacs and Antidotes; for the volatile Salt of Vipers is alone sufficient to do the Work, if given in just Quantities, and duly repeated; provided moderate Sweats be encouraged in Bed: Thus it succeeded with Monsieur *Charas*, and in some others I could relate; in one of which the Mischief had gone so far as to induce an universal *Icterus*.

I must remark, that since Dr. *Mead* wrote the Treatise of Poisons, from which these Particulars relative to the Viper are extracted,

extracted, a Man and his Wife, who made it their Business to catch Vipers, came from *Bath* to *Oxford*, and from thence to *London*; and, after having shewn a great Number of Experiments, with respect to the Bite of this Animal, at last discovered an effectual Remedy, which consists in nothing more, than chafing the Part wounded with Olive-oil, before the Fire; and, if the Case should be extremely bad, wrapping the entire affected Limb in a Cerate, made of White-lead, and the same Oil.

I must further observe, that as the viperine Poison acts by inducing a Coagulation of the Blood, which spreads gradually from the wounded Part to the Heart, of which I have seen an hundred incontestable Instances; and as rubbing in the Oil, prevents the Coagulation, and resolves the Blood already coagulated; hence, perhaps, we may account for the Efficacy of Unctions, so much practised by the antient Physicians, especially those of the Methodic Sect.

And, farther, may we not presume, that the Oil of Animals, so exquisitely treasured up in the Reservoirs of the Cellular Membrane; may, upon some Occasions, by mixing with the Blood, prevent Coagulations, and consequently Distempers, from such a Cause?

VIPERARIA. The same as SCORZONERA.

VIPERINA. The same as SCORZONERA.

VIRGA AUREA.

The Characters are;

The Root is fibrous; the Leaves are alternate and entire, and the Calyx is squamous. The Flowers are produced on the Tops of the Stalks and Branches, in a long Series like a Rod, are less than those of the Aster, have shorter Pedicels, and are generally of a golden Colour.

Boerhaave mentions fourteen Sorts of *Virga aurea*; which are,

1. *Virga aurea*; folio amplissimo; dentato. *An.* *Virga aurea*, *Canadensis*, latissimo folio, glabro. *T.* 485.

2. *Virga aurea*; montana; latiore folio, glabro. *H. R.* *Par.* 186.

3. *Virga aurea*; annua. *Zanon.* 205. *T.* 484. *Conyza Canadensis*, annua, acris, alba, folio *Linariae*. *Bocc.* 86. *Aster Canadensis*, annuus, flore papposo. *H. R.* *Par.*

4. *Virga aurea*; *Canadensis*; hirsuta; panicula minus speciosa. *H. R.* *Par.*

5. *Virga aurea*; *Novæ Angliæ*; altissima; paniculis nunquam reflexis. *Flor.* 2. 34.

6. *Virga aurea*; angustifolia; panicula speciosa; *Canadensis*. *H. R.* *Par. M. H.* 3. 125.

7. *Virga aurea*; *Novæ Angliæ*; foliis longissimis, glabris. *Flor.* 2. 35.

8. *Virga aurea*; foliis angustis; lævibus; non ferratis; panicula speciosa; floribus magnis.

9. *Virga aurea*; *Noveboracensis*; glabra; caulibus rubentibus; foliis angustis, glabris. *Flor.* 1. 26.

10. *Virga aurea*; angustifolia; minus ferrata. *C. B. P.* 268. *Boerb. Ind. A.* 97. *Virga aurea*. *Offic. Ger.* 348. *Emac.* 430. *Raii Hist.* 1. 278. *Synop.* 81. *Virga aurea vulgaris*. *Park.* 542. *Virga aurea vulgaris latifolia*. *J. B.* 2. 1062. *Tourn. Inst.* 484. GOLDEN-ROD.

The common Golden-rod grows to be two or three Feet high, having round hairy Stalks, full of a fungous Pith; the lower Leaves grow on pretty long Foot-stalks; they are three or four Inches long, broadest in the Middle, and narrow at both Ends, indented about the Edges, and hairy on both Sides; those, which grow on the Stalks, are less, and stand on shorter Foot-stalks, and sometimes without any. The Flowers grow thick together, in small Spikes, on the upper Parts of the Branches; they are composed of small yellow Petals, set about a little fistular Thrum, which afterwards turn into Down. The Root is long, running aslant with many Fibres; it grows in Woods and Hedges, and flowers in July.

The Leaves and Tops are used, this being accounted one of the best vulnerary Plants, and much used inwardly in Traumatic Apozems, and Wound-drinks; and, outwardly, in Cataplasms, and Fomentations.

It is somewhat restraining, and useful against Spitting of Blood, and other Hæmorrhages; and is of great Service against the Stone. *Miller's Bot. Off.*

Golden-rod is styptic, bitter, and gives no Tincture of Red to the blue Paper. It is likely, that its Salt resembles that which is natural in the Earth; but it is mixed with a great deal of Oil, and terrestrial Parts. Thus this Plant is vulnerary, and diuretic. It is prescribed in Pusans, and Broths, for the Dysentery, and for all Sorts of Hæmorrhages. These Medicines are lenitive, also, and provoke Urine; The distilled Water of the Tops, and the Extract of the whole Plant, have the same Virtues. The Leaves and Flowers of the Golden-rod, are taken after the manner of Tea. It is used in the *Eau d'Arquebuse*, and vulnerary Potions. *Martyn's Tournesfort.*

It is a most celebrated Vulnerary, both for internal and external Use, and even to be preferred before the *Solidago Saracenica*. For internal Wounds, says *C. Hoffman*, it is effectual, by carrying off the Ichor with the Urine; which agrees with the Observation of the most celebrated Physicians, that almost all vulnerary Potions are diuretic; and it was customary for the Combatants at Wrestling and Boxing, in their ordinary Drink, to take *Valerian*, which is a prime Diuretic. In external Wounds, this Plant is of Efficacy by Exiccation and Absterision; for which Purposes it is highly qualified.

That it is none of the least Lithontriptics and Diuretics, is agreed by all: It was first experienced by *Arnold. Villanovanus*, in the Stone, who used it in Powder; and it is celebrated for this Disease by *Barclay*, in his *Argenis*, and in his *Euphormio*. The Dose is two Drams of the Powder every Morning in warm White-wine.

C. Hoffman says, it is endued with a remarkable absterfive Virtue; whence it is so much celebrated in Obstructions of the Viscera, where there is a Tendency to a Dropsy; for which Intention, the Decoction of it was a long time kept as a Secret, tho' it be, also, commended against all Fluxes of the Belly and Uterus, and internal Hæmorrhages, which proves it to be rather astringent than absterfory, unless, perhaps, it performs those Effects by its desiccative, or drying Quality, which all ascribe to it. *Raii Hist. Plant.*

11. *Virga aurea*; Mexicana. *C. B. P. App.* 517.

12. *Virga aurea*; folio hirsuto salicis raro & levissime ferrato; caulibus atropurpureis.

13. *Virga aurea*; major; foliis glutinosis & graveolentibus. *T.* 484.

This *Boerhaave*, by Mistake, has taken notice of already, under *Conyza*; *mas*; *Theophrasti*; *major Dioscoridis*; for which I refer the Reader to *CONYZA*.

14. *Virga aurea*; omnium minima. *H. R. Par. Boerb. Ind. alt. Plant.*

The *Virga Aurea* is so acrimonious, that no Pepper can be compared with it, tho' it leaves not the least Relish of Acridness in the Mouth, but proceeds through the whole Body. It is like the *Ranunculus urens* of the Shops; and is of a moderately, or somewhat astringent Taste, which at first is not unpleasant, but leaves an ungrateful Relish in the Mouth. The Leaves are gathered in May, and dry'd for Use. *Barclay*, in his *Satyricon*, says, that he cured a Person of Quality, to whom he was sent on an Embassy, of the Stone, and a Suppuration of the Kidneys, with the Powder of the dry'd Leaves. Three or four Ounces of the Plant macerated in Water, are a good vulnerary Dose, and proper for internal Hæmorrhages, the Dysentery, and Diarrhoea. Externally it depurates Wounds, absterges Putridness of the Gums, fastens loose Teeth, and cleanses malignant Ulcers, and Fistulas. I have often exhibited it with great Success in all Sorts of putrid, viscid, and cold Indispositions. The Leaves duly dry'd, and infused after the manner of Tea, and drank with an Addition of Honey, are highly corroborative and deterfive, and of extraordinary Efficacy in Ulcers of the Lungs, and Wounds of the Breasts, and other Parts.

The *Virga aurea*, as we are told by *Tournesfort*, is a Plant of *Canada*, but is now common throughout *Europe*, because the Seeds brought from that Country have diffused themselves through all the *European* Regions, and grow without Difficulty; for the Seeds are agitated and dispersed into all Parts by the Winds, and where-ever they fall, easily take Root, and spring up. *Hist. Plant. adscript. Boerhaav.*

VIRGA AUREA is, also, a Name for several Sorts of *DO-RIA*; which see.

VIRGA AUREA, *Linariae foliis*. A Name for the *Comaurea*, *Germanica*.

VIRGA PASTORIS. A Name for the *Dipsacus sylvestris*; *capitula minore*; vel *Virga Pastoris, minor*.

VIRGA SANGUINEA. A Name in *Boerhaave* for the *Cornus*; *fœmina*.

VIRGATA SUTURA is the *Satura Sagittalis*, Sagittal Suture of the *Cranium*.

VIRGINALE CLAUSTRUM. The HYMEN.

VIRGO. Besides the various Kinds of acute and chronical Diseases, there are, also, some Disorders incident to Virgins, pregnant, and Child-bed Women, as, also, to Children.

When the Body of a Woman has arrived at its full Growth, if her Constitution is good, more Blood is generally prepared than can be contained in the Vessels; for which Reason it is eliminated from the Uterine Arteries, under the Name of the *Menses*.

If, in such a State and Condition of Body, this Blood is retained, a Plethora, Slowness, a Sense of Weight, Paleness, a Pain of the Loins, and Groin, and a Depravation of almost all the Functions, whether natural, vital, or animal, are produced, and may be easily accounted for from the too great Pressure

Pressure upon the Vessels, by the redundant, stagnant, and suffocated Blood.

The Blood, when thus accumulated, often finds surprising Ways, not known in the natural Discharge of the Menstrues, since Physicians have sometimes seen it eliminated by the Eyes, the Ears, the Gums, the Salival Ducts, and the Oesophagus, by Stool and Urine, by the Breasts and Skin, as, also, by Wounds and Ulcers.

By this means all the Viscera are often weakened, and a surprising Number of Disorders produced, partly by the conceived Putrefaction, and partly by the Injury done to the Vessels.

This Disorder is known, first, by the Age of the Patient; secondly, from her full Growth; thirdly, from a Plethora; and, fourthly, from the Signs of the Disease, subsequent to this Plethora.

It is cured by various Remedies adapted to the different Causes from which it proceeds.

Thus it may proceed either from a natural or accidental Concretion of the Pudenda, in which Case the Surgeon is, with a proper Instrument, to make a due Incision.

But, when it proceeds from a Stagnation of the Humours, these are to be rendered fluid; first, by Fomentations, and Frictions of the Feet; secondly, by Venesection in the Feet; thirdly, by the Exhibition of uterine Purgatives, such as Aloes, Myrrh, Betony, Coloquintida, Gum Ammoniac, Bdellium, Sagapenum, Opopanax, Galbanum, Asa-fetida, and the Elixir Proprietatis; fourthly, by Emmenagogues, which besides these already enumerated, are Birthwort, Mug-wort, Motherwort, Chamomile, Juniper, Marjoram, Marum, Feverfew, Pennyroyal, Rue, Savin, Sage, Elder, Mother of Thyme, Tansey, the Tree of Life, and Thyme; fifthly, by Plaisters, Fomentations, Liniments, Vapours, and Heat. The Plaisters proper for this Purpose are, those of Cumin, Melilot, Galbanum, Bay-berries, Labdanum, and Oxyroceum, applied to the Soles of the Feet, the Navel and Groin. The Fomentations may consist of Venice Soap, and a Decoction of the above-mentioned Herbs. The Liniments are to be prepared of Soldiers Ointment, nervine Ointment, that of Elecampane without Mercury, that of Agrippa, and that of Sowbread; distilled, aromatic Oils, and especially the distilled Oils of Juniper-berries, Hyssop, Mace, Marjoram, Origanum of Crete, Rosemary, Savin, Spike, Tansey, and Amber; the Oils by Infusion of Wormwood, Dill, Chamomile, Catmint, Rue, Castor, Saffron, Orris, and Earth-worms. Thus,

Take of Soldiers Ointment, and nervine Ointment, each one Ounce; of the distilled Oil of Juniper-berries, one Dram; of the distilled Oil of Savin, and of the Oils of Rue and Castor by Infusion, each half an Ounce: Make into a Liniment, to be applied to the Navel, Pubes, and Groin.

As for the Vapours, those arising from a Decoction of the Herbs already mentioned, and received into the Uterus, are most proper. And, sixthly, by corroborating the Vessels weakened by the Plethora, by means of Chalybeates and Astringents: Thus,

Take of the Filings of new and unrusty Iron, two Ounces; of Peruvian Bark, and Winter's Cinnamon, each two Ounces; of dried Rhubarb, half an Ounce; and of generous Rhenish Wine, two Pints: Make into a medicated Wine, of which two Ounces may be taken thrice a Day upon an empty Stomach.

When the Cause of the Disorder is by these means removed, the Symptoms already mentioned either spontaneously cease, or are to be cured in the same manner with the Disorder they most nearly resemble, which may be easily done from what has been said. *Boerh. Aph. & Mat. Med.*

VIRIÆ, or VIRIOLÆ. Rings worn upon the Arms as Amulets.

VIRIDE ÆRIS. Verdégrise.

VIRIDELLUS. Vitriol; or the Epilepsy.

VISCAGO. A Name for the *Lychnis*; *facie Auriculæ Ursi*.

VISCAGO. Mucilage.

VISCALEUS. The same as Viscum. *Johnson.*

VISCARIA. A Name for the *Muscipula*, Catch-fly.

VISCERA. The Bowels.

VISCERALIA.

Visceral Remedies in general are, those which impart Strength and Firmness to the sanguineous Viscera, such as the Liver, Spleen, Uterus, Kidneys, and Lungs; by which means they are qualified for a more happy and expeditious Performance of their respective Functions. To this Class we may, therefore, commodiously refer hepatic, splenic, pneumonic, uterine, anti-cachectic, anti-hydrotic, anti-isteric, anti-hysteric, and anti-phthical Me-

dicines: But the most considerable Viscerals are, the Roots of red Gentian, long and round Birthwort, Succory, Zedoary, Fern, true Rhubarb, and Rhapontic, Turmeric, and Rest-harrow, Peruvian Bark, Winter's Bark, the Barks of Tamarisks, the Ash, and Capers, together with Cloves; the Herbs Wormwood, the Lesser Centory, Fumitory, Carduus Benedictus, Marsh-trefoil, Golden-trefoil, Baum, spotted Lungwort, Spleenwort, Agrimony, Horehound, Dodder, *Paul's* Berony, Scabious, Spurge, Maiden-hair, and Mouse-ear. The Viscera are, also, excellently strengthened by some of the resinous Gums, such as Myrrh, Aloes, Bdellium, the Gum of the Ivy-tree, Gum Ammoniac, Olibanum, Sagapenum, Opopanax, and Asa-fetida. Some Minerals are, also, excellent Viscerals, such as the Flowers of pure common Sulphur, Filings of Steel, and all Preparations of that Metal. Some chymical Preparations are, also, powerful Viscerals, such as the Salts of Herbs obtained by Incineration, the Arcanum Tartari, the Terra foliata Tartari, Cream of Tartar, Sal Polychrestum, antimoniated Nitre, Spirit of Sal Ammoniac, Tincture of *Mars* extracted with Spirit of Wine from the Flowers of Sal Ammoniac prepared with Blood-stone, the Tincture of Tartar, the Tinctura Antimonii Alcalifata, the Elixir Proprietatis prepared with a Lixivium, the Essence of Soot, the Visceral Elixir prepared with an aqueous saline Menstruum, the Antimonium Martiale Cachecticum, *Becher's* Mass of Pills, and others of a like Nature. To the Class of Visceral Medicines, also, belong Mineral Waters, especially such as contain a certain subtile chalybeate Principle, such as those of *Pyrmont*, *Spaw*, and *Swalbacen*; and much more those which contain a larger Quantity of a chalybeate Principle, such as those of *Lauchstad*, *Radeberg*, *Bebra*, and *Frayenwald*.

These balsamic Viscerals, partly by a sulphureous, balsamic, and somewhat fixed earthy Principle, and partly by their alkaline, sulphureous, saponaceous, and bitter Quality, perform their Operation upon the Viscera, whose Vessels are obstructed and infarcted by gross and viscid Humours, by inciding and dissolving the tenacious Juices, and, at the same time, procuring a due contractile and elastic Force to the Vessels and Fibres of the Viscera, which had lost their Strength and Tone. Hence they are of great Efficacy, both for the Prevention and Cure of those chronic Diseases, which arise from any Disorder of the Viscera.

Though all Viscerals agree in this, that they strengthen the Tone of the Viscera, and remove Infarctions and Obstructions, yet it is necessary to vary them, according to the Diversity of Viscera affected, and the Diseases thereby produced. Thus, for Instance, if the Liver is obstructed, and a Jaundice, Cachexy, or Scurvy, produced by that means, the most efficacious Viscerals are those possessed of a certain saponaceous and deterfitive Bitterness, such as the Five aperient Roots, Rhubarb, Turmeric, Opopanax, Bdellium, Venice Soap, Elixir Proprietatis without an Acid, Essence of Rhubarb prepared with Salt of Tartar, Essence of Trefoil, and all good Preparations of Steel. When there are too great a Relaxation and Infarction of the Lungs, and the Diseases by that means produced are present, Myrrh, Gum Ammoniac, Flowers of Sulphur, *Paul's* Betony, Scabious, Chervil, Lungwort, Mouse-ear, Horehound, and Maiden-hair, are generally thought most efficacious. When the Spleen being preternaturally large, and infarcted with Blood, favours the Generation of an unpure Blood, and especially of a Cachexy, the Barks of Tamarisks and Capers, Fumitory, Spleen-wort, Dodder, Spurge, the Roots of Rest-harrow, and Chalybeates, are preferable to other Remedies. When from a weak, and too much relaxed Tone of the Kidneys, nephritic Pains and Stones are formed, the Bark of the *Egyptian* Thorn-root, and an Infusion of it; as, also, the Robs of Hounds-tongue and Juniper, are, in a peculiar manner, efficacious. From a weak State of the Uterus, and its Vessels, and a slow Circulation of the Blood and Humours, arise numberless chronic Diseases, which are efficaciously cured by long and round Birthwort, Mugwort, Myrrh, Feverfew, Galbanum, Bdellium, Opopanax, Amber, *Becher's* Mass of Pills, and others, prepared in the same manner. If the Intestines, and their Glands, the secretory, excretory, biliary, pancreatic, and lacteal Ducts, are so deprived of Strength, that by a copious Defluxion of Humours, excessive Fluxes are produced; or, if the Humours stagnating in the Vessels lay a Foundation for febrile Motions and Paroxysms, Rhubarb, Peruvian Bark, Winter's Bark, Cascarilla Bark, and the most subtile Crocus, and Essences of *Mars*, are found more efficacious than any other Remedies.

But, with respect to Corroboratives in general, it is to be observed, that they produce far better Effects, if not only before their Exhibition the redundant Blood is lessened, and the Sordes of the *Prima Via* evacuated by proper Laxatives; but, also, if, in order to render the Humours more fluid, they are exhibited in Decoctions or Infusions, or which is still better, with Medicinal

dicinal Waters, or Whey; by which means, the Operation of these Corroboratives, which are of an astringent Nature, is greatly assisted in removing violent chronic and inveterate Disorders; especially when their Use is for a considerable time persisted in, and proper Exercise, whether by Riding or Walking, used. *Fred. Hoffman.*

VISCIDITAS. See LENTOR.

VISCUM, VISCUS, *is*.

The Characters are;

The Leaves are conjugated, narrow, and oblong; the Flower is monopetalous, shaped like a Bason, quadrifid, sprinkled with Warts, and male; the Ovary grows in a different Place from the Flower, and is of a tender Substance, surrounded with four small Leaves; and becomes a roundish Berry, full of a Glue, and containing a flat Heart-shaped Seed.

Boerhaave mentions but one Sort of *Viscum*; which is,

1. *Viscum*; baccis albis. *C. B. P.* 423. *Boerb. Ind. A.* 228.

Viscum. Offic. Ger. 1168. Emac. 135. Raii Hist. 2. 1583.

Synop. 3. 464. *Viscum vulgare*, Park. Theat. 1392. *Viscum* vel *Viscum arborum*. Merc. Bot. 1. 77. *Viscus Quercus*, & *aliarum arborum*. J. B. 1. 89. MISSEL AND MISSELTO.

This Plant is never found upon the Earth; it grows upon the Oak, Apple, Plum, Pear, Acacia of America, and several other Trees. That which is found in the Wood of *Vincennes*, occupies the best Branches of the White-thorn, on whose Branches neither Earth, nor any other Matter, is to be found, which may seem proper to make the Seeds of this Plant chit. There is first discovered only a Tumor in those Parts to which the Mistletoe has fastened itself; its Flowers grow by threes, at the Division and Extremities of the Branches; each Flower is a yellowish Bason, of about three Lines Diameter, of the Thickness of Spanish Leather, cut into four Segments, rounded in three Points, and opposite to each other, in Form of a Cross, in such manner, that those which are opposite, are equal between themselves, but unequal with respect to the others; each Segment is raised with a little Bump, paler than the rest, and divided into Apartments full of little oval Holes, filled with Dust resembling Flour of Sulphur, or that which flows from the Summit, of other Plants.

The Flowers of Mistletoe produce nothing; the Fruits grow upon different Branches from those which bear the Flowers; these Branches are found, sometimes, upon the small Plant that bears the Flowers; and sometimes, also, upon Plants which bear only Fruit.

These Fruits are disposed, also, by Threes, at the Extremities of the Branches; each Fruit begins by a little oval Embryon, encompassed with four thick yellowish Leaves, half a Line long, pointed, and easily falling off; this Embryon thickens insensibly, and forms an oval Berry, three Lines long, like a little Pearl, filled with a flat Seed shaped like a Heart, covered with a silver-coloured Membrane, very fine, and full of Glue, that is to say, a very viscid, whitish, and sweetish Substance, in which the Seed naturally germinates, and pushes forth two Radicles out of the Side of its Notch.

This Seed, in all Appearance, produces the young Plants of Mistletoe to be seen upon the Branches of the Trees now mentioned; for some do but just peep, (if I may so say) and have only the Radicles which began to appear in the Berries. Nevertheless, we cannot say, that this Seed passes thro' the Root of the Oak, and the other Trees, and ascends into the Branches by the Sap-vessels; for each Seed is two Lines diameter, and the Texture of these Vessels cannot be perceived by our naked Eyes. It follows, then, that this Seed must be applied, by some external Cause, to the Branches of the Trees: These Causes may be reduced to two principal ones.

The Birds, perhaps, by crushing these Berries with their Feet or Bills, may give them an Opportunity of fastening themselves to the Branches, by their Glue: As we see the Magpies and Jackdaws contribute to the multiplying of several Plants, by carrying about their Kernels, and burying them. It may happen, also, that the Birds which have swallowed the Mistletoe-berries may void them upon the Branches of the Trees on which they perch; which made *Plautus* say, *Ipsa sibi avis mortem cacat*; tho' it is not very easy to comprehend how the Seeds which pass thro' the Gizzards of the Birds should escape being bruised, and ground to Pieces.

It may happen, also, that these Berries, falling, either of their own Accord, or by the Violence of the Winds, may stick, sometimes, against the Branches of the neighbouring Trees, especially if they happen to be applied by that Part by which they hung upon the Mistletoe; for this torn Part easily fastens itself to any Body on which it falls: But in what manner soever these Berries stick, we have Reason to believe, that the Glue, which they are filled with, insensibly softens the Bark to which it is fixed; and then the Seed, which had germinated before in its Berry, as we observed above, pierces it easily, by its Radicle. Perhaps this Glue, tho' it appears so mild and insipid

to us, ferments with the Sap of the Trees, and tears the Fibres of their Bark, which favours the Passage of the Fibres of the Radicle considerably. Thus the *Ova fœminea*, falling into the Body of the Uterus, fasten themselves to it, by means of the Placenta; the Juice of which, fermenting with that of the Glands of the Bottom of the Uterus, makes a little Inflammation, by means of which these two Parts stick together.

The Radicle, then, of the Seed of the Mistletoe, finding it easy to pierce the Bark of the Branches, lengthens into greenish Fibres, which run, at first, thro' the parenchymous, and piercing, afterwards, the ligneous Part, interlace themselves with the Fibres of the Branches, and insinuate themselves into their Vessels, out of which they draw a Juice proper for their Nourishment. One may easily distinguish these Fibres, if one take the Pains to trace them, after having discovered the first Bark. It is no wonder, that the Place where they insinuate themselves should swell, since they increase the Bulk of it; and, besides, these Roots, by taking hold, press the Vessels of the Branches in some Places, strangle them, and make them burst into others, which causes the Interception and Extravasation.

Mistletoe can live only upon Trees, because, perhaps, its Radicle, not having a Structure proper to separate from the Earth, and prepare the Nourishment necessary to the Vegetation of this Plant, it is necessary that this Preparation should be made in the Root of another Plant, which is to it as a Nurse; in the same manner as, the Stomachs of Children being too weak to prepare their Nourishment, they must either have a Nurse, or it must be accommodated to the Weakness of their Stomachs. To satisfy myself concerning the Production of Mistletoe, I have sown the Seeds of it for three Years together; but I have never seen any of them come up: I have fastened, also, several Berries, in March and April, upon young Branches of the Apple-tree and White-thorn; but the Violence of the Winds, and the frequent Rains which usually fall in that Season, have not permitted me to satisfy myself entirely concerning this Matter: So that I only propose Conjectures, which have Probability enough to be received in Natural Philosophy.

The Wild Pear-trees are covered over with Mistletoe, and I observed upon their Trunks, tho' the Bark was hard, the first Shootings of the Seed, which I had long sought, but could never find, in France, where this Plant is so common. These Seeds, which are of the Shape of a Heart, were out of their Cases, and stuck, by their Clamminess, to the Trunks and Branches of these Trees, when the Wind, or any other Cause, shook them out: Each Seed was laid in such manner, that the Point of the Root began to pierce into the Bark, whilst the Eye of the Seed shot out, and unfolded itself. All this confirmed me in my Opinion which I had mentioned concerning the Multiplication of Mistletoe, in my History of Plants which grow about Paris. *Tourn. Voyage into the Levant.*

The Fruits of the Mistletoe begin by Embryons crowned with four little Leaves, or charged with a radiated Crown, composed of four little yellowish Leaves, articulated about the Head of each Embryon; these Embryons proceed out of a yellowish round Mass, articulated with the Extremity of the Branch, and two opposite Leaves, which terminate it on the Sides. This Observation shews, that M. *Tournefort* was mistaken in the Description which he has given us of these Embryons. The Berries of Mistletoe, each of them, often inclose two Seeds; the Flowers of the male Plants are monopetalous, cut into four equal Parts, each charged, on its inner Surface, with a Summit, which is strongly fastened to it: It flowers at the same time with the female. *Vaill.*

Mistletoe is accounted a cephalic and nervine Medicine, particularly useful for all Kinds of Convulsion-fits, for the Apoplexy, Palsy, and Vertigo; for which Purposes, some prefer the Mistletoe of the Hazel to that of the Oak. They who have a mind to know all the Virtues of this Plant, may consult Sir *John Colbatch's* Discourse of the Mistletoe.

Of the Berry of this Plant was formerly made the *Viscus Aucupum*, or Birdlime, by boiling the Berries in Water till they burst, when they are well beaten in a Mortar, and afterwards washed in Water, till all the branny Husk was cleared away; but with us, in England, Birdlime is made of the Holly-tree, which they strip off about *Midsummer*, boiling a good Quantity of it in Water for about twelve Hours, till the whitish outward Bark is separated from the green; this they lay in a cool Vault, or Cellar, covering it with Fern, or such-like Matter, letting it lie for a Fortnight, by which time the Bark will be turned into a Jelly, which they afterwards beat in a Stone Mortar, till it becomes a tough Paste; this they wash well in running Water, till all the Sordes are cleared away, and then put it into earthen Vessels.

Birdlime is a powerful Attractive, and good to ripen hard Tumors and Swellings: It is an Ingredient in the *Emplastrum Diachylon magnum*. *Miller's Bot. Off.*

The Birdlime, or Glue, used for Fowling, was much used, by the Antients, in Medicine. It has the Virtue of mollifying and dissolving Tumors, the Parotides, and Abscesses, being mixed with Rosin, and an equal Quantity of Wax; it, also, cures the *Epinyctides*, and, as *Pliny* says, dries up strumous Ulcers, and cures the Epilepsy. It is good for many other Things, which may be found in *Dioscorides*, *Pliny*, and *Galen*.

The Wood is of principal and specific Use in the Epilepsy; it is, also, prescribed for the Apoplexy and Vertigo, taken inwardly, or hung about the Neck: For these Disorders it is acknowledged to be effectual, by the unanimous Consent of antient and modern Physicians. We know some, says *J. Bauhine*, who have made use of the Wood of *Viscum*, macerated in Wine, with Success, against the Vertigo. The Powder of *Viscum*, especially what grows upon Oaks, not only cures the Epilepsy, but provokes the Menstrues: It is, also, an Arcanum against a Pleurisy, being taken once and again, and a third time, in Water of Carduus and Poppy. *D. Bowles*.

J. Bauhine writes, that he has several times advised the Use of *Viscum*, bruised and macerated in proper Waters, against Worms of the Intestines in Children.

The Powder of the *Viscum* which grows on the *Oxyacanthus*, being infused in White or Spanish Wine, and given two Hours before the Paroxysm, or Fit, and the Dose repeated, if necessary, has often removed, and perfectly cured a Quartan.

The Leaves, after they have been chewed, and ground by the Teeth of labouring Beasts, and Cows, are, by our rustic People, esteemed effectual for expelling the Secundines.

Viscum is a parasitic Plant, or Shrub, which grows on other Plants or Shrubs.

It is much controverted whether the Seed of this Plant, which is perfect and mature, ever produces a Plant of the same Kind. *Aristotle*, *Pliny*, and all the Antients, with one Consent, hold the Affirmative, and that *Viscum* is propagated from the Seed of the Berries passing thro' the Bodies of Thrushes, Wood-pigeons, and other Birds of that Kind, after the pulpy Substance, involving the Grains, is concocted. Such is the Nature of the Seed, says *Pliny*, that, unless it be matured in the Bellies of Birds, it will not shoot. But *Julius Scaliger*, and, after him, *J. Bauhine*, and most of the Moderns, assert the contrary, and endeavour to prove the same, by a Multitude of Arguments; some of which, however, are easily answered. It is more difficult to answer the Argument drawn from the Situation of the *Viscum* on the Branches: For how is it possible for the Seed of the *Viscum* to settle on slender, erect Sprays, on which the Birds themselves can hardly rest, and those, too, agitated by the Winds, and washed with frequent Showers? Or, what is more, how can the Seed lodge itself on the prone Part of the Branches, or that Side of them which faces the Ground? To this Objection, however, it may, with some Shew of Probability, be answer'd, that the Excrements of the Birds, fed with *Viscum*, participate of its Nature; and therefore the Seed, beset with that viscid Matter, may be so firmly agglutinated to the Branches, as not easily to be separated from them by the Force of Wind or Weather. We, indeed, for our Part, are not free to admit of spontaneous or equivocal Generation; and since all Seed, as *Theophrastus* truly says, is for the Sake of Generation, it seems to us absurd, and by no means probable, that Nature should have created any perfect Seed, and that too in great abundance, which yet, in all its Species, is wholly useless, and unfit for the Propagation of its Kind. *Raii Hist. Plant.*

Pliny tells us, *Lib. 16. Cap. 30.* that, among other Products of the *Luxus*, it bears *Viscum* on that Part of it which looks towards the North, and *Hyphear* on its South Side. And *Lib. 17. Cap. 44.* he further says, that there are three Kinds of *Viscum*; for what grows on Firs, and Larch-trees, in *Eubœa*, is called *Stelis*; in *Arcadia*, *Hyphear*; and that the *Viscum* [properly so called] grows on the *Quercus*, *Robur*, *Ilex*, especially the *Ilex Sylvestris*, and the *Terebinthus*, and on several other Trees, but most plentifully on the *Quercus*, whence it is called *Dryos Hyphear*, "the *Hyphear* of the Oak:" And a little after he says, that the *Hyphear* is fittest to feed Cattle.

Theophrastus, whom *Pliny* transcribes with some Variations, and, perhaps, Mistakes, in the Beginning of *Cap. 23. Lib. 2. de Caus. Plant.* tells us, that it is very surprising, and looks quite odd, and unaccountable, that some Seeds and Plants will not shoot or grow in the Earth: Of this Nature are the *Viscum* [*Stelis*], *Stelis*, and *Hyphear*. *Stelis* is a Word they use in *Eubœa*, but *Hyphear* is an Arcadian Term, and *Ixia* [*Viscum*] is a Name they use in common. Some will have these three to be of the same Nature; but there seems to be some Difference between them, in that they grow on different Plants; for the *Hyphear* and *Stelis* grow on Firs and Pines, but the *Ixia* on the *Quercus* and *Terebinthus*, and many other Sorts of Trees. Others allege, as a good Argument for their being distinct, if

the Observation be right, that not only each of these is produced on homogeneous Trees, as, for Instance, the Pine and Fir, but more than one are to be found growing on different Parts of the same Tree, where on one Side you may observe the *Stelis* or *Ixia*, and on the other the *Hyphear*.

Here *Theophrastus*, and his Transcriber *Pliny*, seem to make the *Hyphear* and *Stelis* distinct Species from the *Viscum*, but, says *Rai*, erroneously; for if they were really different, how comes it to pass that, in so many Ages, and among such a Multitude of Authors since the Time of *Theophrastus*, this Distinction could never be discovered, but has hitherto escaped the diligent Search, and curious Eyes, of the most sagacious Botanists? Nor do we approve those Distinctions of *Viscum* which, are taken from the different Kinds of Trees on which it grows; as if what grew on Trees of different Species were itself, also, specifically different. And what *Theophrastus* has written, that it always preserves its Leaves on Evergreens, but loses them on Plants which shed their Leaves, is contrary to Matter of Fact; for what grows on Pear-trees, Apple-trees, Almond-trees, and many others, whose Leaves are caducous, is perpetually green, and never loses its Leaves. As to what *Matthioli* says of the *Viscum* growing on the *Quercus*, *Robur*, and *Castanea*, that all its Leaves fall off at the Approach of Winter, let him answer for himself: For my Part, I could never make the like Observation on any Tree, at any time of the Year. *Raii Hist. Plant.*

VISIO. Vision.

Light, which is an Aggregate of all Colours collected together, sends forth Rays on all Sides: These Rays, tho' very subtle, are, in like manner, compounded of all Kinds of Colours; whence they are again divisible into simple Rays, which, collected separately, or of one Sort, or of different Sorts together, represent Variety of Colours; but, all united, form a very splendid lucid Beam, or very white Brightness. These Rays proceed from a lucid Point; as from a Centre, towards all Points without it, in strait Lines, thro' an homogeneous Medium, in no estimable Space of Time, passing thro' pellucid, and falling upon opaque Objects. Hence, all Points of the Cornea are struck by Rays contained within a Cone whose Vertex is the lucid Point, and its Base the Plane of the Cornea, if there be no Impediment interposed between the radiating Point and the Cornea.

The same Rays, approaching denser Bodies, are there incurvated, some more, some less: Hence they are separated, and being separated, and reflected, exhibit Variety of Colours, falsely ascribed to the reflecting or refracting Body, unless so far as they are separated by its means: The Reflexion, then, is here various, according to the Variety of the Colour latent in the Ray; the Angle, however, which the reflected Ray makes with a Perpendicular erected at the Place of Incidence, seems to be the same as that made by the falling Ray with the same Perpendicular; and in other Respects there seems to be no Alteration at all.

If these Rays pass out of one Medium into another, in their Approach to the latter they are incurvated, and, in that Condition, pass on thro' that Medium; and the more dense this is, the nearer incurvated are they towards a Perpendicular, and so on the contrary: And the same is, also, owing to a singular Cause latent in some Fluids, not to be determined but by Experiments. This Inclination is called *Refraction*.

This Refraction, with regard to Sense, is regulated by one certain Law, which is as follows: If the same Ray falls into the same pellucid Medium in Variety of Angles, the Sines of the Angles of Incidence will bear the same Proportion to one another, as the Sines of the refracted Angles.

Hence it follows, that Rays proceeding from a radiating or reflecting Point to the pellucid Cornea, are there refracted towards a Perpendicular, with almost the same Alteration of Course as in Water; so they pass on thro' the aqueous Humour, and have their Course determined through the Perforation of the Pupil to the Superficies of the crystalline Lens; but those Rays which enter with so great Obliquity as to fall on the Iris, are thence reflected, and fall out of the Eye again, that they might not, by their Reflexion and Ingress into the Eye, disturb the Distinctness of Vision; and those other Rays, which, on account of their Obliquity, fall between the lower Part of the Uvea and the vitreous Body, or on the Superficies of the vitreous Body, are immediately suffocated in the black Pigment of the same, and lost, as if they had never been, that so no Rays might be transmitted thro' the Vitreous Humour, but such as, after penetrating the Pupil, fall upon the crystalline Lens; the Iris, in the mean time, being contracted, or dilated, admits more or fewer Rays, in proportion as the Object is nearer, and more vivid, or more remote and languid; under this Law, or Regulation, that the nearer, or more luminous, the Object, the narrower, or more contracted, the Pupil. This happens from a Mechanism peculiar to that Part, and defends that

that very tender Membrane, the Retina, from being offended, dried, or scorched.

The flatter, therefore, the Cornea, the less it collects the Rays which fall upon it from one lucid Point, and the more it disperses them, so that the fewer in Number arrive at the crystalline Lens, and even those very divergent, unless they come from a very remote Object: On the contrary, the rounder the Figure of the Cornea, the more it will unite the Rays which strike upon it from one radiating Point, and the greater Number will it collect in the crystalline Lens, and those very divergent. And hence you may assign one Reason for the Vision of short-sighted and aged Persons.

The crystalline Lens, after receiving the determined Rays from [the Pupil], unites them still more by a new Refraction, and renders them convergent, under the following Law, or Regulation, that those Rays which proceed from one Point without the Eye, being here collected into one Point not far remote, are thence conveyed thro' the vitreous Humour to the Retina, on which they paint only that one Point precisely from which those Rays proceeded. If the crystalline Lens be very dense, or round, the Point of Collection [the Focus] is too near the Lens, which creates Confusion; if, on the other Hand, the Lens be too rare, or flat, the Point of Collection is too remote, whence a Confusion is again occasioned; and this affords us another Reason for the Vision of old Persons, and *Myopes*, or such as are short-sighted.

From the two last Paragraphs we may account, or assign the Reasons why short-sighted Persons have their Sight helped by a concave dioptric Glass, or moving the Object nearer; and why aged Persons see more distinctly thro' a convex dioptric Glass, or when the Object is more remote.

Both these Defects in the Persons just mentioned, are, also, remedied by bringing the crystalline Lens to the Cornea, or removing it at a Distance; which Purposes seem to be answered two different Ways; as by compressing the Bulb of the Eye by a strong Contraction of all the four Muscles [See OCULUS] at once, whence the Bulb is lengthened; or by a Contraction of the Fibres which compress the vitreous Body, and elevate the Lens. There appears no other Method of answering these Intentions.

The Refraction which a Ray suffers in passing out of the Air into the Cornea, is nearly equal to what it suffers in passing out of Air into Water; and the Refraction of a Ray, passing from the aqueous Humour into the Lens, is equal to what happens to a Ray passing out of Water into Glass; whence the Alteration is inconsiderable: And, in the last Place, a Ray, passing from the crystalline Lens to the vitreous Body, suffers but little Alteration by Refraction, and, perhaps, none at all, when the vitreous Humor is pretty closely compressed; by which means, that Part becomes more dense. Hence the principal, and most necessary Use of the vitreous Humor seems to be, that the Lens, by having free Space to move, might adjust and accommodate the Eye to different Distances, being itself a Substance of a less mutable Figure than the vitreous Body.

The End, or Design, of all this Apparatus, [of Humors and Refractions] is, that there may be a distinct and vivid Collection of those Rays, which, proceeding from one Point of the Object, enter the Eye, and penetrate the crystalline Lens, in the Bottom of the Eye, directly under the Pupil, and that so there may be painted in this Bottom as many Points as were conspicuous in the Image: Hence, the Picture, or Image, in Miniature, formed on the Retina, resembles the Object.

And since the mucous Medulla of the optic Nerve has its Seat precisely in this Place, directly under the Pupil and the Lens, it appears, that this is the Part which receives the Pictures, and, by a Continuation of the Impression, presents them to the common Sensory; and excites in the Mind the Idea of the Thing seen.

It appears, also, from what has been said, that the Experiment of *Picard* and *Mariotte* is so far from disproving what has been advanced in the preceding Paragraph, as some Authors have thought, that it is a clear Confirmation of it; and we have even Occasion hence given us, to break forth into Praises of infinite Wisdom in placing the Entrance of the Optic Nerve not in the Axis of Vision, nor towards the exterior Angle of the Eye, but towards the Nose, in a middle Altitude.

The Perfection, therefore, of Vision, depends on such a Figure, Transparency, Fabric, and Energy of the Solids, and such a Density and Transparency of the colourless Humors, as are qualified for collecting Multitudes of Rays from every visible Point of an Object, unmixed with others, upon one distinct Point of the Retina, this Focus being formed neither too near, nor remote; and, in the next Place, on such a Mobility of these Solids and Humors, in Conjunction, as is necessary for a clear and distinct painting of Objects placed at different Distances; for, with these Requisites, their Size, Figure, Distance, Situation, Motion, Rest, Light, and Colour, are very

well represented. In the Retina there is, besides, required such a Situation, Expansion, Quickness of Sense, Tenderness, and Justness of Proportion, between the medullary, arterial, venous, and lymphatic Substance, as dispose it for transmitting, by a free and sound Optic Nerve, pure and perfect Images to the common Sensory.

There is, then, no Emanation of Rays from us, nor are they reflected from Objects back again upon us, as the *Stoics* asserted; nor is Sight performed by Emission of a visible Species from the Object towards us, as the *Pythagoreans* thought; nor by Emission of Effluvia from the Object and the Eye meeting together, and, after mutual Embraces, reflected, as the *Platonists*, by an extraordinary Way of Ratiocination, endeavoured to prove; nor, lastly, is it owing to a material Emanation of corporeal Images, as was the Opinion of *Epicurus*; but is performed in that simple and mechanic Way which we have above explained.

Queries on this Subject are such as the following:

Why Objects placed at the least Distance, in which the Eye can bear to see distinctly, appear most plainly?

Why, when removed thence to a great Distance, they appear distinctly, but affect us in a more languid manner? Why, also, when placed too near, they seem confused? What is necessary to a distinct, what to a strong Vision? And the like. Which are all easily answered, from the Premises. *Boerhaav. Institut. Medic.*

VISNAGA.

The Characters are;

The Root is fibrous, and annual; the Leaves are broader, shorter, and blunter, than those of Fennel. The Umbella is generally contracted, and closed; and the Seeds are much smaller than those of Fennel.

Boerhaave mentions but one Sort of *Visnaga*; which is,

Visnaga. Offic. J. B. 3. 31. Raii Hist. 1. 456. Boerb. Ind. A. 49. Gingidium umbella longa. C. B. P. 151. Gingidium Hispanicum. Ger. 885. Emac. 1042. Visnaga Gingidium appellatum. Park. Theat. 890. Fœniculum annuum, umbella contracta oblonga. Tourn. Inst. 311. SPANISH PICKTOOTH.

This is a Plant of about a Cubit and an half in Growth, with the striated, glabrous, and geniculated Stalk of the *Anethum*, and the smooth Leaf of the *Pastinaca erratica*, but divided into larger Segments: The Umbellas of the Flowers are white, and their Pedicles, especially the external ones, are above a Palm in Length, and are hard, and stiff; and each Pedicle, both internal and external, bears on its Top a new Umbella of numerous small Pedicles; every Umbella, also, as well as every Top of a Branch, has small Leaves subcent at its Base; the Seed is small, like that of the *Apium* of the Shops, and acrimonious.

It grows in *Italy*, *Sicily*, and the southern Parts of *France*, spontaneously, but is cultivated, with us, in Gardens; and flowers in the Summer.

J. Bauhine mentions a *Gingidium Ægyptium* with larger and firmer Umbellas and Pedicles than those which grow in our Gardens; and we, also, remember to have observed such.

The Description of the *Daucus Campestris*, in *Cæsalpinus*, agrees, in all Respects, with that which he had before given of the *Visnaga* in the same Book; so that it seems quite the same Plant.

The Pedicles, or Footstalks, of the Umbellas, on account of their Stiffness, and sweet Scent, serve for Toothpicks with many Persons, especially among the *Spaniards*; whence we call it *Spanish Picktooth. Raii Hist. Plant.*

The Virtues, according to *Bauhine*, are the same with those of *Fœniculum*, or Fennel. *Hist. Plant. adscript. Boerhaav.*

VISQUEIRO. The Name of a *Brasiliân* Tree, which affords a soft viscous Resin, used for Birdlime. *Raii Hist. Plant.*

VITEX.

The Characters are;

The Leaves run, as it were, into five Divisions; and, in
* * U
European

European Plants, are caducous. The Flower is monopetalous, tubulous in the lower Part; in the upper, as it were, bilabiated, and disposed in Spikes: The Ovary, which is seated in the Centre of an indented Calyx, becomes a globous Fruit, divided into four Capsules, containing oblong Seeds.

Boerhaave mentions six Sorts of *Vitex*; which are,

1. *Vitex*; foliis angustioribus, Cannabis modo dispositis. See AGNUS CASTUS.

2. *Vitex*; foliis angustioribus; Cannabis modo dispositis; floribus cœruleis. H. L.

3. *Vitex*; five Agnus; flore albedo. H. R. Par.

4. *Vitex*; five Agnus minor; foliis angustissimis. H. R. Par.

5. *Vitex*; trifolia; minor; Indica; rotundifolia. Breyh. Prædr. 2. Cara Nosi. H. Mal. 2. *Negundo* fœmina, *Acosta*. H. A. i. 181.

This is a Shrub about a Man's Height, of the Bigness of a Peach-tree, according to *Garcias*; or of an Almond-tree, according to *Acosta*; and growing in sandy Places: The Root is fibrous, of a brownish Colour without, and whitish within, with a thin Bark, of a bitterish, but when chewed awhile, of a somewhat acrimonious Taste; the Leaves are generally three on one Pedicle, two opposite, and the third at the End of the Rib larger than the others; they are of an oblong-round Figure, cuspidated in the fore Part, with an even Margin, moderately thick, soft, smooth, with their upper Face of a dark Green, but paler beneath, of a bitter and acrimonious Taste, and a grateful Smell, much like Lavender: According to *Acosta*, the Leaves have the Taste and Smell of Sage: The Flowers grow many together on common Pedicles, out of Nodules, which are produced by Pairs in a decussated Order above the Origin of the Leaves; these Flowers adhere to short Pedicles, are of a purple-ceruleous Colour, and have the same Smell as the Leaves, only brisker: They consist of five shapeless Petals, with a Bell-shaped Neck; one of the Petals is erect and broad, but concave and hairy in the interior Part; the Neck of the Flower towards that Part of the Leaf has, also, its interior Part hairy; the other four Petals are expanded to almost their Breadth, and more like one another, only those next the erect Petal are somewhat broader and rounder, the others towards the anterior Parts. The Flower is furnished with four erect, purple-ceruleous Stamina, which have blackish and arched Apices, and in the Middle a slender, purple-ceruleous Style [Pointal]; with a bifid Cuspis, inflected towards a ceruleous Leaf, and taking its Original from the Rudiment of the Fruit [the Ovary] within the Calyx; the Calyx, which straitly embraces the lower Neck of the Flower, consists of five short, faint-green, cuspidated Leaves, and is striated with slender Ribs, or Fibres, lengthwise: The Fruits are round, and somewhat oblong Berries, of the same Smell with the Flower, the greatest Part of the Berry comprehended within the Calyx, and of a faint-green Colour; but the upper Part, which appears above the Calyx, is at first redish and shining, but afterwards, when dry, of a black Colour, like Ink: In the Middle is an oblong-round Stone, under a green and hard Pulp, which is not thoroughly softened with Maturity; the Stone contains a whitish, tasteless Kernel.

The Oil of the Root, by Distillation, is clear, somewhat greenish, of a sweet, acrid, penetrating Taste, and void of Smell.

This Tree, says *Acosta*, is of such frequent Use in Medicine in these Countries [*Malabar*, and the adjacent Parts], that unless it had pleased God that a manifold Increase of young Shoots should succeed in the Room of those Branches which are cut off, the Trees had long ago been consumed, or, at least, been extremely dear and scarce; but the more the Branches are lopped, the thicker they grow, and are always green.

The tender Branches, Leaves, Flowers, and Fruits, bruised, and boiled in Water, or fried or boiled in Oil, are successfully applied to all Pains, proceeding from what Cause soever, but especially to Pains of the Joints from a cold Cause; and in Tumors and Contusions they have surprising Effects. Some apply the same to Wounds, and affirm, that in one Night it has removed the Pain, and digested the Matter.

The bruised Leaves are applied to old Ulcers with good Success; for they digest the contained Matter, cleanse the Ulcer, and cicatrize it; and they are really found to be of such Use in Wounds, Abscesses, and Contusions, as to render the Assistance of a Surgeon unnecessary. The Women wash their whole Bodies at all Seasons with the Decoction of the Leaves, and are so firmly persuaded that the Flowers, Leaves, and Fruit of the *Negundo*, have a Virtue of promoting Conception, that they would stone any Person who should endeavour to convince them of the contrary. The Leaves used in Mastication amend a fetid Breath. Thus far *Garcias* and *Acosta*. Raii Hist. Plant.

6. *Vitex*; trifolia; minor; Indica; serrata. Breyh. Prædr.

2. *Bennesi*. H. Mal. 2. Raii Hist. 2. 1575. *Negundo mas* *Acosta*. H. A. i. 179. *Boerb. Ind. alt. Plant.*

The Leaves of this Species grow by Threes and Fives on Pedicles, and are of an oblong and pretty narrow Figure, and contracted into an acute Point, but rounder and broadest at the Pedicle: In their fore Part they are more or less finely crenated, of a darkish-green Colour, but clearer in the upper Part; the largest Leaf is at the Extremity of a Rib; the two next, which are larger than the others, adhere to the Middle of the Rib by Pedicles not an Inch in Length; the other two Leaves are very small, and seated on the common Pedicle: In its other Characters it agrees with the preceding; its serrated Leaves, resembling those of the *Sambucus*, shew it to be the *Negundo mas* of *Garcias* and *Acosta*. Raii Hist. Plant.

The Seeds of the *Vitex* are effectual in the Hysterical Passion; and provoke Urine, and the Menfes. Hist. Plant. adscript. *Boerhaav*:

VITICELLA. A Name for the *Bryonia alba*.

VITILIGO. A Species of white Leprosy. See LEPROA.

VITIS.

The Characters are;

At the Joints of the Branches shoot forth Tendrils which clasp and twine themselves about whatever lies in their Way; the Flower is rosaceous, pentapetalous, and furnished with five Stamina; the Ovary grows in the Bottom of the Flower, is furnished with a short, hairy Tube, and becomes a soft, succulent Berry, containing several Seeds, generally four; the Flowers and Fruit are disposed in Clusters.

Boerhaave mentions twelve Sorts of *Vitis*; which are,

1. *Vitis*; sylvestris; Labrusca. C. B. P. 299. *Labrusca*. *Lemery's Hist. des Drogues*.

This is a Species of Vine which grows, without cultivating, by the Sides of Highways, and near Hedges; it bears a very small Grape, which, when ripe, becomes black, and sometimes ripens not at all.

The Plant is deterfive and aperitive, and its Fruit is astringent. *Lemery des Drogues*.

2. *Vitis*; vinifera; ex cujus Uvis acerbis, immaturis, Omphacium exprimitur. *Boerb. Ind. A. 2. 232. Vitis*. Offic. Ind. Med. 124. *Vitis Vinifera*. Mont. Ind. 55. THE VINE.

The Vine is so well known to every Body, that it would be needless to spend time in describing it: With us it generally runs up the Sides of Houses, or Walls; in the Wine Countries it is planted in Vineyards, as a Standard Tree. The Differences of the Grapes, which grow on them, are almost as many as the Countries they grow in, as to their Colour, Taste, and Largeness; and there is as great a Diversity in the Wines produced from them. Amongst these, the Canary, the Malaga Sack, and the Alicante, for sweet Wines, are reckoned best; the Sherry and Mountain, for dry Stomach Wines; the Red and White Port, and the French, to drink with Food, are most in Esteem; and to these, for their Excellency, and grateful Taste, may be added the Muscadine, the Smyrna, and Cyprus Wines.

As to the Nature and Use of Wine, there have been so many Volumes written about them, that it would be superfluous to say much here: Moderately used, it is very cordial, and of great Service to Mankind. It strengthens the Stomach, helps Digestion, comforts the Bowels, and is the best Preservative against the Plague. *Miller's Bot. Off.*

The Vine is reckoned, by *Theophrastus* and *Varro*, among Trees; but because it stands in need of Assistance, and must be forced to trail on the Ground unless it meets with something to lay hold of, in order to support itself, it can hardly deserve the Name of a Tree, tho' its Trunk sometimes grows to the Size of a Man's Leg, or, perhaps, Thigh. The Antients numbered it among Trees, with respect to its Bigness, in which it really exceeds some Trees, according to *Pliny's* Account of it, *Lib. 14. Cap. 1*. There is to be seen, he says, in the City *Populonia*, an Image of *Jupiter*, made out of one Vine, which has stood uncorrupted for many Ages. At *Massilia* [*Marseilles*] is a public Drinking-bowl, of the same Wood; and at *Metapontum* the Temple of *Juno* is supported by Pillars made of the Wood of the Vine. The Staircase by which you ascend to the Temple of *Diana*, at *Ephesus*, is made, as they say, of the Wood of a single Vine, in the Isle of *Cyprus*, where Vines grow to an extraordinary Bigness: Nor is there any Wood of a more durable Nature. There is no End of the Growth of this Plant; a whole House, or Villa, has been encompassed and overspread with the Branches and sequacious Tendrils of a single Vine. At *Rome*, in the Portico of *Livia*, one Vine, extending itself upon Poles, overshades the whole open Walk; and the same Vine has yielded twelve Amphoræ of Must: They over-top the Elms in every Place; and it is reported, that *Cynæas*, the Ambassador of King *Pyræus*, admiring the Height of the Vines at *Aricia*, but disliking the

austere Taste of the Wine, merrily said of it, that its Mother deserved to hang on so high a Gibbet. Thus *Pliny*.

C. Bauhine divides the *Vitis* into the *Sativa* and *Sylvestris*; or cultivated and wild: Of the *Sativa*, or cultivated, there is the greater Sort, of which there are very many Species, and the less. The Grapes of the larger differ in Colour and Size; for in some they are green, in others whitish, or of a deep yellow, or a deep black-red, or ceruleous, or a light-red. As to Form and Size in some Species, the Grapes are oblong, and of the Size and Shape of Prunes, and this Sort may be called *Pergulana* (perched, or staked up); of others the Grapes are round, and bigger or smaller; some again have no Grain, or Stones, others a single one, or perhaps two; a bearded Grape is more rarely to be met with. The lesser Sort of *Vitis* bears a black Grape, very seldom white or yellow, with a very small soft Kernel; they differ, also, in Taste; some are sweet, others sharp, others of a musky Taste, such as the *Vitis Apiana* of *Pliny*.

There is a Difference, also, in the Leaves; for some are larger, and more deeply cut, as the *Italica*, the Leaves being cut home to the Pedicle, and divided into acute Lobes; others are of a less Size. Some again are thinner, others thicker; some green, others red; others spotted; some hard to the Touch, others soft; some smooth, others a little hairy. Thus *C. Bauhine*.

Of the Kinds of Grapes *Pliny* thus briefly speaks: The Kinds of Grapes, in respect of Size, Colour, Taste, and Kernels, are innumerable, and they are still multiplying upon us; here they glitter in Purple, there they sparkle in Rose-colour, or shine in Green; the whitish and the black Sort are common; the *Bumasti* swell like turgid Breasts, and others run into Length with long Kernels like those of Dates, and so on.

That the Kinds of the *Vitis*, as well as of the Pear-tree and Apple-tree, are innumerable, was acknowledged by the Antients; since, as *Pliny* truly says, they are almost as many as the Differences of Soil, and new Sorts are produced every Day, and ever will be produced; but it would be extremely difficult, not to say impossible, to accommodate the ancient Names of Vines to the most noted and cultivated modern Species, and, therefore, we shall not attempt it, as having neither Means nor Leisure for such an Undertaking.

3. *Vitis*; *Corinthiacæ*; five *Apyrina*. *J. B.* 2. 72. *Boerb. Ind. A.* 2. 232. *Uvæ passæ minores, Passulæ*. *Offic. Uvæ passæ minores, vel Passulæ Corinthiacæ*. *C. B. P.* 299. *Corinthiacæ*. *Park. Theat.* THE CURRANT VINE.

These are a smaller Sort of Grapes, which took their Name from their growing in Plenty about *Corinth*, though we have them principally from *Zant* and *Cephalonia*; these they only gather off the Bunches, and lay them to dry in the Sun, and so put them up in large Buts.

Both these, and the *Uvæ passæ majores*, are opening and pectoral, helpful against Coughs and Consumptions.

The Currants are more used in the Kitchen, than in Medicine. *Miller's Bot. Off.*

Currants are of a temperate Quality, mitigate the Heat in Fevers, allay Thirst, and loosen the Belly. *Dale.*

4. *Vitis*; *Apiana*; *Plinio*. *C. B. P.* 298. *Uva Muscatella*. *Car. Step. Præd. Rust.* 342.

5. *Vitis*; *Pergulana*; *acinis Prunorum magnitudine & forma*. *C. B. P.* 298.

6. *Vitis*; *folio Apii*. *J. B.* 2. 73.

7. *Vitis*; *alba*; *dulcis*. *J. B.* 2. 73.

8. *Vitis*; *Frontiniacæ*. *C. B. P.* 299.

9. *Vitis*; *nigra*; *dulcis*; *Vintint dicta*.

10. *Vitis*; *multiplex*; *alia*; *pro diversitate, quæ obtinet in acinis ratione coloris, saporis, magnitudinis, admodum vari cultuque industrii Vindemiatoris semper novâ.*

11. *Vitis*; *quinquefolia*; *Canadensis*; *scandens*. *T.* 613. *Edera, quinquefolia Canadensis*. *Corn.* 100.

12. *Vitis*; *vulpina dicta*; *Virginiana*; *alba*. *Plukn. Alm.* 392. *Boerb. Ind. alt. Plant.*

The Leaves, with the Tendrils of the Vine, being bruised, and applied, mitigate Pains of the Head, and with Polenta, cool the burning Heat and Inflammation of the Stomach. The Leaves applied alone have the same Effect, as being of a refrigerating and astringent Quality. The Juice of the same drank, is effectual in the Dysentery, Spitting of Blood, the Stomachic Passion, and the Green-sickness. The Tear of the Vine, which is a sort of Gum, and concretes about the Stock, taken in Wine, expels the Stone, and used by way of Unction, cures the Lichen, Pfora, and Leprosy, first prepared by an Affriction of the Parts with Nitre. The same with Oil, frequently used to anoint the Hair, has the Effect of a Psilothrum; but the most efficacious for that Purpose is, the Liquor discharged from the green Sprays by Exudation when burning, which, also, removes *Myrmecia* [a kind of little black Warts]. The Ashes of the Sprays, with the expressed Husks of the Grapes in Vine-

gar, cure a Condyloma and Thymus, affecting the Parts about the Anus, being anointed with it. The same is effectual in Luxations, and the Bites of Vipers, and applied with Oil of Roses, Rue, and Vinegar, is good for an Inflammation of the Spleen. Botanists ascribe still more Virtues to the Ashes and Lixivium prepared of them; but there seems to be but little Difference between the Ashes of Woods and their Lixivia, except in their containing more or fewer Salts to emit them.

Grapes, in the Opinion of *Galen*, are the chief of all autumnal Fruit; more nutritive than any of the fugacious Sort; or such as will not keep, and have least of a bad Juice, especially when perfectly ripe.

All fresh Grapes disturb the Belly, and inflate the Stomach; for which Reason they are forbidden to be eaten in Fevers; but after they have been gathered and hung awhile, they are more innocent, and not only good for the Stomach, but restore a lost Appetite, and consequently are of Service in Languishings; they, also, render the Body soluble. But there is a very considerable Difference in Grapes: The sweet are most nutritive, and fatten the Body, cause Inflations in the Stomach, and provoke to Stool; austere Grapes, on the contrary, nourish but little, and bind the Belly. *J. B.*

I remember to have read somewhere of a *German* Matron, who, during the whole Time of Vintage, which lasted a Month or two, in which she lived upon Grapes, never used to drink, which shews that Grapes are good to quench Thirst.

Every body knows; says *Palladius*, that the larger Grapes, which make the finest Shew, and are of an hard and dry Grain; are brought to the Table; but the most fruitful, which have the tenderest Skin, and the richest Taste; and especially such as soonest fade, are set aside for the Press.

Vitis, according to *Donatus*, in *Eunuch*. comes from *Vico*, which *Festus* expounds by *alligare*, to tie; and *Nonius*, by *vincire*, to bind about; and *inflectere*, to inflect or bend. *Raii Hist. Plant.*

The distilled Water of the Tops of Vines cut in the Spring, is aperient, deterfive, and of Service in the Stone, and Nephritis; and, used externally, is good to deterge the Eyes. The Leaves and Tendrils are astringent and refrigerating, and proper in a Diarrhoea and Hæmorrhages, and are used in Fomentations of the Feet; the young Branches or Sprays, are aperitive. The immature Fruits of the *Vitis* are called *Agrestia*, and the mature *Uvæ*, which increase an Appetite, and provoke to Stool. The Fruits dried in the Sun, are called *Uvæ passæ*, or *Passulæ*, the largest of which are the *Uvæ Damascenæ*, the smaller *Uvæ Corinthiacæ*, which latter are serviceable in Coughs, and to expectorate Phlegm, and to render the Body soluble. The Leaves boiled, are astringent; the Water, which distils spontaneously from the Plant, deterges cutaneous Defections of the Face. The Tartar extracted from *French* Wines, is red; from *German* Wines, white. *Hist. Plant. adscript. Boerhaav.*

There are several Sorts of Raisins used, though *Dale* mentions only the two following:

1. *Passula Damascenæ*. *Offic. Passula maxima*; five *Damascenæ*, *Zibebæ dictæ*. *Schrod. IV. p. 172. Vitis Damascena*. *Hort. Reg. Par.* 186. *Tourn. Inst.* 613.

The *Zibebæ* stoned, and infused in a convenient Quantity of Spring-water, or a proper distilled Water, make a grateful Sort of Drink for sick Persons, and good to quench Thirst. The Stones have an astringent Virtue, and are proper in Vomitings and Fluxes of the Belly, whether used internally or externally; they are roasted and triturated for these Purposes. *Schrod.*

2. *UVA PASSA MAJOR*. *Offic. Uva passa major* *beuæ* *Græcis forte*. *C. B. P.* 299. RAISINS OF THE SUN.

Raisins of the Sun are made of the Grapes after the following manner; Cut the Stalks off the Bunches they design for that Use almost in two in the Middle, and by that means hinder the Sap from coming to them in any Quantity, and let them hang thus on the Branches, till by Defect of Nourishment, and the Heat of the Sun, they are sufficiently cured; when they are put up into Casks for Use. The *Malaga* Raisins are managed another Way: They dip the Bunches of ripe Grapes in a boiling-hot Lye, made of the Ashes of Vine-stalks, taking them out presently, and then lay them on Boards in the Sun to dry, and afterwards they are packed up in Frails. *Miller's Bot. Off.*

Raisins of the Sun, as well as the *Zibebæ*, and Currants, are all hot or temperate, lenient, loosen the Belly, correct Acrimony, are grateful to the Stomach, Lungs, and Liver, and mitigate a Cough. *Schroder.*

Raisins, by their acrimonious and penetrating Heat, vellicate the Teeth and Gums, and do them no small Injury, by disposing them, when frequently eaten, to Putrefaction. *Raii Hist. Plant.*

VITIS ALBA. See BRYONIA ALBA.

VITIS IDÆA.

The Characters are ;

The Flower is monopetalous, Bell-shaped, and has growing in it a globous Ovary, which becomes a soft umbilicated Berry, full of Juice, and containing small Seeds.

Boerhaave mentions five Sorts of *Vitis Idæa* ; which are,

1. *Vitis Idæa* ; foliis oblongis ; crenatis ; fructu nigricante. *C. B. P.* 470. *Tourn. Inst.* 608. *Boerb. Ind. A.* 2. 71. *Myrtillus. Offic. Vitis Idæa angulosa.* *J. B.* 1. 520. *Raii Hist.* 2. 1488. *Synop.* 3. 457. *Vaccinia nigra.* *Ger.* 1229. *Emac.* 1415. **BLACK WORTLES, or BILL-BERRIES.**

The Bill-berry Bush is a small low Shrub about a Foot high or more, with many tough, flexible, angular green Twigs, bearing small, oblong, round-pointed Leaves, crenated about the Edges, among which the Flowers grow singly on short Foot-stalks, of a red dull Colour, in Shape of a Bottle, which are succeeded by round umbilicated Fruit, as big as Juniper-berries, and much of their Colour, full of a pleasant sweet purple Juice. It grows in Heaths among Fern, in a boggy Soil, and in thin woody Places ; and flowers in *May*, and the Fruit is ripe in *July*. The Fruit only is used, and that but seldom in the Shops.

Bill-berries are cooling, binding, and grateful to the Stomach, and of use in Fluxes or Hæmorrhages. *Simon Paulli* says, they are much used against the Scurvy in *Norway*, and other Northern Countries. An agreeable Syrup may be made of the Juice, and used in all the fore-named Intentions. *Miller's Bot. Off.*

These Berries, according to *Dodonæus*, are cold and drying, with a manifest Astringent. They are good for an hot Stomach, quench Thirst, mitigate the Heat of burning Fevers, bind the Belly, stop Vomiting, cure a Dysentery proceeding from yellow Bile, and are effectual in the Cholera Morbus. But for these Purposes the Rob or Juice, inspissated with Sugar or Honey, is far preferable to the Berries, because these being of a cold Nature, being eaten crude, are offensive to a cold and weak Stomach, and disturb rather than bind the Belly. But *Casp. Hoffman* thinks, that the Berries which grow in the Sunshine, and are thoroughly ripe, are by no means of so cold a Nature as to injure a cold Stomach by their Crudeness.

The same Author is of Opinion, that the black Wortle-berries may rightly and regularly be substituted in the room of Myrtle-berries with these Conditions : First, that you take such as grow in Northern Countries, and not in *Italy* or *Spain* ; Secondly, that they be not perfectly ripe : Thirdly, that they be not green or fresh gathered, but dry'd : Lastly, that you take not the crude Juice, which is considerably refrigerating from its immoderate Aqueousness, and somewhat astringent, but inspissated into a Rob.

That this Juice is of fine Parts, and vehemently astringent, is evident from the Marks or Stains which it leaves on the Hands and Mouths of those who eat the Berries, and which can hardly be washed out ; hence it is used to dye Linen and Paper of a cerulean or sky-blue Colour.

The Shepherds and Peasants, who are Inhabitants of mountainous Countries, delight to eat the Berries ; for their Sweetness is accompanied with an Acidity, which is very grateful to the Palate. *Raii Hist. Plant.*

2. *Vitis Idæa* ; Zeylanica ; odoratissima. *T.* 608. *Myrtus Zeylanica, odoratissima, Baccis niveis, monococcis.* *H. L.* 435.

3. *Vitis Idæa* ; Æthiopica ; Buxi minoris folio ; floribus albicantibus. *H. A.* 1. 125. *Buxus, Africana, folio oblongiori, non serrato.* *Indic.* 238. *H. R. D.*

4. An *Vitis Idæa* ; foliis Myrti angustissimis ; longis ; alternis ?

5. An *Vitis Idæa* ? *Quæ Buxus, Africana, rotundifolia, serrata.* *P. B. Prodr. ? Plukn. Phyt. T.* 18. *H. R. D. Boerb. Ind. alt. Plant.*

It is called *Vitis* from its tough flexible Branches, with the Epithet of *Idæa*, because in former Times it grew plentifully on Mount *Ida*.

The Berries are astringent, and useful in the Diarrhœa and Dysentery : Of the expressed Juice is prepared a Rob, which is excellent for these Distempers. *Hist. Plant. adscript. Boerhaav.*

Besides the foregoing Species of *Vitis Idæa*, *Dale* mentions the following ;

- VACCINIA.** *Offic. Vaccinia nigra fructu majore.* *Park. Theat.* 1455. *Vitis Idæa magna quibusdam, sive Myrtillus grandis.* *J. B.* 1. 518. *Raii Hist.* 2. 1487. *Synop.* 3. 457. *Tourn. Inst.* 608. *Vitis Idæa foliis subrotundis exalbidis.* *C. B. P.* 470. *Vitis Idæa foliis subrotundis.* *Ger.* 129. *Emac.* 1416. **THE GREAT BILL-BERRY.**

This Plant is pretty shrubby, with a Multitude of round, ramous Branches, a Cubit and half in Length, covered with a light-red Bark, and of a pretty solid and close Substance. *Cla-*

sius says the Branches sometimes spread on the Ground, are tough, and covered sometimes with an ash-coloured, sometimes a reddish Bark. The Leaves are of the Size of those of the common *Vitis Idæa angulosa*, oblong, but round ; glabrous, and not at all serrated like those of the other, somewhat glaucous in the lower Part, or, according to *Clusius*, whitish and venous, of an astringent and somewhat acid Taste, and caducous. The Flower is like that of the common Sort, White inclining to Purple, concave, the Lips being cut into five Lobes, reflexed outwards, and furnished with its proper Stamina. The Berries, which are equal to those of the Juniper, or *Myrtus Tarentina*, have a broader Umbilicus, whence proceeds an Apex ; whence it happens, that the Berries are not so round as those of the common *Vitis Idæa*. They adhere to pretty long Pedicles, are of a grateful, subacid, and vinous Taste, and contain some minute yellowish Grains. The Root is hard, ligneous, and abounds with capillary Fibres.

It delights in cold and mountainous Places : *Clusius* found it among the *Austrian* and *Stirian Alps* ; and *John Bauhine* in the Mountains of *Burgundy*, and other like Places. We have observ'd it in the mountainous Parts of *Cumberland*, and in great Plenty near *Gambleby* six Miles from *Perith*, in the marshy Pastures on both Sides of the Road.

The Hunters and Ploughmen ascribe an inebriating Quality to the Berries, as we are assured by *Du Choul*, *Camerarius*, and others, especially when eaten pretty freely. The Leaves and Branches are of the same Use to the *Silesian Dyers*, as the *Sedum Alpinum* to those who live in the Countries amongst the Alps. *Raii Hist. Plant.*

VITIS MARINA. See *FUCUS MARINA*.

VITIS NIGRA. See *BRYONIA NIGRA*.

VITIS SYLVESTRIS, trifolia. A Name for the *Toxicodendron* ; *triphyllum* ; *glabrum*.

VITIS VINIFERA. See *VITIS*.

VITISALTUS. The same as *CHOREA SANCTI VITI*.

VITREA TABULA. The internal Table of the *Cranium*. See *CAPUT*.

VITREUS HUMOR. The vitreous Humour of the Eye. See *OCULUS*.

VITRIFICATIO. Vitrification ; that is, the Conversion of any Body into Glass.

VITRIOLUM. Vitriol.

Dale mentions three Sorts of Vitriol ; which are,

1. *Vitriolum cæruleum seu Romanum.* *Offic. Vitriolum cæruleum.* *Charlt. Foss.* 11. *Vitriolum Cyprinum cæruleum.* *Worm.* 25. *Chalcalthum Cyprinum.* *Aldrov. Mus. Metall.* 339. *Matth.* 1363. *Atramentum cæruleum Romanum cæstum.* *Kentm.* 14. **BLUE, or ROMAN VITRIOL, and CELESTIAL STONE.**

It is a crystalline Substance, ceruleous, or resembling the Sapphire, compact like Sugar-candy, and of an acid, austere, acrid, and astringent Taste. It is either made of a Solution and Crystallization of Copper, or imported from *Cyprus* and the *East-Indies*.

Roman Vitriol is heating, drying, highly astringent, and constringing, provokes Vomiting, and expels Worms. *Schroder.* This Sort is esteemed the best for Medicinal Use, and is very much commended for the Scabies and Ulcers contracted from the *Lues Venerea.* *Worm.* It is the Basis of *Digby's* sympathetic Powder, and cures the Scabies and Lepra.

2. *Vitriolum viride.* *Offic. Charlt. Foss.* 11. *Vitriolum viride seu Romanum.* *Tourn. Matth. Med.* 185. *Chalcalthum viride falsitium ; Atramentum Sutorium Officinarum.* *Schw.* 373. *Atramentum viride durum solide cæstum.* 13. **GREEN VITRIOL, or COPPERAS.**

This, also, is a crystalline Substance, but of an herbaceous Colour, and more granulated and grumous-like common Salt : It has the Taste of the preceding.

There are two Sorts of *Green Vitriol*.

3. **VITRIOLUM ALBUM.** *Offic. Worm.* 25. *Geof. Prælect.* 106. *Charlt. Foss.* 11. *Chalcalthum candidum.* *Aldrov. Mus. Metall.* 339. *Atramentum album durum falsile.* *Kentm.* 13. **WHITE COPPERAS.**

White Copperas is a white granulous Substance, concreted like white Sugar, of the Taste of *Green Vitriol* ; it is imported to us from *Germany*, being found in the Mines of *Gosselaer*, of the Figure of Icicles, and transparent.

It agrees in Virtues with *Green Vitriol* ; but is more used in Collyria than the other Vitriols. There is, also, prepared an excellent Emetic of *White Copperas* dissolved in Water, and coagulated by boiling to the Consistence of White Sugar, as we are informed by *Geoffroy Prælect.* 106. who thinks *Tournesfort* mistaken in affirming, that it is made of *English Vitriol* dissolved in Water, and boiled till the Water is evaporated ; what remains consisting of pretty large grumous Masses resembling White Sugar, which being exposed to the Air, assumes a yel-

a yellowish Colour on the Outside. This *Vitriol* is of great Use in Styptic Waters, in Dying, and in making Ink. *Dale*.

Some derive the Name *Vitriol* from *Vitrum*, because it has the Colour and Transparency of Glass; in *Greek* it is named *χάλας*, as if it were an Efflorescence of Brass; and in *Latin* *Atramentum Sutorium*, because it is used in blacking Leather. *Vitriol* is either natural or factitious. The former is found in Crystals, or Striae, sticking to the Roofs of Mines; and the latter is made by boiling the vitriolic Veins of some mineral Ores in Water, and afterwards letting them stand in the Cold to crystallize; or by corrupting and fermenting the *Pyrites*, or *Marcasite*, and then mixing it with Water, from which *Vitriol* is afterwards obtained by Coction and Crystallization. This Way of making *Vitriol* seems to have been unknown to the *Greeks*.

White *Vitriol* is brought from *Germany*, made up in Loaves, like Sugar, and is of a sweetish astringent Taste: They are mistaken who think that white *Vitriol* of *Goslar* is only the Green, calcined by the greatest Degree of Fire; for it is found in proper Mines, like a downy Efflorescence, which being dissolved in Water, to a due Consistence, is afterwards boiled till it concretes into a white Mass, like Sugar. Sometimes little Pieces of it are found in the same Mines, transparent like Crystal. This *Vitriol* contains an imperfect Iron Ore, or, perhaps, an Iron Ore mixed with Calamine or Lead. Blue *Vitriol* is dry to the Touch, and concremented into blue Crystals, like Sapphires, of a rhomboidal Figure, flattened, and consisting of ten Sides. It is brought from several Places, especially from *Hungary* and *Cyprus*; and its beautiful blue Colour is owing to the Copper which it contains. The Taste of it is very acrid and austere. Green *Vitriol* has different Names, from the different Places where it is found; as *Roman*, *Swedish*, *English*, and *French*. It contains a large Portion of Iron, from whence its green Colour is derived: It is kept in the Shops, either in large rhomboidal Crystals, or in Heaps of small crystal Grains, sometimes a little unctuous, and sticking to the Hands. It is of an acid styptic Taste; and indeed it cannot well be supposed to have any other; *Vitriol* being an acrid Salt, which having corroded Iron or Brass coagulates with them, and concretes into a pellucid Mass, either of a green or blue Colour, according to the Metal which it has dissolved. Some Authors mention likewise red *Vitriol*; but I have not been able to learn what it is.

Vitriol is obtained by various Arts from Waters, Earths, vitriolic Stones, and especially from the *Pyrites*. In *Galen's* Time, blue *Vitriol* was made in *Cyprus*, by the Heat of the Sun exhaling the Humidity of a vitriolic Water. In some Places of *Hungary*, the same *Vitriol* is now made by boiling and evaporating a Water of the same Kind, and the green *Vitriol* is made by a Method not much different, in other Places of *Germany*. In some Places it is made by frequent Ablutions of an Ash-coloured Earth, marked with Spots of different Colours; some of which look like the Rust of Iron, others like Verdegriese, with a strong sulphureous Smell, and an unpleasant bitter Taste: This *Vitriol* is therefore composed of a Mixture of Iron and Copper; and accordingly its Colour is a Mixture of Blue and Green. In *England*, at the Distance of about a League from *London*, green *Vitriol* is made from the *Pyrites*, which are heavy dense Stones of a dark Colour on the Outside, but their inner Surface is radiated from the Centre to the Circumference, the Rays shining like Bath Metal: They are perfectly insipid to the Taste, and by being exposed to the open Air, for a sufficient Length of Time, they acquire an inward Kind of Fermentation, and spontaneously fall to Pieces. In the Cracks or Openings, we observe a certain Sort of white, saline, downy Efflorescence, of an acid styptic Taste. Afterwards the whole Substance of the Stone is dissolved, and falls into a fine Powder of a saline and vitriolic Taste, and sulphureous Smell. If fresh *Pyrites* be burned, and calcined in the Fire, the Fumes which they emit smell like Brimstone, and a red Calx remains, which contains some Iron and Copper. The Way of extracting *Vitriol* from the *Pyrites* is this:

The entire Stones are spread about in a large Area, the Height of about three Feet; and there they lie exposed to the Air for three Years, being turned one in six Months, that the Rays of the Sun may calcine them the better, and the Rain's penetrate them more easily. By this means they are reduced to a vitriolic Earth, which being well washed with Rain-water, the Liquor is afterwards conveyed by Pipes into Cisterns: Then they boil it to a due Consistence, in large leaden Vessels, throwing in a Quantity of old Iron, which is presently consumed by the Lixivium. Afterwards the Liquor is set to cool in other Leaden Vessels, with Sticks fixed a-cross, about which the *Vitriol* crystallizes.

The *Pyrites* of *Sweden* and *Liege* are very full of Sulphur, and the Way of preparing *Vitriol* from them, shall be related in speaking of that Mineral. Sulphur is obtained from these

Pyrites, per Descensum, and then the remaining Mass is calcined, and afterwards made into a Lixivium; which being strained, is boiled in leaden Vessels, and then set to crystallize, as before, in a cold Place.

A Solution of *Vitriol* turns the Tincture of *Heliotropium* into a faint purple Colour, coagulates Milk, turns Syrup of Violets to a greenish Colour, but does not change a Solution of corrosive Sublimate. When it is mixed with a Solution of Salt of Tartar, or Lime-water, the Colour becomes a little yellowish, and it communicates a black or dark-purple Tincture to the Infusion of Galls, which indeed is peculiar to *Vitriol*.

By Distillation an acid Spirit is obtained from *Vitriol*, by a very great degree of Fire, called by the Name of the Spirit or Oil of *Vitriol*, which turns the Tincture of *Heliotropium*, and Syrup of Violets, to the Colour of Fire, coagulates Milk and Blood, and raises a strong Fermentation and Heat with any alkaline Salt. The Oil of *Vitriol*, or that strong acid Liquor obtained from it by Distillation, when mixed with common Water, raises an intense Heat; with Sal Ammoniac it raises an Effervescence, but generates Cold, though the Fumes that arise feel hot.

After this Distillation is over, a blackish or red Earth remains in the Retort, called *Colcothar*, and it is the Calx or Crocus of either Iron or Copper, according to the Nature of the *Vitriol* that hath been distilled. From this Process it is evident, that *Vitriol* is composed of an acid Salt, subdued by metallic Parts; which is, also, easily demonstrated from the artificial Ways of producing *Vitriol*. If Spirit of *Vitriol* be poured on the Filings of Iron, a very good *Vitriol* is obtained; and if Copper Plates, stratified with Sulphur, be calcined in a Crucible, the Water in which this Calx is made to boil for some time, if evaporated, will leave behind a true blue *Vitriol*.

The Virtues ascribed by Chymists to *Vitriol* are past Belief; neither do we find the Event to answer their Promises. *Dioscorides* mentions an emetic Quality of it; and says, that, dissolved in Water, it is good against Worms in the Intestines, and after eating poisonous Fungi. He tells us farther, that this Solution, snuffed up the Nose, purges the Head, and reckons it among the astringent, heating, and caustic Medicines. *Pliny* commends it in Diseases of the Eyes, Fluxes of the Blood, and for the Cure of Ulcers, and *Galen* made Use of it in Collyriums. At present it is used as an Emetic, Vermifuge, Styptic, Detergent, and Antiphlogistic; but is seldom given inwardly without Preparation. Externally, white *Vitriol* is principally used in Collyriums, to allay an Inflammation of the Eyes, and stop their Running; and it is thus prescribed:

Take of white *Vitriol*, one Scruple; of Rose or Plantain-water, one Ounce: Let the *Vitriol* be dissolved in the Water, and strain the Solution, which, if it be too acrid, may be made milder, by the Addition of more Water. Or,

Take of the common or *Florentine* Orris, a Scruple; Rose and Plantain-water, of each three Ounces: Boil them over a gentle Fire till a third Part be consumed; and in the strained Liquor dissolve eight Grains of *Vitriol* for a Collyrium.

Powder of blue *Vitriol* is applied to the Extremities of the bleeding Vessels in Wounds, and stops the Bleeding, by cauterizing the Vessels, and coagulating the Blood.

Among the Preparations of *Vitriol*, the first is Purification, called *Gilla* of *Vitriol*, in which white *Vitriol* is mostly made use of; it is purified by Solutions, straining and drying, twice or thrice repeated; and then being taken, from a Scruple to a Dram at a Dose, in a proper Vehicle, will excite Vomiting: This is recommended by *Paracelsus*, and other Chymists, as an excellent Emetic, as not only cleansing the Stomach, by gentle Vomiting, but, also, strengthening both Stomach and Intestines afterward, by its Astringency: Whence it is given with Success in Diarrhoeas and Dysenteries. This *Gilla* was very much in Use before antimonial Emetics were known, and the Use of *Ipecacuanha* was discovered, but is now almost left off. *Geoffroy*.

THE ANALYSIS OF VITRIOL INTO SPIRIT, OIL, AND COLCOTHAR.

1. Take eight Pounds of the common green *Vitriol* of *Goslar*, put it into two earthen Long-necks, each containing four Pounds; cover them with a Tile; set them upon an Hearth, and surround them with Fire, that the Whole may grow gradually hot: The *Vitriol* will then begin to fume, and, upon increasing the Fire, and bringing it nearer, to melt; and, upon making the Fire still stronger, to thicken and turn grey: Then surround the Long-necks on all Sides so with Fire, that the Matter may grow yellow, and begin to appear red

at the Sides of the Vessels. Now let all cool: The Long-necks will be cracked: Take out the Matter, and beat it to Powder; it will be of a yellow Colour. This is the Calcination of Vitriol, in order for distilling the Spirit, and Oil thereof. This Operation ought to precede, otherwise the Distillation would be tedious, on account of the Time required to draw over the aqueous Phlegm, or else the Receivers would crack, on account of that Phlegm arising hot into them; and the Distilling-vessels, also, burst, as being forced by the melted Matter. Hence the Matter is to be calcined only so long as till it ceases to melt in the Fire. In this first Part of the Operation the eight Pounds of Vitriol are reduced to five.

2. Put these five Pounds of calcined Vitriol, first bruised, into a strong Long-neck. Let the Long-neck be large enough to hold double the Quantity; set it in a Furnace; when properly placed in the Furnace, and the Wall is built up, apply an Adapter to the Mouth of the Long-neck, luting it on carefully, with a Mixture of Clay and Lime; wrap a wet Linen Rag about the other End of the Adapter, and apply thereto a very capacious Glass Receiver, so as exactly to fit, and so as the Adapter may not reach above two Inches into it. Let this Receiver rest horizontally upon a Bench, so that the Axis both of the Receiver, the Adapter, and the Long-neck, may lie in the same horizontal Plane, lest otherwise the Neck of the Adapter, or the Receiver, should be pressed upon. Lute the second Juncture in the same manner as the first, and put Linen Rags about it, spread with the same Luting; and thus leave the Vessels for twenty-four Hours, that the Luting may grow dry.
3. Make the Fire with proper Cautions; a white Fume will first rise, and the Receiver grow warm; keep the Fire up in this State for six Hours; oily Veins will afterwards run down the Sides of the Receiver; and in this State again continue the Fire for six Hours; then for six Hours longer keep it up to its utmost Height, that the Long-neck may be thoroughly red-hot; a thick Oil will thus come over. If the Vapour should pass through the Luting, put a Linen Rag, spread with the same, and well heated upon the Crack; and thus it will be stopped: Though the Fire should be ever so long continued, the Vapour would not cease to rise, but the Produce would not defray the Cost; so that I judge eighteen Hours sufficient. Now, therefore, let all cool, till the Adapter is but just warm, and the Receiver grown quite cold.
4. Have then ready at hand a Bottle with a narrow Neck, and fitted with a wide Glass-funnel; then carefully moisten the Rags, and the Luting applied to the Mouth of the Receiver, and take them away gently, with Care to prevent the Dirt from falling in, the Fume from coming out so as to prove offensive, and the Glass from cracking, by being moved obliquely. Take it therefore away in a strait Line, and avoid the noxious Fumes. Cleanse the Mouth of the Receiver, that no Luting may drop in; then pour the Liquor out of the Funnel into the Bottle, stop it up, and set by the Receiver for the like Purposes. I have usually thus obtained one-and-twenty Ounces of thick, black, strong, and smoking Oil of Vitriol. A red, blackish, light, powdery, austere Calx, remains in the Long-neck, to the Quantity of fifty-two Ounces; so that five Ounces are lost in the Operation.

R E M A R K S.

And thus the Oil or Spirit of Vitriol is prepared, which has numerous Uses in Chymistry and Medicine; for it is a most powerful ponderous Acid, and a great Preservative, though itself a Caustic; and hence Vitriol consists of this, and Colcothar, and Phlegm. This Oil of Vitriol will scarce boil without a Fire of six hundred Degrees. If put into a Glass Body, and urged with a Sand-heat of five hundred Degrees, it yields its wild suffocating Spirit and Water, then changes from black to limpid, and becomes exceeding ponderous and fiery; and if poured into a Glass wet with Water, it produces such a Heat as instantly to crack the Glass: It attracts Water out of the Air. If four Ounces of this Oil be, by a Sand-heat, distilled in a little Retort, with a long and very curved Neck, so as that one Drop may follow another at the Distance of six Seconds, and fall into fair Water, contained at the Bottom of the Retort, as pure and perfect an acid Spirit will be thus obtained, as Oil of Sulphur by the Bell: But this requires a skilful Operator. Each Drop, when it falls into the Water, makes an Hissing, as if Fire had fallen therein: But if a falling Drop touches the Glass, it immediately cracks it, as if it were cut with a Diamond.

If a stronger Fire be used, the Neck of the Retort cracks, the Labour is lost, and a pernicious suffocating Fume exhales, which ought to be cautiously avoided. This Process is otherwise noble, and of excellent Use, at may be learnt from a prudent Exercise of Chymistry and Medicine. *Paracelsus* describes the best Method of preparing this Spirit to be by distilling recent Vitriol to Dryness, in a Vessel of *Hessian* Earth, and cohobating the Liquor upon the Remainder, the oftener the better, at last using the utmost Violence of Fire; and by this means he promises a Liquor serviceable in many Cases. The Direction is ingenious, and Artific-like, provided the Vessel be kept from bursting by too large a Quantity of the dry Vitriol. The Caution is to use a little Quantity at once, in a Proportion to the Vessel. *Boerhaave's Chymistry*.

The Mass that remains after the Distillation of Vitriol, called *Colcothar*, is a red martial Earth, still impregnated with some Quantity of acid Salt, and by often washing and drying, it becomes an Astringent, which is used externally to stop Bleeding in Wounds; and from the Water in which it is washed, a Salt is obtained, called the *fixed Salt of Vitriol*, or *Salt of Colcothar*. When the Colcothar has not been much calcined, it remains white and pellucid, not emetic, but diuretic, and aperient. Though this Salt is so much fixed as not to rise by a very great Degree of Heat, continued for several Days, yet it is easily made volatile by means of Borax, and is sublimated in the Form of silver-coloured saline Flowers. This is the sedative Salt of the great *Homburg*, and is thus prepared:

Take the fixed Salt of Vitriol well calcined, and Borax, of each two Ounces: Dissolve them separately in four Pints of warm Water; and then, having mixed the Solutions, pass the turbid Liquor through Cap-paper, and then distil it in a Glass Alembic, to Dryness; which being done, white saline silver-coloured Flowers will be sublimed. These are to be gathered, and kept for Use. The fixed Salt that remains in the Bottom of the Alembic, by a new Affusion of Water, may be fitted for a new Distillation, which being continued to Dryness, fresh Flowers will arise; and this Operation may be repeated till all the Salt is sublimed. The same Preparation may be obtained by taking Oil of Vitriol instead of the fixed Salt, and mixing it with twice its Weight of Borax. In this Case there is no Precipitation; but nevertheless Flowers are raised of the very same Kind with the former.

These Flowers are almost insipid to the Taste, and not easily dissolved in Water. They calm the feverish Heat of the Blood, and especially in burning Fevers, they prevent or remove delirious Symptoms, and allay spasmodic Affections, whether hypochondriacal or hysterical, at least for a time. In a Word, this Salt is an excellent Anodyne, and has a just Title to all the Virtues ascribed by Chymists to Vitriol, Sulphur, or what they call the *Archæus Sedor*. The Dose is from one to ten Grains, in any proper Liquor. It is however unsafe to order this Salt in Inflammations of the Lungs, Spitting of Blood, and other Inflammations of the Thorax; for though it be insipid to the Taste, yet it contains latent *Spicula*, which being gradually disengaged in the Body, may irritate and vellicate the Membranes of the Lungs, and so bring on a Cough.

Vitriol is, also, the Basis of the famous sympathetic Powder, to make which they calcine *Roman Vitriol* by the Rays of the Sun in the Dog-days, to a white and yellowish Powder, and keep that Powder for Use in Vessels close stopped. *Digby*, and others, have said wonderful things of this Preparation, which are not confirmed by Experience. However, it certainly stops Bleeding, when applied immediately to the open Extremities of the Vessels; and hence some have endeavoured to cure Wounds by the Use of it, mixing only a small Quantity of Gum Tragacanth in case of a purulent Discharge. *Geoffroy*.

THE DULCIFY'D OIL OF VITRIOL.

Ever since Chymistry began to be cultivated and improved, the Distillation of a sweet Oil from Vitriol has been known. *Basil Valentine*, and *Paracelsus*, make Mention of it; for as the ancient Chymists endeavoured, besides their own Secrets, to find a Substance for converting the more ignoble Metals into Gold, so they were persuaded, that the Matter of this Substance was to be sought for in Vitriol; for which Reason they have subjected this Salt to various Analyses by Fire, and obtained several Preparations from it, as may be seen in the Writings of the most celebrated Chymists, who accounted Vitriol the Matter of the true Philosophers Stone, as is evident from that remarkable Canon of the Chymists: *Vista Interiora Terræ, Reperies Ibi Occultum Lapidem Verum Metallorum*. Visit the interior Parts of the Earth, and you will there find the true secret

secret Stone of Metals. The initial Letters of the *Latin Canon* express the Name of *Vitriol*, from which various Preparations have been obtained; but none more remarkable than that Process by which Oil of Vitriol is rendered sweet. This is mentioned by *Valerius Cordus*, from whom *Conradus Gesner* has taken the Process, which in *Euonymus's Thesaurus de Remediis Secretis*, is ordered to be carried on in the following Manner:

Take of the most acrid burning Wine thrice sublimated, five Ounces; and as much of the austere Oil of Vitriol: Mix in a *Venetian Glass*; put it in a small Cucurbit with a narrow Mouth, and lute up the Orifice close, and let it stand thus for a Month or two: Then pour it into a Cucurbit with an annexed Alembic; then put it in a small Furnace, and cover the Half of it with Ashes; then apply a Receiver, lute the Joinings well, and extract the five Ounces of burning Wine which you have poured in: But that this may be more safely done, place the Cucurbit in *Balneo Mariae*; for thus the Wine will ascend without the Oil. When you have extracted the Wine, place what remains in a Furnace, so that the Sand may reach the Middle of the Cucurbit; then applying another small Receiver, lute the Joining carefully; then apply a moderate Fire, and gradually extract the Moisture till none appears left at the Bottom, always taking care so to regulate the Fire, that the Liquor may not boil up to the Pipe of the Alembic; for if such a Boiling should happen, you cannot check it, nor hinder it from going over into the Receiver, so that all the Oil is lost; for it boils very easily. Then you will see, that an aqueous and pinguious Humour are contained in it. You must separate the one from the other, so that nothing aqueous may be left in the Oil; for the Water corrupts the Oil, which, when separated, is to be preserved for Use. It is to be carefully kept, because only a small Quantity of it is obtained from one Pound of the austere Oil, and it easily evaporates on account of its aerial Quality. It is good against all Putrefactions in the Body, and against the Plague; it is, also, proper for carrying Pus, and thick and viscid Humours, out of the Lungs, in a Pleurisy, a Peripneumony, and an uneasy Cough; for it may be safely taken internally, and neither suffers the Formation of the Stone in the Kidneys, nor in the Bladder. It, also, cures the Bladder when exulcerated. The Dose is one, two, or three small Drops, in moderately temperate Wine.

Crollius, in *Basilica Chymica*, orders the sweet Oil of Vitriol to be prepared thus:

Take of the rectified Oil of Vitriol, one Part; and of Alcohol, four Parts: Digest in a Vapour Bath for some Months, and afterwards distil; and thus you will have floating on the Water an Oil of Vitriol of a grateful Taste and Smell, and of great Efficacy in Medicine.

These are the two Processes I have found in the Writings of the most ancient Chymists. Now it may justly be questioned, whether this Process answers, since I never remember to have met with it in any other Author, especially with this Detail of Circumstances and Cautions. Hence, it is probable, that the Chymists of the succeeding Age either did not prepare it, or did not look upon the Process as genuine, tho' in reality it is most true.

That described by *Crollius*, is the true *Spiritus Vitrioli Dulcis*; and, as in this Preparation, he has omitted the principal Circumstances added by *Gesner*, it is justly to be doubted, whether he ever prepared such a sweet Oil of Vitriol, especially because he informs us, that the Oil floated on the Water; whereas on account of its Weight, it rather subsides to the Bottom. *Hartman*, also, in his Notes on *Crollius*, doubts with respect to this Process, and substitutes another sweet Oil of Vitriol in its stead; which is prepared thus:

Boil Oil of Vitriol in a new iron Pan with common Water, till the corrosive Salt is collected at the Bottom of the Pan; and then the rest of the Oil of Vitriol becomes sweet. The same Effect is produced by extinguishing red-hot Iron, for several times, in Oil of Vitriol; but by this means the Virtues of the Oil are greatly changed, and its medicinal Effects lost.

Every one must be sensible, that Oil of Vitriol, when mixed with Iron, loses its corrosive Quality, but degenerates into a vitriolic Liquor, which, in some measure, subsides to the Bottom. But this is not the sweet Oil of Vitriol which ought to resemble that of Olive-oil, to be inflammable, of a fragrant Smell, and aromatic Taste, leaving no Acidity on the Tongue. It ought, also, to be dissolvable in highly rectified Spirit of

Wine, and to be possessed of anodyne and sedative Virtues. The celebrated Author of the Dissertation *de Vitrioli Elegiis*, speaks in the following Manner of the *Oleum Vitrioli Dulce*: "*Paracelsus* boasts, that he is able from Vitriol to obtain a Spirit, or rather a sweetish Oil of a green Colour, by means of which, he affirms, he can cure the Epilepsy. The Art of obtaining this puzzles the most expert Chymists, since, so far as I know or remember, no one has ventured to affirm, that he was Master of such a Secret." But I have observed, that two Centuries ago, the Preparation of this Oil was known to *Gesner*, and *Valerius Cordus*, the Truth of which will be more evinced by what follows. When, without any Knowledge of *Gesner's* Process, I above twenty Years ago had prepared some sweet Spirit of Vitriol, I found this highly fragrant Oil. The Process, as carried on by me, is as follows:

Take one Pound of Oil of Vitriol by Rectification freed from all its Phlegm, and of highly rectified Spirit of Wine entirely free from Water, six Pounds; to which pour the Oil of Vitriol. This produces a great Heat and Noise, resembling that produced by red-hot Iron immersed in cold Water. The Mixture becomes warm, and acquires a red Colour, and a grateful Smell; a few Days after, distil from a Cucurbit, with the Sand laid pretty high about it. Thus there is first obtained a pretty fragrant Spirit of Wine, and afterwards a more fragrant one. If the Mixture begins to be changed into a black Substance at the Bottom of the Cucurbit, the Spirit is to be removed, and another small Receiver applied; the Fire in the mean time being very mild and gentle; for unless this Caution is observed, the Whole of the black Mass suddenly comes over, and all the Labour is lost. But if we carry on the Process with a gentle Fire, we obtain a Phlegm of a sulphureous Taste, together with at least five Drams of an Oil, which subsides to the Bottom. This sulphureous Water is decanted, and we obtain a sweet ethereal Oil, of a grateful and penetrating Taste and Smell; and this is to be carefully preserved in a Phial.

1. That there is an Acid in this sweet Oil of Vitriol is obvious from this, that if any of it is put in a Silver Spoon, and held over a Candle, it contracts a reddish Colour, becomes acid, and tinges the Spoon with a black Colour.

2. If this aromatic Oil is for some Months kept in a Glass covered with a Swine's Bladder, it successively corrodes it, and that which remains in the Phial contracts a red Colour, and an acid Taste.

3. If it is boiled in a Phial with Quicksilver, it attacks the Quicksilver.

4. This aromatic Oil, when recent, is thoroughly dissolved by highly rectified Spirit of Wine, to which it communicates its Taste and Smell, together with an anodyne and sedative Quality, highly beneficial in all Pains and Spasms.

5. This Spirit of Wine impregnated with sweet Oil of Vitriol, if mixed with a small Quantity of the Solution of Gold, makes a yellow Tincture, which, when dropped on Iron, tinges it with the Colour of Gold.

6. When this Solution of Gold stands for twelve Hours, a black Powder subsides to the Bottom, a Sign that the Sulphur of the Vitriol unites with the Powder of the Gold, and that both of them are precipitated to the Bottom.

This curious and remarkable Process clearly discovers the Production of ethereal and distilled aromatic Oils. *Glauber* informs us, that highly-rectified Spirit of Wine may be converted into Oil, if it is mixed with Oil of Salt concentrated with *Lapis Calaminaris*. I tried this Experiment, but could obtain no Oil, besides the sweet Spirit of Salt; but by the Help of this Experiment I obtained an Oil, from the Production of which we learn, that highly-rectified Spirit of Wine is nothing but an æthereal Oil by the fermentative Motion resolved into the minutest Parts, and intimately mixed with the Phlegm: But when the Oil of Vitriol intimately unites itself with the oleous Particles disjoined in the Spirit of Wine, it is again coagulated into an Oil.

Hence it is obvious, that an Acid may enter the Mixture of distilled Oils, and that without a manifestly acid Taste it may be concealed and covered by the Oil and Sulphur: By the Admixture of the acid Sulphur of the Vitriol, since the whole Oil is sulphureous, the pinguious and oleous Parts of the Spirit of Wine acquire a new and penetrating Taste; for which Reason the Sulphur of Vitriol, in a liquid Form, may justly be accounted an excellent Anodyne, of great Efficacy in the Cure of Diseases, as I have often found from Experience. *Hoffman. Obs. Phys. Chym.*

THE FIXED ANODYNE SULPHUR OF VITRIOL.

We shall now consider that black Mass, of the preceding Process, which, in Distillation, remains at the Bottom: If to this

this a sufficient Quantity of common Water is poured, the Acid is diluted, and the Liquor, assuming a brownish Colour, is, by a due Evaporation, so concentrated, as again to yield true Oil of Vitriol; with which, and the Addition of the highly-rectified Spirit, we may again attempt the Preparation of the Spirit and sweet Oil of Vitriol. All the Acidity being washed away by the common Water, there remains, in the Filtræ, a subtil Powder, of a blackish Colour, and which, when dried, and thrown upon live Coals, flies all off with a sulphureous but not a fetid Smell. If this Powder is put into a Crucible, and urged by a strong Fire, it becomes red-hot, and a considerable Part of it is dissipated in the Air.

Upon laying this Powder, *stratum super stratum*, with Plates of Silver, these were not dissolved, as they generally are by mineral Sulphur; then I put two Drams of Salt of Tartar into the Crucible, in order to melt the Silver; after the Addition of a Dram and an half, I obtained an alkaline Mass, of a redish Colour, like that Liver of Sulphur which is obtained from a like Treatment of Salt of Tartar, the *Arcanum Duplicitatum*, and Powder of Charcoal.

Hence we may conclude, that it is a fixed Earth; and we are carefully to examine whether its Origin is to be derived from the Oil of Vitriol, or from the oleous and sulphureous Part of the Spirit of Wine; whether there is a peculiar medicinal, sedative, and anodyne Quality in it; and whether there is not, perhaps, an anodyne Sulphur of Vitriol in it.

It is a common Opinion, that, in the Distillation of Vitriol with an Acid, by means of the rapid Motion of the Fire, some subtil, chalybeate, or coppery Parts, are elevated, and ascend: For this Reason, the Antients, and especially *Basil Valentine*, preferred red Oil of Vitriol to that which is white, because they thought the former contained Sulphur of *Mars* and Copper, on which its Colour depended. But that this is false, is demonstrated, partly by the Rectification of the Oil of Vitriol, in which it becomes limpid like Water, without any Remainder of coloured Particles; and partly by the momentaneous Conversion of white Oil of Vitriol into red, by the Addition of a small Quantity of Oil, any inflammable Substance, or of a Piece of Paper.

Many esteem the Earth, left after the Distillation of the highly-rectified Spirit of Wine, and the Oil of Vitriol, a metallic chalybeate Earth: But I tried an Experiment upon it with a large Burning-glass, upon which, it was immediately evaporated into the Air; nor was there any fiery Ebullition like that which always happens in the Fusion of Iron by means of solar Fire; nor did Spirit of *Sal Ammoniac*, when poured to it, extract any Copper, as was evident from the want of a bluish Colour, which, by an Admixture of an urinous Spirit, always discovers itself in Copper.

I am, therefore, of Opinion, that this highly-black and light Earth remaining in the Cucurbit after the Distillation of sweet Oil of Vitriol, andedulcorated by Water, is the phlogistic Part of the highly-rectified Spirit of Wine, and of the Vitriol: And that it is so, may, I think, be demonstrated, in the following manner: All Oils even of the most subtil and æthereal kind, when kindled exhale a black Smoak, which, when collected, constitutes a black combustible Powder; now it is equally certain, that all inflammable Spirits are only subtil Oils by a fermentative Motion united with Phlegm: But as distilled Oils, when mixed with Oil of Vitriol, first become red, and then, after Distillation, and Evaporation, leave a large Quantity of phlogistic Earth; so it is not to be wondered at, if an inflammable Spirit, in the same manner mixed with Oil of Vitriol, should, by its intimate Union with it, not only contract a red Colour, but, also, leave a large Quantity of combustible Earth, and diffuse a Smell like that of Sulphur; for that fetid Smell, diffused by its Smoak, when kindled, arises from acid Particles mixed with a sulphureous Earth.

In this Experiment it is observable, that the thick and black Matter, swelling like kindled Sulphur, and the Phlegm of an acid Taste, do not appear till the Distillation is almost over, the superfluous inflammable Spirit consumed, and the earthy Particles of the Spirit of Wine, and Oil of Vitriol left: These volatile and oleous Particles, being mixed with acid fixed Particles, ought, also, to be separated by a gentle Fire; for by a strong Fire, they will quickly elevate, and raise all that ponderous Mass, so that it shall come over a long Cucurbit, and the Alembic. Hence we learn, that a small Quantity of volatile Matter is, on the Approach of Heat, capable of raising a great deal of the fixed Substance with which it is mixed. *Fr. Hoffman. Obs. Phys. Chym.*

VITRUM. Glass. *Vitrum Antimonii* is Glass of Antimony. *Vitrum Saturni*, is Glass of Lead.

VITTA. That Part of the Secundines with which the Head of a Child, when born, is sometimes covered as with a Coat, is called *Vitta* in a Female; but *Galea* in a Male.

VITULUS. The Calf. For an Account of the alimentary Substance contained in Veal, see the Article *ALIMENTA*.

Veal, I mean the Flesh of all the Parts of a Calf, is much used in Food, and ought to be white, juicy, tender, plump, and well-tasted.

The Head and Lungs of a Calf are pectoral, good to qualify the sharp Humours of the Breast and Throat, and for the Phthisic. Calves Feet are, also, pectoral, their Substance is glutinous, qualifying, and moistening. They are boiled in Broths to moderate the Loss of Blood, in the Menfes, Piles, and Spitting of Blood.

Veal, and the other Parts of a Calf being endued with a Juice that is temperate, produces no ill Effects; but they are not good for those who have a Looseness, caused by the Relaxation of the Fibres; for they will increase this Disorder.

Veal contains much Oil, Phlegm, and volatile Salt. It agrees at all times, with any Age or Constitution; but it is better for weak and tender People, and such as live a sedentary Life, than for those that are strong, robust, and accustomed to constant Exercise, who require more solid Food, and that does not so soon consume as Veal.

REMARKS.

A Calf ought to be chose when very young, and while it sucks, because then its Flesh and other Parts, are tender, dainty, and easy of Digestion; whereas these same Parts will afterwards become dryer, harder, and consequently, not so easy of Digestion. *Brucerius* says, the Romans and Italians let their Calves suck six Months, and sometimes even a whole Year; and that during that Time, they took care they should eat no Grass, as being persuaded their Flesh would thereby be more dainty, healthy, and better tasted: In short, as these Animals are naturally of a dry Constitution, the younger they are, the more good Effects their Flesh should produce, because it is in a better Temper.

Avicenna pretends Veal is very wholesome, and that it produce good Juices. Lastly, *Galen* says, that roasted Veal is easy of Digestion, and very nourishing.

Veal is nourishing, cooling, and moistening, because it contains an oily, viscous, and balsamic Juice, that is fit to unite with the solid Parts, to embarrass the sharp Humours, and to moderate their Fury and Impetuosity. It loosens the Body, by making the Humours contained in the Vessels more fluid, and the Passages more free and open. As for a Calf's Liver, as it consists of a compact and earthy Substance, as well as those of other Animals, it is not strange it should make the Humours gross, and bind the Body. They make use of the Fat or Suet of Veal, and especially that about the Kidneys, in Pomatums: This, as well as the Marrow of the Animal, is of a dissolving Nature.

The Runnet, which is made use of to curdle Milk, is in Latin called *COAGULUM*; which see. *Lemery on Foods.*

It is very remarkable that Veal, however easy of Digestion it is generally esteemed, will not agree with some Stomachs, but excites a kind of Sickness and Uneasiness, for many Hours after; a certain Evidence that it does not duly digest; and these are generally the Stomachs, which digest other Animal Food without any Uneasiness.

VIVERRA. Offic. Charlt. Exer. 20. *Viverra, Læis, Furo.* Mer. Pin. 167. *Mustela sylvestris.* Gesn. de Quad. Digit. 762. Aldrov. de Quad. Digit. 327. Johnf. de Quad. 107. *Mustela sylvestris Viverra dicta.* Raii Synop. A. 198. **THE FERRET.**

The Flesh, and Gall of this Animal, are recommended in an Epilepsy, the Gout, and are said to be good against Poisons. *Dale. Lemery.*

VIVIPARUS. An Epithet for those Animals which bring forth a young Animal, by way of Distinction from those which produce Eggs, and are called *Oviparus*.

ULCUS. An Ulcer.

What is meant by an Ulcer, seems so well known to every Person as to require no prolix Description; for the Definitions which are usually given us, both of this and many other things, are generally more obscure and difficult to be understood than the Names themselves. The most clear, however, and distinct Notion given of an Ulcer is, by those who define it a *Solution of the soft Parts of our Bodies together with the Skin, produced by some internal Cause, as an Inflammation, Abscess, or acrimonious Humours.* But Wounds which become inveterate and even Contusions when difficult of Cure, come within this Definition, and pass at length into Ulcers, and are commonly so called.

The proper and usual Seat of an Ulcer, then, is in any of the softer Parts of our Body, as the Skin, Fat, Glands, Flesh, and

and internal Viscera: For if there be any Exulceration or Corrosion in the harder Parts, as the Bones; it comes rather under the Notion of a Caries; or what is commonly called *Spina Ventosa*, than that of an Ulcer; though on account of some kind of Resemblance which it has with an Ulcer or Erosion of the softer Parts, they are sometimes treated of in Conjunction.

How Abscesses, Contusions, and Wounds differ from Ulcers, will be sufficiently illustrated by an attentive Consideration of the Nature of each Disease: For though Wounds and Contusions, as well as Ulcers, consist in a Dissolution of the soft Parts, yet they differ from them in a very material Point, as they proceed from an external Cause, and are produced, as it were, in a Moment; whereas Ulcers, on the contrary, owe their Original chiefly to some internal Cause, and form themselves by Degrees. As for Abscesses they are, as it were, the first Principles of Ulcers, or Ulcers not yet arrived at Maturity, as when an Inflammation passes into a Suppuration, the Skin remaining as yet entire. But as soon as the Skin breaks, and there is an Effusion of mature Pus, the Abscess is supposed to pass into an Ulcer, whether the Rupture happens spontaneously from an Erosion by the Pus, or the Skin be opened by the Surgeon's Knife.

Ulcers can by no means be reckoned all of one Kind, but are distinguished into various Species on many Accounts; as (1.) with respect to the different Parts of the Body in which they are seated; for sometimes they infest the Skin, at other times the Fat, and sometimes the Glands and Flesh; (2.) as to their Magnitude; for some Ulcers are large and extended; others small and contracted within narrow Limits; some deep, others shallow and more superficial; in particular, Ulcers of a considerable Depth, but narrow, and more especially distinguished by the Narrowness of their Orifice, or Beginning, usually pass under the peculiar Denomination of Sinus, or Fistula. Ulcers differ, (3.) with regard to Duration; for some are recent, others inveterate; (4.) on account of their attendant Symptoms; in which respect some Ulcers are mild and favourable, others malignant, that is, attended with very acute Pains, or fetid, putrid, pinguious, rheumy, or discharging much Ichor, creeping, or spreading, cancerous, or inclining to a Cancer, callous, fistulous, or verminous; there is a Difference between them, (5.) with respect to their Causes, in which Light they assume the Epithets of scorbutic, venereal, carious, cancerous, pestilential, and such as are supposed to proceed from Fascination. In the last place Ulcers are distinguished (6.) by the Parts in which they are seated. Thus some infest the Nostriis; others the Fauces; Palate, Breast, and Anus; and one Sort has the Name of *Fistula Lacrymalis*.

The Opinion of some late Physicians, who ascribe the principal Cause of Ulcers to some foreign Acid, corroding the Parts of the Body like Aqua-fortis, seems too precarious and ill-founded to demand our Assent, since there is hardly any Kind of acrid Humour, whether it be saline, lixivial, alkaline, or acid, that is not capable of corroding the Body, and exciting an Ulcer. And indeed, as the Blood in Stagnation is generally converted into an alkaline Acrimony, which has nothing at all of the Acid in it, as some would persuade us, since the very fetid Smell of Ulcers shews the Alkali to have by much the Predominance, I think it appears very plainly that the Cause of Ulcers is oftener to be ascribed to alkaline than acid Humours, as we know and take it for granted, that by Alkali our Physicians mean any Kind of acrimonious or saluginous Substance, which resists and enters into Conflict with all Kinds of Acids; as, for Instance, Salt of Tartar with Vinegar, and Oil of Tartar per Deliquium with Spirit of Vitriol. But to proceed. As there is a great Variety of Poisons, so is there, also, of acrimonious Substances, and consequently of Ulcers. The more pestilential the corroding Acrimony, the more noisome and fetid, the more phagedenic and dangerous are the Ulcers, and sometimes to such a Degree of Malignity as to become quite incurable, as in a Carcinoma, or Cancer. It is to be observed, also, that Ulcers may owe their Original not only to Acrimony, but to any Cause whatever, which is capable of effecting a Stagnation and Corruption of the Blood. Thus Tumors, Inflammations, Wounds, Contusions, Fractures, Luxations, Scirrhuses, Cancers, and Caries, very frequently degenerate into Ulcers, which, also, tho' they may happen at first to be mild and safe, often become at length malignant and dangerous, either from a bad Habit of Body, an improper Regimen of Diet, or unskilful Treatment and Bandage, and other like Causes.

Tho' most Kinds of Ulcers may be discovered and known by the bare Sight, yet that we may examine more exactly the Depth of a Sinus, and which Way it proceeds and has its Course, and whether it be attended with a Caries, we use the Help of Probes. Whether it be a new or an old Ulcer is best known by interrogating the Patient, who will, also, probably make the best Discovery of the Causes why the Disease is be-

come inveterate, and whether it be owing to some subjacent Caries, or to an improper Regimen of Diet, or Method of Cure. An Ulcer is to be judged mild and favourable principally on the following Account; if, in the first place, it be not inveterate, nor accompanied with any bad Symptoms; if again the Pus be moderately thick, whitish, smooth, and not very fetid; and, lastly, if the Patient be young and vigorous. On the contrary, Ulcers are justly esteemed malignant and difficult of Cure, if the Patient be of an infirm, scorbutic, or hydropic Habit of Body; if the Pus be immoderately thin, acrid, fetid; yellow, whitish and reddish, greenish or blackish, or too thick, and much resembling Lard. No less Danger is to be apprehended, when the Patient labours under intense Pains, or the Ulcer is of such a Nature as to reject the Method of Cure used in Wounds, and recent Abscesses, by Digestives, and vulnerary Balsams.

Impure and putrid Ulcers are so called, when the affected Flesh appears corrupted, soft, whitish, or livid; or when the Matter discharged is thicker, and more glutinous than ordinary, or appears green, or variegated. Ulcers of the fluent or rheumatic Kind are such as discharge Plenty of thin Sanies. Phagedenic, or spreading Ulcers, discover themselves by corroding the circumjacent Parts, in a quicker or slower manner, according to the Degree of Acrimony in the Matter. We call an Ulcer fistulous, when it penetrates to a considerable Depth under the Skin, or between the Muscles, and especially when the Sinus is large, and the Outlet, or Orifice, narrow. And, lastly, Ulcers are said to be callous, when their interior Parts are covered with a Kind of hard, and, as it were, cartilaginous Substance.

Ulcers are judged to be venereal, when consequent upon lying with an infected Woman, or after some venereal Disorder, as a Gonorrhoea, venereal Bubo, or the Lues Venerea. Various is the Situation of these Kinds of Ulcers, tho', for the Generality, they are seated in the same Places in which venereal Bubos are produced; or in the Nose, Fauces, and Penis; which last are called Ulcers, or Carcinomas of the Penis, in French Chancres, "Shankers." In the other Sex these venereal Ulcers are most incident to the Labia Pudendi, and the Neck of the Uterus. Cancerous Ulcers are either the very same with those exulcerated Carcinomas treated of under CARCINOMA, [see that Article] or such as, in their Progress, and attendant Pains, most nearly resemble a Carcinoma. Ulcers are said to be carious, when some adjacent Bone is found deprived of the Periosteum, and corroded, or affected with a Caries. That Ulcers may be produced by Fascination, or Witchcraft, the common Proof is, that Pins, Hair, Threads, Rags, Nails, Egg-shells, Coals, and other extraordinary and preternatural Things, are sometimes found, in Wounds, or Abscesses. But, if I may be allowed to speak my own Sentiments, in this Affair, I am of Opinion, that not only most of those Signs which are regarded by the Ignorant as undoubted Marks of Fascination, but the very Thing, or Fascination itself, is, at least, very much to be questioned, or else is absolutely counterfeit, and wholly directed and promoted with a superstitious View: For many Ulcers were, in former Times, esteemed the Effects of Fascination, when, in Reality, they were manifestly otherwise.

Recent Ulcers, of a favourable Kind, like recent Abscesses, are not difficult of Cure, especially if the Patient be young and vigorous; but the more inveterate an Ulcer becomes, and the worse the concomitant Symptoms are, the greater is the Difficulty which attends a due Conglutination; whence it is, that very putrid, rheumatic, or much-running, fistulous, callous, carious, and cancerous Ulcers, are not cured but with vast Difficulty, and by the utmost Skill and Management of the most able Surgeons. For as for those bold and confident Quacks and Mountebanks, who boast and value themselves at so high a Rate, on account of their secret Plaisters and Ointments, which they pretend to be of surprising Efficacy in all manner of Ulcers, I am persuaded, and can appeal to Experience, that they very grossly impose upon themselves, and others. The more depraved or infirm the Habit of Body, the older the Patient, the more acrimonious the Blood, the worse the Smell of the Ulcer, and the Colour and Acrimony of the Pus, the more difficult must, of Necessity, be the Cure. When the Ulcers are very large, or numerous, and every Day discharge a vast Plenty of Matter, or Sanies, they very much weaken, and, by Degrees, exhaust and destroy the Patient. Old Ulcers in the Feet, especially in Persons far advanced in Years, and infirm, are by no means to be healed: For, as Experience almost universally shews, the Health of the Patient stands established on a good and hopeful Foundation, as long as the corrupted Matter, collected from all Parts of the Body, is discharged by the Ulcers; but when this Efflux is suppressed by a Conglutination, the Consequence, after some time, is generally observed to be some very bad Distemper, such as Pains of the Head, Vertigo, Apoplexy, Epilepsy, a Difficulty of Breathing, or a Suffocation, or, perhaps,

Diarrhoea, Dysentery, internal Inflammations, and other Disorders of that Kind, which terminate in Death, according to the concurrent Observations of very many practical Physicians. Thus, also, when any inveterate Ulcers, of this Kind, dry up in old Persons, and their Lips contract a Lividness, with a Heat, there is great Danger of a *Sphacelus*, succeeded by Death. But in younger, and robust Persons, the Cure of inveterate Ulcers is attended with more Safety; but the necessary Care to be taken in such Cases is, not only to remove the Cause of the Ulcer, by proper Medicines, but to restore the Blood to its former Purity; which, oftentimes, is not effected but with great Difficulty. If the Disease, therefore, be too inveterate, and the affected Persons impatient of Medicines and Abstinence, it is no wonder if Ulcers cannot be cured, even in robust Constitutions.

Venerae Ulcers are seldom or never to be cured without a previous Expulsion of the venereal Venom out of the Body by proper Medicines; without which, all external Remedies are of no Effect, in this Case. *Fistulous, callous, and carious Ulcers*, are seldom or, rather, never cured but by manual Operation; for oftentimes after inducing a Cicatrix, they form themselves anew, and are more troublesome than before: In particular, a *carious Ulcer*, if the Caries be great, and especially in the Joints, often discharges such vast Quantities of Pus, as extremely to weaken, and, without a seasonable Amputation of the Limb, to destroy the Patient. The Case is much the same with *cancerous Ulcers*; for here, also, unless the Part affected be separated from the Body, there can be no Hopes of a Cure, as we have before observed under CARCINOMA; and sometimes the Cancer or Carcinoma returns after the Operation, and is not to be removed till it terminates in the Destruction of the Patient. As for Ulcers affecting the Viscera, since they are removed from the Reach of manual Operation, or the convenient Application of Medicines, they are often very justly esteemed incurable.

The Method of Cure in Ulcers is extremely various, as adapted to the great Variety of the Disease: For when the Ulcer is but recent, it is to be healed in the same manner as a recent Wound, or Abscess. We must first, then, begin with *Mundification*, or cleansing the Ulcer; after that, proceed to incise, or fill the Cavity with new Flesh; and, lastly, cover and conglutinate the same, as much as possible, with a fair and even Cicatrix.

Mundification of an Ulcer is usually performed in the following manner: First, The corrupted Matter is evacuated; or, when it discharges itself not so freely as it ought, gently expressed with the Fingers; if there be a deep Sinus belonging to the Ulcer, it is to be extirped, by some proper Injections; or, if the Place be open enough, by repeated Intromissions of fresh Lint. If there be any Pieces of Membranes, or other corrupted, pinguious Parts left in the Ulcer, the best way to eject them is, at every Dressing to introduce into the Place Lint moistened with some digestive Ointment, and cover it with a Plaster of Diachylon, Diapalma, or something of the like Nature; and upon that apply Compresses, and over the Whole a Bandage: This Method is to be carefully followed till the Place be thoroughly cleansed, or till the Bottom of the Ulcer appears quite red, and covered with new Flesh.

After due *Mundification*, our next Business is, to fill the Ulcer with new Flesh, which is performed by Help of such Medicines as are commonly called *Sarcotics*, [from *σαρξ*, Flesh] that is, Flesh-generators; among which, the best, and most effectual by many Degrees, is the *Digestive Ointment*; for without some extraordinary Impediment, this *Digestive* is of itself sufficient to produce new Flesh. It is, indeed, the Manner of almost all Surgeons, very gravely to recommend every one his proper Balsamics for the procuring of new Flesh; but there was no Necessity, as I imagine, for them to be so careful and solicitous on this Point, since there is in this very *Digestive*, a balsamic Virtue; and we ought, besides, to consider that this new Flesh owes its Generation not so much to the Assistance of Medicines, as the Benefit of Nature: For all the Care and Diligence of the Surgeon have scarce any other Effect than to remove all such Things as are hurtful, and may prove Impediments to a Cure. If any one, however, should think our *Digestive Ointment* not strong enough for his Purpose, I would advise him to *Balsam of Arcæus*, *Balsam of Peru*, *Balsam of Mecca*, *Balsam of Sulphur*, *Essence of Myrrh and Aloes*, *Oil of Myrrh per Deliquium*, *Oil of Eggs*, and other vulnerary Balsams of the like Kind, to be used in its stead; and, by the best Means he can procure, to accomplish a perfect Conglutination.

Where an Ulcer has penetrated so deep as to have its Bottom remote not only from Sight, but from the Reach of Medicines, it may seem necessary, in every Dressing, after expressing the corrupted Matter collected within, to make an Injection of some cleansing and healing Liquor; such as a Decoction of Agri-

mony, or Birthwort mixed with Honey of Roses, or Essence of Myrrh and Aloes, or what *Belleste*, in his *Hospital Surgeon*, recommends, a Decoction of Walnut-leaves, mixed with Sugar, before the Place be bound up, till the Bottom is conglutinated; and to continue the same till the Ulcer is filled up.

The Ulcer being, by some means or other, as may seem most advisable, incased, and filled up, the Induction of a fit and decent Cicatrix is, in the last Place, to be considered; and there is no better Method to be taken, for this Purpose, than every Day to apply dry Lint to the Place, with a Plaster, till the Cicatrix be completed: But if, by such means, you cannot prevent a Luxuriancy of Flesh, with a Moistness of the Ulcer, it will be proper to sprinkle on the Part some drying Powders, such as those of Mastic, Frankincense, Sarcocolla, Colophony, Lapis Calaminaris, and Tutty; applying afterwards, to the Place, dry Lint, and a Plaster accommodated to retain and hold together the Things applied, continuing the same till the Place be perfectly whole and sound: But if the luxuriant and fungous Flesh has already elevated itself above the rest of the Skin, the best way to consume it is, to rub it with blue Vitriol; or, if this be not strong enough, to sprinkle on it some Powder of red Precipitate, and burnt Alum, till its Growth be entirely suppressed, and nothing appears prominent.

In the last Place, it is hardly to be expressed how much a prudent Regimen in Diet and manner of Living, contributes towards the Incasing and Conglutination of Ulcers: For it has been an old Observation of the Professors of the salutary Art, that very bad Ulcers have often been cured by means of a Regimen, without any considerable Assistance from Medicines; and, on the contrary, that the slightest, and most contemptible, Sores have, by a Neglect of the Rules of Diet, and a preposterous way of Living, degenerated into very bad, and even incurable Ulcers. Great Care, therefore, is to be taken, by every Person infested with an Ulcer, to avoid acrid, salt, and acid Food, and such as is too fat, or heating, with Swine's Flesh, and all such as is difficult of Concoction. If a bad Habit of Body be an Impediment to the Cure of an Ulcer, the Advice of a skilful Physician is required, who, by the Prescription of proper internal Medicines, may not only prevent an Ulcer of a mild and favourable Kind from becoming malignant, and, perhaps, incurable, but, as much as possible, promote and hasten its Cure.

For *fistulous Ulcers*, see the Article FISTULA.

OF MALIGNANT ULCERS.

There are Ulcers of so bad and malignant a Nature, as not to admit of a Cure by the common Method of Treatment of Ulcers of an ordinary Kind; and these are, for that Reason, called, in medicinal Terms, *dyssepulotic, chironian, cacotheta*, [see *Dyssepulotos, Chironium, Cacothetes*] *obstinate, and stubborn Ulcers*. It is not to be doubted but that there are some proper Causes of their Malignity; but what they are in particular, in every Case, which render a Cure so difficult, is alike known to the Generality of Surgeons, and those who are quite ignorant of the Matter. Ulcers, however, of a *stubborn and malignant* Nature, generally infect Persons of a bad, scorbutic, cachectic, and hydropic Habit: They may, also, proceed from the *Lues Venerea*, a Caries, or a Callus, an extraordinary Acrimony of the Blood, or a cancerous Disposition; and the Causes are diligently to be investigated, and extirpated, by those who attempt the Cure of those Kinds of Ulcers; if they would hope for any Success. But an Attempt of this Nature is a Matter of such Difficulty and Importance, as, in most Cases, to require the maturest Thoughts and Deliberations of the most experienced Physician or Surgeon; so much is it above the Capacity of a mere Empiric, how impudently soever he may boast of his incomparable Secrets, and sovereign Remedies of Plasters and Ointments, which he has always in Readiness by him against the worst of Ulcers.

If there be nothing of a Fistula, Callus, Caries, putrid Flesh, or Worms, belonging to the Ulcer, its Stubbornness and Malignancy must certainly proceed from a bad and infirm Habit of Body, on account of a too glutinous, acid, acrimonious, or bilious Blood; or from an imprudent Regimen of Diet, or some venereal Disorder; or in Women, particularly, from an Obstruction of the Menstrues; in Men, from a Suppression of the Hemorrhoids: In such Cases, it is not only the Business of a Physician to prescribe internal Remedies, but injoin, also, a strict Diet; which is of such extraordinary Efficacy, that even the worst of Ulcers have been frequently cured by it, with hardly any Assistance from internal Remedies, provided they are every Day duly cleansed, and dressed with some common vulnerary Ointment, Oil, or Balsam, with some ordinary Plaster, as the Lead Plaster, or Diapompholyges, or the like, carefully laid over it so as to cover the Whole. In Meats and

Drinks

Drinks it must be observed, as an inviolable Rule, to chuse none but the lightest Kinds, and to be very abstemious even in the Use of these: But any thing too salt, acrid, acid, hard, or crude, or whatever is prepared of Fat, Bacon, Swine's Flesh; and farinaceous Masses, or whatever is taken in Quantities beyond the Rules of strict Temperance, is always found to be extremely prejudicial. Patients of a hot Temperament are to avoid heating Meats; those of a cold Temperament are to abstain from Foods of a refrigerating Quality; but a good Diet, or Abstinence, is, however, observed to be more effectual, when assisted with due external Treatment. The *Ulcer* must, therefore, be very carefully extirped and cleansed from the corrupted Matter, lest the same, by its Stay, should become more acrimonious, and, by that means, the *Ulcer* should spread. After Mundification, you may apply the digestive Ointment, with which may be mixed Myrrh, Mastic, or Colophony, or a Decoction of Walnut-leaves, with a little Sugar, or a Decoction of Verdegrise in Wine. In some Patients, simple Spirit of Wine, or Lime-water, applied in Linen moistened with them, is of excellent Service in drying and healing those Kinds of *Ulcers*: If there be any Fistulas in the Case, they are to be cut, then cleansed, and afterwards consolidated with Balsam of Peru, Balsam of Capivi, Balsam of Sulphur, with Oil of Turpentine, or any other agglutinating Medicines; and if, at the same time, there be no Neglect of internal Medicines, there is no doubt but some of the worst of *Ulcers* may, by such Management, be brought at last to a perfect Cure.

If there be a copious Discharge of Humours from these stubborn Kinds of *Ulcers*, it is an Indication of a Mixture of too great a Quantity of thin and acrid Serum with the Blood, which is often owing to the Patient's drinking too much; and such *Ulcers* are called *Rheumatic*. In this Case, since there can be no Way more commodious for the Discharge of the Humours than by the principal Passages downwards, Cathartics and Diuretics, if the Strength will permit, are freely to be administered; and, at the same time, the Patient is to drink less. Excellent Medicines, for these Purposes, are, prepared Millepedes, Essence of Amber, of Myrrh, of Peruvian Balsam, Tincture of Tartar, tartarised Tincture of Antimony, or any other Kinds of balsamic Tinctures, or Essences, proper for provoking of Urine. Drinking too freely, or in great Quantities, which is often the Cause of such Disorders, is quite improper here; on the contrary, the moderate Use of strong Beer, and old Wine, as ordinary Drink, is very wholesome, and the more so if a little Hungarian or Spanish Wine be taken now-and-then at Dinner; except at Dinner, I would advise Abstinence from all manner of Drink. Of Meats, or Eatables, the most proper are such as are dried or roasted, or such as thicken the Blood; for which Purpose, Barley and Rice-puddings, Water-gruel, Calves Feet, and Jellies, are accommodated. External Medicines, also, of a drying Quality, are of principal and necessary Use; among which are, Lime-water, Lapis Calaminaris, prepared Tutty, Chalk, Mastic, Frankincense, Colophony, and native Cinnabar prepared; with one or other of which the *Ulcer* is to be sprinkled, and afterwards covered with the Plaister Diapompholygos, the lead Plaister, or a Plaister of Lapis Calaminaris.

That Sort of malignant *Ulcer*, which spreads and extends itself gradually, by corroding the adjacent Parts on every Side, has the Epithet of *corrosive*, or *phagedenic*, and indicates the State of the Blood to be highly acrimonious. The first Care of the Physician, therefore, in this Case is, by internal, lenient, and emollient Medicines, to correct the ill State of the Blood: To this End are especially adapted Decoctions of the Roots of China, Sarsaparilla, Comfrey, Polypody, Liquorice, Scorzonera, the Lapathum Acutum, the Herbs Mallows, Marshmallows, St. John's-wort, Sanicle, Agrimony, white Horehound, and the like. Of Foods, the most proper are, such as were prescribed before for *rheumatic Ulcers*; for every thing acrid, salt, or too much seasoned with Spices or Acids, and all Meats prepared with any Part belonging to a Swine, is highly prejudicial, and therefore to be avoided. On the other hand, purging Medicines now-and-then administered with a Mixture of *Mercurius Dulcis*, are not only serviceable in diminishing the Sanies of the Blood, but of great Efficacy as Lenients, in correcting the Acrimony of the Blood, and promoting the Cure. Topical Remedies may be such as were recommended before, and the Use of them, after a careful and thorough Exterision or Mundification of the *Ulcer*, is to be continued till its Progress be entirely checked, and the Place perfectly healed.

Somewhat of the Nature of phagedenic or corrosive *Ulcers* are *cutaneous Ulcers*, or such as arise in the Skin, and most commonly in the Face, as well of Children, as adult Persons; for they not only owe their Origin to an acrimonious Blood, but dilate and spread themselves. In cutaneous, therefore, as well as phagedenic *Ulcers*, the most proper and effectual Medicines are such as potently evacuate by Stool; and gradually

correct the Acrimony of the Blood, and are before specified. To Adults I would recommend, for these Purposes, before other Things, the aforesaid Decoctions of the Woods, or the Decoction of the Root of the Lapathum Acutum, or of the Herb Fumitory. Of either of these is to be taken the Quantity of eight or ten Ounces, three or four times a Day, warm; and, after the first Draught in the Morning, it will be proper for the Patient to compose himself in his Bed, and to sweat. To these may not improperly be added, the Essences of Fumitory, of the Woods, and of Amber, or the tartarised Tincture of Antimony, to the Quantity of thirty or forty Drops, to be taken several times a Day, with the forementioned Decoctions; also absorbent Powders mixed with Antimony and Flowers of Sulphur, and the Use of the same is to be continued for some time; but a careful and exact Regimen seems as necessary here as in any Case whatever. For Infants not weaned from the Breasts, it has been found of great Service to use Medicines which gently purge and correct the Blood; the Mother, or Nurse, who suckles the Child, being enjoined a strict Regimen, besides the Use of the Remedies before-mentioned. Topics proper in this Circumstance are, principally, Oil of Tartar *per Deliquium*, applied two or three Times a Day with a Pencil, or Feather, either alone, or mixed with Oil of Eggs and Wax; after which, the Place must be covered with a Plaister, either the Lead Plaister, or *Emplastrum de Minio*, or *Emplastrum de Sperma Ceti cum Camphora*, to secure it from Injuries by the external Air. Where the Disease has spread itself over the Face, as it often happens in Infants, a Plaister is not convenient; and it is better to adapt a Linen Mask, or Vizard, to the Face, as is advised in Ambustions: Also, *Oleum Philosphorum*, Oil of Eggs, Lime-water, and Water with which diaphoretic Antimony has been edulcorated, are good Remedies; if the Face be every Day washed and cleansed with them. Instead of these, it may be sometimes proper frequently to anoint the Place with Ointment of Litharge, or *Unguent. Diapompholygos*, or *De Enula*; mixing therewith, if the Disease be more stubborn than ordinary, a small Quantity of Quicksilver, or red Precipitate: If the cutaneous *Ulcers* flow with Sanies, like those of the rheumatic Sort, it may be necessary to treat them every Day, with an Insersion of an absorbent and drying Powder, prepared of Tutty, *Lapis Calaminaris*, Cerufs, Chalk, or the like, mixed with native Cinnabar, or red Precipitate; or to anoint them very frequently with beaten Cream.

But of all corrosive and malignant *Ulcers*, none are more virulent or formidable than those of the *cancerous* Kind, since they are to be treated with the same internal and external Remedies, as we have prescribed for an exulcerated Carcinoma [see CARCINOMA]; tho' *M. A. Severinus*, a very celebrated Physician and Surgeon, seriously assures us, that we are to expect more Relief from manual than medicinal Operations, in such Cases; for many have been cured by Steel and Fire, when Medicines have been of no Use. When, therefore, it is determined to treat an *Ulcer* of this Kind with Burning, or Excision, we are to take all possible Care that the same be entirely extirpated, and that no corrupted Part remain; for that would entirely defeat the End and Design of the Operation: Some, instead of these severe Operations, use a phagedenic Water, prepared in the following manner:

Take Water of Quicklime, one Pint; Sublimate Mercury; half an Ounce: Mix them together. Or; instead of Mercury Sublimate, use an Ounce, or an Ounce and half, of white Precipitate: This is to be applied warm frequently; with Lint dipped therein.

Instead of Sublimate Mercury, I have often used, with very good Success, *Mercurius Dulcis*, in Lime-water, for stubborn *Ulcers*, as a much safer Medicine than the other. As for digestive Ointments, they are quite improper in cancerous *Ulcers*; and even found to be fatal.

If there be a Putridness and Fetidness attending the *Ulcer*, it must proceed either from a very depraved Habit of Body, or want of Care or Skill in the Surgeon employed in the Dressing. It is the Physician's Part here, by proper Medicines, to correct and strengthen the Habit with all convenient Speed; while the Surgeon takes due Care frequently to extirpate and cleanse the *Ulcer*, and so much the more, if the same be affected with a burning and intense Heat: For when *Ulcers* are but seldom dressed and cleansed, as is usually the Case after great and bloody Battles when the Number of the Wounded is very considerable, it can scarce be avoided, but that the vitiated Flesh will be infested with Heats, Putridness, or Worms. For preventing such Inconveniencies, there is no readier Way, than to apply our digestive Ointment, mixed with *Unguentum Egyptiacum*; or the *Unguentum Fuscum* of *Wurtzius*, or the phagedenic Water, or red Precipitate, either by itself; or mixed with burnt Alum, or well worked into the digestive Ointment, and to continue the same

state till the corrupted Flesh be totally consumed, and the Bottom of the Ulcer comes to its natural red Colour. While this is doing, it will be convenient to wrap the affected Part in Linen moistened with Spirit of Wine, which is a Medicine that very potently resists Putrefaction. The Sore being thus cleansed from the putrid and corrupted Parts, the Conglutination is to be performed by the same Means as have been prescribed for other Kinds of Ulcers, the Surgeon taking all due Care that the Patient be frequently refreshed, and have his Spirits enlivened not only with comforting Meats and Drinks, but by such cardiac and antiseptic Medicines as are directed by the Physician, lest Nature should sink, and the Strength be exhausted under the Length of the Cure. *Vermineous Ulcers* are to be treated in the same manner; for whatever resists Putrefaction, is, also, an Enemy to Worms, and all due Care is supposed to be taken, at every Dressing, for extergering the Worms and putrid Flesh; after which the Cure is effected by the Methods above prescribed.

In the last Place, there are some Ulcers so malignant and obstinate, that though they cannot be discovered to have contracted any Venereal Contagion, they yet resist all the Medicines hitherto prescribed. In this Case I have learned by long Experience, that there is no Method of Cure so prevalent and effectual as what is performed by means of mercurial Medicines, or by a gentle Salivation. For I have found the Blood, in some Patients, corrupted to such a degree, as not to be lenified, much less corrected, without the Help of Mercury. But if there be any manifest Signs of Venereal Contagion contracted by the Patient, this Method of Cure by Mercury becomes absolutely necessary, as we shall demonstrate below.

Of the Cure of VENEREAL ULCERS.

Venereal Ulcers, as we have already observed, are generally seated in the Groin, or Inside of the Thighs, being the Effects of Exulcerations of Venereal Buboës: They are, also, generated in the Prepuce, Frenum, and Glans of the Penis; in which Cases they take the Name of *Cancro*, in French, *Chancres*, (whence the *English Shankers*); in Women they infect the Vagina, and *Labia Pudendi*; sometimes the Nose, Palate, Lips, Fauces, Tongue, and Uvula, the Forehead, Cranium, and other Bones, are affected with them; and one single Ulcer of this Kind, if neglected, or ill-treated, is capable of exciting an universal *Lues Venerea*. The whole Affair, therefore, of the Cure consists chiefly in evacuating and eliminating, by proper Medicines, as soon as may be, the Poison of the Venereal Infection.

No Medicines are better adapted to this Purpose, than Cathartics, incorporated with *Mercurius Dulcis*, either in Pills or Powders, and frequently administered. With these must be joined the Use of the Woods in Decoction, for correcting the Blood, together with Essences of the Woods, *Pimpinella alba*, and Amber, and Tincture of Antimony, and the like, which are of excellent Service, when taken in the Morning early, in Bed, by promoting a moderate Sweat. A strict Regimen of Diet is in no Case more necessary than the present: For Wine, and all other heating Liquors, as well as salt, acrid, and acid Meats and Drinks are highly pernicious. If these Remedies prove too weak and ineffectual on account of the Inveteracy of the Disease, or its Complication with the *Lues Venerea*, it will be necessary, either to use stronger Sudorifics, such especially as Decoctions of the Woods, with a proper Regimen; or to call in the Assistance of Mercury, in order to excite a gentle Salivation, which at once cures the Ulcer, and expels the Venereal Venom.

When these Kinds of Ulcers affect the Mouth, Uvula, Fauces, Tonsils, or Tongue, not only internal Remedies are to be employed, but the Mouth itself is to be very often washed with a Decoction of the Woods, either simple, or mixed with Honey of Roses. After this the affected Part is to be anointed and cleansed, either with *Hartman's* Green-water, or Honey of Roses, mixed with a few Drops of Spirit of Vitriol to give it a gentle Acidity; and, at last, it is to be healed by the Use of Essences of Amber and Myrrh, or Oil of Myrrh *per Deliquium*. If the Ulcer appears in the external Parts, the best Way is to apply the Digestive Ointment, or Basilicum, mixed with Quicksilver, or white or red Precipitate in Lint, or *Vigo's* Frog-spawn Plaister, or Diachylum mixed with Mercury, in order to exterge and cleanse the Parts. After Mundification, the Ulcers are to be sprinkled with the Essences just mentioned, or the absorbent Powders so often prescribed, which may have their Virtue augmented, by mixing with them a small Quantity of red Precipitate, in order to Exsiccation and Conglutination: No less effectual for the Purposes of Cleansing and Healing are the phagedenic Water, or Lime-water, impregnated with *Mercurius Dulcis*, applied in Lint, moistened therewith several times in a Day; especially if the Parts be now-and-

then gently touched with the Lapis Infernalis. You have, also, an excellent Conglutinant, after Mundification, in a simple Ointment prepared of Quicksilver, mixed with a sufficient Quantity of Turpentine, or in the following Mercurial Ointment.

Take of Unguentum Mundificativum, or Diapompholygos, crude Mercury extinguished in a little Turpentine, each an Ounce. Or,

Take of an Amalgama of Mercury, and Lead, one Ounce; Bole Armoniac, two Ounces; Ointment of Roses, a sufficient Quantity: Make them into an Ointment.

If the subjacent Bone be carious, it is to be treated with such Remedies as are prescribed for the Cure of a Caries [see the Article Os], and particularly with Euphorbium; Oil of Cloves, the phagedenic Water, or Spirit of Nitre in which Mercury has been dissolved, or, if it may safely be done, with a red-hot Iron. Sometimes these Kinds of Ulcers in the softer Parts of the Body, and particularly the Groins, make a constant and copious Discharge of a Lymph; and such Ulcers are found to be so stubborn, that no Medicines can be found of sufficient Force to exterge and dry them. Such a Circumstance is usually attended with a Rupture, or Erosion of some lymphatic Vessel; and here we are first to attempt a Suppression of the Flux by Compresses, and a strait Bandage, which has sometimes happily succeeded: But if a Bandage proves of no Service, there is no better Remedy for so foul and troublesome a Nuisance, than the Application of a red-hot Iron; and the same must be repeated as often as Necessity requires.

Venereal Ulcers of the Penis, or Glans, carelessly treated, usually terminate in the *Lues Venerea*, and Perforations and Corrosions of the Urethra, through which the Urine passes, as through a Sieve. Sometimes the whole Glans, or Penis, are affected with a Scirrhus, or Shankers, to such a Degree as to require the Use of the Knife. If the Disease infects the Nose, it commonly produces a very fetid Ulcer, called, in the technical Way of speaking, *Oxana*, which sometimes consumes the whole Part. Sometimes the Palate with its Bones is so miserably corroded and perforated, that whatever Drink or liquid Food is attempted to be swallowed, is rejected through the Nostrials: These Perforations are seldom closed, or brought to a Coalition, especially if larger than ordinary: They may, however, when their Orifices are consolidated; be closed up with a thin Piece of Gold or Silver. It is much more usual for the Tonsils, with the outer Membrane of the Uvula, or the entire Uvula, to be corroded and consumed. In all these Affections, Mercury, and the Decoctions of the Woods, are the principal Remedies. Sometimes it happens, as I myself have had several Opportunities of observing, that the very Cranium itself, especially about the Forehead, is corroded and perforated with a Caries, in so surprising a manner, as to discover the very Brain, with the Pulse of the Arteries belonging to it, which are plainly to be discerned; whence very formidable and dangerous Symptoms must arise, the Consequence of which is sometimes Death, unless it be prevented by the seasonable Administration of the before-mentioned Remedies.

Of CALLOUS ULCERS.

Ulcers of the callous Sort are seldom or never cured without a previous Extirpation of the *Callus*. Now there are three Ways by which the Callus may be extirpated. The first and gentlest, which takes Place in a recent and softer Callus, is by Corrosives, and those of the mildest Sort; some of the principal of these are burnt Alum, and red Precipitate, either used alone, or mixed in equal Portions, or with a Mixture of the Digestive Ointment, or Basilicum, or Unguentum *Egyptiacum*, or the Brown Ointment of *Wurtzium*. With some or other of these Medicines are the callous Parts to be anointed several times in a Day, and these are usually effectual, especially those mixed with red Precipitate. But if none of those milder Topics prove of sufficient Force to eat away and consume the Callus, it will be proper, in the second Place, to make a thorough Scarification of the callous Parts, and afterwards rub them with the Lapis Infernalis, or Butter of Antimony. A third Method, no less expeditious than the former, is by Spirit of Nitre, or Aqua-fortis, impregnated with as much Quicksilver as can be dissolved in it over the Coals, and every Day applied to the Part.

There is yet a gentler Way of extirpating a Callus, described by *Le Dran. Tom. 2. Observ. 115*. This Method is to apply, for four or five Days together, a Plaister compounded half of a Plaister of Diachylum with Gums, and half of *Vigo's* Plaister, mixed with four times the Quantity of Mercury, to be renewed every Morning and Evening, in order to soften, in some measure, the Lips of the Callus. After this the Callus is

is to be scarified, all manner of Ways, to the Bottom, the Ulcer being covered afterwards with a Bit of Lint, till the Blood, which commonly flows in small Quantities from the Incisions in the Callus, be stopped: This done, the same Plaster is applied over the whole Ulcer, so as to touch the bare and newly scarified Lips of the Callus. About four Days after, the Surgeon repeats the Incisions, or *Scarification*, as it is usually called, and renews the same the third or fourth time if there be Occasion, that is, if the Callus be not dissolved. By this Method, as the above-mentioned Surgeon affirms, is the Callus gradually subdued, softened, and at length totally disappears, leaving in its room a very laudable Cicatrix, without the Assistance of any other Remedy. I never had an Opportunity, I must confess, of trying this Method.

If the callous Ulcer be, also, fistulous, an Incision is first to be made into the Sinus, in the same manner as has been directed for a Fistula, before we attempt to consume the Callus; after which the Callus is to be consumed, by the Methods above related. If the Application of the Knife be too much dreaded by the Patient, or otherwise unsafe, it will be convenient to introduce into the Sinus a Tent of *Unguentum Egyptianum*, or the Brown Ointment of *Wurtzius*; by which means the Callus, if not very obstinate, is insensibly consumed, and may be the sooner, if the fore Part of the Tent, before its Introduction, be rubbed with red Precipitate, Lapis Infernalis, or Butter of Antimony, and this be continued till the Callus be consumed. If these corrosive Tents will not penetrate to the Callus, the most convenient Method will be to use the Syringe, and make frequent Injections of the Phagedenic Water, or of *Unguentum Egyptianum*, or *Wurtzius's* Brown Ointment, dissolved in Spirit of Wine, into the difficult and winding Sinus, compressing afterwards the Mouth of the Ulcer, that the Liquor may be retained for some Space of Time, within. The Callus being thus removed, the Cure of the Ulcer is to be managed like that of a Fistula.

It may sometimes happen, that in callous and fistulous Ulcers which are of long Standing, or full of Turnings and Windings, these corrosive Medicines are of little or no Service; or, what is worse, may be more disposed to corrode and vellitate the Nerves, and excite most terrible Convulsions, sooner than consume the Callus. In such a Circumstance it cannot but be most proper to make an Incision in the Ulcer, in the same manner as directed for cutting the Fistula [see FISTULA], but with all due Care and Circumspection, for Fear of wounding some Artery, Nerve, or Tendon.

If neither the Method of Incision just recommended be thought of Force sufficient, or expeditious enough, in extirpating the Callus: In this Case, if the Patient be endowed with a good Measure of Strength and Intrepidity, and the Place be safe and convenient, with respect to the Nerves and Arteries, the most expeditious Method that can be used, is to separate or cut off all the Callosities with the Knife, or cauterize them with a red-hot Iron. By this bold and resolute Operation, the inveterate and stubborn Ulcer is, as it were, converted into a very recent Wound; and, consequently, may be healed by common Remedies, unless the Cure be prevented by a Caries, a bad Habit of Body, the *Lues Venerea*, Scurvy, Dropsy, or some other Indisposition.

Of the Cure of MAGIC ULCERS, or such as are supposed to be induced by Fascination.

For Ulcers on which they bestow the Epithet of *Magic*, on account of their strange Phenomena, as containing Threads, Needles, Nails, and the like, *Paracelsus*, *Helmont*, *Agricola*, and many others, have been very careful to prescribe Remedies, which are, for the most part, of no Significance, and either superstitious or idle. The best of them, however, seem to be Oaken and Willow-leaves, Maidenhair, St. John's Wort, by some called *Fuga Daemonum* on this Account, Quicksilver, Asa-fetida, Antirrhinum, and some others: Any one of these, either hung about the Neck, or used in some other insignificant manner, according to Prescription, will, as it is pretended, secure the Body from all malevolent Influence and Effects of Fascination. Some prescribe the Ashes of a Woman burnt for Witchcraft; others the Ashes of burnt human Dung, to be sprinkled on the Ulcer. *Heerius* and *Horstius* recommend especially the *Unguentum de Visco corylina*, or Ointment of Mistletoe of the Hazel, against magic Ulcers: *Mynsicht* prescribes his Foetid Plaisters: Others advise other Things.

Whatever our Sentiments ought to be on this Head, it is certain a Physician best consults his own Reputation, as well as the Health of his Patient, when he treats Diseases and Maladies of this Kind, which, by the ignorant Vulgar are, for Reasons vain and ridiculous, reputed the Effects of Magic, upon careful and due Thought and Examination, accommodated to the Nature of the Ulcer, and especially to the Habit

of the affected Party; such are the Remedies recommended under the preceding Heads: For though we should be never so willing to grant, that a Person may suffer in his Body, and be disquieted, by the crafty and cunning Tricks and Delusions of the Devil and Magicians, yet we have no sufficient Reason to convince us, that the Disorder thus caused, is supernatural, and, on that Account, incurable by natural Means; so as to oblige us to have Recourse to superstitious, sordid, and absurd Remedies. To this it may be added, that ignorant and superstitious Surgeons, and Attendants on Bagnios, report everywhere as magical, all such Ulcers as they are not able to cure; whereas the same falling afterwards into more skilful Hands, when the true Nature and Cause of their uncommon Malignity comes to be discovered, are often healed without much Difficulty. There have been, also, perhaps, in former times, some ill-meaning Surgeons who have pronounced an Ulcer *magical*, without Foundation, in order to extort the more Money for the Cure.

Of the Cure of OLD ULCERS, especially in the Legs.

Though no Part of the Body be secure from the Danger of old or inveterate Ulcers, yet are the Legs and Feet more subject to them than other Parts: And for this Reason, though we have formerly treated of malignant or inveterate Ulcers in general, we think it incumbent on us to enlarge more particularly, on those which infest the Legs or Feet. The Causes of Exulcerations of the Legs are generally the same with those of malignant Ulcers in general; for one as well as the other proceed from a bad Habit of Body, a thin and acrimonious Blood, some adjacent Fistula, Caries, or Callus: In Women, from an Obstruction of the Menstrues, and other like Causes. Whoever, therefore, pretends to cure an Ulcer in the Leg, must inquire into its true Cause, and to the same accommodate the Cure, in the Manner prescribed above.

But before we enter into the Method of Cure, it will not be improper to inquire whether a Conglutination of such inveterate Sores or Ulcers in the Feet and Legs can be effected with Safety; because there are Instances in the Writings of the most experienced Physicians, where the Consequences of such Cases have been very severe and dangerous Disorders, and oftentimes most certain and present Death. I have, as I apprehend, in a great measure, given a satisfactory Answer to this Question near the Beginning of this Discourse, when I said, that in Persons far advanced in Years, and of a very bad Habit of Body, it is best to abstain from Conglutination of such inveterate Ulcers, because they are a great means of Health, as being so many Issues or Outlets by which Nature is accustomed to expel the noxious or superfluous Humours. I would not, however, without some weighty Reason, have this Rule applied to young and robust Persons; for since the first Causes of such stubborn Ulcers, either by Abstinence and a prudent Regimen, or by Fontanels, or proper Medicines, may, without all Danger, in such Subjects, be removed, it cannot be doubted but that the Conglutination may afterwards be performed with little or no Detriment to the Patient.

Tho' we have determined the Conglutination of moderate Sores or Ulcers in the Legs or Feet of aged Persons to be dangerous, yet we are so far from thinking all Care and Medicines in their Case useless, that we rather pronounce them highly necessary: The Surgeon here has a double Duty incumbent on him; one Branch of which consists in alleviating as much as possible the Pains and Disorders which attend them; the other Part of his Business is to take care that the Evil may not increase, nor spread; and that no new bad Symptoms, such as Pains and Inflammations, may add to the Disease by exasperating the Ulcer.

In the first place, therefore, Abstinence, and a very exact Regimen of Diet is to be enjoined the Patient, that he may not eat to Excess, nor of such Meats as are noxious and prejudicial in his Case; of which Kind are all acrimonious, hard, and crude Aliments, and Swine's Flesh in particular. Proper and gentle Cathartics are, also, of Service in attracting the redundant and malignant Humours from the lower Parts, and expelling them gently by Stool. Besides these, other internal Medicines, which are contrary to the Cause of the Disease, are occasionally to be prescribed; such, for Instance, as Elixir Proprietatis, and Essences of Myrrh, Amber, and *Peruvian* Balsam; which, as well as all Balsamics, and Bitters, are highly serviceable for correcting the immoderate Thinness and Acrimony of the Blood in Persons advanced in Years.

With respect to external Treatment, it is above all things necessary, that the Ulcer be kept clean, and once or twice every Day exterged from Sanies. After this it is to be filled with Lint, either dry, or dipt in a Decoction of the Leaves of Walnut or Birthwort, for the Reception of the acrid Humours. Upon this it will be proper to apply *Baubine's* Plaster for old

Ulcers, or the *Emplastrum Diasulphuris* of *Rulandus*; the Lead Plaister, the Plaister of Diapompholyx, or of *Lapis Calaminaris*, or any other of the like Nature. These Directions being carefully and regularly observed, and the affected Part guarded, as much as is possible, from the Injuries of the Air, or external Cold and Humidities, it is not to be doubted but the *Ulcer* will prove of the mildest Sort, and serve as a Drain to the whole Body for the Evacuation of corrupted Humours, and consequently be found beneficial and salutary, and highly conducive to the Prolongation of Life and Health. And really it seems probable, that the Observation of those admirable and wholesome Effects of inveterate *Ulcers* in aged Persons induced the antient Physicians; who followed Nature as the best Guide, to raise Fontanels in sick and valentudinary Bodies, which might do the Office of *Ulcers* in draining and evacuating the Body of acrid and superfluous Humours.

If it should happen, as is sometimes the Case, that by means of some Blow, or taking Cold, or by immersing the Leg in cold Water, or from a Fit of Anger, a Fright, Sorrow, or an improper Regimen of Diet, that the diseased Part be seized with a Pain or Inflammation, it will be convenient to wrap the Place in a Linen Cloth folded and moistened with *Hungary Water*, or with theriacal, or camphorated Spirit of Wine, or with Lime-water and the said camphorated Spirit, and frequently to repeat the same; and the Patient is to be strictly enjoined to keep his Leg in Bed, and to guard it from external Cold, taking every Morning some Cups of Tea, or some other Sudorific, and to sweat well afterwards in his Bed; by these means the Pain and Inflammation are usually in a short time removed. But the Case becomes dangerous, when the Inflammation is violent, especially in a corrupted and weak Body, and begins to pass into a Gangrene. In such a Circumstance the same Remedies are to be employed, both internal and external, as have been prescribed for a Gangrene [See the Article *GANGRENA*]. But Care is to be taken, above all things, that such infirm and aged Patients be every now-and-then refreshed with Cardiacs, and comforting Medicines, and frequently cast into a gentle Sweat. If these Kinds of Remedies be postponed and neglected, the Danger usually increases, and there is very great Reason to fear, that the Disease will gradually degenerate into a Sphacelus, followed by Death.

When inveterate *Ulcers* of this Kind, in old and infirm Subjects, dry up spontaneously, and turn livid, the Patients, for the most part, are immediately seized with an Horror, Nausea, and Feebleness, which are Indications of a great Decay of Nature, a Corruption of the affected Part, and an extremely dangerous Condition, which often terminates in a speedy Death. Under such formidable Symptoms there is the greatest Necessity to have immediate recourse to a proper Diet, and corroborative Medicines for preserving the Strength. Topics convenient to be applied to the *Ulcer* are the Roots of Gentian, or Florentine Orris bruised; or, if these prove not strong enough, the Root of Black Hellebore reduced to Powder, or in Globules; or, in the last place, if this be ineffectual, Powder of Cantharides, or a Globule of a Blister-plaister of the Shops. By this Method such *Ulcers*, when in a State of Exsiccation, or in a manner dry'd up, are stimulated and irritated to such a Degree as sometimes to flow afresh, and so begin to relieve the Patient from the malignant Humours by which he was oppressed, after which the *Ulcer* is to be treated in the manner prescribed. But if these Medicines prove of no Effect, and the *Ulcers* continue in a State of Dryness, there remains no Hope of the Patient, whose Case is desperate, and Death unavoidable. *Hist. Chir.*

ULEX. A Name for the *Genista spartium*; majus; brevioribus aculeis.

ULMARIA.

The Characters are;

The Leaves are pinnated, resemble those of Agrimony, are triangulated, and divided after the Manner of those of umbellated Plants. The Apex of the small Pedicle is expanded into a monophyllous, quinquefid Calyx, which is expanded like a Star. The Flowers are rosaceous, pentapetalous, collected into Panicles, scarce visible, and furnished with numerous Stamina. The Ovary, which grows in the Centre of the Calyx, consists of three, four, or five little Pods, furnished with a Tube, and becomes a Fruit composed of a Multitude of small membranaceous intorted Sheaths, collected into an Head, and containing one small Seed.

Boerhaave mentions two Sorts of *Ulmaria*; which are,

1. *Ulmaria*. *J. B.* 3. 488. *Raii Hist.* 1. 623. *Synop.* 3. 259. *Boerb. Ind. A.* 295. *Tourn. Inst.* 265. *Ulmaria Regina Prati*. Offic. *Ulmaria vulgaris*. *Park. Theat.* 592. *Ulm. Regina Prati*. *Ger.* 886. *Emac.* 1043. *Ulmaria Barba Capri floribus compactis*. *C. B. P.* 164. **MEADOW-SWEET.**

Meadow-sweet has a long, reddish, fibrous Root, from which spring several pinnated Leaves, having two or three Pair of opposite large serrated Pinnæ, with an odd one at the End, cut

into three Parts; they are hoary underneath, and green above, wrinkled, and full of Veins, and having several very small Pieces between the Pinnæ; the Stalk is red and angular, growing two or three Feet high, beset in an alternate Order with the like Leaves. The Flowers grow upon the Top of the Stalks, Umbel-fashion, being small, five-leaved, and full of Apices of a white Colour, and are followed by little round Heads, made Screw-fashion, of several Seeds set together. It grows in moist Meadows, and by River Sides, and flowers in June. The Leaves and Tops are used.

They are alexipharmic and sudorific, and good in Fevers, and all malignant Distempers; they are, likewise, restraining, binding, and useful in Fluxes of all Sorts: They are put into the *Aqua Lactis*.

The only Official Preparation is the *Aqua Ulmaria*. *Miller's Bot. Off.*

Its Leaves have an herby, saltish, and glutinous Taste; they give a faint-red Colour to the blue Paper; the Root gives it a deep one; it is styptic, and a little bitter; its Salt seems to resemble the Sal Ammoniac; but is united with a great deal of Sulphur, and a pretty deal of Earth.

By the chymical Analysis it yields some acid Liquors, some volatile concrete Salt, a good Quantity of Sulphur, and a pretty deal of Earth: Thus it is sudorific, cordial, and vulnerary. The Decoction of its Root in Water is very good in malignant Fevers, and is preferable to that of *Scorzonera*.

The Extract of its Root is said to be sudorific, but it is very moderate; for though you should give a Dram of it in the Morning, another in the Afternoon, and a third at Night, with a Grain of Laudanum, you must continue this Practice for two or three Days, before you can perceive any considerable Effect. The same is, also, observable in other Sudorifics. A Decoction of its Root is deterfiv and vulnerary. Its Juice enters the *Emplastrum Felicis Wurtzii*. *Martyn's Tournefort.*

The Flowers, infused in Wine or Beer, communicate to them a grateful Smell and Taste in manner of the *Pimpinella*. The Flowers are of a pleasant Smell, exhilarating the Heart without oppressing the Head, whence they are very proper in Summer-time to adorn or be strew'd in Parlours and Dining-rooms. One *Renatus* of *Rochelle*, as we are told by *J. Baubine*, affirms, that the Flowers communicate a grateful Smell to Methueglin, and improve it to such a Degree as to compare with the Wine of *Crete*, or *Candy*, which they call *Malmsey*.

I myself have seen, and can solemnly affirm, says *S. Pauli*, that *Queen of the Meadows* has had surprising Effects on a Girl who had a mortal Wound in the Bladder, and in an almost incurable Fracture of the Arm; whence it justly deserves to be an Ingredient in the most celebrated and useful Plaister of *Felix Wurtzius*, who highly extols the Roots of this Plant, and seems to prefer it before all other Vulneraries, or any such as are recommended in Fractures. *Raii Hist. Plant.*

2. *Ulmaria*; floribus in longas spicas congestis. *Barba Capra*, floribus oblongis. *C. B. P.* 163. T. 265. *Barba Capri*. *J. B.* 3. 488. *Boerb. Ind. alt. Plant.*

Ulmaria is antispasmodic, antiepileptic, corroborative, and astringent: Hence our Peasants use it in a Dysentery, and Diarrhoea, and to repress Vomiting. I have found it, also, of Service in regulating the disorderly Motions of the Heart, Blood, and Spirits; and where-ever Condensation, Strengthening, or Astringent are required, this Herb is of excellent Use. The Leaves are good for an Hæmoptoe; and the bruised Root is applied to Wounds, in order to stop the Blood, and consolidate the Part. A Decoction of the Roots is proper in malignant Fevers. *Hist. Plant. adscript. Boerhaav.*

ULMUS.

The Characters are;

The Flower is monopetalous, Bell-shaped, and adorned with many Stamina. The Ovary in the Centre of the Flower becomes a foliaceous, Heart-shaped Fruit, soon mature, concealing in the Middle a membranaceous, Pear-shaped Capsule, full of a Seed of the same Figure.

Boerhaave mentions four Sorts of *Ulmus*; which are,

1. *Ulmus*; campestris, & Theophrasti. *C. B. P.* 426. *Tourn. Inst.* 601. *Boerb. Ind. A.* 220. *Ulmus*. Offic. *J. B.* 1. 139. *Ulmus vulgaris*. *Park. Theat.* 1404. *Ulmus vulgarissimus folio lato scabro*. *Ger. Emac.* 1480. *Raii Hist.* 2. 1425. *Synop.* 3. 468. **COMMON ELM.**

The Elm is one of the commonest Trees we have: It has a rough thick Bark, and the Branches are clothed with somewhat rough, crenated, green Leaves. The Flowers are small and staminate, coming out early in the Spring before the Leaves. The Seed is round and foliaceous.

The Bark is principally used, being absterfiv and cleansing, and is frequently used in Gargarisms for sore Mouths and Throats, to clear them of tough viscid Phlegm. It is, likewise, accounted good for Ruptures, and to consolidate Wounds. *Miller's Bot. Off.*

The Seed of the *Ulmus* is called *Samera*, and is ripe about the latter End of April.

As to its Virtues, according to *Dioscorides*, the Leaves, Tops, and Bark, are of an astringent Quality. The Leaves bruised in Vinegar are effectual against the Lepra, being rubbed on the Parts, [*Galen* ascribes this Virtue to the Bark, *Pliny* to both the inner Bark and Leaves] and conglutinate Wounds, and much more effectually if the Bark be bound about the Place instead of a Fillet. The Roots have the same Virtue of conglutinating Wounds, and the Decoction of the Roots, or, according to *Dioscorides*, of the Bark of the Roots, is used by some to wash Fractures, in order to accelerate Consolidation by inducing a Callus. The same Decoction is said to mollify Hardnesses of the Joints, and to resolve Convulsions of the Nerves. The fat Substance swimming on the Decoction, restores Hair fallen off, being rubbed on the Place. The Bark of the Root bruised, and worked up with *Muria*, into a Malagma, mitigates the Pain of the Gout.

A Dram of the Bark [an Ounce] taken in an Hemina of cold Water [*Dioscorides* says in Wine or Water] works by Stool, and particularly upon phlegmatic and watry Humours. *Plin. Dioscorides*. It is strange, says *Ray*, that an Astringent should purge. *Pliny* commends the Tear for Collections [Abscesses] Wounds, and Ambustions; but the Elm in our Country, says *Ray*, discharges no Tears, either spontaneously; or from Wounds.

The Bark of the Tree boiled in common Water to near the Consistence of a Syrup, and then mixed with a third Part of Aqua Vitæ, is a singular Remedy against the Pain of the Sciatica, the Part affected being fomented with it for some time by the Fire.

The Humour found in the Follicles, which grow on the Leaves, rubbed on the Face, brightens the Skin, and makes the Countenance more amiable. *Matthiæolus* writes, that it cures the Enterocoele in Children, if Bolsters dipped therein are applied to the Groin, and tied under their Thighs. *Fallopian* says, that he never found any thing more effectual in Agglutination than this Liqueur. Of the same is prepared an Oil, which, as we are assured by *Sylvius*, is of extraordinary Efficacy in Wounds; but we could never observe, says *J. Bauhine*, that Oils had any good Effect on simple Wounds, but rather fill them with Sordes, and prevent their Conglutination. *Raii Hist. Plant.*

2. *Ulmus*; folio latissimo scabro. *Ger. Emac.* 1481. *Raii Hist.* 2. 1426. *Synop.* 3. 469. *Tourn. Inst.* 601. *Boerb. Ind.* A. 220. *Ulmus montana*. *Offic. C. B. P.* 426. *Ulmus latiore folio*. *Park. Theat.* 1404. THE WYCH HAZEL.

This is found frequently in Hedges. The Bark is used in Medicine; and agrees in Virtues with that of the preceding Elm.

3. *Ulmus*; minor, folio angusto, scabro. *Ger. Emac.* 1480.

4. *Ulmus*; folio glabro. *Ger. Emac.* 1481. *Park. Theat.* 1404. *Boerb. Ind. alt. Plant.*

ULNA. The Name of a Bone in the fore Arm. See BRACHIUM.

ULNARIS MUSCULUS. *Winslow* describes three Muscles under this Name; the *Ulnaris Internus*, the *Ulnaris Externus*, and the *Ulnaris Gracilis*; for which last see PALMARIS LONGUS.

The ULNARIS INTERNUS is a long Muscle, fleshy at its upper Extremity, and tendinous at the other, situated on the outer Part of the Ulna.

It is fixed by its upper Part in the back Side of the long or internal Condyle of the Os Humeri, in that Part of the Olecranon which is next the Condyle, along the upper Half of the Ulna very nearly; and to the Middle common Tendon of the neighbouring Muscle, termed commonly *Profundus*.

It runs in the Direction of the external Angle of the Ulna, and ends by a long Tendon in the Os Pisiforme, or Orbiculare of the Carpus, reaching, also, to the Os Unciforme, being united to the Ligament common to these two Bones.

When the *Ulnaris Internus* acts alone, or as the principal Mover, it brings the Hand obliquely toward the internal Condyle, and toward the Olecranon, though with Difficulty.

When it acts together with the *Radialis Internus*, it turns the Hand equally towards the two Extremities of the Bones of the fore Arm; and thereby moves not only the Carpus in general on the fore Arm, but, also, the second Row of the Carpus on the first, and the metacarpal Bones on the second.

When it acts with the *Ulnaris Externus*, it turns the outer Edge of the Hand toward the Olecranon.

The ULNARIS EXTERNUS is a long Muscle lying on the Outside of the fore Arm, fleshy toward the Os Humeri, and tendinous toward the Carpus.

It is fixed above to the external Condyle of the Os Humeri, being there united to the *Anconæus minor*; to the annular Ligament of the Head of the Radius, and to the upper Half of

the external Angle of the Ulna. From thence it advances, and forms a Tendon, which passes through the external Notch at the lower Extremity of this Bone, on one Side of the Styloide Apophysis.

The Tendon having afterward passed under a particular Ligament situated near the Os Cuneiforme of the Carpus, is inserted in the Outside of the Basis of the fourth metacarpal Bone, sending some tendinous Filaments to the Basis of the little Finger. It is, also, often fixed in the Basis of the third metacarpal Bone.

When the *Ulnaris Externus* acts with the *Ulnaris Internus*, it turns the outer Edge of the Hand toward the Olecranon.

With the *Radiales Externi*, it turns the Back of the Hand toward the outer Condyle. This Motion is termed *Extension*, but very improperly, when applied to the Hand; for the *Metacarpus*, which is naturally bent this Way, will be still more bent by the Action of these Muscles. I should chuse, therefore, to term this Motion the Inversion, rather than the Extension, of the Hand. The *Carpus*, indeed, may, in some Sense, be said to be extended, because the Bones of the second Row are brought to a straighter Line with those of the first.

When this Muscle acts alone, it brings the outer Edge of the Hand obliquely toward the Olecranon, and the external Condyle, at the same time; but this is performed with Difficulty. *Winslow's Anatomy.*

ULOMELIA, ὑλομελία, *Ionice*, ὑλουεμία, from ὑλῶ, for δλῶ, entire, and μέλῶ, a Limb, in *Hippocrates*, signifies the entire, absolute, essential, and universal Nature of any Thing. This appears to be the Sense of the Word in the following Passages, *Lib. de Artic.* περὶ ἀσθενῶν ὑλομελίας γεγενῆσθαι, "there will be a Treatise of the full and complete Nature of the Glands;" where *Galen*, in his Comment, expounds the Place by τὴν ἀλόκληρον φύσιν τῆς τῶν ἀσθενῶν φύσεως, "the perfect and entire Nature of what essentially belongs to the Glands." The Word is used in the same Sense in two Places of the *Treatise de Glandulis*, from which *Erotian* expounds ὑλομελίας by ὅλης φύσεως, "the entire Nature." Again, *Lib. de Aliment.* where we read, κατὰ μὲν ὑλομελίαν πάντα, the Passage imports, that all the Parts conspire, or are accommodated to the universal Good or Benefit of the Whole; and κατ' ὑλομελίαν is there opposed to κατὰ μέρος, which is used to express a particular Relation and Consent of the Parts among themselves. We read, also, in his Epistles, ὑλομελίαν τὴ σκῆψιν; by which he plainly means, "the universal Nature of the Body," which he recommends to the Study of a Physician. *Hesychius* takes ὑλομελίαν for an Adverb, and expounds; by καθόλου, συλλυβδῆν, "universally, comprehensively;" and adds, that some understand it, ἐπὶ τῆς ἀβρίας τῶν ὅλων φύσεως, τὸ γὰρ ὅλον ἔλον λέγει, "of the complex Nature of things; for ὅλον he calls ἔλον."

Ὀλομελίαν signifies, also, a Perfection and Soundness in all the Members; and ὑλομελῆς is absolutely perfect in all the Parts; and is expounded by ὑγιῆς, ἀλόκληρῶς, "sound, entire." And thus it imports, in *Lib. de Corde*; where we read, τὴν μὲν γὰρ καρδίαν ἰδοὺς ἂν ῥιπταζόμενον ὑλομελῆ, "you may observe the Heart agitated in every Part which belongs to it."

ULON, ἔλον, in the Plural *Ula*, ἔλα, are the Gums or Caruncles which are placed about the Teeth. Ὀῦλα, says *Ruffus Ephesius*, αἱ περὶ τὰς τῶν ὀδόντων ῥίζας σάρκες; "The Ula are the fleshy Parts about the Roots of the Teeth." But *Pollux* tells us, that the ἔλα are the Flesh which incompasses the Teeth on the Outside; and that the Flesh which surrounds them on the Inside is called ἐνυλα (*Enula*); see ENULON. The Gums are said to have this Name bestowed on them on account of their Softness and Tenderness; for ἔλῶ, in *Hesychius*, is expounded τρυφερὸς καὶ ἀπαλὸς, "delicate and soft;" and *Erotian* explains ἔλῶ ἐρίῳ, τὸ μαλακῶ, "soft Wool." The same Author says, that ἔλον ἐρύβιον signifies τὸ πυρρὸν, "red, or rufset," coloured;" and by some is taken to mean τὴν ἰσομεγέθη δούβῃ ἀποροχρόδονν, "a Wart, of the Bigness of a Vetch." Ὀῦλα, in *Hippocrates*, *Lib. 2. de Morb.* is put for a Tumor and Disorder of the Gums.

Ula, ἔλαι, also, signifies the Gums, 7 *Epid.* where we read, ἔλαδον ὑπερσάρκωσις, "a fleshy Excrecence in the Gums," &c. But *Lib. 5. Epid.* we read it ἔλῶν, and the same is repeated. Ὀῦλαι, also, in *Erotian*, is expounded by κριθαί (*Crithe*), "Grains of Barley."

ULOPHONOS, ὑλοφόνῶ. The Name of a poisonous Plant; the same as Ixia.

ULPHA. *Rulandus* explains this by *Lapsatura*; *Castellus* by *Recrementum Cotis*.

ULRACH. Dragons Blood. *Rulandus*.

ULTRAMARINUM. Ultramarine. A fine Magistery of *Lapis Lazuli*, of a fine blue Colour, much used in Painting, but not in Medicine. *Junken* describes the Method of preparing it.

ULVA. A Species of Moss. See the Explication of botanic Terms, under the Article BOTANY.

ULULA. Offic. Aldrov. Ornith. 1. 538. Bellon. des Oyse. 142. Gefn. de Avib. 700. Mer. Pin. 171. Jonf. de Avib. 32. Charlt. Exer. 78. *Strix cinerea*. Will. Ornith. 68. Raii Ornith. 105. Ejusd. Synop. A. 26. THE GREY OWL.

The Parts in Use are, the Gall, Fat, and Flesh. The Gall is commended for the Albugo, Cataracts, and Films; the Fat for clearing the Sight; the Flesh boiled in Oil, and that Oil mixed with Sheep's Butter and Honey, is good to heal Ulcers. Pliny. It is esteemed by some for the Gout. Dale.

UMARI. See CAMARINHAS.

UMBELLA. See FLOS UMBELLATUS, in the Explication of botanical Terms, under the Article BOTANY.

UMBELLIFERA ALSATICA. A Name for the *Oreose-linum, pratense*; *Cicuta folio*.

UMBELLIFERA CANARIENSIS. A Name for the *Butleuroides*; *quæ Simpla nobla Canariensium*.

UMBELLIFERA, FOLIO PANACIS. A Name for the *Passinaca, folio quasi Libanotidis latifolia*; and, also, for the *Passinaca*; *semine longissimo*.

UMBILICATA LINFOLIA. A Name for the *Omphalodes*; *Lusitanica*; *Lini folio*.

UMBILICUS MARINUS. Officin. *Operculum Cochleæ cælatæ*. Bellon. de Aquat. 430. Mont. Exot. 6. *Operculum Cochlearum marinarum subrotundum in se contortum*. Long. Math. Test. 56. This is the Cover of the *Cochleæ Cælatæ*, and is a stony kind of Substance, of a flat Superficies, remarkable for a spiral Line of a deep-yellow Colour, hollow in one Part, after the Figure of a Navel, of a carnation, or igneous Colour, and an earthy Taste. As to the Virtues, Johnson says it stimulates to Venery.

Augustinus Scilla is persuaded, that these Substances are either the Eggs of the *Cochleæ*, or some other short, imperfect Productions of the same: But the ingenious Mr. Ray, when he was on his Travels in Italy, and at Rome, procured the Fish itself just taken out of the Sea, alive, in its Shell, with this kind of Operculum or Cover over it.

UMBILICUS VENERIS. A Name for the *Saxifraga*; *Sedi folio, angustiore, serrato*.

UMBILICUS VENERIS is, also, a Name for the *Cotyledon*; *major*.

UMBILICUS, is, properly, the Navel.

UMBLA. The Name of a River Fish, somewhat like the Trout. It is esteemed very good Food, and to be aperient, and resolutive.

UMBRA. Offic. Salv. de Aquat. 115. Raii Ichth. 299. Ejusd. Synop. Pisc. 95. Rondel. de Pisc. 1. 132. Gefn. de Aquat. 1029. *Umbra marina*. Aldrov. de Pisc. 81. Bellon. de Aquat. 129. THE GRUNTER, or SHADOW-FISH.

It is taken in the Mediterranean Sea. The Parts in Use are, the Bones found in the Head, and called in the Shops *Lapides Umbrarum*: These are commended for the Colic, and, in France, are commonly set in Silver, and sold by the Goldsmiths under the Name of Colic-stones: For, they say, if it be only carried about one, or worn about the Neck, it not only removes the Pain of the Colic, but prevents its Return. Bellon. Dale.

UMBRAGINES. Pigmies. Rulandus.

UMBRATILIS PUGNA, *Græc. σκιμαχία*, is a Species of Gymnastics, in which the Patient fights with Head and Heels, or boxes and wrestles with a Shadow. He is not only to use his Hands, says Oribasius, but his Legs, in this Encounter with a Shadow; and sometimes to put himself in a Posture of Leaping, and throwing himself on his Adversary, and to use his Heels like a Wrestler; sometimes he is to press, or spring forward; and sometimes to retreat, as from a superior Force. The Patient, in this kind of Exercise, did not always fight with a Shadow, but sometimes encountered a Pillar, or a Post. Of this *Umbratilis Pugna* we find not only Notice taken in Plato, who, in his *Apology*, and elsewhere, says, of those who fought without an Adversary, that they did *σκιμαχῆν*, "combat a Shadow;" but, also, by St. Paul, who, 1 Cor. ix. alludes to it, in these Words, *ἐπὶ πύκτιναι, ὡς ἀπὸ ἀέρος δέξασθαι*, "so fight (box) I, not as one who beatech the Air." Mercurialis de Art. Gymnast. p. 191.

The *Umbratilis Pugna*, or *Sciamachia*, is good to remove the Sense of a Lassitude, to strengthen the Shoulders, and for Weakness of the Nerves, and a Tremor; it, also, draws the Humours downwards, especially in those who act the Wrestler in standing on Tiptoe; and it is of good Service to the Kidneys, and Intestinum Colon, and in Diseases of the Thorax. Oribas. Med. Col. Lib. 6. Cap. 29.

UMBU. See IVA-UMBU.

UMBU. Pison. *Prunifera Brasiliensis Fructu magno, radicibus tuberosis*.

In Bigness, Structure, and Fruit, it appears, at a Distance,

like a small Citron or Lemon-tree; the Trunk is short, and not thick, but divided into a Multitude of twisted Branches, of a weak Contexture; the Leaves are not large, but smooth, and of a lively Green, but of an acid and astringent Taste; it bears a whitish Flower; and the Fruit is of a yellowish White, and resembles a pretty large Plum, but has a harder Pulp, tho' but little in Quantity, because it covers a large Stone, as does the Fruit *Acacia*; and when it is ripe, in the rainy Months, becomes of a very grateful Taste, being of an acid mixed with a Relish of sweet; but is, otherwise, so harsh, as to set the Teeth on Edge; and is, therefore, reserved for the same Uses as the Leaves, which are adapted to the Intentions of refrigerating, and astringing: The Root, which has something peculiar, and remarkable, beyond the Roots of other Trees, spreads far and wide under-ground, and swells to various thick and ponderous Tubera, which, if you consider their Shape and Colour on the Outside, which is an Ash-colour, you would take for large Potatoes, or Roots of the *Linhyama*; but, when their outer Pellicle is taken off, they will appear different; for, on the Inside, they are of a Snow-white Colour, and full of a soft and succulent Pulp, exactly like that of the Gourd, and dissolving, in the Mouth, into a cold watery Juice, very sweet, and grateful to the Palate.

It is highly comfortable and refreshing to feverish Persons, to such as labour under violent Heats, and to Travellers, as I have often experienced, says Piso; and, in the Sweetness and Wholsomeness of its Water, is not at all inferior to the Citrus. Raii Hist. Plant.

UNCAM. Quicksilver. Rulandus.

UNCIA. An Ounce.

UNCINUS. A small Hook. Castellus.

UNCTIO. Unction.

UNCTUARIUM. A Room, in the ancient Baths, where People were anointed.

UNCTUOSITAS. Unctuousity, or Unctuousness.

UNCUS. An Hook: Of which many Sorts are used in Medicine.

UNDATIO. A kind of preternatural Motion of the Heart. It should seem to be that Sort of Motion which makes an undulating Noise, perceivable externally.

UNDIMIA. A kind of cedematous Tumor, the Matter of which is coagulated, and glutinous, like the White of an Egg.

UNEDO. See ARBUTUS.

UNGUEN. An Ointment.

UNGUENTARIUS. A Vender of Ointments, and Perfumes.

UNGUENTUM. An Ointment.

Ointments are divided into simple and compound; though it so happens, that some of the former are considerably compounded: And, amongst the latter, there are some simple Ointments, and others very little compounded.

It frequently occurs, that Turpentine, Ceruse, Lard, and some other Things, are ordered to be washed in Rose-water, or the Juice of some Herbs; but this is a Circumstance that avails so little to any Purpose of Moment, that I never knew it complied with: So that a Continuation of such Directions seems principally to be in Compliment to the old Prescriptions, which abound in such minute Exactnesses. It may here, also, be observed in general, that where Oil is directed in an Ointment or Plaister, the wholesale Traders, who seek only Profit, generally substitute Lard; and where Ceruse, Minium, or Litharge are concerned, they are generally used in Over-proportions, because they make such a Weight come out much cheaper.

The *Unguentum album Camphoratum*, and *Rubrum desiccativum*, are much of the same Intention, though the former is the more cleanly Medicine, and most in Use; and there is no Circumstance in their Making, of Consequence, but the mixing of the Camphire, when the other Materials are so cool, that their Heat will not evaporate it; but even long Keeping will, in a great measure, if not wholly, lose it: So that the Goodness of these is solely known by their smelling strong of this Ingredient. The *Unguentum de Minio Camphoratum*, & *Plumbo*, and *Nutritum*, are within the same Intention: But the two former are not used; and the latter is so inconvenient, upon account of its soon growing dry, and even milky, that it is, also, but in little Esteem: The common Diachylon, also, lowered into an Ointment, with a little Oil, is the same thing, and of a much smoother and better Consistence. The *Unguentum Tutie* comes in too, as a Dryer, and a Cooler; but hath nothing remarkable in its Making, and is principally used against Inflammations in the Eyes.

The *Unguentum Egyptiacum* is the only one, amongst many others, brought to a Consistence with Honey, that is in Use; and

and this principally in Sores of the Mouth, where those Things which are more properly Ointments, are nauseous. The green Colour of Verdegrise changes black in the Boiling.

The *Unguentum ex Apio*, amongst the lesser, and *Mundificativum ex Apio*, amongst the greater Compounds, are exactly the same: But I never knew any thing made or prescribed under either of these Titles.

The *Unguentum à Gummi Elemi*, most commonly called *Limentum Arcaei*, from the Name of its Inventor, and the *Basilicon Minus*, are the principal in Use amongst our Surgeons, for deterring Dressings; though there are others of like Intention, and some of them newly added, from the Experience of Persons now living, which are not yet so much established in the Shops; as the *Unguentum Basilicon flavum*, *Unguentum aureum*, à *Resina*, and *Detergens*.

There are some considerable Compositions of this Form, in the Intention of Emollients, at the Head of which is the *Unguentum Dialthææ*; but the great Demand for this, as it is much used, hath taught the wholesale Men very greatly to spoil it, in order to render it cheaper; for they accustom themselves to make it without the Mucilages, and counterfeit their Scent with a little Fenugreek Powder; the Neats-foot Oil, also, is hardly to be expected from them: When it is good, it is of a yellow Colour, and no ill Scent. The *Unguentum Liliorum*, de *Mucilaginis*, and *Emolliens*, are of the same Intention, but not in Use.

Amongst the compound Ointments, there are some which take in a Number of very warm aromatic Ingredients, and seem designed for Paralytic Infirmities, and Cases that require brisk attenuating Applications: Of these are in most Esteem, the *Unguentum Martiatum*, and *Nervinum*; both which are much the best when fresh made; though that can be done but once in a Year, when the Ingredients are in their proper Season.

There are Ointments, also, within the Intention of Strengtheners; but this at first View seems to be a very improper Form for such Things; because an Astringent, in an unctuous Vehicle, is the most unsuitable manner possible for its Application; the Slipperiness of the one entirely frustrating the Efficacy of the other: For which Reason, those few, that yet keep a Place in the Dispensatory, are entirely neglected; neither the *Unguentum Mastichinum*, nor the *Astringens*, being ever made; altho' it hath so happened, that the latter is twice prescribed in the last Dispensatory, but the second time under the Title of *Unguentum Sumach*.

The next Intention, of any Consequence, for which we are provided by this Form, and which seems as suitable to it as any, is against cutaneous Foulnesses, as the Itch, and such-like Distempers; and this seems to be the Reason that there is such Choice of them now given: But tho' most of these have the Reputation of great Antiquity, and hold their Places in abundance of officinal Dispensatories down to the present, especially the *Unguentum Emulatum Nicotianæ*, and *Ex Oxylapathæ*; yet they are so uncleanly in Use, that they are almost altogether fallen to Neglect, unless in some of our Hospitals, those which contain Mercury being much more neat, and efficacious, for the same Purposes, as the *Unguentum cæruleum*; but even this must greatly give Place to many Prescriptions, for Elegance, which are to be met with only in extemporaneous Practice for the same Intentions.

Some other Things, of this Division, are, little less than Oils brought into Ointments by the Exchange of Oil for Lard; as the *Unguentum Rosaceum*, and *Sambucinum*; with some others, newly added, not yet brought into Use; as the *Unguentum Digitalis*, *Linariæ*, and some few others; but these require no particular Remark. Some others, also, pretty difficult to tell what they were intended for, as the *Valentia Scabiosæ*, *Tapfi Valentia*, *Tapfsmel*, and *Unguentum Splanchnicum*, cannot be of any great Service to inquire into, especially as they are neither regarded in the Shops, or Prescription. The *Unguentum Populaceum*, and *Diapompholygos*, are designed as Coolers, but now daily give Place to much neater Ointments in extemporaneous Practice. The Pomatum only remains, of this Division, to be taken notice of; but both the Making and Use of that is almost entirely got amongst the Women; that which is directed in the Dispensatory being of no manner of Regard. *Quincy's Prælect. Pharm.*

UNGUENTUM ÆGYPTIACUM. See ÆGYPTIACUM UNGUENTUM.

UNGUENTUM ÆGYPTIACUM MAGIS COMPOSITUM.

A more compound Egyptian Ointment.

Take of Verdegrise, four Ounces; of the sharpest Vinegar, six Ounces; of Honey, one Pound: Let them all boil over a gentle Fire, to a dusky Colour; adding, towards the

latter End, of Roch Alum, and Sal Ammoniac, of each half an Ounce; and make them into an Ointment.

UNGUENTUM ALBUM. See ALBUM UNGUENTUM.

UNGUENTUM AMARUM.

The bitter Ointment.

Take of the Oils of Rue, Savin, and Mint, of each two Ounces and an half; Juice of Wormwood, one Ounce; Powder of Rue, Gentian, the lesser Centory, and Myrrh, of each one Dram; of the Pulp of Colocynth, two Drams; of Succotrine Aloes, three Drams; of Lupin-flowers, half an Ounce; of Ox's Gall, and of Wax, of each one Ounce and an half: And boil up to an Ointment, with a sufficient Quantity of the Juice of Wormwood.

The *Augustan Dispensatory* hath a Composition of this Intention, under the Title of *Unguentum ad Vermes*, which agrees with this, in many Ingredients; but that takes in many others, which *Zwelfer* justly finds fault with, as of no Advantage to the Medicine: This, therefore, seems to have had no Regard to that as a Pattern, but very plainly follows the Prescription taken into the first Dispensatory of the College from *Foesius*, under the Title of *Unguentum ad Lumbricos majus*, this differing from that in nothing but the Expulsion of some needless Ingredients, as the Juice of Peach-blossoms, &c. and changing Hepatic for Succotrine Aloes; but this last Alteration is against the Opinion of those who prefer the Hepatic Sort in external Applications, as this is designed principally to anoint the Bellies of Children troubled with Worms, because its more vigorous and fetid Scent is most likely to pass thro' the Pores, and give the intended Disturbance to these troublesome Creatures.

UNGUENTUM AD AMBUSTAM.

Ointment for Burns.

Take of the inner Rind of fresh Elder, and of the fresh Leaves of the same Tree, each two Ounces: Bruise them well, and boil them in two Pounds of Linseed Oil, till the aqueous Moisture is consumed; then press out the Oil, and dissolve in it six Ounces of white Wax; and whilst they remain fluid, sprinkle the following Powders therein, keeping the Whole perpetually stirring; Powder of Cerase, three Ounces; and of Calamine, one Ounce: Then taking the Mixture from the Fire, and permitting it to cool a little, add thereto two Drams of Camphire, reduced to a Powder, by being rub'd with a few Drops of Oil of Almonds: Lastly, mix all together, so as to make an Ointment.

This seems to be an excellent Ointment for the Purposes expressed by its Title, and deserves always to be kept in Readiness, to provide, in the best manner, against such Contingencies as we meet with every Day.

UNGUENTUM ANTIPSORICUM.

Ointment for the Itch.

Take of Elecampane-root, and the Root of sharp-pointed Dock, each three Ounces: Slice and bruise them; then pour thereon three Pints of Spring-water, and a Pint of Vinegar: Boil them to an half, and strongly press out the remaining Liquor; to which add six Ounces of the Leaves of fresh Water-crelles; and two Ounces of those of Sage: Let the Herbs be well bruised, and mixed up with four Pounds of Hogs Lard: Then boil all together, till the aqueous Moisture is exhaled, and press out the Ointment; whereto put four Ounces of the Oil of Bays; and mix the whole together.

Sulphur may be hereto added, occasionally.

If that stubborn cutaneous Distemper, the Itch, be curable by vegetable Preparations, this Ointment bids fair to effect it; but, in case of Failure, you see the Compilers order the Assistance of Sulphur, to be used at Discretion; and in the following Ointment, what rarely fails, the Assistance of Mercury.

UNGUENTUM ANTIPSORICUM CUM MERCURIO.

Ointment for the Itch, with Mercury.

This is made of the preceding Ointment, by adding thereto four Ounces of Quicksilver, killed by being ground with a proper Quantity of Venice Turpentine; and mixing them together, according to the Rules of Art, so as to make an Ointment.

U N G

The three last Ointments are from the *Edinburgh Dispensatory*.

UNGUENTUM ASTRINGENS SIVE SUMACH.

An astringent Ointment.

Take of Oil of Roses, often washed in Alum-water, one Pint and an half; of white Wax, four Ounces; of unripe Galls, Cypress-nuts, Myrtle-berries, Balaustines, Pomegranate-peel, Acorn-cups, Acacia, Sumach, and Mastich, of each one Ounce: After all are well beat, macerate them for four Days in the Juice of Medlars and Services; then let them all be dried by a moderate Fire, and make them into an Ointment, with the Oil of Wax.

UNGUENTUM AUREUM.

The golden Ointment.

Take of yellow Wax, half a Pound; of common Oil, two Pounds; of Turpentine, two Ounces; of the Pine-tree Resin, and Colophony, of each one Ounce and an half; of Frankincense, and Mastich, of each one Ounce; of Saffron, one Dram: First of all melt the Wax in the Oil; then put in the Turpentine, and give them a Boil together: After they have stood to cool a little, sift in all the rest, finely powdered; but add the Saffron last of all, and stir them about with a wooden Spatula, till they become an Ointment.

This is a Composition originally of *Mesue*, and had a Name first given it, both on account of its Colour, and the wonderful Virtues ascribed to it; on which last Score, too, by some Authors, it is called *Unguentum Regis*. The *Augustan Dispensatory*, and all the Editions of the College, have received it, exactly the same, down to the present; yet I cannot learn, that it is in any great Esteem in the present Practice of our Surgeons: Tho' *Zwelfer* says, it is a wonderful good Incarnier, especially in the most tender Constitutions: But he says, that it is much better for several Purposes, especially in Wounds of the Head and Tendons, to use in it Oil of Turpentine, instead of the common Oil.

UNGUENTUM BASILICON FLAVUM. See BASILICON.

UNGUENTUM BASILICON MINUS, seu TETRAPHARMACUM. See BASILICON.

UNGUENTUM COERULEUM.

The blue Ointment.

Take of live Quicksilver, one Pound; of *Venice* Turpentine, six Ounces: Mix them together, in a Mortar, till the Globules of Mercury disappear; and then add to it four Pounds of Hogs Lard made warm, so as to make them together into an Ointment.

UNGUENTUM DE CALCE. See CALX.

UNGUENTUM CITRINUM.

The yellow Ointment.

Take one Ounce of Quicksilver, and dissolve it in as much Spirit of Nitre as will serve for that Purpose: Then add, by Degrees, a Pound of melted Hogs Lard; and mix them into an Ointment.

For the Purposes of a Detergent, this seems to be a fine Contrivance. *Edinburgh Dispensatory*.

UNGUENTUM DETERGENS.

A detergent Ointment.

Take of yellow Resin, of Sheeps and Hogs Fat, of each one Pound; of yellow Wax, and Powder of Olibanum, of each one Pound and an half; Gum Euphorbium, and Powder of Verdegrise, of each two Ounces; of *Straßburg* Turpentine, three Ounces: Let the Fats, Resin, and Wax, be melted together, and strained; then to them sift in the Olibanum, Euphorbium, and Verdegrise, in Powder: And, lastly, put in the Turpentine; and, when the Vessel is taken off the Fire, keep stirring, till the Whole is cold.

UNGUENTUM DIALTHÆÆ. See ALTHÆA.

UNGUENTUM DIALTHÆÆ COMPOSITUM. See ALTHÆA.

UNGUENTUM DIAPOMPHOLYGOS. See CADMIA.

UNGUENTUM DIGITALIS. See DIGITALIS.

UNGUENTUM E GUMMI ELEMI. See ELEMI GUMMI.

U N G

UNGUENTUM EMOLLIENS.

The emollient Ointment.

Take of fresh Butter washed in Rose-water, six Ounces; of Oil of sweet Almonds, four Ounces; Oils of Chamomile and Violets, of each three Ounces; of Ducks and Hens Fat, of each two Ounces; of Orrice-root, two Drams; of Saffron, half a Dram: When the Orrice and Saffron are powdered, and the rest melted together, make them into an Ointment.

UNGUENTUM ENULATUM. See HELENIUM.

UNGUENTUM ENULATUM CUM MERCURIO. See HELENIUM.

UNGUENTUM FUSCUM.

The brown Ointment.

Take of Colcothar, and the Phlegm of Vitriol, of each one Ounce; of Vinegar, one Ounce and an half; of the Flowers of Verdegrise, five Drams; of despumated Honey, three Ounces: And make into an Ointment.

UNGUENTUM LILIORUM.

Ointment of Lilies.

Take of the Oil of white Lilies, six Ounces; of the Oils of Dill and Chamomile, of each two Ounces; of the Oil of sweet Almonds, one Ounce; of Ducks and Hens Fat, of each two Ounces; and of yellow Wax, three Ounces: And melt them all together into an Ointment.

It seems calculated for the same Intention as the *Unguentum de Alibea*, to soften and discuss Tumours.

UNGUENTUM LINARIÆ. See LINARIA.

UNGUENTUM MARTIATUM. See MARTIATUM UNGUENTUM.

UNGUENTUM MASTICHINUM.

The Mastich Ointment.

Take of the Oils of Mastich, Wormwood, and Spikenard, of each two Ounces; of the Powders of Mastich, Mint, red Roses, red Coral, Cloves, Cinnamon, Aloes-wood, and Camels Hay, of each one Dram; and of Wax, a sufficient Quantity to make it into an Ointment.

UNGUENTUM MERCURIALE SEU NEAPOLITANUM.

The Mercurial or Neapolitan Ointment.

Take of Quicksilver, one Pound; of *Venice* Turpentine, and liquid Storax, each two Ounces: Grind them together in a Mortar, till the Globules of Mercury are no longer visible; then add thereto three Pounds of melted Hogs Lard, and four Ounces of Oil of Bays: Mix all together into an Ointment, according to the Rules of Art.

The liquid Storax is here added with Judgment, both as it promotes the entire Dissolution of the mercurial Globules, by its Viscosity, and gives the Whole a grateful Scent. *Edinburgh Dispensatory*.

UNGUENTUM DE MINIO CAMPHORATUM.

Camphorated Ointment of red Lead.

Take of Oil of Roses, one Pound and an half; of red Lead, three Ounces; of Litharge, two Ounces; of Cerufs, one Ounce and an half; of Tutty, three Drams; of Camphire, two Drams; of Wax, one Ounce and an half: Make them into an Ointment with a leaden Mortar and Pestle, the Wax being first melted with a gentle Fire; and the rest being added in fine Powder.

UNGUENTUM DE MUCILAGINEBUS.

The mucilage Ointment.

Take of the Oils of white Lilies, Orrice, Violets, and Chamomile, of each six Ounces; of the Mucilage of Linseed, Quince-seeds, Fenugreek-feed, and Marshmallow-roots, of each four Ounces; of Ducks and Hens Fat, of each five Ounces; of white Wax, one Pint: Mix, and make into an Ointment.

UNGUENTUM NERVINUM.

Nerve Ointment.

Take of Cowslip-leaves, with their Flowers, of Sage, Ground Pine, Rosemary, Lavender, Bays with the Berries, Chamomile, Rue, Smallage, Melilot with its Flowers, and

and of Wormwood, of each one Handful; of Mint, Betony, Pennyroyal, Parsley, the lesser Centory, and St. John's-wort, of each half an Handful; of Sheep's or Neat's-foot Oil, five Pounds; of Mutton or Beef-suet, or the Marrow of both, two Pounds; Oil of Spike, half an Ounce: Bruise them, and boil together with the Oils and Suets, till they become an Ointment.

This is much like the *Martiatum*, but the warmer of the two; and it is in Esteem enough to keep its Place in the Shops, and be sometimes prescribed.

UNGUENTUM E NICOTIANA SEU PETO.

Ointment of Tobacco.

Take of the depurated Juice of Tobacco, of fresh Hogs Lard, diligently washed, of each one Pound: And boil them together, to the Consumption of the Juice; then add, of Turpentine, four Ounces; and of round Birthwort, in Powder, two Ounces: And make them into an Ointment.

This is originally taken from a Dispensatory of *Laurentius Jobertus*. Its first Prescriber gives it an extraordinary Character for dissipating scrophulous Tumours, and healing green Wounds; but the modern Practice directs it principally in cutaneous Foulnesses; tho' it is so uncleanly a Medicine, at best, as to be offensive to nice Persons.

UNGUENTUM NUTRITUM.

An Ointment by Mixture.

Take of Litharge of Gold, in fine Powder, half a Pound; of White-wine Vinegar, five Ounces; of Oil of Roses, one Pound: Let the Litharge be stirred about in a Mortar, by Turns pouring in Oil and Vinegar, in little Parcels, until the Vinegar ceases to be visible, and the whole becomes a white Ointment.

It is very drying, and even, in keeping, will grow so brittle, as to want fresh Oil to make it fit for Use; but it is not greatly in Use.

UNGUENTUM OPHTHALMICUM.

Ointment for the Eyes.

Take of Tutty and Calamine, of each six Drams; of calcined Lead, and Camphire, of each two Drams; of Myrrh, Sarcocolla, Aloes, and white Vitriol, of each one Dram: Make them all into a fine Powder. Then take of fresh Butter, twelve Ounces; of white Wax, two Ounces; and when these are melted together, by Degrees shake in the forementioned Powders, and stir all together, till the Whole is cold, and become an Ointment.

UNGUENTUM EX OXYLAPATHO.

Ointment of sharp-pointed Dock.

Take of sharp-pointed Dock-root, boiled in Water, and strained thro' a Sieve, and live Sulphur, of each one Ounce and an half; of Hogs Lard, boiled in the Juice of Scabious, to the Consumption of all the Juice, half a Pound; of the *Unguentum Populneum*, boiled in the Juice of Elecampane, half an Ounce; some Drops of Oil of *Rhodium* Wood: And let them all be reduced, in a Mortar, into an Ointment.

It is designed for the Itch, and cutaneous Distempers, but is so troublesome to make, and so uncleanly, at best, that it is seldom used, or made.

UNGUENTUM PECTORALE.

Pectoral Ointment.

Take of the Ointment of Marshmallows, two Ounces; of *Sperma Ceti*, half an Ounce; of Oil of Mace, obtained by Expression, two Drams; of the distilled Oils of Aniseed and Rosemary, each half a Dram; of the Oil of sweet Almonds, one Ounce: Melt the Ointment of Marshmallows, the *Sperma Ceti*, and the Oil of Almonds, together; then, having removed them from the Fire, put in the distilled Oils, and the Oil of Mace, so as to make an Ointment.

There is nothing in the Composition of this Ointment that forbids its internal Use as a good balsamic or pectoral Medicine, provided the Oil of Mucilages be carefully made for the Oint-

ment of Marshmallows contained therein; however, its Title denotes it designed for external Application; and, indeed, by being rubbed warm upon the Chest, it cannot but be of considerable Efficacy, in some Diseases of that Part. *Edinburgh Dispensatory.*

UNGUENTUM E PLUMBO.

Ointment with Lead.

Take of the Oil of Roses, six Ounces; of calcined Lead, and Litharge, of each ten Drams; of Turpentine, one Ounce; of Ceruse, and Antimony, of each half an Ounce; of white Wax, two Ounces: Make them into an Ointment, by mixing them together in a leaden Mortar.

UNGUENTUM POMATUM. See POMATUM UNGUENTUM.

UNGUENTUM POPULNEUM. See POPULUS.

UNGUENTUM E RESINA.

Ointment of Resin.

Take of the finest Pine-tree Resin, of Turpentine, yellow Wax washed, and fine Oil, each equal Parts: Let the Wax and Resin be melted in the Oil, and then the Turpentine added to them, so that they may all have a Boil over the Fire together, and be strained, S. A.

UNGUENTUM ROSATUM.

Ointment of Roses.

Take of Hogs Lard, cleared from all its Membranes, and well washed, one Pound; and add to it one Pound of fresh red Roses; which suffer to stand together for seven Days; then boil them over a gentle Fire, and press out the Lard; afterwards macerate again with fresh Roses, for the same Space of Time, and boil and strain as before: Lastly, put to it six Ounces of the Juice of red Roses; of Oil of Sweet Almonds, two Ounces; and boil over a slow Fire, to a Consumption of all the Juice: Then strain it again, that it may become an Ointment, S. A.

UNGUENTUM RUBRUM DESICCATIVUM.

Red drying Ointment.

Take of common Oil, two Pounds; of yellow Wax, twelve Ounces; of *Armenian* Bole, and the Caput Mortuum of Vitriol, of each six Ounces; of Calamine levigated, four Ounces; of Litharge, and Ceruse, of each six Ounces and an half; of Camphire, half an Ounce; and boil over a gentle Fire to the Consistence of an Ointment.

UNGUENTUM SAMBUCINUM. See SAMBUCUS.

UNGUENTUM SATURNINUM, *vulgo* BALSAMUM UNIVERSALE.

Ointment of Lead, commonly called the Universal Balsam.

Take of Litharge of Gold, and red Lead, of each one Pound; of Vinegar, four Pints; and boil them together till one half of the Liquor is wasted; then strain off the other; to the Remainder add the same Quantity of Vinegar, and proceed to boil and strain as before, till the Operation shall have been performed six several times. Then mix all the Parcels of strained Liquor together, in a glazed Earthen Vessel, and exhale them to the Consistence of an Extract. Take of this Extract, and of white Wax, each three Ounces; of Oil-olive, a Pound; and mix them together, according to the Rules of Art, so as to make an Ointment.

As Vinegar is so good a Solvent for Lead and Litharge, it may be worth the Pains to prepare the Extract, for this Ointment, in the manner here described: It is, without Dispute, a much better way, than using calcined Lead and crude Litharge; and this, if it had no other Advantage, would give it the Preference, as an Healer and a Dryer, to the UNGUENTUM E PLUMBO, usually ascribed to *Foesius*, and above described. *Edinburgh Dispensatory.*

UNGUENTUM SPLANCHNICUM.

An Ointment for the Bowels.

Take of the Bark of Caper-root, six Drams; of Bryony-root, *Florentine* Orrice, Powder of sweet Fennel-seed, and

and Ammoniacum dissolved in Vinegar, of each half an Ounce; of the Tops of Wormwood, and Chamomile-flowers, of each one Dram; of the Ointment of Bays, one Ounce and an half; Let those things be powdered which require it, and sifted, and the rest mixed therewith in a warm Mortar, so as to make an Ointment, *S. A.*

UNGUENTUM TUTIÆ. See CADMIA.

UNGUENTUM VERMIFUGUM.

Ointment against the Worms.

Take of the Leaves of Female Southernwood, common Wormwood, Rue, Savine, and Tansey, each two Ounces: Bruise and boil them with a Pound and an half of Oil-olive, and a Pound of Hogs Lard, till the aqueous Moisture is consumed; then strain and press out all that will run; to which add of the Gall of an Ox, and of Succotrine Aloes, each one Ounce and an half; of Colocynth, and Wormseed, of each one Ounce: Boil them all together, keeping them continually stirring, so as to make an Ointment. But observe, that the Aloes, the Colocynth, and the Wormseed, are reduced to very fine Powder.

Here we have an Instance of a Composition, where the Ingredients, though numerous, conspire to the same Intention, and seem to uphold each others Virtues; there is nothing improper, or indiscreetly admitted in the Whole; so that it cannot well fail of answering its End, as an external Application in the Case of Worms. *Edinburgh Dispensatory.*

UNGUES. The Nails.

The Nails are looked upon by some as Productions of the cutaneous Papillæ; and by others, as a Continuation of the Epidermis. This last Opinion agrees with Experiments made by Maceration, by means of which the Epidermis may be separated entire from the Hands and Feet, like a Glove or Sock.

In this Experiment we see the Nails part from the Papillæ, and go along with the Epidermis, to which they remain united like a kind of Appendix; and yet their Substance and Structure appears to be very different from that of the Epidermis.

Their Substance is like that of Horn, and they are composed of several Planes of longitudinal Fibres folded together. These Strata end at the Extremity of each Finger, and are all nearly of an equal Thickness, but of different Lengths.

The external Plane or Stratum is the longest, and the rest decrease gradually, the innermost being the shortest; so that the Nail increases in Thickness from its Union with the Epidermis where it is thinnest, to the End of the Finger where it is thickest.

The graduated Extremities or Roots of all the Fibres of which these Planes consist, are hollowed for the Reception of the same Number of very small oblique Papillæ, which are Continuations of the true Skin, which, having reached to the Root of the Nail, forms a semilunar Fold, in which that Root is lodged.

After this semilunar Fold, the Skin is continued on the whole inner Surface of the Nail. The Fold of the Skin is accompanied by the Epidermis, to the Root of the Nail exteriorly, to which it adheres very closely.

Three Parts are generally distinguished in the Nail, the Root, Body, and Extremity. The Root is white, and in Form of a Crescent; and the greatest Part of it is hid under the semilunar Fold.

The Crescent and the Fold lie in contrary Directions to each other. The Body of the Nail is naturally arched, transparent, and appears of the Colour of the cutaneous Papillæ which lie under it. The Extremity of the Nail does not adhere to any thing, and still continues to grow as often as it is cut.

The principal Use of the Nails is to strengthen the Ends of the Fingers and Toes, and to hinder them from being inverted towards the convex Side of the Hand or Foot, when we handle or press upon any thing hard. For in the Hand, the strongest and most frequent Impressions are made on the Side of the Palm, and in the Foot, on the Sole; and therefore the Nails serve rather for Buttresses than for Shields. *Winslow's Anatomy.* See POLLEX.

UNGUIS, is, also, the Name of a Disorder of the Eye, called Pterygion. See OCULUS.

UNGUIS ODORATUS. Offic. Onyx. Dioscorid. THE SWEET HOOF.

It is unknown in our Shops, which substitute in its stead, the *Blatta Byzantina*; as we have demonstrated from the Observations of the learned *Martin Lister*, under that Article. *Dale.* See BLATTA BYZANTINA.

It is, also, a Name for the BLATTA BYZANTINA.

UNGUIS, in Botany, is the white and inferior Part of the Leaves of Roses, and some other Flowers.

UNGUICULI. The same as ALABASTRA.

UNGULA CABALLINA, is the TUSSILAGO. Colts-foot.

UNGULA OCULI is a Pterygion, a Disorder of the Eye. See OCULUS.

UNICORNU, MONOCEROS. Offic. Park. Theat. 1611. *Monoceros*. Raii Ichth. 42. Ejusd. Synop. Pisc. 11. *Monoceros*, *Unicornu marinum*. Charlt. Pisc. 47. *Cetus marinus Narwal dictus*. Mont. Exot. 6. *Balæna decimum sextum genus dicitur Nahwal*. Schonef. Ichth. 28. THE UNICORN.

It is taken in the *Davis's Straits*; and the Part in Use is the very large, white, round, striated, turned Tooth, growing out on the Left Side of the upper Jaw, almost in the same manner as that of an Elephant; but that on the Right Side soon falls off. It is distinguished from Ivory by the Fineness of its Fibres: It is, also, generally more solid and ponderous; in other respects it resembles Ivory.

As to the Virtues, it is sudorific, alexipharmic, and cordial, whence it is commended against Poisons, contagious Diseases, and the like; it is, also, thought effectual in the Epilepsy of Infants. *Schroder*. *Andreas Baccius* has written a whole Book of the Unicorn, in which he directs Fragments of it to be set in Rings, and worn upon the Fingers, or hung about the Neck instead of an Amulet, so as to touch the Skin. It has the same Virtues as Hartshorn, Ivory, and the like Substances.

The Fragments of Horns, which are sold under the Name of *Unicorn's Horn*, are no other, as we are assured by *Paulus Ammannus*, than Bones of the Whale, Sea-horse, or Teeth of the Elephant, which, as *Cardan* says, may be made, by artificial Means, to resemble this Horn. *Dale.*

UNICORNU FOSSILE. Offic. Geoff. Prælect. 73. *Schrod.* 359. *Cornu fossile*. Worm. 54. Charlt. 23. *Cornu fossile*, *vulgo Monocerotis Cornu*. Boet. 425. *Ceratiis*. Aldrov. Mus. Metall. 630. Gefn. Lap. Fig. 154. *Ebur fossile*. Clus. Exot. 68. *Lapis Arabicus*. Cæsalp. 611. *Turquesia*. Ind. Med. 47. *Dens Elephanti petrefactus, aliis, Lithoræzarga, alba.* THE UNICORN-STONE.

The fossil Unicorn, or *Lapis Ceratites* of *Gesner*, is a stony Substance, resembling in Colour, Smoothness, and Shape, the Horns, Teeth, and Bones of Animals. It is made up of an outer, hard Part, of an yellowish, blackish, or Ash-colour, and a soft, friable, compact medullary Part, without Pores, of an astringent and drying Quality, sticking very close to the Tongue, and sometimes of an agreeable Smell.

It is often dug up in the Form of Bones turned to Stone, among which we often find the *Dentes Molares*, and *Incisorii*; and we can perfectly distinguish between the Root of these Teeth, and that Part which appears without the Gums. Sometimes we meet with Fragments of the Radius and Tibia, representing the natural Conformation of these Bones in a very perfect manner. There are, likewise, dug up large Branches, and Trunks of Trees, in which the Species of Wood is still distinguishable. There is, therefore, no room left to doubt, but that these stony Substances are really Petrifications of the Horns, Teeth, and Bones of Animals, or of Wood; which being putrefied, by remaining long under Ground, and, in a manner, calcined, their Substance becomes more rare and porous, as we see daily in rotten and worm-eaten Wood. By the Afflux of a fine Marl dissolved in Water, these porous Substances are filled, and the Water insensibly evaporating, the Remainder incorporates with the Bones, or Pieces of Wood, into a stony Substance, of the same Form and Figure with what they were before. But if these earthy Parts, which concrete with them, be of the crystalline or flinty Kinds, then they turn to a Substance like Crystal or Flint, as we see in several Sorts of fossil Shells.

The fossil Unicorn is found in many Places of *Germany*; and at *Mont Martyr*, near *Paris*, there were lately found many Bones hid in a stony Substance. The *Germans* esteem it for its astringent, alexipharmic Qualities, and as a Provoker of Sweat, and accordingly, often use it in Diarrhoeas, Dysenteries, Hæmorrhages, the *Fluor Albus*, malignant and pestilential Fevers, and in the Epilepsy. The Dose is from ten Grains to a Dram. But they do not use all Kinds of it indifferently, but choose that which has a pleasant Smell, and which has been previously tried upon Dogs, or other Animals, because it sometimes contains a poisonous Quality, especially when dug out of the Earth, mixed with Arsenic; and therefore great Care is required about it. *Geoffroy.*

It agrees in Virtues with the *Terra Lemnia*, and is recommended against malignant Distempers; it resembles, also, Unicorn's Horn, particularly in resisting Poison, and curing the convulsive Motions of Infants; and is often used in the Small Pox and Measles. Of this Substance calcined, is prepared the factitious Turquoise. *Dale.*

UNIFOLIUM. A Name for the *Smilax*; *unifolia*; *humillima*.

UNIO. A Pearl. See MARGARITÆ.

UNNI CHILENSIUM de Læet. *Hispanis Murtilla*. The Name of an *Indian Tree*, which bears a Fruit in Clusters, about the Size of Peas, of a sweetish, and at the same time, somewhat acrid Taste. The Natives express a clear Liquor from it, which resembles Wine; and of this Juice they make a sort of Vinegar.

UNQUASI. Quicksilver. *Rulandus*.

VOARCHADUMIA. A kind of *Cabbala*, or Ænigmatic Art, relative to Metals, which proposes the Exaltation of Gold by Cementations, and other Methods, in which the *Hebrew Letters*, of some occult and mysterious Virtues, are employ'd. The Curious may see an Account of this in the *Theatrum Chymicum*, Vol. 2. p. 500.

VOCIFERATIO. Vociferation. See **ANAPHONESIS**.

VOLA. The Hollow of the Hand, or Palm.

VOLANS. Mercury. *Dornæus*.

VOLATICA. The same as *Lichen*. See **LEPRA**. A sort of wandering Pain, attended with a Tumor, and affecting sometimes one Part, sometimes another, is called *y. Hannemannus* in the *Act. Hassniens. Volatica Scorbatica*.

VOLATILIS. Volatile. In Chymistry, those Substances are called *Volatile*, which rise, and fly off, upon the Application of Heat, or Fire; as those which endure the Fire without Diffipation, are called *fixed*.

VOLEMA. The Name of a certain Species of very large Pear. *Virg. Georg.*

VOLSELLA, λαβίς, is the same as **FORCEPS**, [see the Articles **FORCEPS** and **ACANTHABOLUS**] is a surgical Instrument, contrived for taking hold of any thing, according to the Etymology of the Greek λαβίς [*Labis*], used by *Hippocrates*, *Lib. de Sterilib.* and *Galen*, *de C. M. S. L. Lib. 3. Cap. 3.* and derived from λαμβάνω [*lambano*] to apprehend, or lay hold of. Its principal Uses are in removing Plaisters and Lint from Wounds and Ulcers, and in extracting Splinters, and other things of that Kind; as, also, in taking hold of various things, in which respect it is very useful in Anatomical Dissections: It is commonly made of Steel, but sometimes, for Brightness and Curiosity, of Silver. *Tab. XXII. Fig. E*, represents the *Volsella*, or *Forceps*, which is denticulated, or furnished with Teeth, by which means it is enabled to hold a thing the faster.

VOLVA, in *Scribonius Largus*, No. 104. is the middle Part, or Core of the Apple containing the Kernels, prescribed by him, among other things, for a Weakness of the Stomach rendering it incapable of retaining the Food.

VOLUBILIS, a volubendo, from twisting, or twining, according to *Blancard*, is a Name for the **SMILAX**.

VOLUNTARIUS, κατὰ προαίρεσιν, ἐκούσιος, voluntary, spontaneous, is applied to any thing which is in our own Power to have it done or not done. In this Sense *Motion*, *Tears*, and other Actions, are said to be voluntary. *Castellus*.

VOLUNTAS, θέλημα, according to *Dr. Willis*, *de Anima Brutorum*, is an Attendant of the rational Soul, proceeding from the Understanding, and a kind of rational Appetite, in the same manner as the sensitive Appetite is connected with the Imagination, and is the procuring Hand of the corporeal Soul. *Castellus*.

VOLEPTAS, ἡδονή, Pleasure, is the ultimate Perception of the sensitive Soul, in which all other Affections acquiesce; and, consists, according to *Dr. Willis*, who has attempted to describe it, in the Treatise just before quoted, in a grateful and elegant Alteration, Expansion, Agitation, and Motion of the Spirits, occasioned by sensible Objects. *Castellus*.

VOLVULUS, in *Pathology*, is the same with **ILÆOS**, which see. In *Botany* it is a Name for the *Convulvulus*; *Linariæ Folio; affurgens*.

VOMER, ὤν, ὤν, in Anatomy, according to the Description given it by *Chefelden*, is seated between the Bones of the Palate, and the sphenoidal Bone, being, also, joined to the Process of the Ethmoides, and Part of the lower Jaw, and having its fore Part, which is spongy, continued to the middle Cartilage of the Nose, and making in Conjunction with it, the *Septum Nasi*. See a fuller Description of this Bone under the Article **CAPUT**.

VOMICA is commonly taken for a suppurated Impostume, or an Abscess with a Suppuration. *Castellus*.

Vomica Pulmonum is a latent Disease of the Lungs, which often deceives under a Shew of Health. What goes by this Name is a small Abscess seated in some Part of the Lungs, and straitly inclosed within a Bag, or Membrane. This Disorder is most incident to those who are affected with a *Tabes*, or labour under an *Anastomosis*, or Rupture of a Vein in the Lungs. In this Disease, the Breath smells ill long before the *Vomica* breaks, sometimes Blood comes up with Coughing, the Body is perpetually dull and heavy, and the Cough very long and troublesome, and sometimes followed with an Expectoration of the *Vomica*;

in which Case the Patient is seized with no small Fever, succeeded by bloody Spit, and vast Perturbation of Body; the Consequence of which Circumstance may possibly be a Recovery to a good State of Health. It has often happened, that the *Vomica*, by a sudden Rupture, has discharged itself into the Heart, and occasioned sudden and unexpected Death. *Lommii Obs. Med.*

Vomici, in some Authors, are such as are affected with a *Vomica Pulmonum*; and *Johnson Lexic. Chym.* calls Quicksilver *Vomica Liguoris æterni*, "the *Vomica* of the eternal Liquor."

VOMILIUM, supposed to be from *Vomo*, to vomit, is a Name bestowed by *Libavius*, *S. A. Chym. Lib. 6. Cap. 19. 20.* on *Mercurius Vitæ*, and *Aurum Vitæ*, on account of their Effects. It is extended, also, to other Emetics; so that *Vomilia*, in the Jargon of the Chymists, may be supposed to be the same with *Vomitioria*.

VOMITIO, Vomition, or the Act of Vomiting.

VOMITORIA, **VOMITIVA**, ἐμετικά. *Vomitioria*, Emetics.

Vomitary Medicines, or Emetics, are indicated,

1. From the Foulness of the Mouth in the Morning, from its Bitterness, from Eructations, Nausea, a gnawing Pain of the Stomach, with a gradual Decay of the Appetite, neither excited nor attended by a Fever.
2. From spontaneous Vomiting, together with great Facility in the Action.
3. From the Nature of the Matter, as it is known to be moveable or immovable.
4. From the Situation of the Place affected with a Repletion or Obstruction below the Diaphragm, and especially if that Affection be primary, and nothing contraindicates.
5. From the general or epidemic Nature of the Disease.
6. From the Constitution of the Year.

Emetics are forbidden by the Contraries to the fore-mentioned Indications.

The Body is prepared for taking a *Vomit* with the more Ease and Safety;

1. By rendering the Matter moveable by Dilution, Attenuation, and Dissolution.
2. By relaxing and lubricating the Passages with mollifying, oleous, and gentle Medicines.
3. By premising Phlebotomy, if the Body be plethoric, or excessively robust, and, at the same time, very strongly agitated.

Vomiting is excited,

1. By irritating the Spirits by presenting some very nauseous Idea, or by some unaccustomed Agitation, as on the Sea, or otherwise.
2. By irritating the Fibres of the Fauces and Pharynx with a Feather dipt in Oil, or something like it.
3. By swallowing large Draughts of fresh warm Water, with Oil, Honey, Sugar, and the like.
4. By every thing highly acrimonious, and at the same time viscid; by the Flower and Seed of Dill; by the Leaves of *Asarabacca*; and by the Root and Seed of *Atriplex*; or by more violent Simples, as the Cataputia, *Esula*, the Root of *Cyclamen*, the Flower, Juice and Bark of the *Ebulus*, or Dwarf-elder; the Flowers, Seeds, and Root of *Broom*; both the *Hellebores*, the Seeds of *Nasturtium*, *Ricinus*, *Thymelæa*, and *Cnicus*; the Roots of *Bryony*, *Iris*, and *Tithymalus*; the Herbs *Gratiola*, and *Tobacco*.

5. By Antimonials, as the *Crocus*, *Glaſs*, *Flowers*, or *Regulus* of Antimony, in Substance, Infusion, Rob, Syrup, emetic Wine, the *Mercurius Vitæ*, Emetic Tartar, and the like, which produce various Effects according to the different Degrees of Violence.

6. By Mercury rendered acrimonious by Acids, in which, also, great Variety may be observed, in proportion as the Acid more copiously and openly, or more sparingly and covertly, adheres to the Mercury.

The Choice, Dose, Form, with the proper Time for administering Emetics, are indicated by the Age, Sex, Temperament, Season of the Year, the Nature of the Disease, and of the Matter to be evacuated.

Vomiting is promoted by copious Draughts of mild, aqueous, honeyed, and warm Liquor, taken after every Paroxysm of Vomiting, and the same, after being discharged, again repeated.

Vomiting is repressed by swallowing some smooth Oil, by Opates, Aromatics, grateful Acids, and Corroboratives, either taken inwardly, or outwardly apply'd. *Bocrhaav. Institut. Medic.*

VOMITUS. A Vomiting. See **PYRETOS**.

Vomiting and a *Nausea*, seem to be retrograde spasmodic Motions of the muscular Fibres of the Oesophagus, Stomach, and Intestines, attended with strong Convulsions of the Muscles of the Abdomen and Diaphragm, which, when gentle, create a Nausea;

Nausea; when violent, a *Vomiting*. These convulsive Disorders proceed from the immoderate Quantity, or Acrimony of the Food; from Poisons; from some Injury of the Brain, as a Wound, Contusion, Compression, or Inflammation of that Part; from an Inflammation of the Diaphragm, Stomach, Intestines, Spleen, Liver, Kidneys, Pancreas, or Mesentery; from an Irritation of the Gula; from a disorderly Motion of the Spirits by unaccustomed Agitations in a Coach, Ship, or otherwise; or from the Idea of something nauseous. *Boerhaav. Institut. Medic.*

There is scarce any Accident, in human Life, which occurs more frequently than *Vomiting*; for there is no Person but vomits at one time or other; and there are very few Diseases which are not attended with this troublesome Symptom. Now *Vomiting* is no other than a preternatural Inversion of the peristaltic Motion of the *Oesophagus*, Stomach, and especially the *Duodenum*, to the Degree of a convulsive Contraction, by which the Contents of the Stomach, accompanied sometimes with those of the *Duodenum*, are discharged by the Mouth.

The Affection itself is too manifest, to require a Description by diagnostic Signs; but the Symptoms which attend it are to be regarded with Care and Attention, and the rather, as the Causes of *Vomiting* are various, to a great Degree. In general, we may observe, that some Persons are very easy to vomit, and disposed to that Action on the least Occasion; others, on the contrary, are with great Difficulty provoked to it, and find it no less troublesome, with much Striving, and after many vain Efforts, to discharge their Stomachs this way. The first of these Persons are called, by a technical Term, *Eumeti* [ἐμεῖς, from ἐμ, importing Facility, and ἐμω, to vomit]; and such are Children in comparison of Adults; Women, if compared with Men; and, among Men, they who are of a lax Habit of Body: They, on the contrary, who are of a close, well-set Habit of Body, short-necked, and of a robust System of Nerves, are termed *Dysmeti* [δυσμέτοι, from δὺς, importing Difficulty, and ἐμω, to vomit].

The antecedent and concomitant Symptoms of *Vomiting* are usually a very troublesome Nausea, with a Tension and Weight in the epigastric Region, a Bitterness in the Mouth, Heat, a gnawing Pain, and Loss of Appetite, with a great Anxiety of the *Præcordia*, and Restlessness. Much Spittle distils into the Mouth, and is evacuated by Spitting, and the Patient is, besides, affected with a Vertigo, Dimness of Sight, Heaviness of Head, Redness of Face, Trembling of the under Lip, and most of all with a Cardialgia, till, at length, after much laborious and fruitless Eructation, he discharges the Contents of his Stomach. All these Symptoms plainly enough indicate a spastic and convulsive Subversion of the Stomach and adjacent nervous Parts.

The Matter discharged by *Vomiting* is what gives the several Denominations to that Affection: A mucous, chylous Discharge of Reliques of Foods not perfectly dissolved, is called a *pituitous Vomiting*; a Congestion of bilious Matters evacuated this Way constitutes what we call a *bilious Vomiting*; other Denominations, as those of *blackish*, *corrupt*, *green*, *æruiginous*, and *porraceous*, are taken from Accidents owing to a Mixture of other Humours, and particularly such as are acid, or corroding. Sometimes Worms and Insects are thrown up by *Vomiting*; and sometimes a stercoraceous Matter from the very Bottom of the Intestines, is, by an Inversion of the peristaltic Motion, discharged the same Way. At other Times Pus and a sanious Matter are evacuated; and I myself once observed a fleshy and membranous Mass, like a Polypus, which was generated in the Stomach, expelled by *Vomiting*. Frequently there is a Discharge of pure Blood, and in such a Case the *Vomiting* is denominated *sanguineous*; sometimes the Blood is black and corrupted, which constitutes what we call the *Morbus niger*, or *black Disease* of Hippocrates.

The proximate Seat of the Matter discharged by *Vomiting* is the Stomach, by whose preternatural Motion with that of the adjacent Parts the same is expelled; but the more remote Parts, as the Liver, Pancreas, by means of their Ducts, the Spleen, the Mass of Blood and Humours, and the Habit of the Body, as it happens in Tumours, by means of the Vessels and Glands, have their Contents attracted the same Way. The Causes which irritate the sensible and nervous Substance of the Stomach to a systolic and compressory Motion are to be sought not only in itself, but in the adjacent and remote nervous Parts, since we may, on some Occasions, observe, that *Vomiting* is excited by Consent of Parts in a Multitude of spasmodic Affections: And this Observation is of so great Moment, that for its better Illustration, we cannot but think it very proper to premise an exact Description of the Fabric of the Stomach and *Duodenum*, according to the Discoveries of the newest and most approved Anatomists.

The first Parts, then, which here offer themselves to our Sight, are, the *Coats* of the Stomach, which has four ascribed

to it. The outermost is *membranaceous*, and takes its Rise from the *Peritonæum*, and is continued to the Coat which surrounds the Concavity of the Diaphragm; the second Coat is *muscular*, and consists of a double Series of Fibres, of which the external is constituted of longitudinal Fibres, which serve in contracting the Length of the Stomach; the internal Series of Fibres consist partly of such as extend themselves from the *Cardia*, or the Mouth of the Stomach, to the *Pylorus*, and cause an Approach of both Orifices to one another; and partly of circular ones, which are disposed over the Breadth of the Stomach, and are instrumental in its Contraction: The third Coat, which is subjacent to the former, has the Denomination of *nervous*, and is furnished with tendinous Fibres, which are extended obliquely over the Stomach; this Coat is larger than the former, on which Account it is rugous, and provided with a Multitude of Glands: The fourth is called the *villous Coat*, and is composed of nervous *Papillæ*, and Ends of Vessels erected like *Villi*, or coarse Hairs, and lined with a Mucus, derived from the forementioned Glands; but between the outer Coat, and the muscular as well as between this and the nervous Coat, and between this last and the villous Coat, there is a triple cellulous Substance, containing very numerous Blood-vessels.

The next Parts which deserve our Consideration, are the *Vessels* of the Stomach: These are two *gastric Arteries*, the *right*, and the *left*, and *coronary Artery*: For the *Aorta Inferior*, after entering the Abdomen thro' a Perforation near the Spine, immediately sends forth the *Arteria Cœliaca*, which is divided into three Branches, the first of which is the *hepatic*, whence arise the *Arteria Pylorica*, *Gastrica dextra*, and *Duodena*. Another Branch is, the *Coronary*, whose Ramifications extended over the Stomach are innumerable; and the third Branch is the *splenic*, which taking its Course to the Spleen, sends forth first the *pancreatic Artery*; secondly, the *left Gastric*; thirdly, the *epiploic Artery*; and, fourthly, the *Vasa Brevia*, one of which is *venous*: By this Connection of Arteries it appears, that the Consent of the Humours, in their Circulation thro' the Parts before-mentioned is very considerable. The *Veins* are, the *coronary*, the *right* and *left Gastric*, and one of the *Vasa Brevia*; these all arise from the *Vena Porta*, whose Trunk, taking its Course under the *Duodenum* to the *Pancreas*, sends forth, in the first Place, the *Vena Cystica*; *Pylorica*, and *Duodenales*; after this, sends off three, and sometimes but two Branches: One of them, which is the *splenic*, is subdivided into the *coronary*, *left Gastric*, *pancreatic*, *epiploic*, and the venous Portion of the *Vasa Brevia*; another Branch, the *greater Meseraic*, supplies the *intestinal* and *gastro-epiploic Veins*; and the third Branch, the *internal hæmorrhoidal*, produces the *right gastric* and the *duodenal Veins*. Hence it appears, that an Interruption of the Circulation of the Blood in one of the *Viscera* is succeeded by a Regurgitation to some other; the Veins are accompanied by lymphatic Vessels, as the Arteries are by Nerves; these Nerves proceed partly from the *Par Vagum*, and partly from the intercostal Branch; the *Par Vagum*, descending in two Branches on both Sides of the *Oesophagus*, distributes innumerable Ramifications over the whole Stomach, and afterwards concurs in forming the Plexuses of the intercostal Nerve: This latter, after perforating the Diaphragm, forms, near the *Cœliac Artery*, *semilunar Ganglia*; whence arise, on the right, the *Plexus Hepaticus*, and *Renalis major*; and, on the left, the *Plexus Lienaris*, *Stomachicus*, and *Renalis sinister*. From the *Plexus Hepaticus* and *Renalis dexter*, with the semilunar Ganglion, arises the *Plexus Mesentericus Superior*, by whose Intervention the five Plexuses, before-mentioned, on both Sides are so united, that the Parts which are supplied from them with Nerves, are mutually related to one another by the strictest Consent.

In the next Place, the Structure of the *Duodenum* highly deserves our Contemplation: This Part, with respect to its Coats, Nerves, and Vessels, agrees with the Stomach, and, beginning at the *Pylorus*, forms three Flexures; the first Flexure, tending from the Stomach obliquely downwards is at the same time reflected backwards, and has inserted into it, near its End, the common biliary Duct, which conveys the Bile and pancreatic Juice; after this, when it approaches the right Kidney, it forms another Flexure, where it rests upon the Pancreas; and, lastly, near the Spine, in its Approach to the left Kidney, it makes a third Flexure, over which the Artery and the *Plexus Mesentericus Superior* have both their Course; the Constriction of which immediately affects the *Duodenum*; the Capacity of this Intestine far exceeds that of the others, contrary to the common Opinion, which makes it less.

These two Parts, the *Stomach*, and the *Duodenum*, which may justly be called a *lesser Stomach*, are not only connected with one another in a very remarkable manner, but with other nerveo-membranous Parts; as, first, with the *Oesophagus*, by a Communion of the same common Coats; and hence they communicate, also, with the Coat which surrounds the Fauces and the Mouth. Secondly, they have a Connection with the whole

intestinal Duct, or Tube, not only by the Communication of the same Coats, but, more especially, by means of the *Plexus Mesentericus Major*, from which all the Intestines are supplied with Nerves. And, thirdly, they have a strict Relation to the *Omentum*, which is very firmly connected to the anterior Part of the Stomach. Fourthly, they have a Connection with the Diaphragm by Branches from the *Par Vagus*, and intercostal Nerve; and, also, by a Coat which is common to the exterior Surfaces of both the Stomach and the Diaphragm; and, by means hereof, fifthly, with the nervous and membranous Parts of the Breast, and with the Muscles of the Abdomen. Sixthly, they have a Correspondence with the biliferous Ducts, not only by the *Ductus Cholidochus*, which is inserted into the *Duodenum*, but principally by the *Plexus Hepaticus*, which supplies the *Duodenum* and Stomach with Nerves, and communicates with the *Plexus Stomachicus*, by the Intervention of the *Mesentericus Superior*. Seventhly, they communicate with the Pancreas, which firmly adheres to the *Duodenum*. Eighthly, with the Kidneys, by the right and left *Plexus Renalis*, which is connected with the *Plexus Stomachicus*. And, lastly, with the Head and Brain; as, also, with the Heart, by the Branch of the *Par Vagus*, which is common to them both.

By virtue of the muscular Coat, and its Fibres above-mentioned, which are common to the *Oesophagus*, Stomach, and all the Intestines, there is excited a vermicular kind of Motion, which is peculiar to those Parts, and has the Name of peristaltic: This Motion consists in an alternate Constriction and Relaxation of the said Parts, and tends from the upper Parts downwards. In the Stomach, by contracting and straitening it, after different manners, and dilating it again, with the constant Assistance of the Motion of the Diaphragm and Muscles in Respiration, it promotes the Digestion of the Aliments, and their Expulsion thro' the *Pylorus*. In the Intestines it is the means of an Absorption of the laudable Humours by the lacteal or chyloferous Vessels, and of the Protrusion of the excrementitious Parts to the lower Region, and their Elimination by the *Anus*.

Whenever this peristaltic Motion, which directs its Force downwards, is perverted into a Motion of the preternatural, spasmodic, and convulsive Kind, there arise Gripes of the Intestines, cardialgic Pains about the *Pylorus*, Spasms, as they are called, of the Stomach, Colics, and Fluxes of the Belly: But if this same Motion, besides its spasmodic Contraction, be, also, inverted, and tends upwards, it first of all forces up the Contents of the Intestines into the Stomach, or if they are there already, impels and protrudes them upwards, whence *Vomiting* is excited, in which Action the *Pylorus*, together with the *Duodenum*, connected to it, and the lower and anterior Part of the Stomach, thro' a violent Contraction of the longitudinal and circular Fibres, are contracted to the upper Orifice, to which the Contents are by this means applied, and the continued Force of the Spasm still pressing behind, are from thence forced into the *Oesophagus*, and, the same inverted Motion being propagated thro' the whole *Oesophagus*, conveyed to the Mouth, and so discharged. This Motion is assisted by a violent Constriction of the Diaphragm and abdominal Muscles, caused by Consent, and by a Compression of the Sides of the Stomach, thence occasioned. Hence it is observed, that, after each Act of *Vomiting*, the Difficulty of Respiration still continues, and the Region of the Abdomen is more or less affected with Pain; and, that in Animals dissected immediately after the Exhibition of an Emetic, a Compression of the Stomach by the Diaphragm and *Musculi Recti* of the Abdomen, is evidently visible; whence some *English* Physicians are of Opinion, that the Fibres of the Stomach contribute nothing at all to the Action of *Vomiting*.

The weaker the Fibres of the Stomach, and the more copious and moveable the Matter to be discharged, the easier is the *Vomiting*; but if the Fibres be considerably robust, as in those who vomit with Difficulty, or the Cause of the *Vomiting* consists in a tenacious, viscid Humour firmly adhering to the Folds of the Stomach, or an acrimonious caustic Matter infesting the Nerves, the Action of *Vomiting* is rendered difficult, and attended with formidable Symptoms: The Action in such a Circumstance is preceded by a very severe Cardialgia, vast Nausea, Anxieties, and Perturbation of the *Præcordia*, laborious and fruitless Eructations, troublesome Concussions of the Abdomen, its Contents, and especially of the Diaphragm; whence proceed singultuous Agitations; a plain Evidence that the Stomach labours under a great Convulsion, which is insufficient to expel the noxious Matter. It very frequently happens at such a time, that the Convulsion is propagated to the bilious Ducts, which occasions an Effusion of Bile into the *Duodenum* and Stomach, and, being discharged by Eructation, the *Vomiting* is not in the least abated: The same Motion is communicated to the *Oesophagus*, and expresses the Lymph from its Glands, and those of the Fauces, much of which is discharged by Spitting. Moreover, from a Compression of the Blood-vessels of the Stomach, and the adjacent Parts, by the violent Concussions, the Blood is im-

pelled in great Quantities to the superior Parts, and the Head, and causes an Infarction of the Vessels, a Distention of the nervous Membranes, and a Disposition to the like Spasms: Hence proceed Redness of the Eyes, Pains in the Head, Dimness of Sight, Vertigo, Trembling of the under Lip, and sometimes convulsive and epileptic Commotions of the whole nervous System.

The proximate Cause which disposes to *Vomiting*, is a Vellication or Stimulation of the nervous Fibres of the Stomach and *Duodenum*: Now the vellicating Matter resides either in the Parts themselves, or in others remote, but connected with them by means of the Nerves: Hence arises a Distinction of *Vomiting* into *symptomatic* and *idiopathic*; the material Cause of the latter is in the Stomach itself, or at least in the *Duodenum*; the other has its Cause more remote, residing in the lower Intestines, the bilious Ducts, Kidneys, Head, or some other distant Part, and depends chiefly on Consent of Parts, by which the irregular Motions are communicated. It is evident, therefore, that there is no such thing as a monarchical Power, which *Helmont* ascribes to his Regent of the *Pylorus*, from which, he thinks, the Origin of the Constriction and inverted Motion is always to be derived. For tho' it sometimes begins at the *Pylorus*, yet the Principle of the Constriction is frequently residing in the lowest Intestines, as appears by the stercoreous *Vomitings*.

Among the material Causes of *Vomiting*, which have their Seat in the Stomach itself, the first which deserves Notice is, the excessive Quantity of Things ingested; which, by oppressing the Fibres of the Stomach, and distending them beyond the Sphere of their Elasticity, and by that means occasioning a more than ordinary Afflux of the nervous Fluid and the Blood, excites them to convulsive Motions, in order to expel the noxious Matter: Hence the Subjects most obnoxious to *Vomiting* are, 1. Excessive Drinkers, on account of the immoderate Quantity of Liquors ingested. 2. Tender Infants, from sucking too much Milk, or a premature Reception of more solid Food; in which latter Case, *Kerkringius*, not without Reason, imputes the Cause to the Straitness of the *Pylorus*, not as yet capable of transmitting solid Aliments. 3. Persons weakened by Diseases, and fasting under them; in which Circumstance, a moderate Allowance of Food, especially of the solid Kinds, may provoke *Vomiting*. 4. Voracious Children, who are much subject to Hiccups and *Vomiting*.

Another Cause of *Vomiting* is the vitiated Matter collected in the Stomach, which is frequently the Reliques of crude Meats, and such as are difficult of Digestion, salt Meats, such as are hardened in the Smoak, and the like improper Foods, which are hard to be concocted. Hence are excited *Vomitings* of a pituitous Kind, which are incident, 1. To Persons of a weak Stomach, but voracious Appetite. 2. To those who, being accustomed to softer Kinds of Food, enter upon a more solid and gross Diet. Hence, also, 3. They who indulge themselves in plentiful Feeding, much Sleep, and a lazy Kind of Life, are, also, much subject to *Vomiting*. The same vitiated Matter, or foul Sordes, by long Residence, becomes acid, and by an Accession of Bile from the *Duodenum*, procured by a Fit of Anger, or, perhaps, some other Cause, is rendered more acrimonious; whence arise, from the Stomach, bilious *Vomitings*.

All bilious *Vomitings*, especially if they are chronic, or periodical, have their *Fomes* in the *Duodenum*. This Intestine is very well accommodated for the Entertainment of the vitiated Sordes, on account of its Flexures, and because of an Affusion of Bile to the chylous Juice which happens in the same. If this Bile becomes inert and unactive, or stagnates on account of the languishing Tone of the Intestines, and is not duly mixed with the Aliments, or has its Substance more and more corrupted by an Accession of acid Humours, it is rendered acrimonious, and in a manner caustic; whence, by vellicating, it excites bilious, green, æruginous, and even black *Vomitings*: For Bile, by a strong Acid, is rendered green; and after it has stood for a considerable time, it becomes of a black Colour; hence the Matter discharged by *Vomiting* is often acid to a high Degree, so as to set the Teeth on Edge, and corrode the very Stones of a Pavement, and silver Vessels. Such was the Matter of the *Vomiting* observed by *Henricus ab Heer*, Obs. 29. which had the Taste of Vitriol: And I myself, in my Notes on *Potterius*, Cent. 2. Caf. 93. have related a Case where the Matter thus discharged was corrosive like *Aqua fortis*; and mixed with Filings of Steel, became true Vitriol.

Persons subject to *Vomitings* which have their Origin in the *Duodenum*, are, 1. *Hypochondriac* and *melancholic* Patients, who, on account of the languid Tone of the Intestines, are much molested with acid and viscid Crudities, from the Remains of the Food in the Stomach and *Duodenum*. To this it must be added, that the Bile is unactive to such a Degree, that instead of a generous Chyle, there is produced nothing but a copious Collection of acrid and acid Humours mixed with a corrupted Bile, by

by long Residence become black, and communicating the same Colour to the Humours, which, for that Reason, the Antients imagined to proceed from the Spleen. These Humours are constantly vellicating the *Duodenum* and *Pylorus*, Parts quick of Sensation, whence the Stomach is easily subverted, especially since these Parts are of themselves subject to an Inversion of the peristaltic Motion. 2. The *scorbatic* are no less liable to this Affection, from the Thickness and Impurity of the whole Mass of Humours; as are, also, 3. The *cachectic*, whose Bile is vapid, and insufficient for the perfect Dissolution of the Aliments; whence their Vomit is more of the bilio-viscid Kind. 4. Infants are much subject to these *Vomitings*, from their sucking impure Milk, rendered acid by the angry and fretful Temper of the Nurse, which frequently is the Occasion of porraceous, æruginous, and green Discharges of this Kind. And, lastly, Persons labouring under a Quartan are molested with these *Vomitings*, proceeding from the *Duodenum*.

Vomiting is, also, excited by the noxious and offensive Qualities of the Things received into the Stomach. Thus Aliments too fat; Fruits, and fermentible Substances, undergoing a more acrid Fermentation, excite *Vomiting*, especially if the Stomach be already oppressed with bilious Humours. The same is effected by Food which is ungrateful, and taken with a Loathing; and the more, if it be of an oily and pinguious Substance. Under this Head must be reduced acrimonious Things, and such as are endued with a subtil caustic Principle, as are all Emetics, and poisonous Substances; particularly the Eggs of the Barbel-fish, for which see *Timaus à Guldenkle, Lib. 3. Cap. 7.* and poisonous Mushrooms, mentioned by *Hildanus, Cent. 4. Obs. 34.* As for Poisons themselves such as Arsenic and Sublimate, it is very well known, that by their highly-caustic Principle, they excite not only *Vomiting*, but very terrible convulsive Symptoms in the whole System of the Body, which are the Effects, also, of the more acrimonious Emetics and Cathartics.

A subtil, acrimonious Humour, infesting the nervous Parts of the Stomach, is, also, a Cause of very troublesome *Vomitings*. Sometimes this Humour is by a *Metastasis* transferred to the Stomach from the Matter of the Gout, *Erysipelas*, *Scabies*, Ulcers, and Purples, to the Stomach. An Instance of *Vomiting* excited from the premature Consolidation of an Ulcer, we find in *J. Rhodius, Cent. 2. Obs. 65.* For the same Reason it happens, that the Small Pox, Measles, and malignant and exanthematous Fevers, are attended with most violent *Vomitings*: For the acrid and caustic *Miasma* of those Diseases, by infesting and irritating the nervous Fibres of the Stomach, produces this Disorder. From the same Cause must we account for those dreadful *Vomitings* in the Pestilence, where, upon dissecting a Carcase, *Helmont*, as he assures us, in his *Tumul. Pestis*, found the Stomach covered over with an *Eschar*. And *Diemerbroeck, de Peste, Lib. 4. Hist. 13.* tells us, that he saw the same Part affected with a Carbuncle.

A Congestion of the vital Blood in too great a Quantity in the Vessels of the Stomach, and by that means distending them to an immoderate Degree, is another usual Cause of *Vomiting*. Hence, 1. Women with Child, in the first Months after Conception, are affected with it, from a Regurgitation of the Blood, caused by a Retention of the Menstrues, to the superior Parts, which ceases when the Foetus arrives at a considerable Bulk, in some Subjects after the fourth Month. We have a remarkable Instance to this Purpose in *P. Lotichius, Lib. 5. Obs. 7.* 2. Women who have no menstrual Flux are, for the same Reason, molested with *Vomiting*. Thus *Panarolus, Sect. 1. Obs. 22.* relates the Case of a Girl from whom the Menstrues never flowed, who for seven whole Years as soon as she took any Food, vomited it up again; but, after her Menstrues began to flow, was freed from that Disorder. 3. Men are subject to the same Distemper from a Suppression of the Hæmorrhoids, which occasions a Reflux of the Blood, in too great Quantities, to the *Vena Porta*, and by that means a Congestion of the Blood as aforesaid, whence *Vomiting* is frequently excited.

A preternatural Constitution or Disposition of the Stomach itself is a sufficient Cause of *Vomiting*. For, first, if the upper Orifice be closed up by a Spasm, or any other preternatural Cause, it excites this Affection, which, however, cannot properly be called *Vomiting*, but is rather to be esteemed a Spasm of the lower Part of the *Oesophagus*; since the Food, before it arrives at the Stomach, is thrown up again, together with a Mucus contained in the *Oesophagus*. Examples to this Purpose may be found in *Willis's Pharmacop. rat. Part. 1. Sect. 2. Cap. 1. Fernelius, Lib. 6. Pathol. Cap. 1.* and *Coiterus, Observ. Chirurg. p. 121.* where you have an Instance of the *Cardia*, or upper Mouth of the Stomach, closed up with a *Scirrhus*, and hard Tubercle.

The Case is otherwise with the *Pylorus*, from whose preternatural Constitution and Obstruction Occasion is given for chronical and perpetual *Vomitings*; so that it may be taken for a

Rule, that whoever is for a long time together molested with *Vomiting*, especially after Meat, and at the same time pines and wastes away in his Body, he has his *Pylorus* ill constituted. We have an Instance of that Part hardened and incrustated to such a Degree, as to be incapable of transmitting Food, in *Sanchez, Obs. 1. p. 376.* of a scirrhus *Pylorus* in *Salmuth, Obs. 20. Cent. 1. Willis's Pharmac. rat. p. 1. Sect. 2. Cap. 1.* and in *A. Med. Berol. Dec. 2. Vol. 3.* of a blackish and corroded *Pylorus* in *Meibom. Diff. de Vom. Sect. 31.* and of a *Pylorus* obstructed by a Piece of Money swallowed, in *Kerkringius, Spic. Anat. Obs. 1.* in which Cases the Patients were molested with *Vomiting* as long as they lived.

A symptomatic *Vomiting* proceeds from the Irritation of the *Oesophagus* or Intestines: Hence it happens, that from the Intrusion of a Feather, or the Finger, into the Fauces, and a Titillation of the Beginning of the *Oesophagus* by the same, the Stomach is immediately subverted, or irritated to Vomition, especially if it be oppressed with a Load of Humours. And that the Beginning of an Inversion of the peristaltic Motion frequently commences from the lower Intestines, and is propagated, by Consent of Parts to the Stomach, we are assured by those *Vomitings* which owe their Rise to the Colic, Gripes, and the like Disorders, in which Cases vast Quantities of Humours, of various Colours and Consistencies, are often discharged. See *Hildanus, Cent. 4. Obs. 32, 35.* And *Marcellus Donatus, Lib. 4. Cap. 3.* affirms, that twenty Pounds of Sordes have been, for several Days together, discharged by *Vomiting*. I have myself observed in old Persons afflicted with an Hernia, where the Falling down of the Intestines has been very considerable, an extraordinary and surprising Discharge of a feculent Matter by vomiting every third or fourth Day, for several Years together.

Vomitings are occasioned by some Disorder in the Intestines, in the following Cases: 1. From their Distention by Wind and Fæces, an Example of which we have in *Dodonæus, Obs. Med. 37.* 2. From an obstinate spasmodic Colic, as we are assured by Experience. 3. From a stubborn Obstipation of the Belly; as it happens in that wandering spasmodic Disorder in which Clysters, after Injection, are discharged together with the Fæces, by the Mouth. 4. From the Iliac Passion, and Hernias. 5. From a Dysentery, according to *Platerus, Obs. p. 875.* 6. From Worms corroding the Stomach and Intestines. See *Amatus Lusitanus, Cent. 1. Cur. 5. Cent. 3. Cur. 20.* I knew a Girl, seven Years of Age, who, having laboured under a violent Cardialgia, Convulsions, and continual *Vomitings*, at length discharged a large Worm by the Mouth, and soon after died. In these Cases there is very often a total Inversion of the peristaltic Motion, which beginning from the *Intestinum Rectum*, ascends even to the Fauces, and conveying all the Contents of the Intestines to the superior Parts, expels them by the Mouth.

There may be, also, a severe *Vomiting* excited by Consent of Parts from a Disorder of the biliferous Ducts in the Liver: For as these Ducts are endued with the same constrictive and dilatatory Motion as the Intestines, so their preternatural Constriction or immoderate Laxness provokes to *Vomiting*. In the former Case there is not only a violent Expression of the Bile into the *Duodenum*, and from thence into the Stomach, in a retrograde way, vellicating its Coats, and exciting to vomit; but the very Spasm of the above-mentioned Ducts is, by Consent of the *Plexus Hepaticus* and *Stomachicus*, propagated to the Stomach. In the latter Circumstance there is too great an Effusion of the Bile thro' the relaxed Tubes into the *Duodenum*.

Causes of bilious *Vomitings* are, 1. Emetics, and strong Cathartics, which excite Spasms in the Stomach and biliferous Ducts, whence there is an Effusion of Bile into the *Duodenum*. 2. A great Fit of Anger, especially when the Subject is eating; and, in such a Circumstance, the Passion of the angry Mother may have a pernicious Effect upon the Child who sucks her Milk. 3. A tertian Fever, on account of the Spasms of the *Primæ Viæ*; in which Case bilious *Vomitings* are of Service. 4. The *Cholera Morbus*, and bilious Fevers. 5. Hypochondriacal Disorders, in which the *Primæ Viæ* are affected with Spasms. 6. The last Cause I shall mention is, Stones in the Gall-bladder, or bilious Concretions, by which Spasms are excited which produce bilious *Vomitings*. Remarkable Instances of this are to be found in the *M. N. C. An. 6. Dec. 1. Obs. 20.* and *Scultet. Armament. Obs. 61.*

Nothing is more common than for Persons under nephritic and calculous Disorders to be affected with a Nausea, *Vomiting*, and Gripes, especially if a Stone happens to stick in those sensible Parts the Ureters, or even in the Kidneys. Observations to this Purpose occur in *Bonetus, Sepulchr. Obs. 60.* and I remember a celebrated Physician, and Botanist, of this Place [Hall], sixty Years old, who from a Stone which stuck very fast in the middle of his left Ureter, laboured under continual *Vomitings*, and Loathings of all Food, for three Months

together, which, at length, induced a Decay of Strength, and Wasting of the Body, terminating in Death. Some Weeks before his Decease, he complained of the corrupt and fetid Taste and Smell of the Matter discharged, imagining it to be mixed with the urinous Secretions, which passed off but in small Quantities. It very frequently also happens, that nephritic Paroxysms after long ceasing, are renewed and re-excited by Spasms of the Stomach and Intestines. The Reason is obvious, for as the left Kidney, by its nervous Plexus, thro' the Intervention of the *Mesentericus Superior*, coheres with the Plexus *Stomachicus*; and the right Kidney, by means of the like Plexus, is immediately connected with the Plexus *Hepaticus* and *Stomachicus*; and besides as the *Duodenum* is connected with the *Involucra* of this Kidney, hence it easily appears why Spasms of either Kidney, but the Right more than the Left, should excite Vomiting, often of the bilious Kind, and so violent, as hardly to be exceeded by Emetics. We have a remarkable Instance, to this Purpose, in *Meibomius, Dissert. de Vomitu, Sect. 27.* where Stones impacted in the Kidneys first excited terrible Vomiting, and, when these ceased, so violent a Spasm of the *Oesophagus* was excited, that something, as it were, seemed to leap out of the Mouth.

Vomiting, also, may, by Consent of Parts, attend Affections of the Head, as *Hippocrates* long ago observed, 6 *Aph.* 50. "A Wound of the Brain," he says, is necessarily succeeded by "a Fever, and bilious Vomiting." And we read the same in the *Coacæ Prænotiones*; and every Surgeon knows, that Inflammations, or considerable Wounds and Contusions of the Head and Brain, and its Membranes, are succeeded by Vomiting. And the same Consequence happens from violent Spasms of the nervous Parts of the Head, as in that severe Pain of the Head called *Clavus Hystericus*, an obstinate Cephalalgia, Hemisrania, Vertigo, spasmodic Apoplexy, and the like Disorders; in all which Cases a Vomiting is occasioned thro' that Consent which the Stomach, by means of the *Par Vagus* of Nerves, holds with the Brain; not to mention, that the Connection of the *Par Vagus* with the fifth Pair of Nerves, is the Cause of Vomiting under difficult Dentition.

A Depression of the Eniform Cartilage, by compressing and irritating the Stomach, may be reckoned among the external Causes of Vomiting. Examples to this Purpose we have in *Barbette, Anat. Lib. 1. Cap. 4.* and *Decker Prax. Barbett, p. 126.* For this Reason Maids who much straiten and compress their *Præcordia* with stiff Boddice, are subject to Vomiting. To external Causes, also, is to be referred, an imaginary Vomiting excited from the Perception of ungrateful Objects, by Sight, or even by Hearing; and, also, that Vomiting which is provoked by a whirling Motion of the Body, or Jactation in a Ship, to Subjects unaccustomed to it.

There is, also, a critical Kind of Vomiting, when the material Cause which produces it is eliminated by the very Vomition, which is therefore very salutary, and is sometimes to be observed in angry Persons, and Cachectics of a choleric Disposition; and, also, in Fevers, both acute and intermittent, and principally about the critical Days: For, by means of this Action, the Stomach, *Duodenum*, the biliary Vessels of the Liver, the Pancreas, with the intestinal Tube and Glands, are purged, and deterged from those Collections of vitious Juices and Humours which otherwise might enter the Mass of Blood, and create various Disorders, which, upon their Expulsion by Vomiting, are not to be apprehended. Of such salutary Vomiting, *Celsus* excellently remarks, *Lib. 1. Cap. 3.* "that it is beneficial to all bilious and full Persons, who have either injured themselves by Repletion, or have bad Digestions. For if more be received than can be concocted, we ought not to run the Hazard of its being corrupted; or if it be already corrupted, there is nothing more commodious than to expel it, by the quickest and most ready Passage. Whenever, therefore, we are molested with bitter Eructations, attended with Pains, and Oppression of the *Præcordia*, let us have immediate Recourse to Vomiting."

The Diagnosis of the different Causes of Vomiting is formed upon the Evidence of concurring Signs. Pituitous Vomiting, attended with a pressive Pain about the Region of the Stomach, are an Indication of Crudities adhering to the *Primæ Viæ*. Bilious, chronical, and periodical Vomiting, signify too great a Lateness of the biliferous Ducts; chronical Vomiting, particularly, of many Years Duration, in which the Food is thrown up half-concocted, indicate some Injury or *Scirrhus* of one of the Viscera. That Vomiting has its Rise from the Stone, we infer, from a Pain in the Region of the Loins, attended with a Diminution of the urinary Evacuations, and with sandy Excretions. Paleness of Countenance, and Pains and gnawing Sensations in the Intestines, attended with frequent Spitting and Itching of the Nostrils give a Suspicion of Worms: But Judgment is necessary in these Cases, to explore, from the various concurrent Symptoms which attend Vomiting, the true Cause of that Af-

fection, without the Discovery of which we can expect but a palliative Cure.

By way of Prognosis, all critical Vomiting are salutary, symptomatical ones bad, and worst of all when excited by a subtle caustic Acrimony vellicating the Nerves. All Vomiting more violent than ordinary, is not free from Danger; for it may cause Abortion, excite an Hernia, and dispose to a Retropulsion of the arthritic, podagric, and erysipelatous Matter upon the nobler Parts, to the no small Detriment of the Patient. It has occasioned a Rupture of the Omentum, as we read *Act. Med. Berol. Dec. 2. Vol. 3.* and a Laceration of the very Stomach, as we are told by *Sanchez, Ob. præst. p. 376.* Bilious Vomiting, especially the green, porraceous, and æruginous, terrify us with Appearance of Danger, and threaten an Inflammation. Vomiting from Worms corroding the Stomach is generally pernicious; and if a dead Worm be discharged, and at the same time there be a Cessation of very severe Symptoms, and terrible Convulsions of the Limbs, all at once, it is a mortal Indication of a supervening *Sphacelus*, which destroys the Worms, together with the Patient. All fetid Vomiting are of bad Prognostication, as they indicate an internal Corruption. Sebaceous or Tallow-like Vomiting indicate a Redundance of corrosive acid Humours in the Stomach, by which the pinguious Substances are coagulated, and an intolerable burning Heat and Cephalalgia are usually excited.

Where there is a plentiful Discharge of a gross Humour tinged with a brown Colour like Gall, to the Quantity of Half a Pint, or a Pint, whether spontaneous, or procured by Art, as it frequently happens in slow Fevers, it is a certain Indication, that the Tone of the Intestine next the Stomach is very much decayed.

Constant Vomiting, for the Space of Half a Year together, or more, and attended with a slow Heat, and an Extenuation of the Body, give strong Suspicion of an ulcerated Stomach. I met with an Instance of this Nature when I practised Physic at *Minden in Westphalia*, fifty Years ago, and had a View of it in the Dissection of a dead Body.

THE METHOD OF CURE.

Critical Vomiting, by which Humours of various Kinds are plentifully discharged, being salutary, scarce require any Cure, but are rather, on some Occasions, to be promoted. But symptomatical Vomiting, which are less sufficient or accommodated for removing the Cause, are the more carefully to be treated, in order to their Cure: And the two principal curative Indications, or Intentions, to be answered, are, in the first Place, to quiet and compose the convulsive and unruly Motion of the Stomach; and, afterwards, to oppose and subdue the material Causes of the Disorder.

The first Intention is answered by Antispasmodics, Corroboratives, and Anodynes, beginning with gentle, and proceeding to stronger Remedies of those Kinds. Of this Nature are, Saffron, and Castor in the Form of Powders, Essences, or Extracts; *Theriaca Cælestis*, incorporated with Powder of Amber, and Absorbents, as Hartshorn, Crabs-eyes, and red Coral: Powders composed of these Ingredients, with spirituous and vinous Waters, such as the Waters of Lime-tree-flowers, Lilies of the Valley, Chamomile, Baum, Mint, Black Cherries, Cinnamon, and the like, are of signal Service in these Cases. Among Corroboratives are distinguished, Nutmegs, Mace, Cardamoms, Cinnamon, *Costus Verus*, Cloves, Orange and Citron-peels, the Roots of red Gentian, Calamus Aromaticus, Galangals, the Herbs Marjoram, Rosemary, and the like; with the Oils and Essences prepared of these Simples. But of all the Remedies specifically appropriated to this Disease, the *Mentha Crispa*, or curled Mint, is the most eminent and effectual; for which Reason, the Oil prepared from it may be mixed with almost all the Remedies administered in these Cases, as being an eminent Paregoric as well as Strengtheners. Among Anodynes, I can affirm, that my own anodyne Liqueur is as effectual as safe, especially if it be mixed with my Balsam of Life; or, if more powerful Anodynes are required, recourse may be had to the *Pilula de Styrace, Wildeganfii*, or *Sydenham's Laudanum*.

With the Administration of these internal Medicines, it may be of good Service to join the Application of Topics to the epigastric Region, in order to repress, in some measure, the Violence of the disorderly Motions. Externals proper for this Purpose are, the strengthening distilled Oils of Mint, Cloves, Nutmegs, Wormwood, Mace, Cedar, and the like, reduced with Balsam of Peru into an Ointment. Epithems, also, for the same Purpose, may be composed of the *Spiritus Matricalis*, *Spiritus Theriacalis*, Hungary-water, and Essence of Saffron; and Cataplasms of camphorated Spirit of Wine, Ferment of Bread, the strongest Wine-vinegar, with Balsam of Peru, and an Addition of some Drops of the Oils of Mace and Mint. Of no less Efficacy is a Plaster of Crums of Bread, and Balsam of Peru, softened with a Drop or two of some distilled Oil;

over which it will be proper to apply resolvent and strengthening Bags warm. Our Balsam of Life does excellent Service in this Case, the Præcordia, and epigastric Region being anointed therewith.

But we shall lose our Pains, if we only use these Things alone, without attempting to remove the material Cause of the Disorder. A Vomiting, then, of the pituitous Kind which depends on Crudities of the *Prima Via*, and a viscid Mucus sticking in them, is best cured by an Emetic, especially if the Vomiting is not of itself sufficient to eliminate the Sordes; and if the Patient is greatly afflicted with an Effort to vomit, a Nausea, and Cardialgia; for, in this Case, after the Use of inciding and digestive Medicines, such as neutral Salts, the Roots of Arum, and especially of Squills, we are to exhibit a gentle Emetic, such as tepid Water mixed with fresh Butter, and copiously drank; or the Root of Ipecacuanha reduced to Powder. To Infants seized with a Vomiting on account of coagulated Milk, or the Meconium contained in the Stomach, it is expedient to give Oxy-mel of Squills mixed with Syrup of Rhubarb.

A bilious Vomiting which arises from a weakened Digestion, and has its Fomes in the *Duodenum*, after the Use of Absorbents, and gently-laxative Preparations of Manna and Rhubarb, admits of a perfect Cure, by restoring the Strength of the Stomach and Intestines; which, after the Sordes are gradually removed, is excellently performed by my visceral Elixir, used for a considerable time together with a proper Regimen, and due Exercise: And as this Kind of bilious Vomiting is of a chronic Nature, so that Species is of a more acute and hurtful Kind, which draws its Origin from violent Spasms of the Stomach and biliary Ducts, excited by Anger. In this Case, it is expedient to correct the Acrimony of the Bile by diluent and acidulated Medicines; by the *Spiritus Nitri Dulcis*; by the Spirit of Vitriol; by Absorbents, fossil Ivory, and Crabs-eyes: The spasmodic Motions are, in the mean time, to be allayed by gentle, antispasmodic, and anodyne Medicines; using for the Sake of Evacuation Potions impregnated with Rhubarb; but where there is a Coagulation of the Bile, or a Gall-stone, nothing is more effectual for resolving them, than the *Caroline Springs*, or any cold medicinal Waters, exhibited tepid. When too great a Relaxation of the biliary Vessels proves the Cause of chronic Vomitings, the most proper and efficacious Remedies are Corroboratives; the best of which are, the *Peruvian Bark*; the Bark of *Cascarilla*; Essence of *Gentian*; and chalybeate Tinctures, exhibited in vinous Waters.

A Vomiting which arises from an acrid Matter adhering to the Nerves of the Stomach, or from a Retropulsion of a Gout, arthritic Disorders, or an Erysipelas, besides mild Sedatives, and Medicines which excite the Motions necessary to the Expulsion of the Matter, requires a recalling of the exanthematous Matter to the Surface of the Body: This End is obtained by exhibiting a diaphoretic Powder, which determines the Motion of the Blood and peccant Matter to the external Parts of the Body; and this Effect is more successfully produced, if a small Quantity of Camphire is added to the diaphoretic Powder, and Clysters, Frictions, and Baths for the Feet, are used. When Poisons or poisonous Aliments excite a Vomiting, nothing affords more certain Relief than the immediate Exhibition of large Draughts of Milk and pinguis Liquors, by means of which the Spicula of the Poison are not only obtunded, but vomited up along with the Liquor drank. Hence some Physicians, in Vomitings arising in Plagues and malignant Fevers from a Miasma stimulating the Coats of the Stomach, order the Root of Ipecacuanha to be taken in some warm Liquor; after which, they exhibit Acids in Conjunction with Diaphoretics. But this Practice is not to be used in Cases where there is an Inflammation of the Stomach.

Acrid, acid, and bilious Sordes, falling into the Intestines, frequently excite a Vomiting accompanied with colical Pains; in which Case, we are first to exhibit internally diluting and demulcent Medicines, such as Decoctions of Oats and Hartshorn, Whey, or a few Spoonfuls of the Oil of sweet Almonds. 2. Antispasmodics; the best of which is, the anodyne mineral Liquor, mixed with a few Drops of genuine Oil of Mace, and exhibited in cold Water. The Laudanum of *Sydenham* may be, also, used for this Purpose; and in Patients of choleric Temperaments, rectified Spirit of Vitriol, either alone, or mixed with the anodyne Mineral Liquor, and exhibited in cold Water, is an excellent Remedy. And, 3. Mild Laxatives; the best of which are Clysters joined with the internal Use of Preparations of Manna and Rhubarb, or the Salts obtained from medicinal Waters dissolved. Where there are Worms in the Intestines, Clysters of Milk alone are most expedient, exhibiting at the same time internally, bitter Resolvents, or mercurial Laxatives; during the Use of which a sufficient Quantity of Milk, or Oil of Sweet Almonds, is to be exhibited.

The preservative Method is principally to be used, when

from too great a Relaxation of the *Prima Via*, Crudities are perpetually generated, and periodical Vomitings by that means produced. In this Case the Region of the Stomach, and of the Back about the first Vertebra of the Loins, with which the Stomach is connected by a certain Ligament, is to be defended from all Cold. Saline, acid, crude, and smoked Aliments, together with such as are of hard Digestion, are to be carefully abstained from. Nor must the Patient for ordinary Drink use Malt Liquors, but some proper Decoction in Conjunction with old generous Wine, especially *Burgundy*. Excessive Sleep is hurtful, but moderate Exercise beneficial. It is, also, expedient for some time to use visceral Elixirs after Meals; Chalybeate Baths, and Liquid Medicines prepared of Steel, are very beneficial. It is, also, of great Advantage at proper Intervals to purge with gentle Laxatives.

To attempt to stop a Vomiting by Astringents and Anodynes, before the peccant Matter is removed, is an highly prejudicial Practice; for when the spasmodic Motions are allay'd, worse Symptoms succeed, such as excessive Anxieties of the Præcordia, Cardialgias, and Inquietudes. For this Reason, the Vomiting generally does not cease by the Exhibition of Corroboratives, before the Excretion of the peccant Matter; for these Remedies are only to be used when the Motions, but not the Matter, are peccant, or when there is no Proportion between the Motion and the Matter, or when the latter is subtle, and in a small Quantity, but the Efforts to vomit strong and violent.

Hence if in Infants especially and Children a Vomiting is excited by the Chin-cough, on account of the Consent between the Stomach and Diaphragm, the Disorder is to be allayed by sedative and anodyne Medicines, such as the Syrops of white and red Poppies, Extract of Saffron, Oil of Sweet Almonds mixed with *Sperma Ceti*, the *Pulvis Marchionis*, Amber, Cinnabar, and a Grain or two of the *Theriaca Castellis*, Clysters may, also, be injected, and the Breast and epigastric Region may be anointed with a Liniment prepared of green and red *May Butter*, the Fats of the Badger, Fox, and Beaver, and a little of the Oil of Henbane.

The Vomiting of pregnant Women arising from a Regurgitation of the Blood to the Stomach, which is, also, observed in Women afflicted with a Retention of the Menfes, and Men labouring under a Suppression of the Hæmorrhoids, is most effectually removed by temperating Medicines, mild Laxatives, Clysters, Corroboratives, and best of all by Venesection, or a Recalling of the usual Excretions of Blood. In Cases of this Kind Emetics are highly prejudicial, since they either excite a Vomiting of Blood, or, which I have frequently seen, bring on an Inflammation of the Stomach.

A bilious Vomiting, accompanied with Spasms of the Præcordia, and excited by Anger, especially when the Patient is at a Meal, is to be treated with great Caution; and the principal Intention of Cure ought to be directed to the Relaxation of the Spasms. In such Cases it is customary with many to exhibit Emetics and Purgatives; but I would advise these to be carefully abstained from, since I have often seen violent Symptoms, and sometimes mortal Inflammations of the Stomach brought on by this means.

When Efforts to vomit or actual Vomitings seize in the Morning, which frequently happens to those who use too much spirituous Liquors, especially over Night, then the precipitating Powders, and such as involve the acid Crudities, together with Medicines which promote Digestion, such as the Stomachic Powder of *Brickmannus*, and candy'd Citron, and Orange-peel, are the most efficacious Remedies.

If, as I have frequently observed, a chronic Vomiting at certain Intervals arises from long-continued Grief, I have found the most efficacious Relief in Analeptics, and especially in the Balsam of Life mixed with an equal Portion of the anodyne Mineral Liquor, and used both internally and externally. Excellent Effects are, also, produced by the *Balsamum Embryonum*, Cinnamon-water impregnated with Quinces, and generous Wines.

When Vomiting is joined as a Symptom to febrile Paroxysms, which frequently happens in Quotidians both of the simple and double Kind, it is proper, if no Circumstance contraindicates it, to exhibit a gentle Emetic. In the Small Pox and Measles the Vomiting ceases spontaneously after the Eruption; and a Mixture prepared of distilled Waters, the Juice of Lemons or Citrons, and the Salt of Wormwood, is of excellent Service. Nor does this Preparation want its proper Use in Tertians.

A Vomiting, arising from the Pain of the Stone, is most effectually allay'd by the Anodyne Mineral Liquor, or the *Spiritus Nitri Dulcis* well prepared. Oleous Clysters, Baths of sweet Waters, Oil of Sweet Almonds taken internally, and Antispasmodics are, also, proper. The Vomiting of Persons labouring under Hernias, or the Iliac Passion, rarely remits till the Tumor is mollify'd and reduced.

Hippocrates in *Epid. Lib. 6.* informs us, that Vomiting is cured by Vomiting; but because Contraries are cured by Contraries, some Physicians have concluded from this Passage of *Hippocrates*, that Similars may be cured by Similars. But this is an Error; for, if Vomiting is cured by Vomiting, the Cure is performed by Contraries; for Vomiting often proceeds from peccant Sordes, and ill concocted Juices lodged in the Stomach, which Nature endeavours spontaneously to evacuate; and when she is not able to do so, her Force is to be assisted by Art. For this Reason young Practitioners are to be advised not to abuse this Maxim, lest by a wrong Application of it they should be led into a preposterous and injurious Practice; for if an acrid caustic Matter adhering to the Coats of the Stomach, or Blood stagnating in the Vessels of the Stomach, is the Cause of the Vomiting, it would be a terrible Error to attempt to increase this Vomiting by Art.

In order to stop excessive Vomiting, Rest, and lying in Bed, contribute considerably; for any Commotion of Body forthwith excites and augments the Vomiting; and this Observation is of singular Use in Practice.

In the Beginning of exanthematous Fevers, such as the Plague, Erysipelas, and Small Pox, Nature often attempts a Vomiting, which ought by no means to be stopped, or treated with Astringents. In Cases of this Kind, such Medicines as gently promote cuticular Excretion are proper; for when the Effluences begin to appear on the Surface of the Body, the Vomiting ceases spontaneously.

The obstinate Vomiting of hysterical Patients ought not to be suddenly stopped by Opiates, or Astringents; for by this Practice I have seen violent Convulsions of the Limbs, and Anxieties of the Præcordia produced; and when these Symptoms ceased, the Vomiting returned.

When frequent Vomiting afflicts and weakens the Stomach, an exact Regard is to be had to the Regimen and Method of Life. It is expedient to eat frequently, though little at a time, and of such Aliments as are proper, and easy of Digestion. Sweet Milk and white Bread agree with some, though not with all; and I can from Experience assert, that the drinking pure cold Spring-water contributes more to strengthen the Stomach, and remove the Custom of Vomiting, than any other Liquor whatsoever: Rich and astringent *Pontac*, and *Burgundian* Wines, are preferable to others, especially *Rhenish* Wine, which is prejudicial to hypochondriac Patients. The Juices of roasted Fleshes are more proper than those of such as are boiled.

In Diseases where Nature is by a certain salutary Motion employ'd in propelling a peccant Humour to the Surface of the Body, which happens in arthritic and erysipelatous Disorders, Topics, and especially Preparations of Camphire, are to be very cautiously applied; for I have frequently observed, that by camphorated Spirit of Wine, which in some Cases is very useful, used by infirm Patients labouring under arthritic Pains, an Hepatitis, and spurious Pleurisy, which are, also, Species of a Rheumatism, the peccant Matter has been forced back to the nervous Coats of the Stomach and Intestines, and excited Vomiting, Cardialgias, and Hiccups. In Cases of this Kind, if an Attempt is imprudently made to stop the Vomiting by Astringents and Opiates, a mortal Inflammation of the Stomach is easily brought on in infirm Patients.

Immoderate and long-continued Vomiting of pregnant Women, which principally happen in the first Months of Gestation, especially in those who indulge themselves too much in Venery, and are plethoric, are by no means to be cured by spirituous Medicines, such things as corroborate the Stomach, Astringents and Opiates; but are to be removed by repeated Venesections in the Arm, Rest of Body, and Tranquillity of Mind; and when a Vomiting of this Kind is so violent as to threaten Abortion, I have seen it more effectually stopped by drinking pure cold Water, than by the Use of any other Medicine whatever. But when an Analeptic is requisite, one Spoonful of Cinnamon-water taken after Meals, is sufficient.

Fred. Hoffman.

VOMITUS CRUENTUS. See **MORBUS NIGER.**

VOPISCUS. The Twin which comes to perfect Birth, while the other perishes in the Uterus. *Castellus.*

VORACITAS. Voracity. See **ADDEPHAGIA.**

VOSACAN. A Name in *Boerhaave* for the *Corona Solis*; *Rapunculi Radice.*

UPUPA. *Offic. Schrod. 5. 324. Aldrov. Ornith. 2. 704. Gefn. de Avib. 70. Schw. A. 368. Jonf. de Avib. 85. Charlt. Exer. 98. Raii Ornith. 145. Ejusd. Synop. A. 48. Will. Ornith. 100. Bellon. des Oyse. 293. THE HOOPO.*

It is a melancholy and very unclean Bird, living on Worms found in Dung, Caterpillars, Beetles, and the like. The Parts in Use are the *Flesh* and *Feathers*. The *Flesh*, and its Decoction, according to *Avicenna*, have a specific Virtue against the Colic. And the *Feathers* applied, are said to mitigate Pains of the Head. *Dale.*

URACHUS, *ὑράχης*, from *ὑέρ*, Urine, and *ῥαχ*, to have, or contain, a Ligament belonging to the Bladder, and of particular Use in the Fœtus. See **ALLANTOIS** and **RENES.**

URÆON, *ὑράιον*, in *Galen. Com. in R. V. f. A.* is the the Extremity of a Bone, particularly the *Os Sacrum. Castell.*

URAGION, *ὑράγιον*, in *Hippocrates, Lib. de Corde,* is the the Apex, or Point of the Heart.

URAGOS, *ὑράγος*, from *ὑέρ*, Urine, and *ῥαγ*, to convey, in *Aetius, Tetr. 4. Serm. 4. Cap. 3.* is the same as *Urachus.*

URANÆ, *ὑράνας*, from *ὑέρ*, Urine, the Ureters, by some so called. *Goræus.*

URANION, *ὑράνιον*, is the Name of a Collyrium; of the Sort called *Adelia*, [see **ADECTOS**] described by *Paulus, Aetius,* and *Trallian, Lib. 2. Cap. 5.*

URANIOS, *ὑράνιος*, from *ὑράν*, *Cælum*, the Heavens, in *Hippocrates*, is commonly spoken of the Air, particularly in *Epid. Sect. 3.* near the Beginning.

URANISCUS, *ὑράνισκος*, a Diminutive of *ὑράν*, Heaven, is a Name for the Palate, or *Hyperoa*, on account of its being the superior Part of the Mouth, and, also, arched in manner of the Heavens. *Castellus.*

URANOS, *ὑράν*, Heaven, by *Hippocrates*, in Compliance with the vulgar Way of Speaking, is commonly used for the Air, which is above us as far as the Region of the Clouds. *Galen, Com. 2. in 1 Epid. T. 4.* It is, also, a Name for the Palate, as in *Aristotle, de Part. Anim. Lib. 2. Cap. 17.*

URANOSCOPUS. *Offic. Aldrov. de Pisc. 264. Rondel. de Pisc. 1. 305. Jonf. de Pisc. 61. Salv. de Aquat. 197. Raii Synop. Pisc. 97. Uranoscopus seu Cœli Spectator. Charlt. de Pisc. Callionymus vel Uranoscopus, ὑρανόσκοπος. Oppian. THE STAR-GAZER.* For a further Account of this Fish see **CALLIONYMUS.**

URCEOLARIS, URCEOLA. Names for the *Parietaria*, from its Use in scouring Glass-vessels [*Urceoli vitrei*].

URCEUS. A Measure of Liquids, of various Dimensions in different Places; in the Territory of *Pergamus*, it contained twelve or fifteen Ounces of Wine. *Castellus.*

UREDINES, in the alchymistical Cant, are the Virtues of Metals communicated to them from the Sun. *Uredo* in *Pliny, Lib. 20. Cap. 18.* is the Smut affecting Fruits; and is a Name given, also, to a burning and very severe Cephalalgia in a remarkable Case related in the *Philosophical Transactions* for June 1668.

UREMA, *ὑρέμα*, in *Hippocrates, Lib. de Nat. Hominis*, is the same as *ὑέρ*, Urine.

URENTIA (Medicamenta), the same as *Caustica*, or rather, according to *Blancard*, **PYROTICA.**

URESIS, *ὑρέσις*, in *Coac. 263.* is the same as *ὑέρ*, Urine, but *ibid. 348.* signifies Miction, or the Action of urinary Excretion.

URETERES, *ὑρετήρες*, from *ὑέρ*, Urine. The Ureters. See **RENES.**

URETHRA. See **GENERATIO.**

The proper Method of opening the imperforated Urethra, or Glans.

Two Cases usually occur, in which the impervious Glans, or Urethra, should be opened. 1. When the Glans is impervious in a new-born Infant. 2. When, in Adults, the Extremity of the Glans being imperforated, the Urine is discharged under it. That the Urethra is impervious in Infants, may be gathered from hence: If, for some Days after their Birth, we do not find the least Marks of Urine in the Cloths and Swaths about them, and if they cry violently. Upon this, the Operation must be speedily performed, lest the Infant should lose its Life, through the Detention of too great a Quantity of Urine. But this Operation is commonly varied, according to the various Dispositions of the Disorder: For sometimes we find some Mark, at least, of an Urethra in the Glans, as the Passage of the Urine is only stopped by a very thin kind of Membrane. In this Case, therefore, the Cure may very easily be performed, by carefully piercing that Membrane with a pretty fine Lancet, or even with the Needle before described in couching a Cataract (*Tab. XXXVIII. Fig. 5. or 6.*); and, after a Discharge of Urine made by the Patient, by introducing into the Urethra, either a Tent fastened to a Thread, and dipt in the Oil of sweet Almonds, or in some other vulnerary Oil, or a small flexible Candle, or a waxed coarse Thread, in order to hinder it from closing again. If the Membrane be somewhat thick and fleshy, it is better to use, instead of the Lancet, either the aforesaid Couching-needle, or even a finer triangular-pointed Needle, commonly called a *Trocar*, like that in *Tab. XLVII. Fig. 6.* and to perform the rest of the Operation in the Manner already directed. But if not the least Mark of an Urethra can be perceived, then commonly the Infants are left by many Surgeons without any kind of Assistance, as incurable. Though it is better, in my

my Opinion, to make the Experiment, and to attempt, tho' in vain, some difficult Operation, than, by neglecting all Methods, to exchange the doubtful Hopes of Recovery for the immediate Danger of Death. Wherefore those Surgeons are to be commended, who, in such a Case, especially if the adjacent Parts of the Abdomen be distended with Urine, duly perforate the Penis with some of the above-mentioned Instruments; and, after a Discharge of the Patient's Urine, set about the rest of the Cure in the Manner already prescribed.

But if this Method should not prove successful, then nothing seems to remain, but the Death of the Child, or piercing the Bladder above the Os Pubis, or perforating the Perinæum, in the Manner directed under that Article. But, whether this latter Method of Cure for this Disorder in Infants has ever been tried by any Surgeon, I cannot be positive.

In Adults several Cases may happen which require the Assistance of a Surgeon to open the impervious Glans: For, sometimes, it is true, the Urethra is pervious, but yet in such a manner that the Urine flows not so much from the Glans, as from some other Part of the Penis below it, and that sometimes nearer, and sometimes farther from it, and even in some Cases from the Perinæum. Sometimes we find a Perforation in some other Part of the Penis and Urethra, besides the Glans, so that the Urine passes two Ways: But almost always such Disorders have been contracted in the Uterus; and consequently they are natural, as it were, to most of those affected with them. In the mean time it cannot be denied, but that they likewise arise from an Ulcer or Wound in the Penis, or sometimes, possibly, on occasion of extracting a Stone out of the Urethra, or from the Acrimony of the Urine, which being stoppt by a Stone lodged in the Urethra, corrodes, and makes a new Passage for itself. Such Apertures are all commonly hard to cure, yet those which are largest and nearest to the Bladder are worst; and if the Aperture is very large, it can never be totally conglutinated. Those Persons whose Penis is perforated near the Abdomen, are to be esteemed quite unfit for Marriage and Procreation; but the Case is otherwise with those whose Urine flows either about the Middle of the Penis, or near the Glans; for nothing at all hinders the subtle Particles, or Aura of the Semen of such Persons in Coition, from passing into the Uterus: So that here the greatest Care and Prudence is requisite in those Surgeons, who, in Cases of this Nature, are called upon to give their Opinion, before any Court of Judicature, as to Matters of Ability or Impotence. If the Urine flow through the Glans, though at a preternatural Aperture; yet since a Man is not unfit for Copulation, nor has any Impediment in discharging his Urine, it seems safer to forbear attempting a Cure, than by an Incision to occasion a dangerous Profusion of Blood, and an Inflammation in the Glans, a Part very full of Blood-vessels. But if the Urethra be perforated below the Glans, or even below the Frenulum, then two things are chiefly incumbent on the Surgeon. 1. To make a proper Perforation through the Glans with some Instrument. 2. To agglutinate and close up, as nicely as possible, the preternatural, and consequently incommodious, Passage of the Urine.

The Glans may be perforated most commodiously in two Manners: The first is, after a Discharge of the Urine, to cut longitudinally in a strait Line the impervious Glans with a Knife, beginning at the preternatural Aperture, in such manner as to lay the Corpora Cavemosa bare, yet without wounding them in the least. Let the wounded Parts bleed plentifully, according to the Patient's Strength and Habit, the more readily to prevent any Danger of an Inflammation. Then if the Bleeding does not stop spontaneously, fill the Wound with dry Lint, which cover with a Plaister and Compress, and make a proper Bandage round it. About twenty-four Hours after, remove the Dressings and Lint, and introduce a smooth leaden Cannula into the Wound, in such a manner as to pass from the Extremity of the Glans, beyond the preternatural Foramen, into the Urethra; and consequently receive and transmit the Urine, till the Cure is completed. Make repeated Scarifications in the callous Lips of the preternatural Orifice; or which is safer, cut them away very nicely with a Pair of fine Scissars; for the finer the Portions cut off are, the better do the Parts agglutinate; to promote which, glutinous Plaisters are exceedingly serviceable, provided they be narrow, but yet adapted to keep the Lips of the Orifice in Contact.

But they must not be brought quite round the Penis, lest by hindering the Circulation they should cause too great a Swelling, and make the Lips of the Orifice part from each other. Put a Compress over the Plaister, and a slack Bandage round it, and last of all secure the Cannula from falling out. After this is done, put the Patient to Bed, and let him keep himself very quiet there, and forbear drinking for some Days, lest he should have too frequent Calls to make Water, or at least a Discharge of his Urine before the Wound is conglutinated should excite

Pain, and, by loosening the Plaister, hinder the Cohesion of the Parts: For indeed the first Dressing should not be removed unless there be some urgent Necessity, before the third or fourth Day; and then it must be done with the greatest Care, lest the Lips of the Wound, having still but a slight Cohesion, should be again separated; and when the Parts are found to cohere, the first Dressing must be kept on for some Days: But if on the contrary, they be not joined, it will be proper to lay on a new adhesive Plaister, till the Lips of the Orifice are firmly united; as to the rest, the same things are to be done, as directed in every Conglutination of Wounds.

The second Method of Cure is performed in the following Manner: Let the Needle, or fine sharp-pointed triangular Trocar, (*Tab. XLV. Fig. 2. or Tab. XLVII. Fig. 6.*) be passed directly, and very carefully, through the impervious Glans into the Urethra; then, after a sufficient Quantity of Blood is discharged, let a pretty long and slender Tent of clean Lint, in order to stop the Bleeding, be introduced into the new made Orifice, and a proper Dressing applied. But if the Bleeding stops spontaneously, let a waxed coarse Thread, or a flexible Wax-candle big enough to enter it, be introduced, in order to hinder the Adhesion of the Lips of the Orifice. Next Day, let a new Tent, dipt in a digestive Ointment, be put into it, but with this Caution, that it reach not beyond the preternatural Foramen from which the Urine has already flowed, so that as often as there is Occasion, the Urine may be discharged thro' it, till the Inside of the new Passage be lined with a Membrane; for otherwise, should it flow through it too soon, it would occasion Pain in the fresh Wound, and hinder the Production of the Skin. For some Days, therefore, let the Tent, and afterwards the Wax-candle of a proper Thickness, be dipt twice a Day in some desiccative Ointment, and let the Urine be discharged through the preternatural Orifice, till by means of the Wax-candle and desiccative Ointment, the Membrane be found to be grown over the Inside of the new Perforation. For then, instead of a Tent, Thread, or flexible Wax-candle, a very smooth and pretty long leaden Cannula is to be introduced into that new Aperture of the Penis, so as to pass beyond the old Orifice, and receive and discharge the Urine; by which means the Agglutination of the preternatural Foramen will be more conveniently accomplished. The following Method of Cure is most commonly made use of: Either the Lips of this Orifice are scarified with the Knife, or cut as nicely as possible, with a fine Pair of Scissars, and then joined by laying an adhesive and narrow Plaister over them, after which the Wound is to be treated in the same manner, as has been shewn above in the first Method of Cure. The preternatural Foramen being closed up, the leaden Cannula is likewise taken out; and thus the whole Cure is completed. Sometimes, such is the State of that preternatural Foramen of the Urethra, that it cannot be closed up or agglutinated; and yet duly perforating the Glans is not entirely an useless Operation; for when it is properly executed, and a new Passage formed, the Patients become afterwards more fit for Procreation. For tho' by this means, perhaps, not all, nor the greatest Part, yet a considerable Portion of the Semen can, in Coition, be thrown into the Uterus. By this very Method of Cure, therefore, those have the Faculty of Generation restored, or at least promoted and increased, who otherwise, through a natural Defect in the Penis, seemed almost or entirely unfit for Procreation. Besides, it is very necessary, after the Cure has been completed, to open a Vein as soon as possible, and repeat Bleeding occasionally, especially in such Persons as are of a laudable and plethoric Habit. For otherwise it may happen, especially in vigorous young Men, that an Erection and Expansion of the Penis should readily ensue, which may divide the Lips of the Orifice, and consequently retard the Conglutination, or render it entirely impossible.

I know very well, that there are some Surgeons, who, in order to close this kind of preternatural Foramen, stitch up the Lips of the Wound. Others choose rather by Corrosives to consume the hard and callous Parts of the Foramen, than to cut them away. But neither of these Methods of Cure, in Cases of this Nature, is much to be commended. For the tender Lips breaking, as commonly happens when stitched, the old Foramen, instead of being closed up, is rather enlarged. And by applying Corrosives the Skin may be corroded too much, and consequently the Orifice made so wide, that the Lips can never afterwards be joined together; and both Pain and a troublesome Inflammation may be thereby caused.

URETICOS, *ἐνὺρικός*, from *ἐνὺρ*, Urine, is sometimes spoken of the Urinary Passages, in which Sense *ἐνὺρικοί πέποι*, are the Ureters; sometimes it is apply'd to Medicines, and so is the same as *Diureticos*, sometimes to the Patient, and imports a Facility of Urine, and in that Sense is used by *Hippocrates*, de *R. V. J. A.* in the superlative Degree, where *ἐνὺρικός τις*, with him, signifies a Person who has a very free and plentiful Flow of Urine;

Urine; and, in the last place, it is spoken of a Disease, and apply'd to a Species of symptomatic Fever; and thus *Uretica Febris* is a Fever attended with a Diabetes.

URIAS, *seles*. The Urinary Tube; that is, the *Urebra*.

URINA. Urine. See RENES.

The principal Symptoms of Urinary Secretion injured are,

1. *Ixveia*, an *Ischury*, or entire Retention of Urine, the primary Causes of which are a Plethora; an Inflammation of the Kidneys, Ureters, Bladder, the Neck of the Bladder, Urethra; a Spasm, and Compression of the same Parts; also, an Obstruction of the same from the Stone, Phlegm, Pus, a Thrombus, Caruncle, Impostume, or Tumor.

2. *Avveia*, a *Dysury*, or Excretion of Urine with Trouble, Labour, or Pain. One Species of this is what we call *segyseia*, a *Strangury*, in which there is an Emission of Urine by Drops, with a burning Sensation. The Cause of both these Disorders is manifold; as principally the Acrimony of new fermenting Beer or Wine, or of their Lees; the acid, salt, alkaline, oleous, aromatic, bilious Acrimony of the Humours; an Excoriation of the Parts of the Bladder, or Urethra, by an Inflammation, some Ulcer, an Attrition by a Stone, and especially from an internal Exhibition of caustic Insects; and, lastly, from a Stoppage of the Passages by a Stone, or a Tumor in the Neck of the Bladder, or the Urethra.

3. An *Incontinence of Urine*, when the same flows without Effort or Consent of the Will, or Respiration. This Disorder generally proceeds from a Resolution, Dilatation, or Dissolution of the Fibres of the Sphincter of the Bladder, or a Consumption of the same by a Suppuration, or a Putrefaction of them by a Gangrene. See INCONTINENTIA.

4. *Διαβήτης*, a Diabetes which is a frequent and copious Discharge of chylous or lacteous Urine. The Cause of it is supposed to be too great a Laxness of the urinary Arteries, in Conjunction with an extraordinary Dilutedness of the Humours, both which proceed from Aquosities. *Boerhaav. Inst. Med.*

An ISCHURY.

A total Suppression of Urine is called *Ischuria*, *ixveia*, "an *Ischury*;" but a Diminution of the Action of making Water, is termed *Stranguria*, *segyseia*, "a *Strangury*;" tho' this latter Word is of much more extensive Signification, as comprehending every *Stillicidium* of Urine, which if not attended with Pain, and the Urine flows by Drops, is a lesser Degree of *Ischury*; but if it be painful, is to be referred rather to a *Dysury*, or Heat of Urine.

An *Ischury*, then, or a total Suppression of Urine, is of two Kinds, as it is commonly distinguished into the *true*, or *genuine*, which attends a full Bladder, and the *spurious* or *bastard* Kind; in which Affection the Bladder is empty, nothing descending into it from the Kidneys.

A *true* and *genuine Ischury* depends on three Causes; the first of these is an *Abolition of Sense in the Bladder*, on account of a Resolution or Obstruction of the Nerve which supplies it, or a Diversion of the Spirits, for want of which the Bladder feels no Stimulation, nor is it at all irritated to Expulsion, as is the Case in Deliriums, and soporose Affections.

A second Cause is a *cold Distemperature of the Bladder*, contracted from refrigerating Causes, either internal or external, which obtund the Sense of the Bladder, and weaken its expulsive Faculty.

A third Cause is a *Straitness of the Neck of the Bladder*, intercepting the Efflux of the Urine. Of this *Straitness* there are three Causes assigned by *Galen, de Loc. Affect. Lib. 1. Cap. 2.* For either, first, he says, the Muscle surrounding the Neck of the Bladder is swelled to such a Degree as to obstruct the Passage, which is the Case when it happens to be affected with an Inflammation, Scirrhus, Abscess, or any other Tumor; or,

in the second place, there is an Excrescence of some Caruncle, the Passage from some preceding Ulcer; or, lastly, the Obstruction proceeds from a Callus, or some other Substance, insensibly generated in Length of Time from a gross and viscid Humour. The Passage may be stopped up, also, by a Stone, a crude and gross Humour, grumous Blood, or Pus.

Moreover the Urine may be intercepted by a Compression of the Neck of the Bladder, from a Tumor of the incumbent neighbouring Parts; for Instance, the Uterus, when turgid with a large Foetus; the Intestinum Rectum, when stuffed with hard Faeces, or the Anus tumefied with the Haemorrhoids increased to a remarkable Bigness.

Again, a Suppression of Urine is sometimes occasioned by an excessive Quantity of Urine too long retained, by which the whole Body of the Bladder is distended in such a manner as to be incapable of contracting itself in order to Expulsion, from which Distension the Passage must of Necessity be contracted and closed up. Now a Repletion of the Bladder from too long a Retention of the Urine, happens in two Cases: The first is when a Person in Health, on occasion of ur-

gent Business, or when he is at Church, or at the Assemblies, at Feasts, riding in a Coach, or in other like Circumstances, for want of a convenient Opportunity of Time and Place, voluntarily suppresses his Urine: And, secondly, the Bladder is excessively filled and distended, so as to be incapable of contracting itself, from an Insensibility of the Stimulus of the Urine, on account of the dulled Sense of the Bladder, occasioned by an Affection of the Nerves which supply that Part, when the Nerves appropriated to the Constriction of the Sphincter Muscle may all the while remain unaffected. This was the Case of a certain Person, as we are assured by *Galen, de Loc. Affect. Lib. 6. Cap. 4.* from a Luxation of the Vertebrae of the Spine.

A *spurious Ischury* so called is, when the Urine is suppressed, the Bladder being empty, because there is no Afflux of Urine to that Part. The Cause why no Urine descends to the Bladder is of two Kinds; being either, first, because the Kidneys form no Urine, nor send it downwards; or, secondly, because the Ureters receive it not. The Kidneys may be injured in their attractive or expulsive Function; the first happens when either the Faculty itself receives Detriment, or the Object is unsuitable and wrong. The Faculty is injured by a violent Distemperature, and principally by a cold one, or is under an Impediment from an Obstruction either in the Kidneys, or the emulgent Vessels, proceeding from the Stone, or a Conflict of gross Phlegm, or Pus, descending thither from some superior Part; sometimes, also, the emulgent Vessels are obstructed by a Repletion from an immoderate Collection of Blood and Serum, an Instance of which *Riverius* gives in *Obs. 1. Cent. 1.*

The Attraction of the Kidneys is injured through the Fault of the Object, when the Serum is either consumed, as in burning Fevers, or diverted to other Parts, which is the Case in a Dropsy.

The expulsive Faculty of the Kidneys is in like manner injured by the same Causes, that is, by a Distemperature, Obstruction by a Stone, grumous Blood, gross Phlegm or Pus, or by an Inflammation.

The Ureters receive not the Serum, nor transmit it to the Bladder, on account of an Inflammation or Obstruction from the Stone, grumous Blood, Pus, or gross Phlegm, or from a Compression of the neighbouring Parts by Tumors.

It is to be observed, that both Kidneys, or Ureters, must be affected, in order to procure a total Suppression of Urine; for while there is an open and a free Passage through one of them, the Urine may continue to flow.

All the forementioned Causes may each of them be considerable enough to procure an entire Retention of the Urine, called an *Ischury*; but if they are too weak for that Effect, they produce only a partial and diminished Excretion, which we call a *Strangury*. Both Disorders proceed from the same Causes differing only in Degree.

The *true* and *proper Ischury* is known by the Weight and Tension of the Hypogastrium, and the circumscribed Tumor, which has the Figure of the Bladder. Its Causes are discovered from preceding and attendant Circumstances; for if the Disorder proceeds from a copious Collection of Urine, which impedes the Contraction of the Bladder, it may be learnt by Relation from the Patient, who will inform you, that he has omitted the necessary Business of making Water for a considerable Time, either on account of long Riding, or out of Respect to the Place, or the Presence of some honourable Person, and that he was never affected in those Parts before. If he happens to labour under a Delirium, Palsy, or any other Disorder, above enumerated among the Causes, the Suppression of Urine is justly to be ascribed to it.

Constrictions from Tumors of the same or neighbouring Parts, or from other Causes above-mentioned, may be known from the proper Symptoms of those Affections. Obstructions of the Urinary Passage may be discovered by introducing a wax Candle or Catheter, which, if they cannot penetrate, but stop by the Way, are a plain Evidence, that their Passage is obstructed by some Stone, Caruncle, or some other Matter that blocks up the Way. And these offensive Substances may be distinguished by the following Characteristics: If a Stone be impacted in the Canal, and the same be descended from the Kidneys, nephritic Pains have preceded; if the Stone be generated, or has long resided in the Bladder, the Symptoms proper to a Stone in the Bladder have, at least, in some slight measure, preceded the Affection. If a Caruncle hinders the Passage of the Urine, it is the Consequence of a virulent Gonorrhoea, or some Ulcer in the Canal of the Penis, which has for a long time been discharging purulent Matter. If the Obstacle be a Grume of Blood, a Concretion of Pus, or gross Phlegm, they will manifest themselves by an Excretion of some small Portions from the Penis in adhering to the Catheter when extracted.

A *spurious Ischury* is distinguished by its having no Tension, nor

nor any Tumor or Weight in the Region of the Pubes, but rather a Perception of a kind of Vacuity, or Emptiness in these Parts. There is no Desire to make Water, no Irritation in the Bladder; and when the Catheter is introduced, tho' the Passage be found free and open, no Urine comes away. Preceding Signs are Stones in the Kidneys and Ureters, an Inflammation, or great Plenitude, or excessive Drinking, not followed by a copious Discharge of Urine, and by that means occasioning too great a Repletion of the Veins; or, lastly, a burning Fever, or a Dropsy, by turning the Course of the Serum another Way, may be the Cause of a spurious *Ischury*.

As to the *Prognostics*: A Suppression of Urine is very dangerous, and if it exceeds the seventh Day, generally mortal. For the Serum retained in the Vessels infects and contaminates the Blood, regurgitates upon the whole Body, endangers Suffocation, and, being convey'd to the Head, there induces a comatous Affection.

A Suppression of Urine, which proceeds from a Wound of the Spine, a Fall, or a Luxation of the Vertebrae, is incurable.

If the Smell of Urine proceeds from the Mouth and Nostrils of the Patient; there is no Hope left of Recovery.

A Tenesmus, supervening a Suppression of Urine, portends Death on the seventh Day; a supervening Hiccough shews Death near at hand.

In the Cure of an *Ischury*, whether total or partial, our Intention is to be directed to the Removal of the Cause. And, first, with respect to the *spurious Ischury*, which depends on Affections of the Kidneys and Ureters, we are to address ourselves to the Cure of the Inflammation, nephritic Pains, and Stone of the Kidneys. But such an *Ischury*, proceeding from a Repletion of the emulgent Vessels, is to be treated by taking away a large Quantity of Blood, and by Hydragogues. A *true Ischury* is cured by Remedies which remove the Cause that produces it. And here, first, if it proceeds from an Inflammation of the Bladder, or adjacent Parts, such Medicines as are adapted to the Cure of such Inflammations are to be employ'd.

If the Suppression of Urine be caused by a Stone impacted in the Neck of the Bladder, it is to be removed by the following Method:

First, let the Patient be placed on his Back, with his Legs elevated, and be strongly shaken for a good while together, that the Stone may slip back into the Bladder; and if it cannot be moved by this means, it is to be impelled by introducing the Catheter. If the Stone has penetrated deeply into the Urethra, its Excretion is to be promoted by all manner of Ways, by gently impelling it with the Fingers, and so bringing it to the Extremity of the Penis; after that by Immersion of the Penis in warm Water, or warm Milk, or by immersing the Patient in a Semicupium, in order to relax and dilate the Passages. If the Stone can neither be extracted outwardly, nor impelled inwardly, we are directed by practical Authors to make a Ligature above and below the Place, and then to make an Incision in the Penis, and so take out the Stone.

An Obstruction of the Neck of the Bladder from an Inflammation, is cured by Remedies proper for an Inflammation. However, if the Urine be retained for a considerable time, a Wax-candle rubbed over with Oil of sweet Almonds, may be gently introduced, avoiding by all means the Catheter, lest, by exciting a Pain, the Inflammation should be increased.

A Suppression of Urine from a Caruncle is cured by an Extirpation of that Caruncle, which must be accomplished by proper Remedies introduced by Help of a Wax-candle, which must be managed by a Surgeon well skilled in such Operations. But when the Symptoms are pressing, for the Caruncle sometimes swells to such a Degree as to obstruct the whole Passage, we are under a Necessity of making a Way for the Efflux of the Urine by the Introduction of the Catheter, though it is to be feared, lest the Part being irritated should swell the more. Before we take this Method, however, we are to attempt a Revulsion by Phlebotomy and Vomiting, and, also, to try to diminish the Inflation of the Caruncle by an Application of Repellents to the Pubes and Perinæum, that a Way may be made for the Discharge of the retained Urine.

An *Ischury* owing to gross Phlegm requires Purgation; first, with *Diaphœnicon* reduced with Rhubarb into the Form of a Bolus, and afterwards with Turpentine frequently exhibited with Powder of Liquorice. After these, a Decoction of the Opening Roots with Oxymel, or Syrupus Byzantinus, may be given; not omitting, during the whole Course, the Use of emollient and opening Clysters, Fomentations, and Semicupiums. All such Remedies as are proper for dissolving and expelling the Stone are, also, convenient in this Case; and among other peculiar Remedies the following are approved by Experience:

Take Benedicta Laxativa, half an Ounce; Troches of Myrrh, two Scruples; Decoction of Savin, three Ounces;

mix them for a Potion. With this Remedy a Suppression of Urine, in a certain Woman, was cured in a short time.

If there be a Redundance of Phlegm in the whole Body, or particularly in the Head, an universal Purgation by Apozems for three or four Days together in the Beginning of the Disorder, will be of very good Service, Phlebotomy being premised.

A very good Medicine, also, in this Affection, is a Julap prepared of the Juices of Pellitory of the Wall, Sea-fennel, and Lemons, with Oil of sweet Almonds, prescribed for the Cure of the Stone in the Kidneys.

Syrupus Fernelii de Raphano, two Ounces the Dose, is, also, very effectual in this Case.

Dodonæus relates, *Lib. Conserv. Cap. 47.* that a Man of eighty Years was perfectly cured of a Strangury by once taking a Lixivium of Egg-shells incinerated and mixed with Spirit of Wine.

Arnaldus Villanovanus recommends Wine of Winter-cherries in the following Case, related in his Book *de Venis*: "There was in my Time, he says, a certain Cardinal, who for Days together had laboured under a Suppression of Urine, and was swelled very big, and his Case was said to be desperate. When all Remedies were of no Effect, at last by the Advice of a Quack, he took a Draught of Wine of Winter-cherries, and made a vast Quantity of Water, and was freed from his Disorder. By the good Success of this Experiment this poor and illiterate Quack grew celebrated and rich." This Wine is prepared as *Arnaldus* there describes it, by taking five, seven, or more Winter-cherries, and bruising them in White-wine, which must afterwards be strained, and so exhibited.

Millepedes, also, bruised in White-wine, and given, are very effectual in provoking Urine. The Oil of Scorpions of *Matthioli*, to the Quantity of five or six Drops, in Broth, or other Liquor, is a potent Diuretic.

The frequent Use of Crystal Mineral provokes Urine, especially where an Inflammation is feared, which is very often excited by too long a Retention of the Urine in the inner Coat of the Bladder.

Spirit of Salt has the same Effect, and in a much greater Degree.

Of common Remedies the Juice of Pellitory of the Wall depurated, and exhibited to the Quantity of four Ounces, with half an Ounce of Sugar, is of great Efficacy; it may be mixed with Sal Prunellæ, or Spirit of Salt.

If a Suppression of Urine, which is owing to a pituitous Matter, makes frequent Returns, there is no better Remedy than the Use of the nitrous and sulphureous Waters of hot Springs, which by frequent drinking and bathing are of mighty Efficacy in dissolving, absterging, and consuming the mucilaginous Matter.

A Person of Quality of this City, labouring under a Suppression of Urine for several Days, after trying many Remedies in vain, was cured by the Injection of the following Clyster, and retaining it two Hours.

Take of the Roots of Smallage, Parsley, Butchers-broom, Asparagus, Mallows, Marsh-mallows, each two Ounces; Pellitory of the Wall, two Handfuls; Seeds of Anise, Fennel, Dill, Caraway, Daucus, Bishops-weed, Bastard-saffron, Rue, and Cumin, with Bayberries, each half an Ounce; Flowers of Chamomile, Melilot, Dill, and Stoechas, each two Pugils: Boil them in red Wine to the Consumption of half; strain the Liquor, and in one Pint of it dissolve four Ounces of fresh Butter, two Ounces of Honey of Roses, one Ounce of brown Sugar, half an Ounce of Benedict. Laxativ. one Yolk of an Egg, Oils of Nuts, Dill, and Linseed, each one Ounce: Make them into a Clyster.

The Chymists, also, have Remedies which they highly extol for these Disorders, such as Spirits of Salt, Vitriol, Sulphur, and Turpentine, which they exhibit to the Quantity of half a Scruple in proper Waters, or in Chicken-broth. They recommend, also, for the same Purposes, Salt of Tartar, and Salt of Bean-stalks, exhibited from half an Ounce to an Ounce.

To make a Revulsion of the Humours from the Parts affected they prescribe an Emetic, by which means they boast to have cured not a few.

Through the whole Course of the Cure, Fomentations, Liniments, Cataplasms, Semicupia, and other external Remedies, the same as are prescribed in nephritic Pains, are not to be neglected. A good Remedy, among others of that Kind, is a Cataplasm of Pellitory of the Wall fry'd with Butter, or what is better, with Oil of Scorpions; also, a Bladder half full of Oil, which will be improved by boiling Scorpions in the Oil.

A common Topic in this Disorder is a Cataplasm of fry'd Onions with Swine's-fat, and an Addition of some Oils, applied to the Region of the Pubes and Loins.

But far more potent in Operation are raw white Onions bruised in a Mortar, and with Oil reduced into the Form of a Cataplasm, and applied to the Kidneys, Ureter, and Region of the Pubes.

A Cataplasm of bruised Radishes has the same Virtues.

When an Ichury is produced by Grumes of Blood, we must attempt their Dissolution by Remedies adapted to that Purpose. Of the Number of these are, Troches of Amber, the Rennet of a Kid, the *Coagulum* of an Hare, Oxymel simple, and of Squills, Syrup of Vinegar, and the like. Among external Remedies, Cow-dung is of admirable Efficacy, according to *Aetius*, *Tetrab. 3. Serm. 2. Cap. 27.*

In the last Place, when a Suppression of Urine, or a Strangury, proceeds from Pus, absterging and incising Remedies are required, and such as are usually prescribed in Ulcers of the Kidneys and Bladder. See ISCHURIA.

Of a DYSURY, or HEAT OF URINE.

By the Word *Dysury*, that is, *Difficulty of Urine*, we understand any dolorific or painful Excretion of Urine, which the Moderns generally express by *Ardor Urinae*, "an Heat of Urine." Numbers of Authors confound this Affection with a Strangury, which they will have to be attended, also, with a painful Sensation, and to be distinguished from a *Dysury* only in that a lesser Quantity of Urine is discharged under it; for which Reason it is, also, called *Stillicidium Urinae*, "an Excretion of Urine by Drops." But we chose, for the sake of Perspicuity, to call a Diminution of the Quantity of the Urine, not attended with Pain, by the Name of *Stranguria*; and comprehended it under the same Chapter with *Ichuria*, because the same Method of Cure serves for both; and proceed, in this Chapter, to treat of dolorific Excretions of Urine, comprising them all under the Name *Dysuria*, "Dysury;" because they all proceed from the same Causes, and require the same Remedies.

The proximate and immediate Cause of dolorific or painful Miction, or making of Water, is, a Solution of Continuity in the sphincter Muscle, or *Urethra*; and therefore whatever is capable of making a Solution of Continuity in those Parts, may excite a *Dysury*, or *Heat of Urine*.

Amongst those Causes, the principal and most frequent is, the Acrimony of the Urine, which is sometimes simple, and without the Mixture of other Humours, as proceeding only from an hot Distemperature of the Viscera, or the Use of hot and acrimonious Food; but it is more frequently procured by a Mixture of acrid Humours, such as Bile, or salt Phlegm. Sometimes a Distillation of Pus from an ulcerated Bladder or Kidneys, is the Cause of this Acrimony in the Urine; sometimes a kind of white and milky Substance, discharged in great Quantity with the Urine, excites this Heat of Urine: This Substance, the Generality of Physicians take to be purulent, and to proceed from the Kidneys: But their Opinion is rejected by *Sennertus*, for this Reason, because if the whole Kidneys were resolved into Pus, they could not supply such vast Quantities as are sometimes excreted every Day, for some Weeks together. He supposes it, therefore, to proceed from a depraved Concoction, first, in the Stomach, and afterwards in the Liver; since an Error of the first Concoction can never be rectified in the second. Hence the Chyle, and after that the Blood, is left in a crude State, without due Depuration from the saline and tartareous Parts, which ought to be separated in the first Concoction; and these Particles, being attracted by the Kidneys, and afterwards transmitted to the Bladder, excite that dolorific Sensation in the Act of making Water. He confesses that he was induced to be of this Opinion, from observing the following Case: A learned Gentleman, who had laboured for some Weeks under an Heat of Urine, and voided the same in considerable Quantities, but so full of a white Matter, that it took up half the Urinal; and with a great deal of Pain, was at last, after trying various Sorts of Remedies to no Purpose; perfectly cured only by drinking Malmsey Wine.

A latent Stone in the Bladder, by Allision to its Neck, creates a Pain in making Water; the same may be excited by gross Sand vellicating the Entrance into the *Urethra*.

An Inflammation or Ulcer of those Parts excite, also, an Heat of Urine, since the Parts, being rendered more exquisitely sensible by those Affections, suffer considerably even from Urine of a good Temperament, just as we see in external Inflammations or Ulcers, the Parts affected not being able to suffer the least Touch from Objects otherwise suited to them. Thus, in a Gonorrhoea, while the Inflammation of the *Urethra* continues, an Heat of Urine is constantly felt.

The Diagnosis of this Distemper is manifest of itself; for the Pain, under Excretion of Urine, is so sensible and acute, as frequently to make the Patient cry out: But the diagnostic Signs of the Causes are to be distinguished in the following manner:

If the Heat of Urine proceeds from its Acrimony, it will appear thin, and high-coloured, and sometimes of a flameous Colour; or it will be remarkable for a Mixture of bilious, pituitous, or purulent Matter; or there will be a Distemperature of the Viscera, or an hot and acrimonious Diet, a sultry Season, or the like preceding procatactic Causes.

As for Stone, and Inflammations of those Parts, and the like Causes, they will manifest themselves sufficiently by their proper Signs.

With respect to the Prognosis, this Affection is not dangerous in itself, but is very afflictive to the Patient; and, with regard to the various Disposition of the Causes, is often difficult to be cured, especially in aged Persons, whom, if decrepit, it accompanies to the Grave; and at whatsoever Age it happens; if it continues long, it causes an Ulceration of the Bladder, and its Neck.

The Cure consists, in the first Place, in the Removal of the Cause: And thus, if the *Dysury* proceeds from the Stone, an Inflammation, or an Ulcer of the Bladder, or its Neck, the Cure is to be managed with an Eye to Indications taken from these respective Diseases; but such Remedies as are, also, proper for mitigating the Symptoms, will be proposed below.

A *Dysury* proceeding from the Acrimony of the Urine; and the Heat of the Humours mixed with it, is to be treated with the following Remedies.

In the first Place, Phlebotomy is necessary to be administered; in order to correct the intemperate Heat of the Liver, and other Parts; and the same is to be repeated several times, with regard to the Greatness of the Plethora, or the Danger of an Inflammation: 1. In the Right Arm, for Evacuation and Revulsion; after that, in the inferior Veins, for Derivation from the Part affected; on which Account *Hippocrates*, and his Follower *Galen*, in all Affections of the Parts below the Kidneys, prescribe opening the inferior Vein.

Purging is, also, proper in this Disease, but only with such Cathartics as are of a lenient and cooling Quality; for otherwise the Heat of Urine would be highly exasperated; and therefore some, in this Case, will not venture to prescribe more than a Bolus of simple Cassia, which is indeed preferable to other Purgatives. But it will be still more refrigerating, if mixed with the Pulp of Tamarinds, or a Solution of Cassia in a Decoction of Lettuce, Purslane, and the Tops of Mallows, may be exhibited for several Days together, that the Conflux of the acrimonious Humours to the urinary Parts may be gradually derived to the Intestines. But if the Redundance of the depraved Humours seems to require stronger Medicines, we may have recourse to the following Potion:

Take Leaves of Lettuce, Purslane, Plantain, and Tops of Mallows, each half an handful; Tamarinds, Half an Ounce; citrine Myrobalans, one Dram: Boil them to six Ounces; strain the Liqueur, and infuse therein, of recent Extract of Cassia, one Ounce: Strain the same again, and dissolve therein, of Rhubarb infused in Water of Lettuce, with yellow Sanders, one Dram and an half; Manna, and Syrup of Roses, one Ounce: Make a Potion.

In a long *Dysury*, a purging Opiate would be of Service.

Vomiting excited by Emetics of the gentlest Sort, must be highly beneficial; for it makes a Revulsion from the Part affected, and avoids those Inconveniencies which usually attend Evacuations by Stool. It will therefore be proper to be used in such Subjects as can bear it with Ease, and to be repeated once or twice in a Week.

By Clysters, frequently injected, not only the acrimonious Humours are derived to the Intestines, and, by degrees, purged off, but the hot Distemperature and Inflammations of the Bladder, and adjacent Parts, are mitigated and corrected. A Formula, for this Purpose, you have as follows:

Take of Roots of Marshmallows, one Ounce; Leaves of Mallows, Violets, and Lettuce, each one Handful; Flow-ers of Water-Lily, and Barley cleansed, each one Pugil: Boil them to a Pint; strain the Liqueur, and in the same dissolve of Cassia newly extracted, one Ounce; one entire Egg; Oil of Violets, two Ounces; for a Clyster.

Mucilages of the Seeds of Marshmallows, Quinces, and Fenugreek, may very properly be mixed with Clysters, in order to mitigate Pain.

But as Lenients for mitigating Pain, and Coolers for correcting the Heat, Clysters consisting purely of Milk, or of the same mixed with the above Mucilages, are usually most efficacious; and we have known some Patients who, after long Pains and Afflictions under this Disorder, have received Relief only from this Remedy, and a Semicupium.

Remedies to be taken at the Mouth are very numerous, and found by Experience to be of Service, as Demulcents, in correcting the Heat of Urine, and the Distemperature of the Parts. Some of the principal are as follow:

Take of the Waters of Purslane, Lettuce, Roses, and Water-Lilies, each one Ounce; Syrup of Violets, and Nymphaea, each six Drams; Sal Prunellæ, one Dram: Mix them, for a Julap, to be often repeated. Or,

Take Roots of Marshmallows, one Ounce; Leaves of Lettuce, Endive, Purslane, and Tops of Mallow, each one Handful; Seeds of Melon, Gourd, Mallow, Lettuce, and white Poppy, each three Drams; Jujubes, and Sebestens, each six Parts; Violets, Roses, and Water-Lilies, each one Part: Boil them to a Pint and an half; strain them; and in the Liquor dissolve of the Syrups of Violets, Jujubes, and white Poppy, each one Ounce and an half; Sal Prunellæ, half an Ounce: Make a Julap, for four Doses, to be taken twice a Day.

Emulsions, also, are of Use, tho' they are diuretic; because they are cooling, and gently cleanse the urinary Passages. Of this Nature is the following:

Take of the Four greater cold Seeds, and those of white Poppy, each three Drams; sweet Almonds blanched, and infused in cold Water, half an Ounce: Pound them in a marble Mortar, pouring thereon, by degrees, of the Decoction of Barley decorticated, Liquorice, Purslane, and the Tops of Mallow, one Pint and an half: Make an Emulsion for three Doses; adding, to every Dose, of Syrup of Violets, one Ounce; Sal Prunellæ, one Dram. If the Pain be greater than ordinary, some Syrup of Poppies may be mixed with it. A Dram of the Powder of Gum Arabic is, also, proper to be added, or the *Syrupus de Althæa Fernellii*.

Broths may, also, be prepared in the following manner:

Take of the Roots of Marshmallows, half an Ounce; Mal-lows, one Handful; Liquorice, half an Ounce; Seeds of Quinces, one Dram: Boil them in Broth of a Chicken or Hen; to be repeated for several Days together.

Whey of Goats Milk, taken in large Draughts, is, also, of signal Service.

Of no less, or rather more Efficacy, in the Absence of a Fever, is Milk taken by itself, especially Asses Milk, which not only deterges, but is a Demulcent, mitigating Pain, and correcting the Acrimony of the Humours.

If the Disorder be of long Continuance, mineral refrigerating Waters, especially such as are impregnated with Alum and Iron, or have a little Tincture of Vitriol, are highly serviceable: For it has been found, by Experience, that the Waters of *Mayenne*, which are endued with the like Virtue, have sometimes cured these Disorders, tho' become inveterate.

Instead of the Julaps above described, a simple Decoction of Mallows, with Syrup of Violets, may be used; by which Remedy, *Forestus, Obs. 4. Lib. 25.* tells us, he was cured of a very severe Dysury. He found no Relief, he says, from any thing, so much as from the aforesaid Decoction; and he informs us, that, with the same Remedy, he cured others who were in the like Circumstances.

The same Author, *Obs. 3. of the same Book*, tells us, that one *Jacobus Joannis*, an Apothecary, cured himself, and others, with Rose-water, beaten with the White of an Egg, and drank at two Doses.

And he further informs us, that an old Man of *Delft* was cured of this Disorder by a Decoction of Chamomile-flowers in Milk, to which he was advised by an old Woman.

Amatus Lusitanus, Curat. 56. Cent. 6. relates, that a Woman who laboured under a Dysury, and could not be cured by a Number of Medicines, which he there describes, was perfectly recovered by a Conserve of the Flowers of Mallows. Of this Conserve she took, every Morning and Evening, the Quantity of one Dram, drinking afterwards a Quarter of a Pint of Water of Mallows. And the same Author, *Curat. 59. ibid.* tells us, that an old Man, who laboured under a Dysury, after excreting a Stone, was cured by the same Conserve, taken in the same manner, in less than three Days. The Conserve of the Flowers of Marshmallows is of the same, or greater Efficacy.

Some experienced Physicians commend Troches of Alkekengi, or Winter Cherries, exhibited a Dram at a time, in some con-

venient Liquor; because they are diuretic, and at the same time obtund and correct the Acrimony of the Urine.

If the Pain be very sharp and pressing, it may be of Service, while the Patient makes Water, to immerge the Penis in warm Milk, or a Decoction of Mallows, and the Seeds of white Poppies; and even warm Water, by itself, is of no small Efficacy in diminishing the Heat and Pain.

By way of Potion, a mild Decoction of Mallows, mixed with Syrup of Violets, or impregnated with Conserve of Roses, will be of signal Benefit.

For Mitigation of the Heat of Urine, it has been found beneficial, to make Injections into the *Urethra*, composed of Milk, Emulsions of the Cold Seeds, Plantain-water, and Whey; with which may be mixed, the Liquor of the White of an Egg well beaten; or a Scruple of the Troches of Winter-cherries.

External Remedies, also, are not a little conducive to the repressing of those Heats: Such are Baths, and Semicupiums; Fomentations of the *Pubes* and *Perinaeum*, by Decoctions of cooling Herbs; Liniments prepared of Oil of Roses, Oil of Water-Lilies, Ointment of Roses, *Unguentum refrigerans Galeni*, *Populeum*, with Camphire, and Mucilage of *Psyllium* (Fleawort) extracted in Plantain-water. Refrigerating Epithems, and the aforesaid Liniments, are, also, to be applied to the Kidneys and Liver, for mitigating their hot Distemperature.

When there is a Flux of acrid and bilious Humours, it will be convenient, in order to their Derivation, to apply a Caustic to the Right Leg, or to open the hæmorrhoidal Veins, which is of excellent Service in all Affections of the Kidneys and Bladder, according to *6 Aph. 11.* since, from the same Branch, called the *Ramus Splenicus*, are propagated those Veins which are distributed over the Kidneys, Bladder, and Hæmorrhoids. *Riverii Prax. Med. Lib. 14. Cap. 3.*

BLOODY URINE.

An Hæmorrhage from the urinary Passages, generally called a Discharge of bloody Urine, proceeds from a Rupture or Corrosion of the Vessels either of the Kidneys or Bladder, in such a manner, as that they evacuate their Contents sometimes with, and sometimes without any Urine. This Disorder is more or less dangerous, according to the Circumstances with which it is accompanied.

It frequently happens that Physicians are egregiously deceived in determining whether the Blood is discharged with the Urine, or not. If pure Blood, in considerable Quantities, suppose a Pint, or more, as it sometimes happens, be discharged with the Urine, or Blood, without any Mixture of Urine, be evacuated by the urinary Passages, the Matter is past all Doubt: But if the Blood is mixed in a small Quantity with the Urine, a more careful Scrutiny is requisite; for often Urine of a bloody Colour is discharged, and deposits a Sediment which exactly resembles Blood: On the contrary, Urine of a brown or blackish Colour is discharged, which is mixed with Blood, tho' no such thing is suspected. For this Reason, we shall enumerate the certain Signs from which this Variation and Difference is to be judged of. If, then, the Redness of the Urine, by which it resembles Blood, proceeds from sulphureous Particles exalted by an Admixture, especially, of alkaline Salts, then, as soon as it is discharged, it appears clear and transparent, whilst the Sediment is of an incarnate and cinnabarine Colour. But this Sediment, by the Application of a sufficient Heat, again dissolves in the Urine, which becomes clear and transparent as before; whereas, when the Urine is red, by means of Blood, it is opaque, and somewhat thick, whilst the Sediment is grumous, of a black-redish Colour, and is either not dissolved at all, or again absorbed by the Urine: Besides, if the Redness of the Urine proceeds from Blood, it tinges the Cloth thro' which it is strained, with a redish Colour, which does not happen when the high Colour of the Urine proceeds only from Salts.

As there are various Passages for the Secretion and Excretion of the Urine, it is of Importance to know whence the Blood discharged flows: If pure Blood is copiously and suddenly discharged, without Pain, *Hippocrates, in Sect. 4. Aph. 78.* justly concludes, that the Blood comes from the sanguineous and vascular Substance of the Kidneys: But when the Quantity of Blood is small, of an obscure blackish Colour, with or without a purulent Matter, and especially if there is a Pain during or after the Discharge, then it is certain that it proceeds from a Wound or Ulceration of the Bladder. That the Discharge of Blood from the Kidneys is without Pain, and that from the Bladder accompanied with one of an highly intense Kind, is to be ascribed to the Diversity of the Structure of these Parts; for the Kidneys are not possessed of an exquisite Degree of Sensation; but when the Blood attempts its Passage thro' the highly-sensitive nervous Coats of the Bladder, an intense Pain must necessarily be produced: Nor is it surprising, that, on such an Occasion, the Patient should be seized with a Train of violent

violent Symptoms; such as Deliquiums, Difficulty of Breathing, an obscure, small, and sometimes frequent Pulse; a Nausea, Anxiety of Mind, and cold Sweats. Thus *Hippocrates*, in *Lib. 4. Aph. 80.* informs us, "That if any Person frequently discharges by Urine Blood, and grumous Matter, and at the same time labours under a Strangury, accompanied with Pain in the lower Part of the Abdomen and Perinæum, such a Person labours under a Disorder of the Parts adjacent to the Bladder." When the Blood is mixed with the Urine in consequence of a Wound of the Ureters by a large or sharp Stone, there is an acute Pain about the Loins, and iliac Region, and a difficult Discharge of sandy Urine, whilst the Disorder is discovered by the other Signs of a Stone lodged in the Ureters. If, in consequence of a Wound of the Blood-vessels of the Bladder, and its Coats, any Blood is discharged, the Urine is not only evacuated with great Pain, and sometimes after a previous Obstruction; but, also, grumous Concretions, full of gross fabulous Molecules, are sometimes discharged with it: And this, also, on certain Occasions, happens, when a Stone, firmly impacted in the Kidneys, wounds them.

There is still another Species of bloody Urine, which is rarely mentioned by Authors, and which proceeds from a too great Distention and Aperture of the Vessels of the Bladder, or rather of the Sphincter. *Cælius Aurelianus*, in *Traët. de Morb. Chron.* speaks of this Disorder in the following Manner: "As in the Anus and Vagina or Neck of the Uterus of Women, so, also, in the Bladder, Hæmorrhoids are sometimes generated, which discharge Blood, at various Intervals. This ought at first carefully to be adverted to, by the prudent Physician, since the Effusion is not at its greatest Height at first, but is gradually augmented, whilst the Patient is now-and-then seized with Deliquiums, and the Blood retained about the Pubes with considerable Pain; for sometimes inflated and tumid Hæmorrhoids produce a Difficulty or Suppression of Urine, by the Greeks called *Dysury*, or *Ischury*." *Archigenes* affirmed, "That as the Menfes and Hæmorrhoids had stated Periods; so, also, a Plethora sometimes vented itself, at certain Seasons, by the Kidneys and Bladder." *Hæurnius*, in *Comment. in Aph. 78. Sect. 4.* when treating of the different Parts from which the Blood is discharged, speaks in the following manner: "The Blood discharged from the Bladder is not intimately mixed with the Urine, but becomes grumous when it subsides; and this grumous Matter, which is sometimes evacuated without Urine, produces a Pain about the Bladder; but Blood discharged from the Kidneys is in a large Quantity, and so exactly mixed with the Urine, that the whole Urine seems to be nothing but a thin diluted Blood: But the Blood immediately subsides, tho' it remains liquid, and is by no means concreted."

But we are not to confound a Discharge of bloody Urine with an Evacuation of bloody Semen; for it frequently happens, that, in Persons labouring under a virulent Gonorrhœa, when the *Prostata* are relaxed, by the too great Afflux of Lymph and Serum, not only the seminal Liquor, but, also, a mucid Serum, full of small Particles of Sand, and sometimes Blood evacuated from the Mouths of the Vessels corroded by the Acrimony of the Matter, is discharged from the Urethra, without any Urine.

We are, also, carefully to distinguish between a Discharge of bloody Urine, and that Evacuation of Blood which is made from the Integuments of the Penis. I have known several Instances of Men, in whom, at certain Periods, a large Quantity of pure Blood has, for several Weeks, been discharged from the Penis, after a preceding tensive Pain of the Groin and Thighs. *Stalport Vander Wiel*, in *Cent. 1. Obs. 80.* has collected Instances of the same Kind. But, in this Case, the Blood discharged is not mixed with the Urine, but is discharged by itself, Drop by Drop, from the Ramification of the external hæmorrhoidal Veins, which is distributed to the Pudenda.

We are, also, carefully to distinguish between a critical and salutary Discharge of Blood, and that which is morbid and prejudicial: The former most frequently happens in large Quantities from the Kidneys, and sometimes but rarely in a small Quantity from the Sphincter of the Bladder, without Pain, or great Uneasiness, and returns at certain Periods. This principally happens by a Translocation of the Blood which ought to be eliminated by the Menfes or Hæmorrhoids, when these Evacuations are either obstructed, or suppressed. I have seen such critical Discharges of Blood from the Penis, in young and old Men of plethoric Habits, succeed a Cessation of the hæmorrhoidal Flux, or an Omission of usual Venesection, without any manner of Danger: I have, also, seen Discharges of bloody Urine, in Women of eighty Years of Age, who lived high, and enjoyed good Health, especially if, after the Cessation of their Menfes, they neglected Venesection.

Besides, I have frequently observed, that old Persons, when the hæmorrhoidal Discharge ceased, and middle-aged Men,

afflicted with the blind Hæmorrhoids, after violent Commotions either of Body or Mind, have discharged a large Quantity of Blood of a brownish Colour, like Coffee, without any Difficulty of Urine; and this Blood, undoubtedly, proceeds from the Blood-vessels about the Sphincter of the Bladder: For the external hæmorrhoidal Veins communicate with the Bladder, and distribute Ramifications to it. But it is not so with the internal Hæmorrhoids, whose Ramifications distributed to the Bladder, have not, as yet, been seen by any Anatomist.

This Excretion of Blood with the Urine, arising from the Suppression of other sanguineous Excretions, especially the Hæmorrhoids, principally happens from the Kidneys, whilst the Blood, accumulated and conveyed thro' the inferior mesaraic Artery to the Coats of the *Intestinum Rectum*, not finding a Passage there, as it were, regurgitates to the Trunk of the great Artery, or is rather there collected in great Quantity; and, being conveyed to the arterial Vessels of the Kidneys, which, both in Number and Bulk, exceed the emulgent Veins, by distending and opening their Orifices, passes to the urinary Ducts which are connected with the Extremities of the small Arteries, from which it is conveyed to the Mouths of the Papillæ, thence to the Pelvis, and thence into the Ureters and Bladder. In such a Case, therefore, neither *Anastomosis*, nor *Diæresis*, nor *Diapedesis*, so much talked of by Authors, obtain.

The Bladder is, also, greatly subject to Excretions of Blood; because, on account of its perpendicular and low Situation, the Return of the Blood from it thro' the Veins, is very difficult. Hence it is, that, in the tumid external Hæmorrhoids, or the internal Hæmorrhoids, when obstructed, especially in plethoric Patients, the Blood accumulated and stagnant there, preternaturally enters the Orifices of the capillary Vessels of the Bladder, or rather of the Sphincter.

The Suppression or Cessation of the hæmorrhoidal Discharge by any Cause whatever, is the principal Cause of that Species of bloody Urine in which the Blood is conveyed from the Kidneys. *Hercules Saxonia*, in *Lib. 3. Cap. 4.* gives us an Instance of a Person of Distinction who, during five Years, labouring under a Suppression of the Hæmorrhoids, now-and-then evacuated from the Urethra large Quantities of Blood, before he discharged his Urine. *Rolfinkius*, in *Dissert. Anatom. Lib. 5. Cap. 26.* tells us, "that a Person of Distinction, subject to the hæmorrhoidal Flux, upon having it suppressed, fell into a Discharge of bloody Urine, which lasted for several Weeks, but disappeared when the Hæmorrhoids were recalled in a very moderate manner." *Reiseli*, in *Epistol. 64.* tells us a memorable Story of a Shepherd, who, having a Suppression of the Hæmorrhoids for three Years, evacuated sometimes such a Quantity of pure Blood, without any Urine, as to fill a Chamber-pot; nor had the Patient, ever in his Life, used Venesection: But after he had three Paroxysms of this Kind returning at stated Periods, limpid and natural Urine was discharged. But when, by the Advice of his Physician, he used Wine pretty liberally, took Pills prepared of Aloes impregnated with Juice of Succory, and Extract of the Troches of Alhandal, the Hæmorrhoids returned, and his Disorder ceased.

Tho' all violent Exercise, in plethoric Persons, lays a Foundation for Hæmorrhages; yet no Species of Exercise has a more direct Tendency to excite a Discharge of bloody Urine, than Riding. Various Instances of this occur in practical Authors: Thus *Riverius*, *Cent. 2. Obs. 13.* gives us an Account of a Man, of fifty Years of Age, who discharged bloody Urine every time he rode. *Hollerius*, also, in *Aphor. 78. Sect. 4.* *Hippocrat.* speaks in the following manner: "If some Persons ride hard, or use immoderate Exercise, they discharge Blood from their over-heated Kidneys." And, a little after, says he, "I am of Opinion, that bloody and turbid Urine was discharged by a reverend Bishop, both on account of the Dilatation made in the Cavities of the Kidneys, and in the urinary Passages, on account of the excessive Heat, first generated by the violent Motion of the Chariot driven quickly in a rough Road, which agitated his whole Body, and especially the Region of his Back; and then, by the succeeding excessive Heat; whilst, with a Coat of Skins, he ascended the Mountain under a scorching Heat of the Sun. By all these Things, so great an Heat was excited in the Parts about the Kidneys, that, on account of their too great Dilatation, bloody Urine was discharged. Hence it is, that even now, when he is fatigued, or uses violent Exercise, his Urine is turbid, and bloody." The Reason why Riding, which is of great Efficacy in curing other chronical Diseases, disposes to Hæmorrhages of the Kidneys and Bladder, is, that by the Compression of the Veins in the Thighs, the *Perinæum*, and the *Anus*, the Return of the Blood is greatly retarded. Hence the Quantity of the Blood is enlarged in the Arteries, and its Motion in the superior Parts increased, especially about the

Loins, by means of the succussory Agitation. Thus the Afflux of the Blood being rendered brisker, the emulgent Arteries, at last, easily open. For *Malpighi*, in *Tr. de Remibus*, justly observes, "That, if we except the Lungs, there is no Part of the human Body more subjected to the Injuries of a redundant Blood than the Kidneys."

A Stone in the Kidneys is, also, frequently the Cause of a Discharge of bloody Urine, which is more troublesome and dangerous than the former: Of this there are many Instances; such as that related in *Horstius*, *Lib. 4. Obs. 37.* where, without any Pain of the Loins, nephritic Patients, especially when plethoric, upon using violent Exercise, are observed to discharge bloody Urine. This probably happens, because a pretty large Stone, of a sharp Figure, may for a long time remain without Pain in the Kidneys, and yet, by its Compression and Attrition, excited by Exercise, considerably injure the vascular Substance of the Kidneys, greatly hurt their natural Functions, and, by that means, lay a Foundation for an Eruption of the Blood: For when the Stone, by its Bulk and Weight, compresses the Ramifications of the emulgent Vein, by hindering the Passage of the Blood thro' them, it proves the Cause why the Blood copiously and impetuously conveyed thro' the small emulgent Arteries, and their capillary Ramifications, which terminate in the urinary Ducts, greatly distends the former, and at last makes its Way into the latter, which, in a natural State, were only destined for the Conveyance of Urine: And this happens more violently and infallibly when in Persons disposed to the Stone, various Medicines which force Urine, and the Stone, are exhibited; which is a common tho' a wretched Custom, especially if these Medicines are of the hot Kind; such as Preparations of Turpentine, Amber, and Juniper: For, in such a Case, the Stone, pent up in the Kidneys, by corroding, excoriating, and dilacerating the small Vessels of the Kidneys, produces an Exulceration; in which Case, Pus and Blood drop thro' the Ureters into the Bladder, and, consequently, a painful Discharge of some Portion of the Urine, with which corrupted Pus and Blood are evacuated, is produced. This, also, happens the more rarely, when the Ureters are exulcerated by a Stone.

There is, also, a copious and dangerous Discharge of bloody Urine, when, from an Exulceration of the Bladder, arising from a copious, acrid, and stagnant Blood, a mucous, purulent, and bloody Matter descends into its Cavity; for, in this Case, the Urine is discharged with intense Heat, intolerable Pain, and Difficulty, whilst the Disorder is accompanied with Tremors and convulsive Motions of the Limbs, attended with Colds and Tremblings. I have, also, frequently seen this happen in Persons labouring under virulent and inveterate Gonorrhoeas, whilst an acrid and corrosive Matter flowed from the Genitals, and corroded the adjacent Parts. When this Case happens, and when the Substance of the Kidneys or Bladder is corrupted, and a purulent and putrid Matter is secreted, fursuraceous Urine is discharged, with small Caruncles or Substances resembling Hairs or Worms in it, which can never come from the Bladder, since it is not possible they should be its Filaments. They must, therefore, proceed from the mucous Matter contained either in the Kidneys, or Bladder, concreted into such a Form and Consistence.

Another Species of bloody Urine may be produced by external Causes, such as Contusions, Falls, Blows, and the lifting of Burdens: This frequently occurs in Practice, tho' it is not very easy to account for it: For if it proceeded from a Rupture of the Vessels in the Kidneys, or a Solution of Continuity in them, it could not be so speedily cured by Venesection, and such Things as dissolve the Blood. I am rather of Opinion, that, by the Contusion or Contorsion, especially of the Blood-vessels, and the Stagnation of the Blood there, its Circulation through those wounded Parts is hindered, by which means the Impetus and Quantity of the Blood is increased in the internal Vessels; and when these, especially in plethoric Persons, are distended, the Blood is easily discharged from them. This very easily happens in the Kidneys, if a Blow has been inflicted on that Region. Hence there are Instances in which Discharges of bloody Urine have succeeded Luxations of the Vertebrae. As *Hildanus*, in *Cent. 2. Obs. 10.* observed a Dysentery produced by the Amputation of a Leg, so I knew a Discharge of bloody Urine succeed a Fracture of the Bone of the Leg: So that it is easy to conceive how, by a Contusion of the Veins, and a Stagnation of the Blood elsewhere, some Part of it may be discharged through the Urethra.

It is certain from Experience, that Discharges of bloody Urine may be produced by violent Gripings of the Abdomen, by acrid Purgatives, and by strong Diuretics, such as Cantharides; but this Symptom is owing to the spasmodic Stricture of the Veins, by which the free Circulation of the Blood is intercepted: Hence we may easily give a Reason why the Measles and Small Pox, especially of the malignant Kind, are sometimes

accompanied with this terrible Symptom. There are Observations in some Authors, in which it is affirmed, that, by Venticulators, in which there are Cantharides, a Discharge of bloody Urine is sometimes produced: But as I never observed any such thing, we may justly suspect that the bloody Urine proceeded from some other Cause.

No Discharge of bloody Urine is free from Danger: For though, at the Beginning, it may appear critical and salutary, on account of the Redundance of Blood produced by a Suppression of the Menfes, or Haemorrhoids, yet it is dangerous, because it not only easily recurs and exhausts the Strength, but, also, if an Error in Regimen is committed, or if it is imprudently treated with Styptics, an Inflammation and Corruption are readily induced on the Kidneys, or Bladder: It, also, frequently happens, that a certain Portion of grumous Blood descending from the Kidneys, is so firmly impacted in that Part of the Ureter, where it is obliquely inserted into the Bladder, as to produce a violent Ischury, not to be cured without the greatest Difficulty. Sometimes, also, Blood becomes grumous in the Cavity of the Bladder; and, adhering firmly to the Sphincter, produces an intense Pain, and a total Suppression of Urine. The same, also, happens, when the Blood-vessels of the Sphincter, like the blind Haemorrhoids, become turgid with thick Blood.

The most dangerous Species of bloody Urine is that which proceeds from a profound Wound or Ulceration of the Kidneys or Bladder, and is accompanied with an intense Pain, and an Evacuation of Pus: We are not, however, to take the mucous and glutinous Sediment, sometimes observed in bloody Urine, for Pus, which generally floats on the Surface; for the Quantity of this Sediment is often so great, that if it proceeded from an Exulceration of the Kidneys, they would soon be consumed by it: It is rather a Mucosity which drops from the too much relaxed glandular Coat of the Bladder and Urethra, or from the wounded Prostate; after which, it is mixed with the Urine.

Having thus considered the various Causes and Seats of bloody Urine, it is incumbent on the skilful Physician to have a due Regard to all these, both in his Measures for the Prevention and Cure of this Disorder: When, therefore, a Discharge of bloody Urine arises from a Redundance of Blood, or is to be dreaded from that Cause, nothing is more safe and efficacious than Venesection; only observing this Caution, that, during the Paroxysm, it is to be performed in the superior Parts, that is, the Arm; and the Quantity to be taken away is to be estimated by the Patient's Strength, and Habit of Body. But if a Discharge of bloody Urine arises from a Suppression of the Haemorrhoids, it is safer, in order to prevent a Relapse, to open a Vein in the Foot: The same Practice is, also, to be observed, when, in a spasmodic Colic, and violent Gripings of the Abdomen, a Discharge of bloody Urine happens, on account of the Stagnation and Congestion of Blood about the Coats of the Intestines, and its Incapacity of being discharged from the haemorrhoidal Veins. Besides, as this Disorder generally returns at stated Periods, it is so much the more necessary we should prevent its Approach by seasonable Venesections.

When this Disorder derives its Origin from a violent Ebullition or Expansion of the Blood, with or without a Plethora, which generally happens by violent Commotions either of Body or Mind, or by the Abuse of hot Medicines, which too strongly agitate the Blood, besides Venesection, nothing is more efficacious than the Use of nitrous Medicines, and such as check the elastic intestine Motion of the Blood; or Refrigerants, the best of which is depurated or artificial Nitre prepared with Spirit of Nitre and Salt of Tartar, mixed with earthy and absorbent Substances, and exhibited either in the Form of a Powder, or a Potion. The best Vehicles for this Medicine are, sweet and acidulated Whey, a Decoction of Barley, pure Spring-water, or Spring-water mixed with an equal Quantity of *Selteran* or *Tonstein* Waters, a Decoction of Hartshorn and Vipers-grass, or small Ale into which a sufficient Quantity of the Tincture of Roses, or Daisy-flowers, with Spirit of Vitriol, but not of Salt, whose volatile Acrimony is prejudicial to the Lungs and Kidneys, has been dropped.

As Costiveness is of great Force, not only in generating, but, also, in sustaining this Disorder, partly because by the Flatulencies and Spasms arising thence the equal Circulation and Distribution of the Blood is hindered, and more copiously conveyed to one, especially the weakest Part, than others, and partly because many impure, acrid, and bilious Sordes, are conveyed from the *Prima Via* to the Mass of Blood and Humours, hence nothing is a better Preservative against this Disorder, or more efficacious for preventing a Relapse, than keeping the Body duly soluble: But this End is not to be procured by Purgatives, acrid Stimulants, or large Doses of Salts; much less by Preparations of Aloes, or Pills which contain even the least Quantity of that Ingredient: The Intention is rather to be answered

swered by mild Laxatives of a corroborative Quality, which, as they are best in all preternatural Excretions of Blood, so, also, they are most efficacious and safe in this. The best of this Kind are, Preparations of Rhubarb mixed with Raisins; such as Currans rendered laxative by a gentle Infusation with a Solution of Rhubarb, or Powder of Rhubarb, mixed with Cream of Tartar.

In order to corroborate and gently constrict the dilated and opened Vessels of the Kidneys, or in order to consolidate their Substance if wounded, the most efficacious Medicines are; Decoctions or Infusions of gently vulnerary and astringent Ingredients, such as Agrimony, Ground-ivy, Horsetail, Yarrow and its Tops, Golden Rod, and the Root of the greater Con-sound edulcorated with *Prussian Honey*, which is highly friendly to the Kidneys. These Decoctions may be, also, mixed with Milk, according to the Situation of the Patient. Almond Milk, especially when used as a Vehicle for *Armenian Bole*, is, also, of singular Efficacy in healing and consolidating these Parts.

If a Corrosion or Ulceration of the Kidneys, Ureters, or Bladder, are present, which often happens when the Disorder is of long Standing, and accompanied with Pains, the principal Intention of the Physician ought to be, to correct the Acrimony of the Humours; and so long as this is neglected, neither an Alleviation of the Pain, nor a Consolidation and Cure of the wounded Part, are to be expected. This Intention is therefore excellently answered by *Fernelius's Syrup of Marshmallows*, *Forestus's Decoction*; and that recommended by *Mynsicht* against a Discharge of bloody Urine. The same End is, also, answered by an Infusion, which, besides the above-mentioned vulnerary Herbs, has, for Ingredients, the Bark of *Egyptian Thorn-root*, and *Cherry-tree Gum*: A Powder, also, prepared of the Roots of Marshmallows and Liquorice, *Sperma Ceti*, the Four cold Seeds, white Poppy-seeds, the Seeds of Club-moss, and Saffron sweetened with a sufficient Quantity of Sugar-candy, are, also, of Service.

For a Dysury or Ischury, which are frequently dangerous Symptoms of an Hemorrhage from the Kidneys or Bladder; whilst grumous Concretions of Blood obstruct the Ureters in that Part where they are inserted in the Bladder, or the Sphincter of the Bladder itself, no Medicine affords a more efficacious or instantaneous Relief, than large Draughts of tepid Water, and the external Use of Baths. In this Case it is, also, expedient, to inject into the *Urethra* and Bladder tepid Water, in order to dilute the acrid Humour, and dissolve the grumous Concretions. *Hippocrates*, as we have already observed, recommends these very Remedies: But if, on account of grumous Concretions in the Bladder, or its Sphincter, such Spasms are excited, as to induce a total and hurtful Ischury, excellent Effects are produced by an Emulsion of the Four cold Seeds prepared with Crabs-eyes and diaphoretic Antimony; as, also, by a Powder prepared of *Sperma Ceti*, Crabs-eyes, and Nitre; externally a Bladder, full of a Decoction of emollient Flowers, is to be applied to the Abdomen; the Body is, also, to be rendered soluble, by a Laxative of Manna, or by an emollient oleous Clyster.

Besides all these Remedies for curing recent, and removing inveterate Disorders of the Kidneys and Bladder; nothing is more efficacious than temperate medicinal Waters; such as the *Selteran*, *Antonian*, and *Wildungenian Springs*, especially if mixed with Milk, but rather Asles Milk. This is sufficiently obvious from the salutary Elements of which they are composed, and the unanimous Consent of those who have wrote concerning their Virtues.

Milk and Whey are, also, excellent Remedies against this Disorder: For *Hippocrates*, in *Lib. de Intern. Affect. Sect. 17*, speaks in the following manner: "If the Urine is discharged like the Juice of roasted Beef, the Patient is to drink Whey and Milk; Whey till he is sufficiently purged, and Milk for forty or fifty Days; by which means, the Disorder is alleviated." The Milk of Sheep and Goats is, also, recommended by *Riverius*, in *Obs. 13. Cent. 17. as*, also, by *Gatinarias* and *Forestius*, who affirm, that, by this single Remedy, they have effectually cured a Discharge of bloody Urine, mixing with each Dose one Dram of *Armenian Bole*. *Riverius* is, also, of Opinion, that this Practice is proper in violent Discharges of bloody Urine; though he thinks it less expedient in those of a moderate Kind.

With respect to Venesection, which is of the greatest Importance both for curing and preventing a Return of the Disorder, if it proceeds from a Suppression of critical Hemorrhages, we are to observe, that, in the Beginning, a large Quantity of Blood is to be taken away; for by this means the Design not only of Evacuation, but, also, of Derivation, is answered: But when a Discharge of bloody Urine is periodical, a Vein is to be opened two or three Hours before the Paroxysm,

and such a Quantity of Blood taken away as the Patient can bear.

Hippocrates, in the Part last quoted, in a Discharge of bloody Urine arising from an Exulceration of the Kidneys or Bladder, orders the Patient to drink temperate White-wine of a yellowish Colour; for too spirituous Wines, or such as abound with an Acid; such as *Rhenish-wine*, are by no means proper where there is a painful Discharge of bloody Urine; but rather sweet Wines, such as those of *Spain*, the *Canary Islands*, and *Hungary*; for they not only promote Digestion, but are, also, friendly to the affected Bladder.

Since it is of great Importance what Kind of Liquor a Person labouring under any Disorder of the Kidneys and Bladder drinks, we are to observe, that he is carefully to abstain from thick and acid Ales, but to use large Quantities of small pure Beer, which, like an aqueous Medicine, resolves and carries off the acrid and sandy Matter. This is confirm'd by the celebrated *Sydenham*, in his *Treatise de Mictu cruento a Calculo Renibus impaeto*. And that Physician, as soon as he entered his Coach, took a large Draught of Small Beer, which he repeated before he return'd Home, if he chanced to stay a considerable time; by which means he affirms, that he prevented a Discharge of bloody Urine: But the Ale used on this Occasion ought to be well boil'd, and fermented.

Though proper Exercise is of great Importance for the Prevention and Cure of chronical Disorders; yet it is quite otherwise in Excretions of Blood, especially from the urinary Passages; for nothing is more effectual in bringing on this Disorder than violent Exercise, especially Riding: And I have, also, seen loud and long-contin'd Speaking prove highly prejudicial in a painful Discharge of bloody Urine, arising from a Disorder of the Bladder. Thus *Hippocrates*, in the Passage already quoted, tells us, "that when Blood is discharged with the Urine, the Patient is soon cured, if he enjoys a State of Rest; whereas by Exercise his Pains are rendered far more intense." *Sydenham*, also, in the before-mentioned Treatise, determines the Matter by his own Example; for when he walked much, or rode in a Coach, though very slowly, in the Streets, he was seized with a Discharge of bloody Urine; whereas, when he performed long Journeys in a Coach on the high Road which is not paved with Stones, he was never afflicted with that Symptom. He, also, tells us, that he went soon to Bed, that the Concoctions, which are diminished by nocturnal Lucubrations, might be the more duly performed.

In a Discharge of bloody Urine, whether from the Kidneys, or the Bladder; whether critical, or symptomatical; nothing is either more common, or more prejudicial, than the Use of Astringents, which too suddenly stop the Evacuation of the Blood; for by this means Inflammations, Exulcerations, and Putrefactions are produced, by the grumous Concretions retained in the Vessels: For as a Spitting of Blood, treated by these Remedies, easily degenerates into an Inflammation, Phthisis, or Exulceration of the Lungs, so, also, a Discharge of bloody Urine terminates in an Inflammation, Exulceration, and Putrefaction. When, however, the Effusion of Blood is very violent, and accompanied with excessive Loss of Strength, I have found excellent Effects produced by the following Mixture, successfully used by *Sylvius*, in Discharges of bloody Urine:

Take of Plantain-water, two Ounces; of the Waters of Purslane and Cinnamon, and of distilled Vinegar, each one Ounce and an half; of prepared red Coral, Crabs-eyes, and Seal'd Earth, each one Scruple; of liquid Laudanum, three Grains; and of *Quercetan's Syrup of Coral*, or *Fernelius's Syrup of Comfrey*, a sufficient Quantity to render the Preparation grateful.

Topics are, also, advantageously applied to the lumbar Region: For this Purpose we may use the Frog-spawn Plaster mixed with Alum, or Sugar of Lead, and a little Camphire: The White of an Egg, beat with Alum, and applied pretty cold to the Pubes, by way of Epithem, is, also, of considerable Service: For these, by their mild, refrigerating, and astringent Quality, in some measure check the Impetus of the Blood.

Those who are now-and-then afflicted with this Disorder, or disposed to it, ought to be very careful with respect to their Regimen and Diet, carefully abstaining from Wine, all Aromatics, especially Garlic and Onions, together with aperient Roots, such as those of Parsley, Parsneps, Celery, and Asparagus. Nor ought they to sleep upon their Backs, or lay them upon too warm Cloths, or Skins: Excessive drinking of warm Infusions of Tea, or other Herbs, is to be avoided, and rather cold, or somewhat cold Liquors, are to be used. I often, with great Success, order a Decoction of dried cherries in Prusan, to be used as common Drink. *Frederic Hoffman.*

Of Predictions from URINE; of the Nature and Causes of URINE; and of what Importance it is with respect to Prognostication.

Since it has been demonstrated that the Life or Death of the Patient in acute Diseases may be predicted from the Stools, [see DEJECTION] we are now in course to examine into the Signs and Prognostics which may be afforded from Urine relating to the same Subject; for the Observation of the Urine is of no less Importance than that of the other Excretions towards the prefiguring a good or bad Event to Diseases. *Galen, de Loc. Affect. Lib. 6. Cap. 4.* tells us, that the gibbous Parts of the Liver, and all others which are superior to these, are subjected to an Expurgation by Urine; and *Com. 2. in Lib. Prognost. 7. 26.* he says, that the Urine is an Indication of the Affections of the Bladder and Kidneys; and more than this he tells us, *Com. 2. in 1 Prorrh. T. 2.* that it indicates, also, the Strength or Weakness of the Blood-vessels, and of the Faculty which generates the Juices. Many Disorders, therefore, though not all, as is vulgarly imagined, in a great many Parts of the Body, may be judged of by the Urine, as may, also, all Fevers, Hectics excepted, and Inflammations, though these latter, when affecting the Thorax, are first signify'd by the Spit, as those which affect the Belly are indicated by the Stools; but even in these Cases, the Judgment which may be made of them from the Urine, is not to be despised.

Since therefore the Observation of Urines is of vast Moment towards the Prognostics of many Diseases, it justly deserves our Inquiry how far we may venture to prognosticate from them with respect to the Life and Death of the Patient. For this End it will be proper to premise a few things concerning the Differences and Causes of Urines, which are necessary to be known, in order to predict Events from them in Diseases.

Every Physician knows, that the Urine is a serous Excrement, secreted by the Kidneys, and from them by the Ureters transmitted to the Bladder, from which it is excreted and discharged from the Body. But by Urine we understand not only the serous Humidities, but all other Substances which are evacuated by Urine, since they are of great Moment towards a Prognosis. For the Matter of Urine seems to be of three Sorts: Sometimes the Excretion consists of the Humidities of the Meat and Drink, which, from those who drink much, are commonly discharged in a crude and aqueous State. Secondly, the Urine is sometimes nothing but the serous Humidity of the Blood impregnated with the Quality of the predominant Humour; and, in the last place, it may be composed of Humidities proceeding from a Colliquation, as when it is of a fattish Substance. This triple Matter of the Urine is very elegantly expressed by *Hippocrates, 6 Epid. Sect. 5. Aph. 14.* in the following Words; *ἔσθ' οὐρόχρονον βρώματι καὶ πρῶματι, καὶ ὡς ἐσθ' ἐόν, ὡς δὲ ὕγρ' ἐστίν*, "Urine is of the same Colour with the Meat and Drink, and is, as it were, a Colliquation of the internal Humid."

But let us now take a distinct View of the Differences of Urines, and they may be distinguished with respect to their Substance, Qualities, Quantity, and Contents.

As to their Substance, some are thin, others thick, and others are of a middle Kind; of the thin Sort some continue so a long Time, others soon become thick; after the same manner, of Urines voided thick, some continue in that State, others become thin.

With respect to their Qualities, there is a triple Difference observable, one in regard to their Colour, another as to their Clearness or Obscurity, and a third with respect to Smell.

Urines, with regard to Colour, are distinguished into white, pale, yellow, gold-coloured, red, green, livid, and black. There are several other Colours of Urine enumerated by some; but these, which are the principal, will be sufficient to furnish us with Prognostics: And some of these Colours are united with, or proper to Urine of a thin Substance, others to thick Urine. To thin Urine belong the light-red, yellow, green, livid, and, also, the black Colours. Some think, that only the pale, light-red, and yellow, are proper to thin Urine; but it is certain, that the green, livid, and black, are sometimes observed in Urine of a thin Consistence, as, for Instance, in the Cases of *Herophon*, the Wife of *Epicrates*, and *Meton*, observed by *Hippocrates, 1 Epid. Aeg. 3. 5. 7.* Of *Meton*, he says, "that his Urine was thin and blackish." It cannot, however, be denied, that black Urine is commonly thick; but the pale, light-red, and yellow, are never voided thick, but are constantly thin; for these Colours are imputed to a Want of Matter.

With respect to Perspicuity, or Obscurity, in the second place, some Urines are clear and lucid, others turbid and obscure, and of those which are voided clear some remain so, others, in a little time, become foul or turbid; in the same manner, of Urines excreted turbid some continue so, others, by a Subsiding of the gross Matter, become clear.

With respect to Smell, also, in the last place, some Urines are fetid, others not.

Urines, as was said, are distinguished, thirdly, with respect to their Quantity, for sometimes the Excretions are copious, sometimes small, sometimes moderate, and, on some Occasions, wholly intercepted.

The last Distinction mentioned of Urines regards the Contents; and under this Head may be observed a Multitude of Differences in Urine. We call the Contents of Urine that Substance which appears in any manner separated from the Body of the Urine, and is observed sometimes on its Superficies, sometimes in the Middle of the Vessel, and sometimes at the Bottom. This last the Greeks call *Hypostasis*, and we (the Latins) *Subsidentia*, *Residentia*, *Sedimenta*, and *Subjecta* (the *Hypostasis*, Settlement or Sediment, which subsides to the Bottom of the Urinal). When the Contents, or separated Corpuscles, occupy the Middle of the Vessel, they are called by the Greeks *Enæremata*, and by the Latins *Sublimationes*, *Suspensa*, *Sublimia*, and *Sublimamenta* (the *Enærema*, or pendulous Substance in the Middle of the Urine, see *ENÆREMA*). If the Contents appear on the Superficies of the Urine, they take the Name of *Nubes* and *Nubeculae*, "Clouds and Mists, or Films." Under the Head of *Hypostasis*, or *Sediment*, may be reduced a Variety of subordinate Distinctions; for some *Hypostases* are thick, others thin, some continuous, others discrete, or incoherent, and not at all united, but unequally dispersed through the Substance of the Urine. They are, also, distinguished into white-pale, yellow-pale, or deep-red, green, livid and black, and into fetid and not fetid. Again, of thick Sediments, some consist of crude and gross pituitous Humours, others are of a melancholic, or black adust, and others, to name no more, of a red and sanguineous Consistence. These thick Sediments, or *Hypostases*, appear, also, of various Forms; some appear in the Shape of Grains, and are for that Reason called by the Greeks *Oroboides*; sometimes they shew like Scales, and have the Name of *Petaloides*; sometimes like Bran, narrower but thicker than the scaly Sort, and take the Appellation of *Pityroides*; and, in the last place, these *Hypostases* sometimes resemble a kind of Meal, and are hence called by the Greeks *Crimnoides*; and like these last, in Appearance, are the purulent Urines, which consist of Pus. Sometimes, also, there appears in the Urine, a thick, pituitous Substance, and a mucous Humour.

In the *Enæremata*, or suspended Corpuscles, as, also, in the superficial Clouds, or Films, appear the same Varieties, with respect to Continuity and Division, Equality and Inequality, Thickness and Thinness, Difference of Quantities, and Diversities of Colours, with those before ascribed to the *Hypostases*. But it is proper to the superficial Contents to consist sometimes of oily and pinguous Particles.

Of the different Causes of the URINE.

In treating on this Head, we shall begin with the thick and the thin Urine: The last Sort in Fevers always indicates a Weakness of Concoction, and is occasioned either from an Obstruction of the Blood-vessels, Ureters, Kidneys or Bladder, by which means only an ichorous, or thin serous Humidity is excreted, or when the Humours take their Course to the Head, as the Case is in Phrenies, where a Thinness of Urine is a common Symptom. Hence we conclude, that a thin Urine is excreted when nothing of the Humours happens to be mixed with it, and that a thick Urine is occasioned from a Mixture of something which is the Result of a Concoction attempted by Nature, or the Removal of some Obstruction. That a thin Urine in Fevers always signifies Crudeness we are taught by *Galen in many Places*; and *Hippocrates 3 Epid. Sect. 3. Stat. Pest.* speaking of epidemical burning Fevers, tells us, they were attended with "plentiful Excretions of thin Urine, which had nothing critical, nor were of any Service to the Patient." This Thinness of the Urine sometimes continues, sometimes alters to Thickness: The latter shews, that Nature has begun its Work or Concoction; but the other indicates, that the Business is as yet unattempted, and is a Sign of an extraordinary Crudeness, as we are taught by *Galen, Lib. de Urinis, Cap. 3.*

Thick Urine is occasioned by a Mixture of Humours, and if it appears in the Beginning, indicates a Redundance of gross Humours, as we are told by *Galen, Lib. Quaest. in Hippocratem dista*; but in the State or Height of the Disorder it shews, that Nature attempts an Excretion of the Humours.

Much Urine proceeds from plentiful Drinking, or a Redundance of Humidities, as in a Dropsy, and a Suppression of Evacuations by Stool in an humid State of the Belly, on which Occasion we are told by *Hippocrates, 4 Aph. 82.* "that copious Excretions of Urine by Night, are an Indication of small Discharges by Stool." An immoderate Quantity of Urine may be occasioned, also, by an Inflammation of the Kidneys attracting to themselves a vast Plenty of Humidities,

ties, as in the Diabetes, or from a Multitude of Humours when the Patient undergoes a critical Expurgation by the Kidneys; as was the Case with many observed by *Hippocrates*, 3 *Epid. Sect. 3*.

Urine in too small Quantities proceeds from contrary Causes, as from drinking but sparingly, from a too plentiful Discharge of the Humidities by Stool or Sweat, or a Consumption of them by an immoderate igneous Heat, as it usually happens in burning Fevers, in which Cases it is often totally suppressed. Sometimes, also, as it is well known, the *Urine* is excreted in small Quantities from an Obstruction of the Passages, by which it makes its Way through the Kidneys or Bladder.

As to the Causes of the Colours of *Urine*, we shall begin with the white *Urine*, which is either *thin* or *thick*. *White thick Urine*, as we are taught by *Galen*, indicates a Redundance of crude and gross Humours, especially what is excreted thick, and continues so. *Urine* of this Kind, in which nothing subsides, indicates an extraordinary Crudeness, and an extreme Weakness of the Faculty of Concoction. Hence such *Urine* in acute Diseases is pernicious, as it proved in the Cases of the Wife of *Philinus*, and the Wife of *Dromeades*, 1 *Epid. Aeg. 4. 11*. But *Urine* of this Kind, which begins to grow thinner, shews that Nature has begun Concoction.

White thin Urine, which *Galen*, *Com. in 4 Lib. Aph.* calls *aqueous Urine*, has for its Causes either a Weakness of the concoctive Faculty, as in old Persons; or an Obstruction of the Kidneys, as in nephritic Disorders before the Stone is discharged; or an Obstruction of the Liver; or, which often happens, a total Diversion of the bilious Humour to the Brain; for which Reason such *Urine* portends a Phrensy, as *Galen* assures us, *Lib. de Urin. Cap. 6*. As this Kind of *Urine* indicates an highly crude State of the Disease, with an extreme Weakness of the concoctive Faculty, it is of all *Urine*s the most pernicious, especially in bilious Diseases, as we are assured by *Galen*, 1 *Lib. de Crisibus*, *Cap. 12*. and *Com. 2. in Prognost. T. 32*.

The Cause of *pale Urine* is the Mixture of too small a Quantity of the yellow Bile with the serous Humidities; but this Sort of *Urine* seems not far removed from a State of Concoction, provided it be not very thin.

Yellow, light-red, or saffron-coloured Urine, if *thin* at the same time, indicate the Disease to be in an absolutely crude State, and the Viscera affected with a violent burning Heat; but when *thick*, it is a Sign of Concoction, and sometimes of a critical Excretion.

Red, and reddish Urine take their Colour from Blood, as we learn from *Galen*, *Lib. de Cris. and Com. 2. in Prognost.* and more fully, *Com. in 3. Epid.* They are occasioned by an Excretion of half-concocted Blood by the urinary Passages, and indicate, as he says in the Treatises just mentioned, a Redundance of an unconcocted and serous kind of Blood in the Vessels, and the inner Parts of the Body; such *Urine* is, also, an Indication to us of the Imbecillity of the secretive Faculty; whence *Hippocrates*, *Lib. Prognost.* tells us, that *reddish Urine* signifies a long Duration of the Disorder, or that a long Space of Time is required for the due Concoction of the Blood. *Reddish, thin Urine*, though the Author of the Book *de Urinis* denies there is any such *Urine*, is occasioned by a slight Tincture of ichorous Blood; but the *thick and reddish* is from a Redundance of unconcocted Blood, as may be often observed in that burning Fever called a *Synochus*.

Resembling the former is that *Urine* which is coloured with Blood, and called *bloody*, or *sanguineous Urine*. Such Excretions are occasioned from the infirm State of the Kidneys, and a Relaxation of the Vessels which terminate in those Parts, called an *Anastomosis*, or a Relaxation of the Ducts which lie between the first and second Sinus; from such Causes proceeded the *bloody Urine* discharged by *Apemantus* and the Carpenter, mentioned by *Hippocrates*, 4 *Epid. T. 19*. Sometimes a Discharge of Blood is occasioned by a Rupture or Aperture of the Veins, or an Ulceration of the Kidneys or Bladder, as we may learn from *Hippocrates*, 4 *Aph. 86*. where he says, "If Blood, or Pus, or Scales, are excreted by *Urine*, and this *Urine* has, also, a fetid Smell, the same indicates an Ulceration of the Bladder;" and *ibid. 77*. "A sudden [ἀνὰ ταυτοῦ] spontaneous, see *AUTOMATOS*] Discharge of Blood by *Urine*, indicates a Rupture of some small Vein in the Kidneys."

Green Urine is either from porraceous Bile, generated in the Stomach, as *Galen* says, from the Crudeness of the Humours, or else from an æruginous Humour in the Vessels, which owes its Original, according to the same Author, *Com. 2. in Prognost.* to a burning Heat, and vehement Adustion of yellow Bile. In Persons who are in Health, or free from a Fever, such *Urine* is generally a Sign of porraceous Bile; but in acute Fevers and Inflammations of the Viscera, it indicates an æruginous and bilious Humour, according to *Galen*, *Lib. 2. de Crit.* where he determines this Colour in particular to proceed from an Al-

teration of yellow Bile, by the Force of a burning Heat, into Bile of a black Colour.

Next in Colour to *green* is *oily Urine*, which however is not fat, or pinguious; but as *Galen*, *Com. in 3 Epid. T. 72*. and *de Crisibus*, describes it, resembles Oil in Colour and Consistence; and this Sort of *Urine*, as he tells us, he had sometimes observed, proceeding from a Concoction of the Disease, without any bad Consequence to the Patient.

But *pinguious*, or *fat Urines*, which by their Fatness resemble Oil, or are called *oily*, because, like Oil, they swim on the Superficies, have quite another Cause, as proceeding always from a Colliquation of the Fat, either of the whole Body, or only of the Kidneys. To this Purpose we read in 7 *Aph. 35*. that "a pinguious and compact Hypostasis indicates an acute Disorder of the Kidneys." And we may know, says *Galen*, in his Comment on that Aphorism, when there is a Colliquation in the whole Body from the feverish Heat, if it were only by an Excretion of Fat with the *Urine* successively, and not all at once, as in a Colliquation only of the Kidneys. Hence we conclude, that there are two Sorts of *oily Urine*; one, which in Colour and Consistence only appears very like Oil, and another, which is of a pinguious Substance, and which *Hippocrates*, in the Aphorisms before-mentioned, says, contains Fat. Of this latter Sort of *oily Urine*, he says, in his *Prognostics*, "If there be a Fatness on the Superficies resembling a Spider's Web, it is to be condemned, for it is a Sign of a Colliquation." *Galen, de Sanit. tuend.* tells us, that this Fat swimming on *Urine*, is like that which concretes on the Superficies of Broths when cooled. And, *Lib. de Urinis*, a Treatise ascribed to him, he makes three Distinctions of this kind of fat or *oily Urine*; the first is what the *Greeks* call *Elæochroos*, which is of the Colour of Oil, and indicates a beginning Colliquation; the second is called *Elæophanes*; this has a more exquisite Mixture of oily Particles, and shews that the Colliquation increases; the last is the *Elæodes*, which in its whole Substance, and in all respects resembles Oil, and shews the last Degree, or Height, of a Colliquation. But the same Author, *Com. in 3 Epid. 72*. makes two Kinds of *oily Urine*, one like Oil in Colour and Thickness, but void of Fatness; another Fat, of which there are two Sorts, one with a Fatness swimming atop, like the Eyes of Oxen, called by the *Greeks* *Elæophanes*; and another, which has its Superficies covered with a fat Substance resembling a Spider's Web, and is called *Elæodes*. All these Kinds of *oily*, or more properly, *pinguious Urine*, proceed from a Colliquation of the Fat by an igneous Heat, as was before observed.

Urine of a livid Colour proceeds from an immoderate Coldness, according to *Galen, de Cris. Lib. 1. Cap. 12*. and is therefore pernicious in acute Distempers, as indicating an Extinction of the natural Heat. It is however sometimes occasioned by a gross, livid Matter, and on that account not deny'd by *Hippocrates* to be good, and sometimes critical.

Black Urine is either the Effect of an immoderate Coldness (though in that Case it may more properly be styled *obscure* than *black*), or of a burning Heat. *Galen, Com. in 1 Prorrh.* tells us, that *black Urine* is occasioned by a Mixture of black Bile with the Serum, which tinges the *Urine* with a black Colour; and *Com. in 3. Epid.* he says, that it proceeds from a melancholic Blood, which like Soot, communicates its Colour to the Serum. Hence, *Lib. 1. de Cris. Cap. 12*. he says, that *black Urine* is a Sign of a Redundance of black Bile, or adust Blood in the Body. But here we are to make a Distinction of this Kind of *Urine* into those of a thick and a thin Consistence.

Thick black Urine always derives its Colour from a more than ordinary copious Excretion of a gross atrabilious Humour, or black Bile, or adust Blood, whence in Quartans, and Disorders proceeding from the Spleen and Melancholy, a thick and black Kind of *Urine* is evacuated.

A *thin and black Urine*, *Galen, Com. 2. in Prognost. and Lib. 1. de Cris.* supposes to proceed either from excessive Coldness, which occasions, also, a Blackness of the Blood, or from an immoderate Heat scorching the Blood. We know and can predict these Kinds of *Urine*, because they are preceded by *Urine* of a yellow, light-red, or saffron-colour; *livid Urine*, also, changes to *black*.

We should next in Order, after *black Urine*, treat of the Causes of *clear and foul, or turbid Urine*. As for *clear Urine*, which is permanent, or continues in a State of Clearness, it is included in what has been said of the Colours of *Urine* in its thin Consistence, and therefore we are to treat only of such *Urine* as is excreted *clear*, but after some time becomes *turbid*. This Kind of *Urine* every one knows to be crude, and to become foul and disturbed from a Redundance of gross Flatulences, and consequently it is regarded by every Physician of the least Experience, as an Indication of Nature's Efforts toward a Concoction.

coction. *Galen, de Sanit. tuend. Lib. 4. Cap. 4.* says, "If the Urine be excreted pure and clear, but is immediately turbid, it shews that Nature sets about the Concoction of the crude Juices; if the Urine becomes not foul immediately, but after some time, it is a Sign that Nature has not yet begun its Work, but will attempt it hereafter." The same Author, *Com. in 3 Epid. in 4 Aph. & Lib. 4. de Sanit. tuend. & Lib. 1. de Cris.* makes three Sorts of turbid Urine; one excreted clear, and becoming turbid afterwards, of which we now speak; another excreted turbid, and becoming clear; and a third which is excreted turbid, and always remains in that State. This last is by Physicians generally call'd *Subjugalis*, with reference to *Horses sub jugo*, "under the Yoke," or us'd to draw; because in Colour, Thickness, and Foulness, it resembles the Urine of a working Horse. Such Sort of Urine proceeds from crude and gross Humours agitated by Heat, and an Elevation of numerous Flatulencies thence occasion'd, which mix with the Serum, and render it confus'd and turbid. For this Reason *Hippocrates, 4 Aph. Cap. 9.* says, "That turbid Urine, like that of Horses, in Fevers, indicates a present or future *Cephalalgia*;" as it is a Sign to us, he means, that Multitudes of Vapours are elevated and convey'd to the Head. *Galen, Com. 5. in 6 Epid. T. 15.* says, "that turbid Urine, like that of Horses, is proper to those who abound with crude Humours, which are put in a State of Fusion by the Heat." By this means, being converted into a spirituous Kind of Substance, they furnish Plenty of Matter for flatuous Exhalations to the Head. Turbid Urine, then, we find, proceeds from crude and gross Humours agitated by Heat.

Turbid Urine, which becomes clear, is, from the natural Heat, employed in Concoction; but Urine always remaining in a turbid State is generally the Effect of a febrile Heat agitating and confounding the Mass of Blood, and is such as we see in the Beginning of malignant Fevers; when Nature has done nothing towards a Concoction. *Avicenna*, and the other Arabian Physicians, tell us, that turbid Urine, which never settles, foreshews an Ebullition of the Humours, on account of the Violence of an extraneous Heat, and the Weakness and Indisposition of the natural Heat towards a Concoction. But *Galen, de Cris. Lib. 1. Cap. 12.* says, that Urine remaining turbid, without becoming in the least clear, indicates that Nature has begun an Agitation in the Blood, and is in full Vigour and Strength, sufficient for Concoction; but that Urine excreted clear, and soon after becoming turbid, signifies that the Agitation of the Humours towards a Concoction is not yet begun, but may be expected. For these Reasons, he prefers that Kind of turbid Urine, which always remains in that State, because they indicate a beginning Concoction, as he more clearly expresses it, *de Sanit. tuend. Lib. 4. Cap. 4.* where he says, that "Urine foul, or turbid, like that of Horses, indicates a Repletion of the Veins with such Humours as are called crude; but that Nature, however, ceases not from her Work, but powerfully concocts them."

And of Urine which becomes turbid after Excretion, he there adds, "If it be voided pure, and immediately turns foul, it shews that Nature attempts a Concoction; but if it grows turbid at some Distance of Time, it is a Sign that Nature is not at present, but will shortly be, employed in that Work." A little after he seems to assert the contrary, when he says, "If there be no Separation, or what subsides is bad, it shews that Nature is weak, and wants Assistance in concocting the Juices." Upon the Whole, it must be said, that turbid Urine continuing in that State, is sometimes the Effect of an extraneous Heat agitating the whole Mass of Blood, and sometimes proceeds from the natural Heat, or Nature itself employ'd in Concoction; and that in the latter Case it is distinguished from the other by its not appearing in the Beginning, but in the Increase of a Disorder, when Nature manifestly attempts a Concoction; after which the Urine has a Sediment, or becomes less turbid, the Strength not much impair'd, and the Disease is free from mortal Signs: And this perhaps is no more than what *Galen* means in the Chapter above quoted, by the following Words: "Of all turbid Urines, let the general Character be a Separation of the thick from the more liquid Part, which is either quick or slow, or none at all. If it be quick and immediate, and what subsides be white, smooth, and equal, it shews Nature far superior to the Juices which it concocts; but if what subsides be bad, Imbecillity of Nature is signified." If then such turbid Urine appears, as we said, in the Beginning of a Disorder, at which Season Nature attempts no Concoction, on account of the Ebullition and Agitation of the extraneous and febrile Heat, it indicates a Turbation from a Redundance of crude and gross Humours put in a State of Fusion by the vehement Heat, which, in Conjunction with the Violence of the Distemper, and the extreme Weakness of the Patient, may be justly esteem'd a fatal Prognostic. *Galen*, therefore, might well say, *Com. in 4 Aph. T. 70.* "Turbid Urine, which

comes to no Settlement, if the Patient be strong, shews the Disease will be of long Duration; if weak, that it will be mortal." Urine, then, which appears turbid, and continues so in the Beginning of a Disease, proceeds not from the natural, but an extraneous Heat, which is confirmed by the Weakness of the Patient, and some pernicious concomitant Sign, and from its having nothing of a laudable Sediment.

We have spoken largely of the Causes of turbid Urine, and would treat, in a few Words, of the Origin and Cause of pungent Urine, or such as is excreted with Pain, and a pungent Sensation: This, in short, proceeds from highly-acrimonious and hot Humours, which are voided together with the Urine, and, according to *Hippocrates, 1 Epid. Sect. 2.* are the Occasion of a Strangury. And *Galen, Com. in 1 Epid.* to the same Purpose, tells us, "that when the excrementitious Parts of the whole Body are purged off by the Passages of the Kidneys, the Patient is seized with a Strangury, as well upon other Accounts, as principally from the Acrimony of the confluent Urine;" this Acrimony is the Effect of an immoderate Degree of Heat.

Fetid Urine is known by every Body to be the Effect of an extraordinary Putridness either in the Vessels, or the Kidneys, or the Bladder.

As to Urines of an equal and unequal Consistence, *Galen, Com. in 7 Aph. T. 33.* makes the following Remarks: "If we take the Word *disjunctus* (distant or separate) in its proper Sense, the Thing is impossible; because Urine is always continuous, without Interstices; but if we understand by this Term an Inequality of Substance or Consistence, he (*Hippocrates*) rightly says, that such an Inequality indicates a vehement Perturbation in the Body: For when Nature prevails, and is predominant, all Things are equally united; but when it is repelled and controlled by Variety of stubborn and rebellious Matters, that Portion of them which is subdued and concocted, takes one Form; and what is renitent and refractory, another; and when there is a great Variety of these contumacious Particles, it shews the Inequality in the Urine to be very considerable, as well as the Perturbation, which is the Cause of it."

We have given you the Causes of the various Kinds of Urine, and proceed to treat of the Causes of its Contents; under which Head we are to inquire the Reasons of those Contents at the Bottom, which we call *Hypostases*, *Subsidences*, and *Sediments*; and what are the Causes of those pendulous Contents in the Middle, which pass by the Names of *Enaeremata* and *Sublimamenta*; as, also, the Reasons of the *Nubes* and *Nubeculae*, or the Clouds and Films which swim on the Superficies of Urine.

In general, the Variety of Contents in Urines depends on the various Generation and Mixture of Flatuities; for when there is a Redundance of these in the Urine, the excrementitious Particles are conveyed to the Superficies; when there is but a moderate or small Quantity of them, they make this Settlement in the Middle; and if there be none at all, they reside at Bottom. Hence it is that an Hypostasis indicates a good Concoction, in which the Flatuities, being dissolved, cause no Perturbation. This, however, is no necessary Consequence from the Contents being lodged at the Bottom, since not every Hypostasis, or Sediment, infers, of Necessity, a Concoction, but that which is white, smooth, and equal at all Times, as we are taught by *Hippocrates*, in his *Prognostics*. Nor do Clouds and Films always signify Crudeness: For, as we are told by the same Author, in the Book just quoted, "Clouds on the Surface of Urine, if white, are good." And *Galen, Lib. 1. de Cris. Cap. 12.* tells us, that in Patients injured to Fasting and immoderate Labour, the Disease often has its Solution before any thing subsides in the Urine; and it is generally sufficient if there be a white Cloud, and a white, smooth, and equal *Enaerema*.

But white, smooth, and permanently equal Contents, in the Bottom of the Vessel, or Urinal, constantly signify Concoction, an *Enaerema* of that Kind a less Degree of Concoction; and a Cloud of the same Sort, as being situated highest of all, a still lesser Measure of Concoction of the Disease.

The Contents, or excrementitious Particles, elevated in the Form of a Circle, to the Superficies of the Urine, is a certain Indication of a *Delirium*, as was observed by the Author of *1 Prorrh.* and I have frequently found the Truth of it by Experience.

A copious Sediment, though it occupies the lowest Place in the Urinal, indicates a Redundance of crude Humours, as *Galen, Lib. 1. de Cris. Cap. 12.* has demonstrated, from Examples of Children bred in Idleness, and pamper'd with full Diet, whose Urine abounds with Crudities, and a Repletion of the Body with crude Humours. And, *Com. 2. in Prognost.* he says, that there appears a copious Sediment in Urine, when the Disease is fomented by crude Humours; and that there is

very little or no *Sediment* in the *Urine* of those who labour under bilious Diseases, or are used to Fasting, and hard Labour.

A *thin Urine*, *Sediment*, or *Hypostasis*, is a Sign of thin Humours; but a *pure Hypostasis*, which scarce rises upon shaking the Vessel, shews a great Weakness of Nature in the second Concoction.

Thick and gross Sediments are, in like manner, Indications of gross Humours, agreeably to what we are told by *Galen*, *Com. in 4 & 7 Lib. Aph.* and *Lib. de Plenitud.* where he says, that "the *Urine* of voracious Persons has a thick *Sediment*." We affirm, therefore, that a gross or thick *Hypostasis* is an Indication of gross Humours, and consequently of difficult and troublesome Disorders.

An *united*, or *continuous*, and *equal Hypostasis*, of a pyramidal Figure, is highly commended, as being a Sign of a very good Concoction; as, on the contrary, a *discrete* and *unequal Sediment*, or *Hypostasis*, has a quite different Signification. *Galen*, *Lib. 1. de Crisf. Cap. 12.* For an *Hypostasis* which is *unequal*, and *discrete*, or consisting of loose and separate Parts, shews a Redundance of gross Flatuosities in the Veins, which are incapable of being dissolv'd and discuss'd by Nature, as we are told by the Author of *Lib. de Urinis*.

As to the Colours of the Contents of *Urine*, *white*, as we said, is judg'd the best, if the Matter be, also, continuous, smooth, and equal; and such is the Result of a perfect Concoction.

Unequal discrete Contents are distinguish'd from an *Hypostasis*, as making a Substance disjunct, or disunited, and dispers'd, like small and minute Particles of Sand, through the Body of the *Urine*. These are the Effects of a copious Phlegm, or proceed from Pus, or a Colliquation of the solid Parts; and of this Nature are the Contents resembling coarse Flour, and the *Hypostasis* which the *Greeks* call *Crimnodes*.

Red and redish Contents signify Crudeness, and Want of Concoction; whence it is justly said by *Hippocrates*, *Lib. Prognost.* "that redish *Urine*, with a redish and smooth *Sediment*, shews the Disease to be of longer Duration than in the first Case [where the *Sediment* is white, smooth, and equal]; but is, however, very salutary." The Author of the Book of *Urinis* says, that red Contents proceed from an ichorous Blood, and signify Want of Concoction.

Yellow and green Contents are bad, because they shew, that the Disease is fomented by a yellow, æruginous, or porraceous Bile.

The worst Colours in the Contents of *Urine* are the livid and the black. A livid Colour soon changing to black, proceeds from a Refrigeration of Heat; and a yellow, light-red, or green Colour, quickly altering into black, is the Effect of an igneous Heat burning the Humours. Justly, therefore, does *Hippocrates*, *Prognost.* pronounce black Clouds in *Urine* bad.

Of Contents in *Urine* which proceed from a Colliquation, and therefore appear in various Shapes, those *Hypostases* which are call'd by the *Greeks* *Oroboides*, because they resemble the Pulse *Orobis*, and, also, *Sandarachoides*, are the Effects of a beginning Consumption of the Flesh after the Fat is consum'd; and are Indications of a Colliquation either of the whole Body, or of the Kidneys.

The Contents, or *Hypostases*, call'd, in *Greek*, *Petaloides*, that is, squamous, or scaly, appear, according to *Galen*, when, after a Colliquation of the Fat and Flesh, the superficial Parts are abraded by the igneous Heat.

The *Pityroides*, or *furfuraceous Hypostases*, which are narrower and straiter, but yet thicker, than the scaly Sort, are the Effects of a Dilaceration and Consumption of the Vessels of the solid Parts by the igneous Heat.

In the last Place, the Contents or *Hypostases* call'd *Crimnodes*, which are like coarse Meal, or Flour, proceed from a Consumption of the solid Parts more violent than the former: Of these Kinds of *Hypostases*, we find *Hippocrates* passing his Judgment, *Lib. Prognost.* in the following Words: "If the *Hypostasis* of the *Urine* be *Crimnodes* [like coarse Flour], it is bad; but the *Petaloides* [resembling Scales] are worse; the white and thin is very bad; but the *Pityroides* [furfuraceous] is still worse." Here *Galen*, in his Comment on the Place, tells us, that these Kinds of *Urine* are the Effects of an igneous Heat scorching the Blood, or consuming the Flesh in an unequal manner.

Of good URINES, portending Recovery.

Urine, as well as other Excretions, affords Indications in Diseases for a *Prognosis* of Death or Recovery, two Ways: First, as it is a Sign of Concoction and Malignity; and, secondly, as it is a Cause, in discovering itself to be a good or bad Excretion. Of *Urine* portending a good Event, in both these Respects, we find *Galen*, *de Crisf. Cap. 12.* and *Com. in 3 Epid.* giving the following Description: "The best Kind of *Urine* is what is of a moderate Consistence, answering in Proportion to the

Quantity of Drink, of a lightish Red, or yellowish Colour, with a white, smooth, and equal *Sediment*, or *Hypostasis*." The best *Urine*, says *Hippocrates*, *Lib. Prognost.* is what has a white, smooth, and equal *Sediment*, during all the time before the Crisis; for this signifies that the Patient is in a safe State, and that the Disease will not be of long Duration: But if there be an Intermission, and the *Urine* be sometimes pure, and sometimes with a white and smooth *Hypostasis*, the Disease will be the longer, and the Patient the less secure." *Galen* adds, "The *Urine* ought to be of a moderately saffron Colour, and of a mean Consistence between thin and aqueous, and thick like that of Horses." The same Author, *Lib. 1. de Crisibus*, *Cap. 12.* says, "that the best *Urine* is rather of a lightish-red, than yellowish Colour." And *Com. in 1 Epid.* and *Lib. 10. Simpl.* he makes it moderately yellow; and *Lib. 2. de Sanit. tuend. Cap. 2.* he says, "that a lightish-red and bilious *Urine*, is an Indication of a perfect Concoction in Diseases."

In many Cases concocted *Urine* has but little Colour; in others it is more deeply tinged; whence it appears, that the best *Urine* is not always observ'd to be of the same Colour. The divine *Hippocrates* was of Opinion, that we were not so much to regard the Colour or Consistence of *Urine*, as its Contents, in order to a *Prognosis*; since, in the Place just quoted, where he describes the best *Urine*, he says not a Word of the Colour and Substance, but only of the Contents: For he tells us, that "the best *Urine* is what has a white, smooth, and equal *Sediment*," omitting the Colour and Substance, which are not observ'd to be always the same in such an *Hypostasis*. And though, indeed, it be necessary for the *Urine*, when furnish'd with the best *Hypostasis*, to be of the best Colour, and of a moderate Consistence, and in temperate Bodies such Colours are usually observ'd, as before describ'd, and reputed laudable, yet as there is a vast Variety in *Urine* with respect to the various Constitutions and Dispositions of Bodies, we are to have recourse to a general Method for discovering the best Kind of *Urine* in all particular Cases. Here we are well directed by *Aristotle*, *Lib. 1. Probl. T. 52.* "The best *Urine*, he says, is moderate in all Respects, and most like that of the Person in Health; which is a Precept to be regarded by the young and unexperienced Physician, in his Inspection of *Urine*; in which, when he sees any Alteration from what it was in a State of Health, he may safely pronounce the Person to whom it belongs fallen from a perfect State of Health and Soundness." This of *Aristotle* is certainly a good Rule for judging of good and bad *Urine*, since the Theory of *Similars* and *Dissimilars* is one of the chief Principles of the Art of *Prognosticating*. Upon these Considerations we, also, conclude, that in Diseases such *Urine* is to be esteem'd the best, as approaches nearest to the *Urine* of the Patient in Health; and this is the Character which *Galen*, also, has given of it, *Lib. 1. de Crisf. Cap. 12.*

But, for our clearer and more exact *Diagnosis* of the best *Urine*, we are attentively to consider the Temperament of the Body and *Viscera*, with the Age, Sex, Diet, and Way of Living, of the Patient: For the *Urine* of Bodies of an hot Temperament is of an higher than ordinary Colour; and the *Urine* of Persons of a cold Temperament, of a lower Colour than is consistent with Mediocrity. In respect of Age, young adult Persons make thinner *Urine*, and more colour'd than Children; and the *Urine* of Children is thicker than ordinary, as that of old Persons is thinner, and more colourless. With regard to Sex, the *Urine* of Women is thicker, and more colourless, than that of Men, and more abounds with Contents: In other Respects, the *Urine* of voracious Persons abounds with crude Sediments; on the contrary, the *Urine* of those who are us'd to Fasting has but little *Sediment*, and is more coloured than the former; and the same Appearance in the *Urine* is effected by Watchings and Fatigue; whereas the *Urine* of those who live in Idleness abounds with *Sediment*, and is less colour'd.

Hence we conclude, that in Children the best *Urine* is what appears of a thickish Consistence, is but slightly tinged, and abounds with a copious, white, smooth, and constantly equal *Hypostasis*. In Youth and Manhood the *Urine* ought to be more deeply tinged, and of a yellowish or lightish-red Colour, and of a thinner Consistence, with fewer Contents, and so much the thinner, and more colour'd, as the Body is of an hotter Temperament; and so much the less colour'd, as the Temperament of the Person is colder. In Women the *Urine*, on some Occasions, must be thicker, and more colourless, than ordinary; in Persons under Circumstances of Fasting, Fatigue, and Watching, higher colour'd, and thinner, with fewer Contents; and in those who indulge themselves in plentiful Living, and Idleness, the *Urine* must be expected less colour'd, of a thicker Consistence, and with a more copious *Sediment*.

But in Bodies of a moderate Temperament the best *Urine* is, as *Galen* says, of a moderately croceous Colour, of a mean Consistence, answering in Quantity to the Drink; with a white,

white, smooth, and constantly-equal Sediment, and, in short, most resembling the *Urine* of Persons in Health. In all Cases the best *Urine* has a white and equal *Hypostasis*, or Sediment; *Urine* with a pendulous Substance, or *Enæorema*, is not so good, and that with a Cloud, or Film, worse than the former. We are, however, taught by *Galen*, *Com. in 3 Epid.* that an *Enæorema* is sometimes good; and that even a Cloud may be good enough to prove a salutary *Prognostic*, according to *Hippocrates*, 4 *Aph.* 70. where we read, that "Persons in whom the Fever comes to a Crisis on the seventh Day, have a red Cloud in their *Urine* on the fourth Day, and other Things in Proportion." And not only a red Cloud, says *Galen*, which was not seen before, prognosticates a Crisis; but a white Cloud much more; and a white, equal, and settled *Enæorema*, more than either; But if the Disease be very quick in Motion, and there be a Change in the Colour and Consistence of the *Urine*, there are sufficient Grounds for prognosticating an approaching Crisis. *Hippocrates*, *Lib. Prognost.* says, that "a Cloud floating in the *Urine*, if white, is good." And a little after, "we are to consider in these Clouds, whether they move upwards or downwards, and also, what Colour they are of; for if they tend downwards, and are of the Colour above-mention'd [white], they are good, and laudable."

With respect to the Substance, *Urine* of a thin Consistence, with a good Colour, is laudable. Hence *Galen*, *Com. in 1 Epid.* says, "It is plain that thin *Urinæ*, but of a good Colour, promise a Recovery on account of the Goodness of their Colour; but, in respect only of their Thinness, they require a longer time for Concoction." So that this Kind of *Urine* prognosticates, indeed, a Recovery, but it is after a considerable time; as it happen'd in the Cases of *Cleonastides* and the *Clazomenian*, 1 *Epid.* *Ægr.* 6. 10. and *Chæron*, 3 *Epid.* *Secl.* 1. *Ægr.* 5.

Thin and colourless *Urine*, where there are Signs of Recovery, indicate an Abscess, as we are taught by *Hippocrates*, *Lib. Prognost.* quoted by *Galen*, *Com. 1. in 3 Epid.* T. 4. to this Purpose: "Thin and equal *Urinæ*, he says, excreted for a long time together, if there be other salutary Signs, indicate an Abscess in the Parts below the Diaphragm." Thus it happen'd to *Pythion*, 3 *Epid.* *Ægr.* 1. who liv'd near the Temple of *Tellus*, of whom it is said, "From the first to the eighth Day his *Urine* was thin, and colourless, and had a cloudy *Enæorema*; on the tenth he fell into a Sweat, his Spit was somewhat concocted, and he had a Crisis, about which time he voided a thinnish [for *ὑπόλευκα*, as all the printed Editions have it, I read *ὑπόλευκα*] *Urine*." On the fortieth Day after the Crisis, a Suppuration appear'd in the Parts about the Anus, and the Abscess produc'd a Strangury.

Of Colours in *Urine*, the laudable, as we said, are the yellowish, lightish-red, suberaceous, or somewhat saffron-like Colour, the moderately pale and subluteous Colour. The reddish *Urine*, with a reddish Sediment, is said, by *Hippocrates*, to be salutary, though it indicates a long Disease; the black Colour in *Urine* is not always bad; it is not so, for Instance, in Disorders of the Spleen, as appears in the Case of *Herophon*, 1 *Epid.* *Ægr.* 3. and in those who abound with melancholic Blood; and the same is agreeable to what *Galen*, *Com. in Epid.* remarks of a female Patient, where he says, "that the Colour of her *Urine*, though black, indicated no Danger, because proceeding from a Retention of the Menfes, which were of a more melancholic Cast." Plenty, also, of black *Urine*, which changes not to aqueous critically excreted, is of Service. Hence *Galen*, *Com. 3. in 3 Epid.* T. 73. says, he knew a Woman who was very much reliev'd by a plentiful Excretion of such Kind of *Urine*; besides, black *Urine* with a plentiful Hæmorrhage from the Nostrils, as in the Case of *Meton*, 1 *Epid.* *Ægr.* 7. or a copious Flux of the Menfes, as was observ'd of the morose Woman, 3 *Epid.* *Secl.* 3. *Ægr.* 11. are not in the least to be dreaded.

Of turbid, or foul Kinds of *Urine*, what soon settles or subsides is good, especially if the Sediment be white, smooth, and equal, according to *Galen*, *de Sanit. tuend. Lib. 4. Cap. 4.* where he writes, "that if there appears a Separation of the thicker from the more liquid Substance in the *Urine*, and what subsides is white, smooth, and equal, it indicates a Superiority of Nature in subduing and concocting the Juice."

Clear *Urine*, which soon becomes turbid, may, also, be esteem'd beneficial, as it signifies, that Nature is at work in concocting the Humours.

With regard to Alterations in *Urine*, those are esteem'd laudable which are made for the better, either in Colour, Consistence, or *Hypostasis*. Hence thick *Urine*, excreted after the Beginning of a Disease, is accounted beneficial, since Excretions, after the Commencement of a Concoction, become thick, if they were thin before; as, on the other hand, when from thick they change to thin, it is a very good Sign; agreeably to the Doctrine of *Hippocrates*, 4 *Aph.* 68. where we read, "that

"they who void a thick, grumous *Urine*, and in small Quantities, and are not free from a Fever, are reliev'd by a supervening plentiful Excretion of thin *Urine*, which is most likely to happen when there has been an *Hypostasis* in the *Urine* from the Beginning, or not long after." Here *Galen*, in his Comment, says, "that Plenty of thin *Urine* is beneficial, as it indicates the morbid Matter to be more attenuated."

It is best for *Urine*, from turbid to become clear, from colourless to grow colour'd, from too high a Colour to become less colour'd, and from wanting Contents to assume either a Cloud, *Enæorema*, or *Hypostasis*, which are white and equal.

Such, then, are the Properties and Qualifications of *Urine*, by which it indicates a Recovery in acute Diseases, as it is a Sign of Concoction; in the same manner it portends a good Event as a Cause in shewing itself to be a salutary Evacuation.

For this Reason, Plenty of *Urine* excreted on a critical Day, indicates a salutary Crisis, and with the greater Certainty, if it be in its own Nature of a laudable Kind, as it was in the Case of *Nicodemus*, 3 *Epid.* *Secl.* 3. *Ægr.* 10. of whom *Hippocrates* observes, 3 *Epid.* *Secl.* 3. "that on the twenty-fourth Day he voided much white *Urine*, which had a copious *Hypostasis*; and he fell into a plentiful hot Sweat, underwent a Crisis, and was freed from his Fever." And of *Pericles*, *ibid.* *Ægr.* 6. he says, "On the third Day his Fever was abated, and he voided Plenty of concocted *Urine*, with a copious Sediment." *Chæron*, also, *ibid.* *Secl.* 2. *Ægr.* 5. is said to escape, by the Benefit of a copious Effusion or bilious *Urine*. To the same Purpose we read, 4 *Aph.* 73. "that where an Abscess is expected in the Joints, the same is prevented by an Evacuation of much thick and white *Urine*." And, 6 *Epid.* *Secl.* 4. *Aph.* 2. "that an Evacuation of thick white *Urine*, such as happen'd to the Servant of *Archigenes*, sometimes happens in Quartans attended with a Lassitude, and prevents an Abscess." But that Kind of thick *Urine* which resembles coarse Meal, portends Death, or a long Duration of the Disease; as we are taught by *Galen*, *Com. in 7 Aph.* 31.

Acrid *Urine*, evacuated with Pain, and in great Quantity, frequently happens to be critical in acute Diseases, agreeably to the Observation of *Hippocrates*, 1 *Epid.* *Secl.* 1. where, after describing an epidemic Disorder very fatal to Children, he says, "that the only serviceable, and most important of all the Judications, and by which many escap'd the greatest Danger, was, an Alteration of the Disease to a kind of Strangury, and Abscesses in the Parts affected." And a little after, "with regard to the Strangury, it was tedious, and very troublesome to the Patient; the *Urine*, in this Case, was copious, thick, various, red, mix'd with Pus, and excreted with Pain." To which he adds, "All who were in this Circumstance recover'd, and not one of them, as far as I know, dy'd." The Case of *Pythion*, 3 *Epid.* *Ægr.* 1. which was much of the same Nature, had probably the same happy Event; of whom we read, that "on the fortieth Day after a Crisis, a Suppuration was form'd about the Anus, and converted itself into a Strangury;" after which, it is probable that he recover'd by the Benefit of copious Evacuations by *Urine*.

There are some Kinds of oily *Urine*, not fat, but resembling Oil only in Colour and Consistence, which are, also, salutary; these never happen but from a perfect Concoction of the Disease, and have been several times observ'd by *Galen*, as he says, *Com. in 3 Epid.* T. 72. from a Concoction of the Disease, without any Detriment to the Patient. And so much for good *Urinæ*, which are of salutary Prognostication.

Of bad URINE, which portends Death.

Thin, white, aqueous *Urine*, of long Continuance; in a Disease not of a favourable Kind, is destructive, as we are assur'd by *Galen*, because it indicates a very high Degree of Crudeness; and it is no less pernicious in acute Fevers, because, according to the same Author, it shews that the yellow Bile has its Course upwards, and is carry'd towards the Head, from whence we may predict a Delirium and Phrensy. And such *Urine* we find condemn'd by *Hippocrates*, 4 *Aph.* 72. where he says, "that white pellucid *Urine* is bad, especially in a Phrensy." And *Galen*, in his Comment on the Place, says, that he never knew one in a Phrensy, from whom such Excretions of *Urine* proceeded, recover. For it is much better, as the Disease is wholly of a bilious Nature, that the *Urine* should appear bilious, and worst of all that it should be thin and transparent, as it was observ'd in *Philistes*, labouring under a mortal Phrensy, 3 *Epid.* *Secl.* 2. *Ægr.* 4. We conclude hence, that thin and aqueous *Urine*, in all acute Fevers, is bad, as portending, at least, a long Duration of the Disorder, with Relapses; for Nature requires a long time for the Concoction of Humours in so highly crude a State, when, if the Fever be not extremely violent, and the Strength not much exhausted, the Patient has been sometimes known, though after a long time, to recover;

but if the Disease be violent, and the Strength much impair'd, such Urine is absolutely fatal: And this is what *Galen* means, *Com. in 4 Aph. 71.* when he says, "If the Strength was before exhausted, such white perspicuous Urine is pernicious, as in Phrenesies; in which Case we have no Instance of Recovery." We may add, as a stronger Confirmation of their Fatality, their long Continuance, and Appearance after the Beginning of the Disorder, as it happen'd in the Case of the Woman who lay ill in *Thasos*, 3 *Epid. Sect. 3. Aeg. 2.* who, on the eleventh Day, evacuated such thin aqueous Urine, and continu'd so to do till the fortieth Day. We have already observ'd from *Hippocrates, Lib. Prognostic.* that a Continuance of such Urine, with salutary Signs, prognosticate, a Solution of the Disease by an Abscess, as it actually happen'd in the Case of *Pythion*, who liv'd near the Temple of *Tellus*, 3 *Epid. Aeg. 1.* and is demonstrated by *Galen*, in his Comment on the Case. But, on the other hand, where are no salutary Signs to accompany it, a Continuance of such Urine is always mortal. Hence *Hippocrates, Prognost.* pronounces aqueous Urine one of the most destructive Kinds, and worst of all in Children.

Thick Urines, according to *Hippocrates*, in the same Book, are bad, especially if they appear in the Beginning; at which time, as *Galen* will have it, *Comment. in 4 Aph. 6.* the Urine is generally thin: But those Kinds of thick Urine which have either none, or a bad *Hypostasis*, are very bad; and of these, *Galen, Com. in 4 Lib. Aph. 1.* says, "thick Urine, without a Sediment, if the Strength be pretty entire, portends a long Continuance of the Disease; but if the Strength be much exhausted, the Death of the Patient." And *Hippocrates, 1 Epid. Sect. 1.* describing an epidemic Fever of the semitertian Kind, says, that "in some Subjects the Urine was thick, and had but a small *Hypostasis*, and the same not of a due Consistence, but crude and unseasonable." *Galen*, also, 1 *Com. in 3 Epid. T. 5.* speaking of these Kinds of Urine, says, that *Hippocrates*, in that Case of *Hermocrates*, by "hinting that his Urine was thick, and without *Hypostasis*, plainly intends, that it was foul and turbid, as he here usually calls that Urine which always appear'd in a crude, disturb'd State, and impregnated with a flatulent Spirit, like Must." Since Urine, then, in which nothing subsides, is of the Number of turbid Urines, thick Urine, also, destitute of a Sediment, is to be esteem'd a turbid Urine, which, says *Galen*, besides indicating a flatulent and crude Perturbation of the whole Mass of Blood, shews the Disease to be fomented by gross Humours.

Having first observ'd, that turbid Urine may be either thin or thick, we proceed to inquire into the *Prognostics* which may be drawn from turbid Urine in acute Diseases. *Galen*, as we before observ'd, makes three Sorts of turbid Urine; one voided thin and clear, and afterwards becoming foul and turbid; a second voided turbid, and continuing in that State; and the last voided foul and turbid, and afterwards growing pure, and clear. These last mention'd, *Galen, de Cris. Lib. 1. Cap. 12.* makes to have a less Degree of Pravity; because it shews, that something of an unequal Turbulency remains, and that the Disease will be concocted in a short time. Worse than the former is that kind of turbid Urine which is discharged clear, and becomes turbid afterwards; because such a posterior Turbation signifies that Nature wants to begin its Work of Concoction of the Disease, but has not actually begun it; and therefore requires a longer time, and a good measure of Strength in the Patient, to perfect the Concoction. Of a mean Kind between the two former, according to *Galen*, is that Urine which is excreted turbid, and continues in a State of Turbation, without growing in the least clear, or subsiding. And this Sort of turbid Urine, he says, indicates, that the Agitation in the Blood is still promoted, in order to a Concoction. The same Author, *de Sanit. tuend. Lib. 4. Cap. 4.* tells us, that "if the Urine appears turbid, like that of Horses, it shews the Veins to be replete with what they call crude Humours; but that Nature, however, is not idle, but hard at work in concocting them." Hence it appears, that turbid Urine, which becomes not clear, nor subsides, is better than such Urine as is excreted clear, and afterwards becomes turbid. This Distinction, however, *Hippocrates* seems not to be sensible of, since he no-where says that this last mention'd is of worse Signification than the other; but condemns, in general, those Kinds of turbid Urine which never subside, nor grow clear, more than the others; and pronounces them pernicious. Thus it prov'd, for Instance, in the Case of the Wife of *Philinus*, 1 *Epid. Aeg. 4.* who dy'd; of whom it is said, "Under her Convulsions great Quantities of Urine came from her, for the most part, involuntarily; white, thick, like what is disturb'd by shaking, after long Settlement in the Urinal; it did not subside, but in Colour and Thickness was like the Urine of a Horse; such was the Nature of her Urine, says *Hippocrates*, as far as it appear'd to me." And of the Wife of *Dromeades*, another fatal Instance, we read, *ibid. Aeg. 11.* "that the Day after she was

seiz'd with a Rigor she had a commodious Evacuation by Stool; that her Urine was thick, white, turbid, like Urine agitated after long Settlement, and did not subside." The same turbid, and not subsiding Urine, was observ'd in the Man who, "being in a feverish State, made a Supper, and drank freely;" 1 *Epid. Aeg. 12.* and in *Hermocrates*, 3 *Epid. Sect. 1. Aeg. 2.* who both died of acute Fevers. *Galen*, also, seems to assert the same *Prognosis* from turbid Urine, in his Comment on 4 *Aph. 70.* where he says, "Some Sorts of Urine remain turbid for a long time, others soon acquire a thick Sediment, and signify a quick Solution of the Disorder; but turbid Urine in which nothing subsides, if the Patient be strong, shews the long Duration of the Disease; if weak, Death." And *de Sanit. tuend. Lib. 4. Cap. 2.* he gives us his Description and Judgment of these turbid Kinds of Urine, in so clear a manner, that we may from thence conclude this kind of turbid Urine to be more pernicious than the rest. "Of all turbid Urine, he says, the general Mark or Character by which it is judg'd, is a Separation of the thicker and grosser from the thinner and more liquid Substance; and this Separation is effected in a quick or slow manner, or not at all; if the Separation be quick, and what subsides be white, smooth, and equal, it shews that Nature has the Dominion over the Juices, and concocts them. If the *Hypostasis* be good, but acquir'd at some considerable Distance of time, it prognosticates that Nature will prevail over the Juices in Length of time. But if there be either no Separation at all, or what subsides is bad, it indicates that Nature is weak, and wants Assistance in concocting the Juices."

We conclude, then, from the Premises, that turbid Urine, in which nothing subsides, is more pernicious than other Urine of that kind. The same may be demonstrated from the Rule of Contraries: For since *Galen* himself confesses, that turbid Urine, which collects an *Hypostasis*, is good, and signifies that Nature will overcome the Disease; the contrary Urine, therefore, which is destitute of all Sediment, and always remains turbid, must have a contrary Signification, and portend that the Disease will prevail over Nature: For turbid Urines, also, not to grow clear, indicates their Turbation to proceed not from the natural Heat employ'd in Concoction, but from some extraneous and preternatural Heat working the Ruin of the Patient. For turbid Urine, which acquires that Property from the natural Heat, terminates in Clearness; but turbid Urine which is the Effect of a Turbation by the febrile Heat, always remains turbid, and collects either none, or a bad *Hypostasis*.

Moreover, among the Kinds of turbid Urine, what remains turbid in the Beginning of a Disease, is worse than the like happening in the Increase; at which time the natural Heat is employ'd in Concoction, and often causes a Turbation in the Urine by filling it with Flatulencies; but in that Case the Urine in a little time deposits a good Sediment, and becomes clear.

As to that kind of foul or turbid Urine which is evacuated clear, and becomes turbid afterwards, whether it has a greater Degree of Pravity than the other Kinds of turbid Urine, as *Galen, de Cris. Lib. 1. Cap. 12.* will have it, I am not perfectly satisfy'd: For if by Urine becoming turbid after Evacuation, it be signify'd, as he there, and *Lib. 4. de Sanit. tuend. Cap. 4.* tells us, that Nature has not indeed yet begun, but is preparing to set about its Work of Concoction; and that by turbid Urine growing clear, it be indicated, that Nature has actually begun a Concoction; it seems to follow, that turbid Urine, depositing no Sediment, is the most pernicious, at least in acute Disorders, and is justly indeed so esteem'd, since it indicates the Presence of a Multitude of crude and gross Humours, which requires a long time for Nature to concoct and subdue; and a great measure of Strength is, also, necessary, for such a Work. Hence, in weak Bodies, and violent Disorders, such Urine portends Death.

With respect to the Colours of Urine, the white, thin, and aqueous, in acute Diseases, are the worst, because, as we learn from *Galen*, it is best, in bilious Diseases, for the Urine and Excrements to appear pretty much colour'd. *Hippocrates, Lib. Prognost.* condemns the thin and fiery red Urine, as "indicating the Disease to be in an absolutely crude State; and that if it continues long, it is to be fear'd the Patient will not be able to support himself till the Urine be concocted." And such is its *Prognosis*, because a thin and fiery-red Urine is a Sign of a violent Disease, and an internal burning Heat, or vehement Inflammation, either in the Liver, Stomach, or Diaphragm.

In Inflammations of the internal Parts, and in acute Fevers, gold-colour'd Urine, of long Continuance, is very much to be suspected, because it indicates a high Phlegmon, or Inflammation, in some one or other of the Viscera.

Black Urine, in acute Disorders, is always attended with Danger, unless it be critically excreted, or flows in a copious manner, under a Suppression of atrabillious Menfes, or a plentiful Hemorrhage from the Nose. In what Cases black Urine is not

to be dreaded we have shewed before ; but in acute Diseases, if not excreted under the Circumstances before-mentioned, it imports Danger, as indicating Plenty of adult Blood, which it will be difficult for Nature to concoct. For this Reason Hippocrates, *Prognost.* pronounces black Urine more destructive than the thin and fiery-red, and worst in adult Persons ; on the same Account he condemns black Clouds floating in Urine as a pernicious Sign.

Thin black Urine, excreted in small Quantities, 1 *Epid. Sect. 2. Stat. 3.* was one of the Symptoms which attended the Beginning of a very mortal epidemic *Causus*, or burning Fever, and portended a fatal Event.

Black Urine changing to aqueous, as in the Woman who lay ill near the cold Water, 3 *Epid. Sect. 3. Aegr. 2.* is destructive. Of her it is observed by Hippocrates, that on the eleventh Day she voided Plenty of thin black Urine, and on the twentieth great Quantities of aqueous Urine flow'd from her ; on which Galen, in his Commentary, observes, that black Urine changed to aqueous is a mortal Sign. The Author of 1 *Prorrh. T. 4.* writes, that " in Persons under Perturbations and Watchings, colourless Urine, with a black Enæorema, is phrenetic," that is, prognosticates a Phrensy ; and we may say, a Phrensy of a malignant and mortal Nature, because proceeding from a black and adult Bile.

Black and fetid Urine is observed by Galen, *Comment. in Aph. and Com. 2. in Prognost. T. 32.* to be destructive. And continually black, thin, and aqueous Urine, with bad Signs, portend Death, as it happened in the Case of the Woman, 3 *Epid.* before-mentioned, of whom it is said by Hippocrates, at the End of his Account, that " her Urine was perpetually black, thin, and aqueous, attended with a Coma, Loathing, Despondency, Watching, Proneness to Anger, Anxiety, and melancholy Disorders of Mind."

But the worst of all is black Urine with a black Sediment. On this Kind of Urine, Galen passes his Judgment, *Lib. 1. de Crisibus, Cap. 12.* in the following Words : " Worst of all, he says, is Urine black in its whole Substance, and I never knew one Person recover after voiding such Urine ; but it is less pernicious if what subsides of it only be black, and less so still, if no more than what floats in the Middle (the Enæorema) be black, and much less pernicious than this last, is a Cloud only of that Colour."

Oily Kinds of Urine, particularly such as have a Fatness on the Surface, resembling a Spider's Web, are condemned by Hippocrates in his *Prognostics* ; and Galen, *Lib. 4. de Sanit. tuend.* says, they are pernicious, as indicating a Colliquation. Of *Pythion*, 3 *Epid. Sect. 3. Aegr. 3.* who lay ill near the Temple of *Hercules*, it is said, that " he voided an oily Kind of Urine." Next to black, oily Urine is the worst, because it is a Sign of an extraordinary Colliquation, and that the igneous and febrile Estuation prevails over the natural Heat, as it did, for Instance, in the aforesaid *Pythion*, and the Woman of *Cyzicus*, *ibid. Aegr. 14.* who both voided first black, and soon after oily, or fat Urine.

No less pernicious is a fat Kind of Urine succeeding a thick, turbid Urine, which deposits no Sediment, because it signifies, that the igneous or febrile Heat, which first excited the Turbation, is not only undiminished, but very much increased. Such was the Circumstance of the Urine observed by Hippocrates in the Case of the Wife of *Dromeades*, and of him, who being feverish, supped and drank freely, 1 *Epid. Aegr. 11. 12.* In the latter Case the Patient on the first Day voided red, thick, turbid Urine, which deposited no Sediment ; on the fifth and seventh he excreted great Quantities of a fat, oleous Urine, and died on the eleventh Day of his Illness. In the other Instance, " the Urine on the second and third Day was thick, turbid, and had no Hypostasis ; on the fourth and fifth oily, and on the sixth the Patient died."

In like manner Plenty of thin aqueous Urine without Contents, no way relieving the Patient, or vitious in any manner, in acute Disorders is very much to be dreaded. Thus Hippocrates, 3 *Epid. Sect. 3. Stat. pest.* describing the Symptoms of an epidemic *Causus* generally attended with a Phrensy, and very mortal, tells us, that the Patients excreted " great Quantities of thin Urine, which were of no Service, nor had any Relation to a Crisis." And afterwards, speaking of the same Subjects, he says, " The Urine was in vast Quantities, and not in proportion to the Drink, but far exceeding it ; and it had besides an extraordinary Degree of Pravity, being neither thick nor concocted, nor duly purged." The same Author, 3 *Epid. Sect. 2. Aegr. 12.* relating the mortal Case of the Woman who lay ill in *Foro Mendacium*, says, that on the tenth Day she voided great Quantities of Urine, which had no Hypostasis. And of the sick Woman by the cold Waters, he says, that her Urine was always much in Quantity, black, thin, and aqueous.

Much thick, or turbid Urine, not subsiding, and no way

beneficial is, also, very much condemned, as are generally all great Quantities of Urine in the Beginning of acute Distempers, being justly esteemed of no Service, because at that Time nothing concocted can be excreted, nor any good Purgation be made.

Thin Urines in small Quantities, under burning Fevers, and acute Inflammations, are very bad, as indicating the Serum of the Blood to be consumed by the fiery Heat, and if the Urine has besides any manner of Pravity, it is so much the worse, as it proved in the Cases of the Wife of *Dromeades* before mentioned, the young Man of *Melibæa*, 3 *Epid. Aegr. ult.* and the Virgin Daughter of *Euryanactes*, 3 *Epid. Sect. 2. Aegr. 6.* in the two last of which the Urine was little, thin, and not of a good Colour ; and in the first Case the Urine was little, thin, and oily. And in the Cases of the Woman who lived with *Tisamenus*, and another Woman who belonged to the Family of *Pantimides*, 3 *Epid. Sect. 2. Aegr. 9. 10.* the Urine was observed to be thin, and in small Quantities. All these Patients before mentioned died in a short time after the Appearance of this Symptom which we are speaking of.

An utter Suppression of Urine from a total Consumption of the serous Humidities of the Blood by the igneous and febrile Heat, or from an Extinction of all the Functions, as Galen expresses it, *Com. 2. in 3 Epid. T. 4.* is a fatal Prognostic in Fevers. Of *Silenus*, who lay sick of a mortal Fever, 1 *Epid. Aegr. 2.* Hippocrates observes, that " On the sixth Day his Urine stopped, and that on the seventh he made no Water ; but that on the eighth he made Water in small Quantities with Pain and a pungent Sensation." This is an Indication to us of a vehement Heat consuming the Serum of the Blood, and rendering it highly hot and acrimonious. In the Woman of *Cyzicus*, 3 *Epid. Sect. 3. Aegr. 14.* the Woman who was a Domestic of *Aristion*, and lay ill of a Quinsy, *ibid. Sect. 2. Aegr. 7.* and the young Man of *Melibæa* before-mentioned, there was a Suppression of Urine a little before their Decease from an Extinction of the Faculty.

Urine little in Quantity, acrid, and of no Benefit to the Patient is, also, mortal, as it is a Sign, that all the serous Humidity is consumed by the burning Heat which affects the internal Parts, and that the Humours are inflamed ; and it was observed by Hippocrates of *Silenus*, that before his Death he voided a small Quantity of pungent acrid Urine. And I have myself, says *Prosper Alpinus*, observed these small Excretions of highly acrid and vellicating Urine in my beloved Wife *Guadagnina*, and several others, labouring under a mortal burning Fever, a little before their Decease.

Urine void of Contents, and having neither Hypostasis, Enæorema, nor Cloud, is bad, unless it be occasioned through Fasting, Fatigue, Watching, or an highly bilious State of Body, in which Circumstances it is a bad Sign for the Urine to appear without Contents, as we are taught by Galen, *de Cris. Lib. 1. Cap. 4.*

Thick Urine, without a Sediment, in acute Distempers, is affirmed by Galen to be mortal.

Urine with a small or a crude Sediment is bad : Such was that observed by Hippocrates, 1 *Epid. Sect. 1.* in those who laboured under an epidemic Kind of semitertian Fever. " The Urine, he says, was thin, unconcocted, colourless, and little in Quantity, or else thick, with a small Hypostasis, and no laudable Constitution, and depositing a crude and unseasonable Sediment."

Galen, *Com. in 4 Aph. 69.* condemns thick Urine on account of the Heaviness of its Sediment ; and the Author of the Book *de Urinis, Cap. 42.* tells us, that sometimes a white and crude Humour is excreted with the Urine, and subsides to the Bottom like a good Hypostasis. And Galen, *Com. 2. in Prognost.* says, that a copious and crude Sediment is an Indication that the Disease is fomented by a Multitude of crude Humours, and by that means rendered difficult and dangerous ; for the same Reason he absolutely condemns a thick and gross Hypostasis, *Com. in 4 Aph. 69.* Of such an Hypostasis is Hippocrates to be understood, 7 *Aph. 31.* where he says, " That an Hypostasis with a branny Sediment (*Crimnodes*) in Fevers, indicates that the Disease will be of long Continuance." We have already observed from Galen, *Lib. 1. de Cris. Cap. 12.* that those thick Sediments, which the Greeks call *Crimnodes*, signify a great Colliquation, and therefore in acute Diseases are mortal. The same Author, *Com. in 7 Aph. 31.* speaking of those Sediments, he says, " It appears then by these Examples [*Silenus*, and the sick Man in the Garden of *Dealces*] that whenever Patients void an Urine with this branny Sediment, if ever they recover, it is but very slowly ; but if the Disease be mortal, they die in a very short time." Galen therefore pronounces such Urine destructive, by hinting to us, that great Numbers whom it concerns, are destroy'd before the Disease is protracted to any considerable Length ; and that whoever happen to escape, recover with much Difficulty, and not till after under-

undergoing a long and tedious Sickness; and for this very good Reason, because such a Disposition as is the Cause of these Excretions by Urine, requires a vast deal of Concoction. *Hippocrates, Lib. Prognost.* highly condemns the *Crimnodes Hypostasis*; such an Hypostasis had the Urine of *Silenus, 1 Epid. Aeg. 2.* who died on the eleventh Day; and that of the sick Person in the Garden of *Deacles, 3 Epid. Sect. 1. Aeg. 3.* in whom the Disease came not to a perfect Crisis till the fortieth Day.

We have before observed, that the *Sediments* resembling the Pulse called *Orobis*, the *squamous*, or *scaly*, and the *furfuraceous*, which the *Greeks* call by the respective Names of *Oroboides*, *Petaloides*, and *Pityroides*, are mortal in acute Fevers, as proceeding from the same Colliquation, unless they are the Effects of some Disease in the Kidneys or Bladder. *Hippocrates*, in his *Prognostics*, passes his Judgment on all these Kinds of Urine in the following Words: "A *Crimnodes* (branny) Hypostasis in Urine, he says, is bad; but the *Petaloides* (*squamous*) worse; the white and the thin Urine have a considerable Degree of Pravity; but the *Pityroides* (*furfuraceous*) is yet worse." We know these Sediments are not the Effects of a Disorder in the Kidneys from the Presence of an actually incumbent, acute, and colliquating Fever, and the Appearance of no Sign by which we can judge the Kidneys to be injured.

A loose, discrete Sediment is, also, disapproved, as it indicates Crudity; and when an Hypostasis of this Nature appears, we can never safely predict the Recovery of the Patient.

The same Judgment is to be passed on an unequal Sediment, according to *Hippocrates Prognost.* where we read, "If there be an Intermission, and the Urine be sometimes excreted pure, and at other times deposits a white and smooth Hypostasis, the Disease becomes the longer, and the Patient the less secure."

A reddish Sediment is disapproved by *Hippocrates, ibid.* because, though it be in a good measure salutary, it indicates the Disease to be of long Duration. And the Author of the Book *de Urinis*, says, that a reddish Sediment shews a Defect of Concoction, but is no mortal Sign. A long Disease is however to be suspected, and therefore such a Sediment seems not free from Pravity, especially in weak Bodies, and violent Diseases, which soon exhaust the natural Strength, and oftentimes before the Disease is concocted.

A black Sediment, or Hypostasis, is very bad in acute Diseases, and, if attended with black Urine, is affirmed by *Galen* to be the worst of all Sediments; a black Enæorema is less pernicious, and a black Cloud least of all the three.

Of *Enæoremas* the sublime [*μελαινόν*] is disapproved, as indicating a Delirium; an Instance of which we have in the Virgin of *Larissa, 3 Epid. Sect. 3. Aeg. 12.* where *Galen*, in his Commentary says, that this *Enæorema* signify'd a Delirium, not in itself, but by Accident, as it was an Indication of a stenuous Blood, since if there were no Flatuosities in the Blood, the *Enæorema* would subside to the Bottom of the Urinal. The Author of *1 Prorrheth. 4. 32. 37.* makes a sublime suspended Substance in the Urine to portend a Delirium, and so much the more, says *Galen, Com. 2. in 1 Prorrheth. T. 1.* if it be attended with a Ringing of the Ears, or a Cessation of a Pain in the Hip, or some other inferior Part remote from the Viscera.

A black, loose, or discrete and unequal *Enæorema*, is bad; but not so bad as a Sediment of that Character, according to the Author of *Lib. de Urinis*, supposed to be *Galen, Cap. 17.*

A black Cloud is condemned by *Hippocrates, Lib. Prognost.* as is, also, a fat Substance swimming on the Surface of the Urine, because it indicates a Consumption. I have several times observed a Cloud of a circular Form elevated near the Surface in the Urine of those who have died phrenitic; and thence concluded such an Appearance to be a pernicious Sign in acute and turbulent Fevers. If therefore the Contents of the Urine, though constituted according to Nature, are by an undue Quantity of Spirit elevated to the Surface, it portends some Disorder, and that no inconsiderable one, of the Head.

To the fore-mentioned Characters of bad Urine we may add, that Excretions of Urine not remembered, or not perceived by the Patients themselves are, also, of bad Signification. Thus, *1 Prorrheth. 29.* we read, that "a Flowing of Urine from a sick Person without his remembering it, is pernicious;" for it indicates, as *Galen* says in his Comment on the Place, a Deprivation of all Sense of the natural Functions.

There remains one thing which highly deserves our Remembrance on this Head, and is as follows: In many very destructive Fevers, the Urine in Colour, Substance, and Contents, appears like the Urine of Persons in Health, and on that Account is esteemed and pronounced laudable by the mistaken and unexperienced Physicians, though at the same time it portends inevitable Death, by indicating to us that the Bile, by which

the Urine is coloured, has its Course wholly diverted upon the Brain, or one of the Viscera, and that nothing of the noxious Humours is excreted with the Urine, which is observed by Physicians to be highly destructive in Phrenies, and, also, in a Pleurisy and Peripneumony. *Prosper Alpinus de Prasag. Vit. & Mort. Aegrit.*

URINACULUM. The URACHUS.

URINALIS HERBA. A Name for the LINARIA. *Blancard.*

URINARIUS. The same as URETICUS.

URNA. A Measure of Capacity among the Romans, derived, according to *Varro, ab urinando*, "from Diving," because, as he says, *in aqua haurienda urinat, hoc est, mergitur ut Urinator*, "in drawing of Water it dives, or is immerg'd like a Diver." It is the fortieth Part of the Culeus, and half of the Amphora, *Columella, Lib. 3. Cap. 3. Volusius Mar-tianus, Columella, ibid.* speaks of Vineyards, which yielded six hundred Urnae the Jugerum, which is at the Rate of above fifty-four Hogsheads and an half to our Acre. *Arbuthnot of Weights and Measures.*

UROCRISIA, or UROCRISIS, *νεκρωσία*. The Judgment formed of Distempers by the Urine; from *νεκρ*, Urine; and *κρσις*, to judge.

UROCRITERIUM. The same as UROCRISIA.

UROCRITICA. The Signs taken from Urine.

UROGALLUS, *J. Jonst. Tetrao. Aristotel.* A Species of Pheasant; there are two Kinds of this Bird, the great and the small; the first is as big as a Turkey-cock, with a black Head, and short Beak, a Neck almost a Foot long, and blackish and reddish Feathers; the second, or smaller Sort, is called the Mountain Pheasant. These Birds live in Northern Countries, and are said to keep themselves for two or three Winter Months under the Snow; they are very good to eat.

Their Fat is emollient, resolvent, strengthening, and nervine. *Lemery des Drogues.*

UROMANTES, from *νεκρ*, Urine, and *μαντις*, a Prophet. A Water-caster; or, in the vulgar Phrase, a Piss-Prophet.

UROMANTIA. The same as UROCRISIA.

URON, *νεκρ*, Urine. See RENES, and URINA.

UROPYGION. See ORRHOPYGION.

UROSCOPIUM. An Inspection of the Urine.

URSUS. *Offic. Schrod. 5. 312. Raii Synop. A. 171. Schw. Quad. 131. Aldrov. de Quad. Digit. 117. Jonst. de Quad. 86. Charlt. Exer. 14. Gefn. de Quad. Digit. 941.* THE BEAR.

The Parts of this Animal, which are used in Medicine, are the Fat and the Gall. The Fat is emollient and discutient, and is of principal Use in the Alopecia; it cures, also, Pains of the Gout, the Parotides, and other Tumors, and heals Ulcers in the Legs. The Gall is recommended to be taken inwardly for the Epilepsy, Asthma, and Jaundice. Outwardly it is of Service in cancerous and spreading Ulcers, the Toothach, Dimness of Sight, and other like Diseases. *Schroder.* The Skin is good for a Person bitten by a mad Dog to lie upon; and serves instead of a Rug to Travellers in the Winter-season. *Schwenhsfeld.*

URTICA.

The Characters are;

The Stalks are not branched. The Leaves on the Stalks grow opposite by Pairs, and are serrated, triangular, and in the European Kinds set with stinging Spines. The Flower is apetalous, staminateous, male, seated, for the most part, in a tetrapetaloidal cruciform Calyx, and having a Calycule in the Middle. The Stamina are sometimes four, sometimes more, and the Testicles are parted into foliaceous Planes. The Fruit generally grows on a Plant distinct from that which bears the Flower, and is either a bivalve Capsule, full of Seed, and consisting sometimes of a Collection of Globules, or a Pincer-shaped Substance holding the Seed in its Gripe, and furnished with a filamentous Tube and Calycule. There are found Ovaries, also, in the Male Plant; so that there are Male, Female, and Hermaphrodite *Urticae* or Nettles.

Boerhaave mentions eight Sorts of *Urtica*; which are,

1. *Urtica*; maxima; racemosa; *Canadensis*. *H. R. Par.*
2. *Urtica*; urens; maxima. *C. B. P. 232. Tourn. Inst. 534. Boerb. Ind. A. 2. 105. Urtica. Offic. Urtica racemifera major perennis.* *Raii Synop. 54. Urtica major vulgaris.* *J. B. 3. 445. Raii Hist. 1. 160. Urtica major vulgaris & media sylvestris.* *Park. 446. Urtica urens.* *Ger. 570. Emac. 706.* COMMON STINGING-NETTLE.

The common Stinging-nettle has a creeping spreading slender Root, full of Fibres, sending forth squarish Stalks, a Foot and an half, or two Feet high, having two oblong sharp-pointed Leaves growing on long Foot-stalks, deeply serrated about the Edges, and covered, as well as the Stalks, with short stinging Hairs, that cause a Burning and Itching in the Flesh. The Flowers are

are small and staminous, growing on long slender Bunches; some Plants bearing larger Flowers, and no Seed, and others small round Seed, and smaller Flowers. They grow everywhere in too great Plenty. The Roots, Leaves, and Seed are used.

They are cooling and restraining. The Juice is good for all Kinds of inward Bleedings, Hæmorrhages, and Fluxes. A Tent dipt into it, stops the Bleeding of the Nose, or of Wounds. The Root is diuretic, and are accounted a Specific for the Jaundice. The Seed is commended for Coughs, Shortness of Breath, and Obstructions of the Lungs. *Miller's Bot. Off.*

The Leaves of this Species of Nettle have an insipid, glutinous Taste, and give no Tincture of Red to the blue Paper; the Roots stain it very little; they are insipid also, but a little styptic; from which we may conjecture, that the Nettles contain a Salt resembling that which is naturally in the Earth, that is to say, composed of Sal Ammoniac, Nitre, and Marine Salt; but in these Plants it is clogged with a great deal of glutinous Phlegm, and united with abundance of Sulphur and terrestrial Parts: For,

By the chymical Analysis we obtain from the Nettles some volatile concrete Salt, a great deal of Sulphur and Earth, and several Liquors, which give a greater Indication of an acrid than an acid Salt; so that it is very likely, that the Phlegm of these Herbs is thickened rather by the terrestrial Parts, than by the Acid: But this thick Phlegm, which is very considerable, is entirely destroyed by the Fire. Nevertheless, it is no Wonder, that the Nettles should be detensive, diuretic, and good to restore the Motion of the Fluids; for this glutinous Phlegm only moderates the great Activity of the acrid Salt, and of the Sulphur.

The Juice of Nettles depurated either of itself, or by gentle boiling it up, stops the Spitting of Blood, and the Flux of the Piles: It is very good for the Dysentery and Fluor Albus. The Cataplasm of Nettles is emollient and resolvent, and consequently good to dissolve Tumors accompanied with an Inflammation; it relieves the Gout, and dissipates sometimes malignant Ulcers, and cold Tumors. The Leaves of Nettles may be taken after the manner of Tea, for the Stone and Gravel; some drink the Wine in which they have been infused. The Roots of Nettles preserved with Sugar, procure Expectoration in an old Cough, Asthma, and Pleurisy, especially if the Leaves be applied as a Cataplasm upon that Side where the Patients feel their Pain: Some drink their Juice for the same Diseases. The young Shoots of Nettles, taken in Broths, purify the Blood. The Conserve of their Clusters, and the Extract of the whole Plant, have the same Virtues. The Pilsan of Nettles is very good in a malignant Fever, Small Pox, or Measles; Emulsions may be made with the Water and Seed of this Plant. *Martyn's Tournefort.*

All Nettles are diuretic and lithontriptic, and are said to have a particular Antipathy to the *Cicuta*, and *Hyoscyamus*. Eaten as a Green, they loosen the Belly, cleanse the Kidneys, expel the Stone, and promote Expectoration, and the Eruption of the Measles. The good Wives in our Country use to gather the fresh Buds of Nettles, and the Leaves at their first coming forth in the Spring, and boil them in Broth, to purify the Blood. The Juice of the Herb, or a Syrup prepared of it, are very effectual in Spitting of Blood.

Take of the Juice of Nettles, four Ounces, for five or six Days together in the Morning fasting, and boil the Nettles in Broth. This Remedy has recovered those who have been left by the Physicians.

A Woman who had a Bleeding from a Vein opened in her Stomach, which returned upon her at every new Cold or Indisposition, found the same Medicine of most immediate Efficacy, when all others failed. The distilled Water, mixed with Spirit of Wine to a great Degree of Acidity, is admirably effectual in restraining an Hæmoptysis. *Hier. Reblingerus*, and *Udalricus Jungius*, two Persons of Quality, who were both very subject to Hæmorrhages at the Nose, used, as a never-failing Remedy, to take a Piece of the white, ligneous, and round Root of the Red Nettle, and put it up their Nostrils, snuffing up some Water.

Externally it is of Service in putrid, gangrenous, and malignant Ulcers, and discusses Hardnesses and Tumors, and represses an Inflammation of the Uvula. The lesser *Urtica* bruised, or the Juice of the same put up the Nostrils, stop their Bleeding.

The Seed of the *Urtica*, especially the Roman Kind, is of frequent Use in Affections of the Lungs, as the Asthma, stubborn Coughs, the Pleurisy, and Peripneumony. A Conserve prepared of the Bunches of the Flowers and of the Seeds, is a most effectual Remedy in the Stone of the Kidneys, Affections of the Thorax, and Spitting of Blood. That the Seed of

Nettles provokes Urine and the Menstrues, and stimulates to Venerary, is agreed by Physicians; whence it is commonly given by lewd Women to those who address them. The Root of the great Nettle is highly commended for the Jaundice; the same boiled in Wine and Honey, is an excellent Medicine in old Coughs, and an Orthopnea.

For the burning Heat, Pustules, and Itching, excited by Nettles, the Remedies are Oil of Olives, Oil of Roses, the Juice of Tobacco, or a green Leaf of the same applied; and, to name no more, the expressed Juice of the Nettle itself, as *Parkinson* tells us.

An immoderate Flux of the Hæmorrhoids, after all manner of Remedies try'd in vain, and the Patient was very much weakened, has been cured only by the Juice of Nettles depurated by a slight Ebullition, given to the Weight of two Ounces with a little Sugar. Examples of this have been collected from *Riverius*, and other practical Writers of Medicine, by *Dr. Tancred Robinson*.

The People in my Country, says *S. Pauli*, know by certain Experience how to prevent the unseasonable Fermentation of their new Beer, and to defend it from the Thunder, by placing in their Vessels a very large Stinging-nettle, with some Bits of Steel. *Raii Hist. Plant.*

3. *Urtica*; urens; minor. *C. B. P.* 232. *M. H.* 3. 435.
4. *Urtica*; urens; pilulas ferens; prima Dioscoridis; semine Lini. *C. B. P.* 232. *Tourn. Inst.* 434. *Boerb. Ind. A.* 2. 105. *Urtica Romana*. Offic. *Urtica pilulifera folio profundius Urticæ majoris in modum serrato, semine magno Lini*. *Raii Synop.* 54. *Urtica Romana*. *Ger.* 570. *Emac.* 706. *Park.* 440. *Raii Hist.* 1. 161. *Urtica Romana sive mas cum globulis*. *J. B.* 3. 445. ROMAN NETTLE.

This Nettle has rounder Stalks, and darker-green Leaves, more deeply serrated, than the common Nettle; they are neither so large, rough, nor hairy, but full of small shining Prickles, that are rather more stinging and burning than the common. Towards the Top of the Branches, from the Bosom of each Leaf, arises a round Ball on a long Foot-stalk, about as big as a Pea, and thick set with sharp stinging Hairs, including several shining Seeds, in Shape like Linseed. It grows in several Places of England, as about *Yarmouth*, and in *Romney-Marsh*; but it is not very common.

This is much of the same Nature with the common Nettle; but the Seed is reckoned more pectoral, and of greater Service against Coughs, and Affections of the Lungs; but is very seldom used. *Miller's Bot. Off.*

It grows in sandy Places, and the Parts in Use are the orbicular, compressed, smooth, shining Seeds, which are of a blackish-red Colour, of a somewhat acrimonious Taste, with a kind of Fineness. They are frequently used in pulmonary Affections, the Asthma, stubborn Coughs, Pleurisy, and Peripneumony. *Dale.*

5. *Urtica*; altera; pilulifera; Parietaræ foliis. *H. R. Par.* 131.
6. *Urtica*; Romana; facie Urticæ vulgaris.
7. *Urtica*; pilulifera; folio angustiori; caule viridi; Balcarica. *Salvadore.*
8. *Urtica*; Americana; caule rubro; folio læte viridi; splendente. *Boerb. Ind. alt. Plant.*

The Nettle is called *Urtica*, *ab urendo*, "from burning," because it is very burning when handled. The four first Species are furnished with small, slender Spines, of so flexible a Nature at the Extremities, that when they enter the Skin they easily bend; but when they penetrate the Flesh they cannot be drawn forth; but are there broken off as it were into Fragments, and excite an Inflammation and Vesicles, which continue till the Pieces are expelled.

The Decoction of the Leaves is aperitive, and commended against the Gout. The greenest and freshest Stalks are used to whip the Limbs affected with the Gout or Palsy, in order to excite an Inflammation in the external Parts. This Plant is of Service in Diseases of the Kidneys and Bladder, Coughs, Phthisis, internal Hæmorrhages, Hæmoptysis, Vomiting of Blood, an immoderate Flux of the Hæmorrhoids, and bloody Urine. The Leaves bruised and applied, resist a Gangrene, and a Decoction of them drank in the manner of Tea, is an excellent Laxative. *Hist. Plant. adscript. Boerhaav.*

URTICA ACULEATA. A Name for the *Cannabina*; flore purpurascens, and for the *Cannabina*; flore albo.

URTICA HERCULEA. A Name for the *Galeopsis*; procerior; foetida; spicata.

URTICA INERS. A Name for several Sorts of *Lamium*; it is, also, a Name for the *Galeopsis*; sive *Urtica iners*; flore luteo.

URTICA MORTUA. A Name for the *Galeopsis*; lutea; amplioribus foliis; maculatis.

URTICA MARINA. Offic. *Charit. Exer.* 68. *Schonef. Licht.* 77. *Urtica*. *Jonst. Exang.* 54. *Urtica marina* 5 & 6. *Rondeletii*

Rondeletii. C. B. P. 369. *Urtica rubra*. Rondel. i. 530. Bellon. Aquat. 342. Gesn. 1039. Aldrov. Exang. 568. *Urtica vel Pulmonis marini* Species. Mer. Pin. 194. SEA BLUBBER.

It swims on the Water; and is often cast by the Tide on the Shore, being a round, compressed, pellucid Substance; resembling a Jelly, with red Veins interspersed. The Virtues are the same with those of the *Lepus marinus*.

URTICATIO. A kind of surgical Operation, which consists in striking any Part of the Body with Nettles, in order to recall the natural Heat.

URUCU. See **ACHIOTL**.

URUCATU *Brasilienfis*. *Marogr.*

This is a Plant which grows upon the Tree *Urucari-iba* without a Root; but it has four or five Leaves, which are broad beneath, and make an oval Bulb, about four Digits in Length, and containing a fat, medullary Substance, of the Appearance and Consistence of a sacitious Ointment, cold to the Touch, of a white Colour, inclining to green, and interspersed with many fine whitish Filaments. Above the Bulb the Leaves part, and become narrow; but shoot up to a Foot or more in Height, wider above, Tongue-shaped, and green like those of the Squill; every Leaf has three Fibres extended according to its Length. It bears neither Flower nor Fruit, and has no Smell, as neither has its Ointment.

This Ointment is cold; and esteemed very proper and effectual for mitigating Pain; and is, also, found by Experience to induce a Sopor. *Raii Hist. Plant.*

URUCURI-IBA. See **PALMA**.

URUMENA, *ερεμνα*. The Urine; or Substances discharged together with the Urine.

URU-PARIBA. See **GUIRA-PARIBA**.

URUS. The wild Bull.

USFIDA. The Scorize of Gold. *Rulandus*.

USNEA CRANII HUMANI. Offic. *Musculus ex Cranio Humano*. Ger. 1374. Emac. 1563. Park. 1313. *Musculus Cranio Humano immatus*. *Usnea Officinarum nostratium*. *Raii Synop.* 36. MOSS OF A DEAD MAN'S SKULL.

They find it frequently in Ireland; whence it is imported to us. The whole Plant, which is in Use, is commended by very many Authors for Hemorrhages; and is an Ingredient in that celebrated Composition called *Unguentum armarium*.

There are two Sorts of *Usnea humana*; the first, which is used in our Shops, is imported from Ireland, and is nothing but a smaller Species of the *Musculus vulgaris terrestris Adiantum aurei Capitulis*, and differs not from the Moss which grows to Stones and Trees, which it exactly resembles, so as not to be distinguished from it neither by Form nor Smell. Mr. Dood, an Apothecary of London, and a very good Botanist, has observed it growing to the Bones of Horses and Oxen lying in the Fields.

The other Species is crustaceous, and grows to Skulls after the Manner of the *Lichen petraeus*; and spreads itself. And this Sort is preferred by Authors to the preceding, as it is supposed to be endued with a peculiar Virtue of subduing and removing several Kinds of Diseases. *Ephem. Germ. Raii Hist.*

This Species of Herb which adheres to the Skulls of Carcasses exposed to the Air, is by different Authors recommended as highly beneficial in various Diseases. Thus it is extol'd as a Specific in Epilepsies, and all Disorders of the Head, in Hemorrhages produced by whatever Cause, and in Dysenteries. It is used internally, externally, alone, mixed with other Substances, and as an Amulet. It is an Ingredient in the *Unguentum Armarium*, *Magneticum*, or *Sympatheticum*. In Hemorrhages it produces its Effects, if only held in the Hand. Thus Boyle, in his Specifics, informs us, that he himself had an Hemorrhage of the Nose stop'd by using it in this manner. Juncker, in Therap. informs us, that it renders the Body so impenetrable as not to be pierced with a Musket-bullet. Some affirm, that the Virtues of that Usnea are greater which has been gathered from the Skulls, during a certain Position of the Stars; when, for Instance, the Moon is in the Increase in the House of Venus, when she is in Pisces, Taurus, or Libra. Others affirm, that the Usnea gathered from the Heads of hang'd Persons is best: But Paracelsus asserts, that what is found on the Skulls of Persons broken on the Wheel, is no less valuable: See Schrod. Ph. Hoffman; Cl. Schrod. Boecler. Ettmuller, Helmont, Barbet, Med. Pauli Quadrip. Konig. Valent. Mus. Hildan. Grube in Arcan. Med. informs us, that those who greatly extol the Usnea in Medicine, suppose, that the vital and animal Spirits of the deceased Person are collected in it, and by a certain medicinal Force derived to any Part affected in a living Person: But as every one knows, that a Carcase has neither vital nor animal Spirits, those seem to be in the right who give no Credit to the peculiar Power of this Plant, or its Specific Virtues in removing obstinate Disorders. Junckerus, in the Work already quoted, affirms, that the Virtues of

this Plant are founded on Credulity, or some other Error. Besides, the Force of Imagination may be supposed to co-operate strongly with this Medicine, as Boyle, de Specificis, thinks; where he informs us, that if a certain Person, when Blood was taking from him, took Usnea in his Hand for the sake of Curiosity, the Blood ceased to flow till he laid it aside again. Marx, the celebrated Dealer in Aromatics, in Nuremberg, does not hesitate to affirm, that the Usnea of the human Cranium is of no other Use but to be preserved as a Rarity. And Boecler is of Opinion, that, as with the Bones of dead Bodies; so, also, with the Usnea, many superstitious and impious things are done. But I am of Opinion, that in Hemorrhages, where styptic Tents, or Pessaries, are expedient, the Usnea mixed with other proper Ingredients, may produce happy Effects. Besides, where esiccant and astringent Medicines are proper, its Powder, whether used externally or internally, must certainly produce some Effect; for it is of a drying and astringent Nature. Thus I agree with Pauli de Med. Corp. hum. Sect. 8: where he speaks in this Manner: "Though the Usnea may produce good Effects in Spittings of Blood, Hemorrhages; and other Fluxes; yet there is no Necessity why a Physician should disgrace his Profession by prescribing it, since there are other Substances equally astringent, and which no Patient will refuse on account of the Horror and Nausea they produce." Ettmuller informs us, that some supply the Place of the true Usnea with the Moss of a Tile, which in Hemorrhages of the Nose, they immerse in Vinegar, and apply to the Crown of the Head; whereas instead of the true Usnea, which is rare, others use one of the artificial Kind, which they obtain in the following manner: They take the Moss of large Meadow Stones, gathered in the Month of April; this, when gently dried, they reduce to a gross Powder in a Glass Mortar, sprinkling it with Malmsey Wine, or that of Petrus Simon, till it has acquired the Consistence of a thick Poulitice. Then with a Knife they spread this Preparation very thin on the Cranium of a Carcase broken on the Wheel. As it becomes gradually dry, they spread more of it on the Cranium, which in the open Air they expose to the Rays of the Sun, removing it when Rains come on. This they repeat till the Plant begins to flourish, and afterwards gather from it an Usnea not inferior to that which grows spontaneously from the Skull. Ludovici, in Pharm. when treating of Vulneraries and Astringents, speaks in the following manner: "Moss may be every-where found; and that obtained from the Oak, and the common Egyptian Thorn, for medicinal Purposes, in Pessaries for Instance, Tents and Ointments are not inferior to the Usnea; gathered in the most superstitious manner, or even that growing in human Skulls." Rieger.

USRUB, or URSUB. Lead. *Rulandus*.

USTILAGO. Blighted Corn.

USTIO. Burning, either relative to the Simples of the *Materia Medica*; or to the surgical Application of the actual Caustery.

USTULATIO. The toasting, or roasting any moist Substance, in order to render it dry. It is, also, used with respect to Wine which is heated; or, as it is usually expressed, burnt.

USUALIA MEDICAMENTA. Medicines which are in common Use.

USURAT. Tin. *Rulandus*.

UTERARIA. Uterine, or hysteric Medicines.

UTERINUS FUROR.

The *Furor uterinus* is a Species of Madness proceeding from an ardent and inordinate Desire of Coition; which deprives the Patient of the Use of Reason, so that she speaks all manner of obscene Words, and abandoning all Shame invites, by all Sorts of immodest Gestures and Expressions, the Men to venereal Embraces.

This immoderate Desire of Copulation is produced by the Plenty, Acrimony, and Heat of the uterine Juices, exceeding the natural Bounds, and creating an extraordinary Turgency in the seminal Vessels, which stimulating, and in a manner inflaming the genital Parts, excites a vehement and untuly Appetite to venereal Commerce. From the same Matter and Fomes ascend Vapours to the Brain, which disturb the Reason, and interrupt the Use of it, tho' indeed the furious Desire of Coition alone, without the Assistance of Vapours, might very well be supposed to produce the same Effect, since all violent Passions are known to create the like Disturbances in the Mind, and particularly an inordinate and extravagant Love, which has the Name of *Eroticus Affectus*. [See AMOR].

The Juices acquire these Qualities by long Retention in hot and salacious Bodies; for which Reason, this Affection is proper to Virgins, and young Widows, tho' it may possibly happen to young Wives, whose Husbands are either impotent, or hated, and not qualified for a sufficient Depletion of the Spermatic Vessels, or satiating the venereal Desires.

Some are of Opinion, also, that the Juices putrefy, and contract a malignant Quality, productive of those severe Symptoms. But they will find it difficult to shew the Difference between the *Furor uterinus* and the *Hysteria Passio*, which owes its Original to corrupted and malignant Juices. For the various Degrees of Putrefaction create different Degrees of Malignity, whence arises a great Variety of Symptoms; yet the manifest Qualities of the Juices, such as its Redundance, Heat, Acrimony, and immoderate Turgescence, together with the excessive Heat of the genital Parts, are sufficient to excite this Affection.

The Causes productive of this Disorder are hot, copious, and acrimonious uterine Juices, Youth, a sanguine and bilious Temperament, partaking of an adust Quality, and atrabilious Food, of bad Juice, rich and plentiful Living, and especially spiced and high-seasoned Dishes, with the frequent Smell of Spices, as Nutmegs, Cubebs, and the like, long Sleep, and on soft Featherbeds, the Courtship and Careless of Lovers, the Reading of obscene Books, Dancing, and other Pleasures and Sports enjoyed in Company with young Persons.

The Diagnosis of this Affection is easily formed from the Premises; but because it comes on gradually, and by slow Steps, its Progress is to be explained. In the Beginning, while Reason is yet entire, the Patient becomes more sad and silent than ordinary, has a wanton Cast of the Eye, and a red Colour in the Face, which is heightened at Intervals, and especially at the Relation of amorous Adventures; at which Time the Pulse and Respiration are altered, through Sympathy of the Heart. Hence *Galen* boasts, that he had discovered the mad and ungovernable Passion of Love in Women by the Pulse, which suddenly alters, and beats in various Manners at the Sight, or recalling to Mind the beloved Object. In Process of Time, as the Disorder increases, she begins to be quarrelsome, and to shed Tears, and now-and-then to burst into Fits of Laughter, and to speak many things inconsistent or indecent; from which, however, nothing certain can be inferred: After this she repents, and is sorry for what is past, till the Return of another Paroxysm, which happens, according to the irregular Motion of the Matter, without any certain Period. When the Disease is arrived at its Height, the Patient invites the Men to venereal Commerce openly and in a public Manner, and talks of venereal Affairs in coarse and common Terms, calling Things by their proper Names.

As to the Prognosis, the Disease is curable if treated in Season; but if suffered to continue for a considerable Time, till it has taken firm Root, it degenerates at last into a true Mania.

There is great Hope of Recovery when the Intervals begin to be long, when the emaciated Body begins to recover Flesh, and when the Patient is not much affected or disturbed at the Mention of Love Affairs.

The Cure of this Affection is to be directed with a View to the Correction of the hot Distemperature of the Viscera, particularly the Uterus, and of the Blood and uterine Juices, and to the Evacuation of the acrid Humours, and seminal Matter. These Intentions are answered by the following Method:

First, then, we are to begin with Phlebotomy, and repeat the same several times, and as often as the Strength will permit, that the whole Mass of Humours, and the Uterus itself may be refrigerated, and a Revulsion of the fervid Blood from the Veins of the Uterus procured.

If there be a Suppression of the Menfes in the Case, the Veins are to be opened in the inferior Parts, in order to provoke that Course of the Humours which Nature has appointed.

If the Blood seems to tend towards the hæmorrhoidal Veins, which is known by their Swelling and Redness, these Vessels are to be opened with Leeches.

After this, Cathartics are to be administered of the milder Kind, and such as evacuate Bile or Melancholy, as either of them most abounds.

After the Use of Purgatives are required Julaps preparatory of the peccant Humours, or such as are refrigerating and gently opening, to be used three Days.

Soon after this, a pretty strong Purge is to be given in order to evacuate the obstinate and deeply fixed Humours. For this Purpose the same Cathartics as are prescribed in a Mania, are here, also, proper to be used, and to be repeated at Intervals.

After repeated Purgation, in order to the Refrigeration of the Uterus and the whole Body, and to allay the Heat of the Humours, the following Bath will be of excellent Service, being frequently used during the Course of the Distemper;

Take of Leaves of Lettuce, Willow, Water-lily, the Vine, Purslane, Navelwort, each one Handful; the Flowers of

Violets, Water-lily, and Roses, each two Handfuls: Boil them all together for a Bath, which the Patient is to use warm, without sweating, twice a Day, long before and after the Times of Eating.

But since an entire Bath cannot easily be continued for many Days together, a Semicupium at least of the Decoction aforesaid, or even of simple Water, is frequently to be used quite tepid, or warm; for the principal Part of the Cure consists in potently refrigerating the Uterus. And this is confirmed by a remarkable Case related by *Harvey* in his Treatise *de Partu*, of a Woman of Quality, who was delirious for above ten Years from a *Furor* and *Melancholia Uterina*. After trying all manner of Remedies without Effect, she happened to be seized with a Falling down of the Uterus, which was not suffered to be replaced till its hot Distemperature was thoroughly qualified by the external Cold. The Success answered Expectation, and the Lady recovered the perfect Use of her Reason in a short time, after which the Uterus was reduced to its proper Situation.

For the farther Refrigeration of the Body, it will be convenient to drink Whey for many Days together.

In short, all those Remedies which are prescribed for the Cure of the Hypochondriac Affection and Mania, are of Service, also, in this Disorder; Respect being had to its Origin, whether from Bile or Melancholy.

To all the Remedies before-mentioned, may be added such as are endued with a specific Property of extinguishing and refrigerating the uterine Juices; among which are the following Preparations:

Take of Leaves of the Water-lily, Willow, and Agnus Castus, each four Handfuls; Lettuce, Purslane, Navelwort, each one Handful; the Four greater cold Seeds, those of Lettuce, White Poppy, each half an Ounce; Seeds of Dill, two Drams; Flowers of Water-lily, and Violets, each one Handful: Bruise them fresh together, sprinkling them with the Juice of Lemons, and distil them in *Balneo Maria*, and to each Pint of Water add a Dram of Camphire: The Dose is an Ounce, to be taken frequently:

Or,

Of the forementioned Simple, or some of them, may be prepared a Decoction, which may be taken at several Doses, sweetened with Sugar, with an Addition of a little Camphire.

Or,

An Emulsion may be prepared of the Four greater cold Seeds, those of Lettuce, and White Poppy, extracted with Waters of the Water-lily, Lettuce, and Willow, with Syrup of Violets.

Opiates may, also, be prescribed of the following Forms:

Take Conserves of the Flowers of Water-lily, Violets, and the Vitex, or Agnus Castus, each half an Ounce; Conserve of Roses, an Ounce and an half; Stalks of Lettuce preserved, one Ounce; Coral, and Emerald prepared, each one Dram: Make them into an Opiate with Syrup of Violets, and Water-lily.

When the Delirium is at its Height, Medicines which procure Sleep are of greatest Service, both internal and external, and such as are prescribed for the Cure of the Phrenitis and Mania.

During the whole Course of the Disease, cooling Clysters, and gentle Cathartics are to be used, avoiding the stronger and more acrid Purgatives, which by Exagitation of the Matter contained in the Uterus, or its Vessels, may cause an Exacerbation of the Symptoms, as is usually the Case.

Injections may, also, be made into the Uterus of the Decoction of those Herbs which have been prescribed for Baths, and other Remedies; and with those Injections Salt of Lead may properly be mixed.

Clysters of Oxycrate frequently administered are of good Effect.

External Remedies are cooling Liniments, applied to the Loins, Pubes, and Perinæum, prepared of Oil of Water-lily, Ointment of Roses, or the White cooling Ointment, with the Juice of Nighshade, Henbane, and Water-lily dissolved, with an Addition of a little Camphire.

A leaden Plate perforated is to be continually worn upon the Kidneys.

With

With regard to the proximate Cause of this Disorder, since the Evacuation of the acrid and corrupt Juices may remove the same, the most proper Means would be, in the Beginning of the Disease, before the Fit of Deliriousness becomes very manifest, or in some more lucid Interval, to dispose of the Patient in Marriage to a young and lusty Man, by whose Embraces the Uterus being satiated, and the Matter contained in its Vessels discharged, the Cure is effectually accomplished.

Pessaries may be prepared of Leaves of *French Mercury* bruised, with a little Myrrh, or Powder of Birthwort. These are to be introduced while the Patient is in the Bath, that the Uterus may not be over-heated, and after an Hour's Time be removed. And soon after Injections are to be made into the Uterus of Whey, or a Decoction of Barley, with a little Juice of Nightshade, Houfleeck, or of Hemlock, which last Herb is peculiarly recommended in this Affection.

For Expurgation of the Juices, the following Bolus is of great Service:

Take of *Venice Turpentine*, three Drams; Troches of *Agaric*, half a Dram; Seeds of Carrot, Hemp, Powder of Wood of Aloes, each eight Grains: Make them into a Bolus with Sugar.

If the Disorder continues, Cauterics are to be applied to the Legs; for there is no Method more effectual than to derive the Matter to the inferior Parts by means of those Drains.

If the Spleen be affected with a Tumor, or Obstructions, as is often the Case, it is to be treated with Remedies properly adapted to those Affections.

And, in the last place, because the Brain and Heart are great Sufferers in this Disease from Vapours ascending thither from the Uterus, proper Relief is to be provided for each Part; the Brain is to be eased as much as possible by Frictions, and Ligature on the inferior Parts, and Application of Cupping-glasses to the Hips and Groins; and the Heart must be relieved by Epi-thems, both liquid and solid, such as are prescribed in Decays of the vital Forces. *Riverii Prax. Med.*

UTERUS. The Womb.

In investigating the curious Structure of the Uterus, we shall first take notice of the surprising Force, or elastic Power, of its muscular Fibres and Vessels, which are capable of being incredibly distended, and of spontaneously returning to their former State. This is principally obvious in pregnant Women, whose Uterus is sometimes incredibly distended by a large Foetus, or Twins, and the Secundines and Waters; but when these are excluded, the Uterus is again lessen'd, and contracted; so as hardly to be an hundredth Part so big, as during Gestation: And though other Parts of the Body, such as the Skin and Scrotum, when distended by a dropical Tumor, or the Stomach and Intestines when turgid with Flatulences, are capable of yielding in a surprising manner, when acted upon by an interior Force, and of contracting themselves into their natural State and Space, when that Force ceases; yet this Power of Dilatation and Contraction is no-where so conspicuous as in the Uterus. Besides, what is still more surprising is, that though the Uterus, which, out of a State of Gestation, is hardly equal to a Pear in Figure and Bulk, grows to so vast a Largeness, yet its Thickness is not lessen'd by this Expansion, but rather remains the same.

Besides, no Part of the human Body is furnish'd with such numerous Vessels as the Uterus. The first of these Vessels are, the spermatic Veins and Arteries, which are contiguous to the Ovaria; and, being in numerous Ramifications convey'd to the Bottom of the Uterus, terminate there, which is sufficiently obvious, from this, that, by blowing into these spermatic Vessels, the Bottom of the Uterus is distended: After the spermatic Veins and Arteries, the next most conspicuous Vessels are, the Ramifications of the hypogastric Artery and Vein, which run to the middle and inferior Part of the Uterus, as, also, to the Vagina; to which, also, especially where it is connected with the Rectum, are distributed the Ramifications of the external hæmorrhoidal Veins, which are by an Anastomosis join'd with the Ramifications of the internal hæmorrhoidal Veins; and, which is particularly to be observ'd, these Blood-vessels, copiously distributed through the Body of the Uterus, not only run everywhere, in a winding incurvated Direction, but are, also, very small in Virgins, barren Women, and such as are not with Child; notwithstanding which, after Conception, in pregnant Women, these Vessels are so enlarg'd, both with respect to Length and Breadth, that their smallest Ramifications become capable of admitting a large Probe.

Besides the large Congeries and winding Direction of the Vessels in the Uterus, there is so remarkable and singular a Con-

currence of these Ducts, that there is no-where so frequent and great an Anastomosis or Conjunction both of arterial and venous Vessels distributed from different Parts of the Body: For when the spermatic Vessels are blown up, the hypogastric are, also, dilated; and when these are expanded, the former are so too. The external Hæmorrhoidals, when blown up, distend the internal, which, when expanded, dilate the former: Besides, there is a manifest Connection observ'd between the spermatic Vessels of the Right and Left Side. But there is this peculiar in the exquisite Connection of the Vessels of the Uterus, that their Extremities terminate in such a manner, as to form mutually communicating oval Cellule of different Bulks, which render the Substance of the Uterus spongy and fungous, and which, in pregnant Women, are surprisingly enlarg'd. Hence it is that the Uterus, especially of a pregnant Woman, when cut transversely, exhibits large and almost numberless Cavities: By means of this sinuous and cavernous Conjunction of the Vessels it is, that not only the Uterus in pregnant Women is greatly distended by the contain'd Blood, and its Compages, which was before tense and constricted, render'd more lax and soft, but, also, that the Orifices of the Extremities of the Vessels, which under the Membrane of the Uterus open obliquely into its Cavity, and through any of which, when Air is blown, it easily passes into the Cavity of the Uterus, are more dilated; by which means, the perforated Filaments of the vascular Membrane of the Chorion can receive Nourishment from them, and convey it to the Foetus.

Nor in this anatomical Consideration of the Structure of the Uterus, and especially of its Vessels, are we to forget, that not only the hypogastric Veins, which return the Blood, have Diameters as large again as the hypogastric Arteries, but, also, that the spermatic Veins do not run straight, but in a winding manner; so that if they were stretch'd out, their Length would amount to some Ells, and be three times greater than that of the spermatic Arteries. All these Circumstances sufficiently evince, that the Motion of the Blood through these Veins is slow, especially since they are destitute of Valves, by means of which, in other Parts of the Body, the otherwise slow Return of the Blood to the Heart is greatly promoted and assisted. With respect to the Structure of the Uterus, it is, also, remarkable, that it is destitute of Fat, with which other internal Parts are copiously cover'd, for this Reason, no doubt, lest its Membrane, being furnish'd with adipose Vessels, should hinder the free Expansion and Contraction of its Sides.

From what has been said, many difficult Phenomena, with respect to the natural and preternatural State of Women, may be more clearly explain'd; many Errors in the pathologic and therapeutic Parts of Medicine detected; and a surer and more compendious Method of treating Diseases, arising from Indispositions of the Uterus, establish'd.

To begin, then, with the most usual Disorder of this kind: It is sufficiently known, that, every Month, Women, from the time of Puberty till they are pretty far advanced in Years, have a salutary Excretion of pure Blood from the Mouths of the Vessels, whether dispersed through the Uterus, or the Vagina; but when this Excretion is either totally suppress'd, too scanty, or returns at irregular Periods, violent and terrible Disorders are produced; so that Physicians, in all Disorders incident to Women, ought to have a just and careful Regard to the State of the menstrual Discharge. But in specifying the Causes of this Evacuation, Physicians run into different Opinions, since some assert that it is owing to a certain specific Ferment; others, that it is produced by a certain determinate Effort of an intelligent Principle, endeavouring to expel what is disagreeable to Nature: Others assert, that this Evacuation is produced by the Influence of the Stars, and especially of the Moon; whilst some maintain, that it is the Effect of a Redundance of Blood, which is denied by others; because, say they, by Venesection, which hinders the Generation of a Plethora, this menstrual Discharge cannot be totally remov'd, or check'd.

But the Person who carefully considers the mechanical Structure of the Uterus, with respect to its Vessels and Fibres, will easily perceive, that the true Causes, and even the Effects, of this periodical Evacuation, are expressive of the greatest Wisdom and Contrivance in Providence: For as the Uterus, on account of the numerous Vessels with which it is furnish'd, and their winding Direction, as, also, on account of the easy and surprising Dilatation, of which it is capable, affords a fit Receptacle for the redundant Blood; hence, if this vital Liquor in Women, who are always greatly disposed to the Generation of a Plethora, is, in process of time, gradually accumulated in the uterine Vessels, and not return'd in a due Degree and Proportion thro' the Veins, the vascular Sinuses are fill'd and infarcted with it, till their Extremities, which terminate obliquely in the Uterus, being too much distended, at last open, and discharge a pure Blood into the Cavity of the Uterus, or the Vagina. But when a suffi-

a sufficient Quantity of the redundant Blood is evacuated, the Mouths of the Vessels again collapse, and are contracted; and the Plethora being diminish'd, the Circulation of the rest of the Blood is render'd freer, not only through the Uterus; but all the other Parts of the Body. Thus, on account of the exquisite Relation every thing in the animal Oeconomy bears to the Circulation of the Blood, this salutary Evacuation is produced.

Since, then, a Redundance of Blood is the principal Cause of the menstrual Discharge, it is sufficiently obvious, that those Physicians commit a terrible Error, who, in Cases where the Menfes are stop'd by previous Disorders, or excessive Hæmorrhages from other Parts, endeavour to recal that Discharge by strong, forcing, and emmenagogue Medicines; whereas their Intention ought rather to be, after the Disorder is surmounted, to restore the Appetite and Digestion, and, by salutary Aliments, which are easily digested, and generate a laudable Chyle, to rouse and augment the depressed Sanguification; and, when this End is obtain'd, the Menfes again flow spontaneously.

But since the Structure of the Uterus, with respect to its Texture, contractile and expansive Power, Largeness and Smallness, is not the same in all, but differs, with respect to Age, hereditary and native Construction of the solid Parts, and Method of Life, it is absolutely incumbent on a Physician, who endeavours either to judge of, or cure Disorders arising from the Uterus, carefully to investigate the Nature and Disposition of that Part, and afterwards to treat the Disorder by proper Remedies. Nothing is more frequent in Practice, than, when in Virgins, and tender Women, the Menfes do not return at their proper Periods, to advise Venesection; and, after that, to prescribe forcing Medicines; and even such as excite a violent Turgescence and Commotion in the Blood; by which means the miserable Patients are thrown into a worse State than before; since a Chlorosis is brought on, and accompanied sometimes with Convulsions, sometimes with Distentions of the Limbs, or with slow Fevers, violent Head-achs, and other Disorders, of a like Nature: This, in my Opinion, happens, for no other Reason, than that the Suppression or scanty Discharge of the Menfes derives its Origin from the tense Stricture of the Fibres of the Uterus, and the excessive Smallness of the Vessels, so that they are difficultly distended by the Blood: For it is certain, from Experience, that young and tender Girls, by the Abuse of Acids, or by the too free Admission of Cold to their inferior Parts, whilst they sit almost naked on the cold Ground, have contracted an anomalous State of the Menfes, accompanied with terrible Symptoms, and hardly capable of being cur'd.

If an irregular State of the Menfes proceeds from this Cause, forcing Medicines are not only useless, but, also, prejudicial; for when the Vessels are contracted, and closed up, and the Blood thrown into a quick Motion and Ebullition, a greater Infarction and Obstruction, and a Regurgitation of the Blood to the more noble nervous Parts, will happen, and, by that means, produce Spasms and Convulsions. Nor is Venesection in the Foot, in other Cases highly beneficial for the Alleviation of the Symptoms, of any great Service; but frequently, on account of the greater Derivation it occasions to the Uterus, confirms the Obstruction, and hinders the Blood from being discharg'd from the Orifices of the uterine Vessels. Almost the only Relief, in this Case, is found in tepid emollient Fomentations, and Baths, which relax the constricted Fibres. This Intention is excellently answer'd by Baths of pure light Rain-water alone, or by those of the sulphurated Toeplitz Waters, seasonably used; but, internally, rejecting all hot, acrid, and balsamic Substances, let the Patient drink mineral Waters; and, if she has not an Opportunity of doing so, the next most efficacious Medicines are, neutral Salts, of an inciding, aperient, gently diuretic, and laxative Quality, exhibited in a sufficient Quantity of some proper Liquor. The most considerable Salts of this Kind are, Borax, *Sedlitz Salts*, the *Terra foliata Tartari*, a Solution of Crabs-eyes, the *Arcaenum Duplicatum*; and, in Persons of bilious Habits, Nitre is of uncommon Efficacy. But, if the *Primæ Viæ* are full of acid Sordes, the Liquor of the Salt of Tartar, with a small Quantity of the Mass of balsamic Pills dissolv'd in it, affords the most surprising Relief.

But as the Suppression or scanty Evacuation of the Menfes arise principally from a Narrowness, Compression, and Stricture of the Arteries of the Uterus, so excessive Discharges of this Kind derive their Origin from the too great Largeness, Relaxation, and weaken'd Tone of the uterine Vessels, and the Sinuses form'd by them in the Substance of the Uterus, and from the slow Return of the Blood through the Veins to the Heart, occasion'd by that means: For, if we except the Liver, there is no Part of the Body in which the Motion and Return of the Blood to the Heart is observ'd to be so difficult, as in the Uterus;

which happens not only on account of the perpendicular Situation of this Part, with respect to the Heart; but, also, because the Vessels, and especially the Veins, as we have already observ'd, run in a very winding and incurvated manner, through the Texture of the Uterus. Besides, since, both on account of the Distension of the Uterus by the Fœtus, and the winding Direction of the hypogastric and spermatic Veins, the quick Motion of the returning Blood is greatly retarded, the Reason is obvious, why the Diameters of the uterine Veins should be as large again as those of their corresponding Arteries: So that we may reasonably conclude, that four times as much Blood is contain'd in the uterine Veins, as in their Arteries. If, therefore, the venous Sinuses, with which the Compages of the Uterus abounds, are preternaturally distended by a thick stagnant Blood, by this means the Blood, being strongly convey'd through the Arteries, and denied a Passage through the Veins, it by its Quantity and Force at last opens the distended Orifices of the Vessels, so that their Contents are copiously discharg'd.

From what has been said we may easily understand why Virgins have more rarely excessive menstrual Discharges, than Women who have brought forth Children, or sometimes pregnant Women, in whom an excessive Hæmorrhage from the Uterus frequently proves the true Cause of Abortion: For it is sufficiently known, that an abortive Exclusion of the Fœtus rarely happens without an excessive previous Hæmorrhage from the Uterus: For when, in pregnant Women, the venous Vessels of the Uterus are preternaturally distended, by the copious Afflux of Blood, and when the Blood becomes grumous, and coagulated in the small Cells of the Uterus, not only the Orifices of the Arteries, but, also, the infarcted Sinuses, being open'd, and a convulsive Motion of the Uterus and adjacent Parts, without which an Abortion is not easily produc'd, happening, the Arteries and Sinuses discharge a large Quantity of Blood with Impetuosity, the Uterus becomes flaccid, the Placenta is separated from the Filaments of the Uterus, and from the Apertures of the Vessels, and, lastly, the Fœtus, is excluded, two or three Days after the Hæmorrhage.

Hence pregnant Women, if in the last Months of Gestation Nature attempts an Abortion with an excessive Hæmorrhage from the Uterus, are often in great Danger; nor is the Danger less, when the Exclusion of a mature Fœtus is preceded by a large Discharge of Blood. It is certain from Experience, that by this Misfortune, both the Mother and Infant are exposed to the most imminent Danger, and unless the latter is brought into the World, both are destroy'd by the Hæmorrhage which cannot be stop't; for so long as the Infant, whether mature, or only an Embryo is retained in the Uterus, the Uterus, with its Vessels, is not only greatly distended, but the Orifices of the Vessels, on account of the more impetuous Afflux of Blood to them, being more opened, discharge a greater Quantity of Blood, which flows continually; whereas when the Fœtus is excluded, though the Mouths of the Vessels opened by the Removal of the Secundines, with which they were before covered, discharge a large Quantity of Blood, yet when the Distension of the Matrix ceases, the open Orifices of these Vessels collapse, and, upon their Contraction, the Hæmorrhage ceases. In such a Case, if we intend to preserve the Mother, and prevent a mortal Hæmorrhage, nothing remains but to extract the dead Fœtus with all Expedition, or in the safest manner possible, to procure a seasonable Abortion. This Doctrine is sufficiently confirmed by *Bhonijs*, in *Dissert. de Abortu salubri*.

Though violent Affections of the Mind, especially Frights, or intense Commotions, and Rarefactions of the Blood, arising from violent Exercise, too hot Baths, or the Use of drastic Purgatives, Emetics, Sudorifics, or Emmenagogues, are the frequent Causes of Abortion, yet unless the Vessels of the Uterus are preternaturally distended, relaxed, and infarcted by a Redundance of Blood, and the Matrix subject to spasmodic and convulsive Motions, an Abortion is not greatly to be dreaded. Hence we may justly reckon it an Error, not only in the Vulgar, but, also, in several Physicians, who are of Opinion, that some Remedies infallibly procure Abortion; whereas it is certain from Experience, that Women of Pleasure, when pregnant, cannot sometimes obtain their wicked Ends by copious Venesections, and the Use of drastic Purgatives, Emetics, and Emmenagogues, though when the Matrix is disposed to a too speedy Exclusion of the Fœtus, Abortion is procured by the slightest Cause. It is, therefore, a singular Proof of the Goodness and Wisdom of Providence, that there are not found in Nature Remedies universally and infallibly capable of procuring Abortion, since by their means numberless Murders might be committed.

Nothing happens more frequently than that Women who have once suffer'd Abortion, are again easily subject to the like Misfortune, at the same Period of their Gestation. It is, also, certain

certain from Experience, that generally sanguineous Masses, as large as an Hen's Egg, together with a large Quantity of grumous Blood, are excluded from the Uterus before Abortion happens, which is a manifest Proof, that the Strength and Elasticity of the Uterus and its Vessels, are so weakened by the preceding Abortion, that they could not soon return to their natural State; for the so frequent Disposition of the Uterus to Abortion is only to be accounted for from the excessive Relaxation and Dilatation of the Vessels. And this Dilatation must be removed, and the Tone of the Vessels restored by a prudent Physician, in the first Days or Weeks after Abortion, or natural Birth, by mild Laxatives, and temperate balsamic Corroboratives, duly repeated, or by a proper Diet; or if the Patient is plethoric, and has conceived, by proper Venesection in the first Months of Gestation; and unless these Measures are taken, this peccant State of the Uterus is not removed without great Difficulty; for, what is carefully to be adverted to, too great a Redundance of Blood with respect to the Vessels and Strength, to which Women of spongy Habits, those who are costive, and such as lead a sedentary Life, are principally subject, proves the material Cause of Abortion. Hence, if in the first Months of Impregnation the Blood is not by the provident Force of Nature discharg'd from the external Region of the Uterus, at the usual Period, which frequently happens; or if too small a Quantity of Aliments are taken into the Stomach, on account of Inappetence, Nausea, Subversion of the Stomach, and Uneasiness of the Præcordia, which in the first Months after Impregnation are very common Symptoms; or if in Proportion to the redundant Blood Venesection is not duly performed, and the Patient's Body kept soluble by proper Remedies, the Fœtus rarely arrives at Maturity, and seldom is retained in the Uterus till the full Time.

There is, also, another no less fatal Error in Practice, which is an Attempt by frequent Venesections in the Arm, the liberal Use of refrigerating, or actually astrigent Medicines, such as Opiates, and Narcotics, to put an imprudent Stop to menstrual or lochial Discharges, either in Childbed Women, or such as have suffered Abortion; for by this preposterous Method, and the Use of improper Remedies, the natural Strength, Tone, and Elasticity, not only of the Uterus, but, also, of all the Solids, are greatly diminished, and the Misfortune rendered either incurable, or far worse than it would have otherwise been; for what to some may perhaps appear a Paradox, we rather affirm, that the same Method, and almost the same Remedies, by which a Diminution and Suppression of the Menstrues are removed, are most beneficial for checking them when immoderate, and reducing them to a natural State: For it is certain from Experience, that both an excessive and too scanty menstrual Discharges, have been cured by a proper Use of hot and cold medicinal Waters, Baths of nervous and emollient Herbs, uterine Clysters, Preparations of Steel, the balsamic Pills, those of *Becher*, and others made in the same manner, Baths for the Feet, and the Use of deterfive nitrous Salts; for in both States the Tone of the Uterus is destroy'd, the Vessels distended with Blood, the Circulation of the Humours through the uterine Ducts not free and easy, but intercepted by Infarctions, Obstructions, and Stagnations; for removing or correcting which, the forementioned Remedies are very proper.

We now come to consider another Disorder of the Uterus, which is to be derived from the same Structure of the Matrix we have already mentioned; for in the Compages of the Uterus, the Direction of the numberless Vessels is winding and intricate, and the Circulation of the Blood through them, highly slow and difficult; so that it is not to be wondered at, if, in consequence of a depraved Nutrition, both the internal Surface, internal Cavity, Neck, or even Vagina of the Uterus, should be preternaturally subject to fleshy and fungous Excrescences of various Figures, Bulks, and Structures, which sometimes so augment it, as to resemble a State of Pregnancy. Fibrous bloody Masses, and polypose Concretions formed of Membranes, are, also, more frequently generated in the uterine Vessels than any where else, and lay a Foundation either for Sterility, or immoderate Hæmorrhages from the Uterus, which are succeeded by Abortion. Concretions of this Kind are commonly called *Moles*, of which there are various Species; by *Lamswerd* distributed into Moles of Nutrition, and those of Generation; but lest these should be confounded, as they easily are, we shall consider their Difference somewhat accurately.

First, then, the Secundines, with a tender Fœtus of one or two Months old, excluded by Abortion, is by ignorant Persons taken for a Mole, because it resembles a fleshy Concretion. Besides, though more rarely, globulous Masses formed in the Uterus itself, often create a Suspicion of Pregnancy, and are frequently found in such Persons when dead, or are excluded by a preternatural Increase of the Motion and Constriction of the Uterus; besides, it sometimes happens, that, a few Months after Abortion, or a legitimate Delivery, Women who have

been judg'd pregnant, have discharg'd from the Uterus solid fleshy Masses, of various Bulks and Figures, which, as they are deform'd, and resemble a Mole, large Mouse, or some other Animal, are not only, by the Vulgar, ascrib'd to Incantation, and said to be Moles, but, also, by some Physicians, given out for preternatural Conceptions, arising from the Imbecility of the seminal Fluid. These Concretions are often carried in the Uterus for a Year, and longer; and, by reason of the various Symptoms peculiar to the Mother, create a Suspicion of a true Embryo; but are generally excluded on the tenth or eleventh Month. But *Mr. Ruysch*, in *Observat. Anatomico-chirurg.* 28. & 58. seems to have advanc'd a more solid and rational Doctrine, when he asserts, that all these Concretions arise from Pieces of the Secundines left after the Exclusion of the Fœtus, and firmly connected with the Vessels of the Uterus; and that these Pieces, being nourish'd by the Afflux of the Blood, increase; and, in Process of time, becoming more compact, and hard, assume various Figures, according to the different Compression of the Uterus: For it often happens, that the Secundines are discharg'd dilacerated; for which Reason, it is expedient, after the Delivery, to inspect whether they are entire, or separated: For, if any Portion remains, the Patient is often subjected to violent Symptoms; for which Reason, the remaining Piece is to be expeditiously expel'd; which I have known successfully done by a proper Clyster, or by the *Pilula Balsamica*. But Masses of Blood, and membranous Fibres, by some call'd Polypuses, are more frequently observ'd, and these, being form'd in the dilated Vessels of the pregnant Uterus, and at last propel'd by the strong Effort of the Matrix and adjacent Parts, frequently cause Abortion, which they either precede, accompany, or follow.

Having thus traced the Difference, and inquir'd into the Origin of Moles, we may the more easily determine that important Question, Whether Virgins can be pregnant with Moles. For it is sufficiently obvious, that the Species of Moles, arising from enlarg'd Pieces of the Secundines, can by no means be found in Virgins. Nor are the Pieces of fibrous and coagulated Blood, which are thought Moles, or Polypuses, found in the Uterus of Virgins, the Vessels of which are very small, and narrow; but they are principally observ'd in pregnant and Child-bed Women. But it is neither unusual, nor impossible, that fungous Bodies should be produc'd, both on the external Surface, and in the internal Cavity, of the Uterus of a Virgin, who has been subjected to some external Violence, such as a Fall from an Height on the Abdomen, as we are inform'd by *Bartholinæ*, Cent. 1. Hist. 97. and by *Horslius*, in *Lib. 4. de Morb. Mulier. Obs.* 39. Nor is it to be deny'd, since it is certain, from Experience, that married Women, Widows, Women advanc'd in Years, those above Fifty, and those of sanguine and corpulent Habits, have, after a long Cessation of the Menstrues, evacuated fleshy and bloody Moles, sometimes as large as an ordinary Fist, and of different Degrees of Softness and Hardness, accompanied with immoderate Effusions of Blood. Of this we have Instances in *Marcellus Donatus*, Lib. 4. Cap. 25. *Joh. Rhodius*, Cent. 3. Cap. 53. and *Rodericus a Castro*, who gives us an Instance of this Kind in a Woman of seventy Years of Age.

On account of the difficult and slow Return of the Blood through the Vessels of the Uterus, especially the spermatic Vessels, which run into various Windings and Curls, like the Tendrils of Vines, and, consequently, make the Way to the Heart longer than it would otherwise be, it, also, happens, that, in the Uterus, and adhering Parts, especially the Tubes and Ovaries, there sometimes happen Inundations of Serum, and aqueous Tumours; for never does the fluid and aqueous Part of the Blood sooner recede from the rest, than when it passes through the Viscera in a slow and languid manner; as is sufficiently obvious in the Liver; for which Reason, in no Part are there more numerous lymphatic Vessels observable, than in the Substance of the Uterus and Liver, and adjacent Parts; and these lymphatic Vessels, being, by the Afflux of the Lymph, distended, are rais'd into large Blisters, or Hydatides, which being broken, a Dropsy is sometimes quickly generated, and a surprising Quantity of extravasated Serum lodg'd in the Cavity of the Abdomen. Thus *Salmuthus*, in Cent. 1. Obs. 38. informs us, that, after a difficult Labour, he found many Hydatides in the Confines of the Uterus. *Pecclinus*, in Obs. 19. tells us, that he found the same in an hysterical Patient, who dy'd pregnant. And *Tulpius*, in Lib. 4. Obs. 45. gives us an Instance of a Woman, in whom the Horns of the Uterus contain'd about nine Pints, or more, of Water and Pus, included in numberless Vessels. More Instances of this Kind occur in *Schenckius*, Lib. 3. Obs. 6, 7. *Rosfrickius de Organ. Genital.* Cap. 20. and *Sydenham*, de *Hydrope*. *Hardeus*, also, informs us, that, in a Countrywoman, the Left Ovary contain'd three Pints of a saltish and fetid Water, and that the Fallopian Tube annex'd to it had a remarkable Hydatid on it. About twenty Years ago, I remember to have seen produc'd, in a Woman of forty Years

Years of Age, by a violent Fall on the hypogastric Region; a Swelling in that Part, accompanied with a tense Pain; and this Swelling was succeeded by a large Discharge of limpid Water, which was first evacuated with the Menfes; and when the Discharge of the Blood ceas'd, that of the Lymph continu'd for half a Year, so that the Patient daily discharg'd almost a Pint; till, having try'd all Remedies in vain, she at last dy'd of a Consumption, and slow Fever.

I have, also, frequently observ'd, that a Dropsy is conceal'd under a State of Pregnancy, which frequently lays a Foundation for Physicians passing a fallacious Judgment; but I have seen pregnant Women, labouring under a Dropsy at the same time, preserv'd by a copious Discharge of the Serum; but when the Humour is discharg'd into the Cavity of the Abdomen, it proves mortal. *Platerus*, in *Lib. 3. Observat.* gives us a memorable Instance of a Woman who was afflicted with an *Ascites* every time she was pregnant. I myself have successfully restor'd Women, who, from a Cachexy, arising from irregular Living, and a Defect of the Menfes, have fallen into a Swelling of the whole Body, accompanied with a Difficulty of Breathing, Drowsiness, and Defect of Strength: From these Women, after the Use of the balsamic Pills prepar'd in my manner, and of the aperitive Salt, a large Quantity of Water was evacuated, not only by Stool, but, also, from the Uterus, both at the time of their Menfes, and out of it; and when this Water was evacuated, all the violent Symptoms were gradually abated: Hence I am of Opinion, that dropical Tumours in Women arise rather from a Fault of the Uterus, than of the Liver; and that when they arise from the former alone, they are more easily cur'd than when the latter is affected; because there is a freer Discharge to the stagnant Serum through the Uterus.

Hence it is easy to perceive the Reason why not only Virgins, but, also, married Women, are so frequently afflicted with a long-continu'd and uneasy Discharge of Serum of various Colours and Consistences, from the Uterus: For because the Tone and Motion of the Matrix, which consist in the equable Contraction and Relaxation of its Fibres, are easily injur'd, and weaken'd, and the Motion of the Humours through the winding uterine Vessels slow and languid, and the Return of the Blood through Veins destitute of Valves, also, very slow; not only Infarctions, and Stagnations of the Blood and Serum, easily arise in the Matrix, but, also, the serous and lymphatic Juice, becoming viscid by its slow Circulation, prepares a Way for itself, and is discharg'd through the Orifices which every-where occur in the Uterus and Vagina. It is the common Opinion of most Authors, that this Humour is secreted from the *Lacuna* of *De Graaf*, or the small Pits remarkable about the *Urethra*, and the small Glands lodg'd there: But in these *Lacuna* there is no Perforation found capable of admitting even a Bristle; but rather, on both Sides of the Orifice, and through the whole Substance of the Vagina, there appear more numerous *Lacuna*, which easily receive half a Finger's Length of a Bristle, and whose Ducts, when compressed, discharge a Liquor not unlike the seminal Fluid. See *Heister. Compend. Anatom.*

But though these Glands, when greatly relax'd, may discharge a copious Humour, yet they are not the only and genuine Seat of a *Fluor Albus*; but there are far more numerous Passages, from which the Matter of the *Fluor Albus*, and the impure serous Liquor discharg'd with and after the lochial Flux in Child-bed Women, derive their Origin. And though *Mr. Ruysch* denies, that Glands have ever been seen, or their Existence demonstrated, in the Uterus; yet it is not to be doubted but the Serum may attempt its Discharge from the small Mouths of the Vessels, which evacuate the Blood during the Menfes: For the celebrated *Fantoni*, in *Anat.* makes a memorable Observation, which is, that Air may be blown through the Veins of the Uterus into the Cavity of the Matrix and Vagina; and from the latter through the former. Besides, according to *de Graaf*, and *Hornius*, Pores and small Perforations are observ'd in the Neck of the Uterus. *Verbeijen*, in *Anatom. C. H. Cap. 33. c. f. Tab. 17. Fig. 2. 3.* informs us, that in a Uterus macerated in Water, and retain'd in a moderate Heat for some time, he saw many globular Corpuscles, not only in the interior Surface of the Vagina, in some Parts form'd into Clusters, and elsewhere disseminated through it, but, also, in the inferior Part of the Cavity of the Uterus; and these Corpuscles, he thinks, ought to be justly look'd upon as small Glands, subservient to the Secretion of a serous and pituitous Humour.

This Disorder, which at first Sight appears so slight, as to be only esteem'd a serous Defluxion, is, nevertheless, highly obstinate, and not to be cur'd without the greatest Difficulty; which, in my Opinion, is owing to this, that most Physicians only seek for the Cause of it in a deprav'd Sanguification, a want of a due spirituous Quality in the Blood, and a Redundance of Serum; whilst, little solicitous to restore the Tone of the Uterus, and promote the brisk Circulation of the Blood through it, they at-

tack the Disorder with Anticachectics, Purgatives, and such Medicines as eliminate the Serum, omitting Corroboratives, which are highly necessary. I, in order to remove this obstinate Disorder, recommend the Use of balsamic Pills, prepar'd after the manner of *Becher*, of bitter Extracts, balsamic temperate Gums, and a small Quantity of Extract of Aloes and black Hellebore, especially if used with some chalybeate Medicine: For ordinary Drink, the Patients ought to use a Decoction prepar'd of the Wood of the Mastich-tree, the Roots of Sarsaparilla, Shavings of red and yellow Sanders, Currants, Hartthorn, and Fennel-seeds; externally, Morning and Evening, balsamic Fumigations of Mastich, Amber, Olibanum, Tacamahaca, and artificial Cinnabar, are to be used; or, by means of a Syringe, the *Aqua Sclopetaria* is to be injected into the Womb, or a Liquor prepar'd of the Root of Birthwort, the Herbs Mugwort, Feverfew, Agrimony, Silverweed, Myrrh, Mastich, Myrtle-leaves, and the Flowers of red Roses boil'd in Red-wine; which proves highly beneficial, not only when injected into the Uterus, but, also, when frequently apply'd with linen Cloths to the Region of the Pubes. But to all these we prefer natural Baths, which, on account of their chalybeate Principle, are of a corroborating Quality; such as the Waters of *Lauchstad*, especially when boil'd with nervous Herbs, which corroborate the Uterus; such as Baum, Mint, Origanum, Mother of Thyme, Clary, *Roman Chamomile*, and Marjoram; for these, frequently exhibited, after the Use of Balsamics, and, when the Body is duly purg'd, are of singular Efficacy, not only in this, but in other Disorders arising from a Fault of the Uterus, especially if at the same time temperate mineral Waters are drank.

But as the Disorders of the Uterus, hitherto specify'd, arise principally from its Relaxation, and want of Tone; so there are others which derive their Origin from its excessive and spasmodic Stricture: For the Matrix has this in common with all other Parts compos'd of muscular and nervous Fibres, that it is, on certain Occasions, seiz'd with Spasms, and sometimes even agitated with convulsive Motions: But as in the internal Orifice of the Womb, which is of an exquisite Sensation, the Remission of the Motions, so, also, the intense and preternatural Rigour, is principally perceiv'd in the same Part, because it is in a great measure compos'd of nervous Fibres connected with each other, and running in a spiral Direction: For sometimes an excessive Constriction of the internal Orifice of the Uterus not only renders Birth difficult, but, also, unless relax'd by emollient Baths, Ointments, and Fomentations, absolutely prevents the Exclusion of the Foetus. It is, also, certain, from Experience, that a rash Admission of Cold to the inferior Parts, especially the Confines of the Uterus, during the lochial or menstrual Discharges, puts a Stop to these Evacuations: The same Effect is, also, produc'd by Frights; which, as they are of great Efficacy in constricting, especially the Fibres and Ducts of the external Parts, so this Influence is in a particular manner observ'd in the nervous and muscular Substance of the Uterus, and its Parts; and frequently proves the Cause of Abortion, or of an excessive or suppress'd lochial or hæmorrhoidal Discharge. Emetics, acrid Purgatives, and all Kinds of Poison, induce a great Change on the Uterus, and, by exciting Spasms in it, easily procure Abortion, in Women of delicate Habits.

It is, also, certain, that, in order to exclude not only the Foetus and Secundines; but, also, Moles, and Masses of coagulated Blood, it is necessary there should be an intense systolic or constrictory Motion of the Uterus, so that its Bottom being constricted and corrugated, its Orifice and Vagina may be dilated. When, therefore, in Women in Labour from a Defect of Strength, this intense Motion and constrictory Force of the Uterus fails, Analeptics are to be us'd; such as Cinnamon, and the Oil and spirituous Water of Cinnamon; as, also, other Corroboratives, such as the Essences of Amber and Myrrh, the Balsam of Life, the *Spiritus Oleosus* of *Sylvius*, and the Bezoardic Spirit of *Buffius*; Emmenagogues, also, are of great Use, as Borax; and Vomits are, by some Physicians, greatly recommended, in order to stimulate the Fibres of the Uterus to a brisker Motion.

On the contrary, when before or during the Labour, the Uterus is seiz'd with spasmodic or convulsive Motions, which often, either before or during the Birth, invert the natural Situation of the Foetus, and when the Mother is afflicted with an intense Heat, it is highly prejudicial to exhibit such spirituous Substances; because they hinder the Exclusion of the Infant, and excite a Fever, or Delirium, in the Mother: But, in such Cases, the most salutary Effects are produc'd by antispasmodic and sedative Medicines, which check and allay the Impetuosity of the Motions: The most considerable Remedies of this Kind are, Saffron, Castor, the Gall of an Eel, Powders of Vipers, of human Secundines, and of Worms; the *Pitula Wildegansii*, the Tops of white Lilies, and the Waters of the Flowers of the Lime-tree, of Elder, of the *Egyptian Thorn*, of white Lilies, and of Primroses. It is, also, expedient, in such Cases, when

when the Patient is plethoric, to open a Vein in the Arm, immediately before the Labour, lest the Nerves of the Abdomen being compress'd by the redundant Blood, the Motion, not only of the Uterus, but, also, of the Muscles subservient to the Expulsion of the Fœtus, should be suppress'd and hinder'd. Almost the same Method is to be us'd, when the *Lochia* are retain'd, in Pain arising from excessive Stricture, which, in Child-bed Women, is known from Pains of the Abdomen: When such a Case happens, the lochial Discharge is not to be procur'd by forcing Medicines, but by Sedatives; for which Reason, *Etmuller*, in *Dissert. de Vi Opii Diaphoretica*, greatly recommends Preparations of Opium for this Purpose: But if, on account of a Diminution of the constrictory Force of the uterine Fibres, the impure and stagnant Blood is not, after the Birth, duly evacuated from the Uterus, besides internal Medicines which excite the Discharge of superfluous Humours, nothing is more beneficial than a Clyster prepar'd of uterine Herbs, such as Southernwood, Pennyroyal, Rosemary, Mugwort, Baum, and Flowers of the Wall-flower, with the Addition of a small Quantity of the Mafs for the balsamic Pills.

There is, therefore, in the Uterus a constrictory and relaxatory, which, in my Opinion, may be justly call'd a peristaltic Motion; for whilst one Part is contracted, another is dilated; by which reciprocal Motion every thing preternatural is effectually excluded from the Uterus. That Child-bed Women often complain of Flatulences bursting from the Uterus, is a Sign that a tenacious Humour, which, by the Heat, is resolv'd into Vapours, remains in the Uterus; and that in the Substance of the Matrix this peristaltic Motion is still carry'd on: Besides, that this alternate Motion of the Uterus, just as it happens to the Stomach in Vomiting, is sometimes inverted, is certain, from this, that the menstrual or lochial Blood, usually discharg'd through the Vagina, is, on certain Occasions, forc'd through the *Fallopian* Tubes into the Cavity of the Abdomen, a Circumstance which always proves mortal. An Instance of this, *Mr. Ruysch* has given us, in *Observat. Anatomico-chirurg. Obs.* 84, & 85. It is, also, to be carefully observ'd, that, when the *Fundus* of the Uterus is closely contracted, and its inferior Part, together with the Vagina, too much relax'd, the Matrix itself may be so contorted and subverted, that Midwives are often deceiv'd, and imagine that a Fœtus still remains in the Uterus. See *Ruysch*, in the Work already quoted, *Obs.* 93. Besides, to the preternatural Motion of the Uterus, which is inverted from the external to the internal Parts, we ought, in my Opinion, to ascribe those violent and fatal Symptoms, which frequently afflict Child-bed Women, such as Fevers, acute Pains, Convulsions, Deliriums, mortal Apoplexies, and Purples of the red and white Kind; because all these Disorders derive their Origins from the corrupted Blood which ought to be evacuated from the Uterus, repress'd to the inferior Parts, and becoming stagnant.

Hippocrates expressly assigns, as the Cause of these Disorders, an intercepted Passage of the Blood through the Uterus, in the following manner: "The Blood, returning from the Uterus, and pressing upon the Diaphragm, produces a Strangulation, by a Retraction of the Uterus; when entering the Head, it gives Rise to Madness, Epilepsies, a Catochus, and Apoplexies; when possessing the Thorax, it excites Coughs; when rushing into the Heart, it produces Palpitations, Tremors, and sometimes Syncopes; and when it enters the Nerves, it gives Birth to Stupors, Immobilities, and Palsies." For all those Symptoms, commonly call'd hysterical, which frequently afflict Women, and have a great Agreement with the Symptoms of the spasmodic and flatulent hypochondriac Disorder, arise principally from a Fault of the Uterus; for there is a great Consent between the Uterus and the principal Parts of the Body; and this Consent is not so much to be accounted for from the Communication of Nerves, and the mutual Concurrence of the irregular Motions in the nervous Parts, as from the System of Blood-vessels, and the disturbed Motion of the Blood in them: For as in hypochondriac Patients, when the Blood, passing with Difficulty through the Liver, is accumulated in these Parts, especially of the nervous Kind, such as the Stomach and Intestines, to which the Ramifications of the *Vena Porta* are distributed, it, by its Pressure and Distention, excites Spasms, accompanied with violent Symptoms; so, also, in Women, when the Blood, becoming stagnant, is not freely conveyed through the Uterus, it regurgitates to the principal Parts of the Body, such as the Stomach, and especially the Intestines, Head, and Thorax; where, according to the Diversity of the Parts, it injures their Functions, and induces various and violent Symptoms. Hence the most skilful and sagacious Physicians, in all Disorders peculiar to Women, have a particular Regard to the Uterus, the State of the Menfes, and the Circulation of the Blood through the Vessels of the Matrix; whereas those Physicians proceed in a preposterous Method, who prescribe various Remedies, in order to remove the Sym-

ptoms; whilst, at the same time, they overlook the Cause and Origin whence they proceeded.

We now come to consider the Consent between the Uterus and the *Intestinum Rectum*, and hæmorrhoidal Veins. With respect, then, to the Sympathy between the Uterus and hæmorrhoidal Veins, we must take notice of an anatomical Error common to those who greatly extol Hæmorrhages and the hæmorrhoidal Discharges, whilst they imagine that the internal hæmorrhoidal Veins, which are Ramifications of the *Vena Porta*, distribute Branches to the Uterus, and especially to the Vagina; whereas *Saltzmanus*, in *Dissert. de Vena Porta*, has clearly demonstrated, that only the external hæmorrhoidal Veins send to the Matrix and Vagina an incredible Number of small Branches, connected with the internal Hæmorrhoids by a mutual Anastomosis: When this Connexion of the Vessels is known, it is easy to render a Reason why, in plethoric Women, the Blood seeks a Passage not only from the Uterus, but, also, sometimes, from the Veins of the Anus: And when the Passage this Way is precluded, the stagnant Blood not only produces Tumours, called the blind Hæmorrhoids, but, also, lays a Foundation for more Disorders, such as oppressive fixed Pains in the *Os Sacrum*, and other Symptoms familiar to those who labour under a Suppression of the Hæmorrhoids. It is, also, certain, that in old Women, who have no longer their menstrual Evacuations, there often arises, if not an hæmorrhoidal Discharge, yet, at least, an Effort of Nature that way, accompanied with the several Disorders usually accompanying a Suppression of the Hæmorrhoids. It is, also, owing to this Connexion of the Vessels, that, in the first Days after Delivery, knotty Protuberances of the hæmorrhoidal Veins frequently arise in the Anus, and excite an intense Heat; and these Protuberances certainly draw their Origin from the strong Efforts of the Patient, forcing a large Quantity of Blood to the Uterus and its Vessels.

The Consent between the Vagina and *Intestinum Rectum*, is sufficiently obvious from this, that their Membranes are so closely connected, and adhering to each other, that they can hardly, by the most cautious Hand, be separated, without Dilaceration. This is the Reason why a *Tenesmus*, a Symptom familiar to those labouring under a Dysentery, easily disposes the Vagina to fall down, and often proves the Cause of Abortion. Hence it is that acrid Suppositories, especially such as are prepared of drastic Purgatives, contribute much to Abortion; and that Clysters, prepared of uterine, nervous, and gently-stimulating Medicines, are very efficacious in expelling Moles, or grumous Blood, from the Uterus; as, also, in recalling the Menfes, or *Lochia*, when suppress'd. I shall now subjoin some Rules and Cautions, highly useful in Practice.

1. Pregnant Women, when plethoric, are by nothing better fortified against Diseases, and the Fœtus preserved sound, and vigorous, than by Venesection, about the third, seventh, and ninth Months.

2. It is an Error to imagine that Venesection in the Foot is prejudicial to pregnant Women, because it procures Abortion.

3. Venesection is often used with great Benefit, when the Patient is afflicted with Pains of the Back, hysterical Symptoms, or Sciatic Pains.

4. Venesection in a Suppression of the *Lochia*, or when the Purples remain in the internal Parts of the Body, often prevents the Danger of speedy Death.

4. The Suppression and Diminution of the Menfes often arise from a Plethora, which is removed by Venesection; so that, immediately after it, the Pulse becomes stronger, and the Blood is more freely conveyed through the Uterus.

6. When a continual or intermittent Fever seizes either a pregnant or Child-bed Woman, Venesection is never prejudicial, but often highly necessary.

7. It is expedient, in the first Days after Labour, to exhibit the *Pilula Balsamica*, by the Use of which the lochial Discharge is not only promoted, but, also, many Sordes, collected during the time of Gestation, are evacuated by Stool.

8. Preparations of Raisins, Manna, Rhubarb, and Tartar, are more proper for pregnant Women than other Laxatives.

9. In order to remove Sterility, the only Intention of Cure is, to restore the Tone of the Uterus, and reduce the Menfes, and Motion of the Blood through the Matrix, to a natural State.

10. Almost all Diseases, arising from a Disorder of the Uterus, if capable either of an Alleviation, or a Cure, require Venesection, gently-laxative balsamic Pills, Baths, both natural and artificial, duly-prepared Chalybeates, gentle Antiscorbutics, Carminatives, and the Use of temperate mineral Waters.

11. *Peruvian* Bark, in Conjunction with other proper Remedies, especially Powder of Chamomile-flowers, if exhibited prudently, and at a proper time, in Intermittents, is not prejudicial to pregnant Women; but proves a most salutary Remedy.

12. Obstinate Disorders arising from a Fault of the Uterus, often require external Applications, such as Fumigations, Injections, uterine Clysters, Fomentations, Epithems, and Baths, that the Virtues of Medicines may be the sooner conveyed to the Part affected.

13. Pregnant and Child-bed Women ought to be very careful with respect to their Diet, Regimen, and Method of Life.

14. Pregnant and Child-bed Women ought carefully to avoid external Cold, and internal Refrigeration, by means of purgative Medicines, and all astringent Acids; nor ought they to use too large Quantities of Aliments. But as Rest of Body is friendly to Child-bed Women, so it is prejudicial to such as are pregnant, who ought for that Reason to use proper Exercise.

OF AN INFLAMMATION OF THE UTERUS.

The peculiar Fabric of the Uterus, the surprising Elasticity of the Fibres of its whole Substance, the Number of its Blood-vessels, and their winding serpentine Direction, the glandulous and nervous Texture, together with the exquisite Sensation of the Neck, and internal Orifice of the Uterus, are Circumstances which render it subject to various Disorders, especially acute and dangerous Inflammations, together with Abscesses, and malignant Ulcers arising thence. Besides, because, not so much on account of the Communication and Sensibility of the Nerves, as the intercepted Motion of the Blood through the fibrous and vascular Compages of the Uterus, its Motion in the other Parts of the Body, is, also, greatly disturbed and perverted, hence there is a great Consent between the Uterus and the more noble Parts of the Body, such as the Head, the Breast, the Præcordia, the Stomach, and whole nervous System; so that when the Uterus is disordered, or inflamed, violent Symptoms happen in the adjacent and remote Parts of the Body.

Among the other Disorders incident to the Uterus, an Inflammation frequently happens, and may be known from the Heat and fixed Pain in the Groins, accompanied with an acute Fever, a Pain of the Loins, and lower Part of the Belly, an Inflation of the Abdomen, a Stimulus to discharge the Urine and Excrements, an Heat and Difficulty of Urine, together with other violent Symptoms in the Præcordia, Head, and Breast. Though the Moderns take little Notice of this Disorder, yet some of the Antients were very full and accurate in describing it: Thus, *Actius* speaks of it in the following Manner: "An Inflammation of the Uterus may be produced by various Causes, such as Blows, Suppressions of the Menfes, external Cold, Inflation, Abortions, and hard Labours. An Inflammation of the Uterus is succeeded by an acute Fever, a Pain of the Head, and its Tendons, a Pain in the Bottoms of the Eyes, and in the Joints of the Arms and Fingers, a Detraction and Declination of the Neck, a Disorder of the Stomach in consequence of its Consent with the Uterus, a Contraction of the Mouth of the Uterus, and a small and dense Pulse. If the whole Uterus is inflamed, there is a violent pulsatory Motion in all its Parts. If its posterior Parts are only inflamed, there is a Pain about the Loins, and the Fæces are retained on account of the Compression of the Intestinum Rectum. If on the contrary, its anterior Parts are inflamed, there is a Pain about the Groin, a Strangury, and difficult Discharge of the Urine, arising from a Compression of the Bladder. When the Sides of the Uterus are inflamed, the Groins are rendered tense, and the Thighs and Legs oppressed. When its Bottom is inflamed, there is a Pain and Tumor principally about the Navel. When its Neck, or inner Orifice is inflamed, there is a Pain in the superior Part of the Abdomen, and, upon introducing the Finger into the Vagina, the Mouth of the Uterus appears hard, and makes a considerable Resistance."

An Inflammation of the Uterus may be justly divided into slight or superficial, and violent or profound; the former frequently happens to Childbed Women, is easily produced, and most frequently succeeds the Milk Fever. This Species admits of a Cure, if prudently treated, and is easily resolved in a few Days. But the violent, or profound Inflammation of the Uterus, which is accompanied with an intense Fever, and a Train of terrible Symptoms, whose Vehemence does not remit, often proves mortal on the seventh, ninth, or eleventh Day, especially when the White Purples supervene, which are always a bad Sign, since they derive their Origin from a corrupted, putrid, and vapid Blood and Serum lodged in the Uterus, and are even a Proof, that the Uterus is already corrupted and sphacelated.

The material proximate Cause of an Inflammation of the Uterus is an unequal Circulation of the Blood through the uterine Vessels; for when the small Vessels are obstructed, con-

tracted, and spasmodically constricted, the Blood is with a greater Impetuosity and Swiftness convey'd through the adjacent Vessels, and their lateral Ramifications, otherwise not susceptible of Blood. Hence arise a Tumor, Redness, and Heat, together with a Pressure of the nervous Coat of the Uterus. The Uterus is disposed to Inflammations by Blows, Contusions, external Wounds, a Plethora, a Cacochymy, a Suppression of the Menfes, or Lochia, a copious Defluxion of Blood to the Uterus, a difficult Labour, the Passions of the Mind, especially Anger, and Frights, excessive Vomiting, or strong Efforts to it, Refrigeration of the lower Part of the Abdomen after violent Exercise in plethoric Habits, the drinking cold Liquors, especially during the menstrual, hæmorrhoidal, or Lochial Discharges. Convulsive Colics, also, and violent spasmodic, and hysterical Affections, produce Inflammations of the Uterus.

Inflammations of the Uterus are never more incident to Women, than when they are in Child-bed; for, after the Birth, the Uterus freed from its Load, by its elastic Force is again reduced to a smaller Space, and gradually contracts itself. Hence the dilated Vessels of the Uterus are contracted, the Blood contained in them is expressed from their open Mouths, before continuous with the Secundines, and evacuated under the Name of *Lochia*, to the great Benefit of the Patient. But at the same time, this Contraction of the Vessels directs the Motion and Course of the Blood elsewhere, that is, from the Uterus and inferior Parts, to the superior Parts and Breasts; and this generally happens about the third Day, with a considerable febrile Commotion, generally called the *Milk Fever*. If, therefore, the Lochial Discharge is prevented by spasmodic Strictures of the Uterus, it not only excites a dangerous and inflammatory Stagnation in the Uterus itself, but, also, increases this usual Conveyance of the Blood from the inferior to the superior Parts, both with respect to its Vehemence and Quantity. In this Case the spasmodic Strictures of the Abdomen are violent, the Discharge of the Blood, or mucid Humour from the Uterus is stopt, the Patient becomes costive, the Feet are rendered cold, there is a Stimulus to discharge the Urine, which is evacuated with Pain; the Countenance becomes red and tumid, the Eyes sparkle, certain Drops sometimes fall from the Nostrils, the Mind is restless, the Sleep either none at all, or disturbed with frightful Dreams; and at last these violent Symptoms, a difficult Respiration, Delirium, Convulsions, and a phrenetic Delirium, often suddenly put an End to the Patient's Life.

These Circumstances are accurately described by *Hippocrates*, in *Lib. 1. de Morb. Mulier.* in the following Manner: "If, says he, the Uterus of the Child-bed Woman is inflamed, the Abdomen becomes hot and large, there is a Suffocation about the Præcordia; and when the Lochia are retained in consequence of Cold, the Uterus is distended." And in *Lib. 2. de Morb. Mulier.* he tells us, "That if an Erysipelas happens in the Uterus, the Breast is affected by it, the Abdomen becomes tumid and cold, the Patient is seized with a violent Fever and Rigor, breathes thick, and is subjected to Delirium and Weakness, a Pain of the whole Body, Dejection and Inconstancy of Mind. The Disorder ascends from the inferior Part of the Abdomen to the Loins, Back, Præcordia, Breast, Neck, Head, and Stomach, so that the Patient seems dead." But 'tis certain from Experience, that pregnant Women of tender and delicate Habits, prone to violent Commotions of Mind, subject to spasmodic and flatulent Disorders, afflicted with an irregular State of the Menfes, or with Costiveness after Labour, easily fall into a Suppression of the Lochia, accompanied with a dangerous and acute uterine Fever. Sometimes, also, an Inflammation of the Uterus arises from a Retention of the Whole, or some Part, of the Secundines; for when the Secundines are retained, the Exclusion of the Blood from the Uterus is not only prevented, but, also, the succeeding Putrefaction excites a Fever, or renders it worse, if already formed.

Now, as in all Inflammations the stagnant Humour, if not dissolved, putrefies, and degenerates either into a sphacelous, or ulcerous Corruption; so the same, also, happens in Inflammations of the Uterus. An Inflammation of the Uterus, which degenerates into a Sphacelus, is soon mortal, and is most incident to Child-bed Women, in whom, when dissected, the Uterus and Vagina are generally found hard, and of a dark, brown Colour. But an Inflammation of the Uterus, which terminates in a Suppuration, or Ulceration, is of a more chronic Nature, and happens principally out of a State of Child-bed. This suppuratory Inflammation of the Uterus is principally incident to Women of sanguine, soft, and spongy Habits, especially if they have been afflicted with a bloody Fluor Albus, and have put an unreasonable Stop to it by Astringents. It is, also, frequently incident to those Women whose Blood is gross and

and impure, who use insalutary Aliments, sweet Summer Fruits, and Sweet-meats, who expose their inferior Parts to the Cold, especially when the Body is over-heated, who are afflicted with Sorrow, who are prevented from satisfying their Inclinations to venereal Commerce by Enjoyment, who neglect usual Venesections, or who being old, lead a quiet and melancholy Life. And in such Women the Inflammation happens more frequently in the Neck and internal Orifice, which consists of nervous Fibres spirally interwoven, than in the Bottom of the Uterus; for which Reason there is an intense and burning Pain in the Pubes, accompanied with a difficult Discharge of Urine. The Signs of an Abscess of the Uterus are by *Hippocrates*, in *Lib. 1. de Morb. Mulier.* enumerated in the following Manner: "If," says he, the Uterus is ulcerated, Blood and Pus are discharged, a fetid Smell of the Parts arises, an acute Pain seizes the Loins, Groin, and lower Part of the Abdomen. The Pain ascends upwards to the soft Parts of the Sides, the Ribs, the Scapulæ, and sometimes to the Clavicles. The Patient is seized with a violent Head-ach, and Delirium: But, in Process of Time, she becomes tumid, weak, subject to Deliquiums, slight Fevers, and Refrigerations; but her Legs are more considerably swelled than the other Parts of her Body. This Disorder succeeds Abortion, if the corrupted and putrefied Humours left behind are not duly evacuated, and the whole Body is excessively hot. It is, also, brought on by uterine Fluxes, the Matter of which is of an acrid or bilious Quality." But for the most part, an Ulcer of the Uterus degenerates into a Gangrene and Sphacelus, and by that means proves mortal. It sometimes, however, happens, that an Apostem formed in the Uterus, breaks internally, and a white fetid Sanies is copiously discharged, by which means the Patient is preserved. See *Forestus, Lib. 28. Obs. 44.*

If the exterior Part of the Uterus is inflamed by external Cold, the Inflammation easily degenerates into a Scirrhus, which becoming ulcerated, is justly called a *Cancer of the Uterus*, and is incurable. It, also, frequently happens, that the Glands about the Neck of the Uterus, and especially its internal Orifice, are changed into a Scirrhus, which at last, degenerates into an ulcerous Inflammation, which, like an ulcerated Cancer, is, also, incurable. Though the Moderns have taken little Notice of this Disorder, yet I have frequently seen Instances of it, and found it accompanied with the same Symptoms, exactly enumerated by *Aetius, Tetrabib. 4. Serm. 4. C. 94.* in the following manner: "Cancers in the Uterus are sometimes with, and sometimes without, an Ulceration; an hard, unequal, prominent Tumor, of a disagreeable, red, and sometimes sub-livid Colour, is found about the Mouth of the Uterus. There is a violent Pain in the Groins, superior Part of the Abdomen, and Loins, whilst the Parts, originally affected, can hardly bear to be touched, or treated in the different Manners necessary for a Cure. But if the Cancer is of the exulcerated Kind, besides Pains, Hardness and Tumor, corroded and unequal Ulcers appear, which have generally sordid, tumid, and whitish Lips, and are covered with un-seemly Crusts. But the Ulcers which seem most pure, appear feculent, livid, red, and bloody. From such Ulcers there is continually discharged a thin, aqueous, black, or yellow fetid Sanies, and sometimes Blood, accompanied with the other Signs of an inflamed Uterus." This Disorder, according to *Hippocrates*, is incurable; but it is to be mitigated by Infusions prepared with Fenugreek and Mallows, and by Cataplasms of a like Nature.

The C U R E.

As an Inflammation of the Uterus is never more frequent than in Child-bed Women, and after Abortion, and is brought on either by the unskilful Management of Midwives in difficult Labours, and their too rough handling the Mother, or by the violent Efforts during Labour, which force the Blood, especially of the impure Kind, to the Uterus, or by an Obstruction of the Lochia, by means of Pains, hysteric Spasms, a Fright, or Refrigeration, it is necessary, both for the Purposes of Prevention, and Cure, that the Physician should be well acquainted with all these Causes. But because it is far more easy to prevent this Disorder when approaching, than to cure it when present, the Physician ought, by all means, to use his utmost Endeavours to put a timely Stop to it, and prevent its Approach if possible.

Without considering those Disorders of the Uterus, which are brought on by external and violent Causes, we shall only observe, that nothing more frequently occurs in Practice, than an inflammatory Fever of the Uterus after Labour, on account of a too scanty, or totally suppressed Discharge of the Lochia. Hence the Physician is in the first Days after Delivery, to take care that the Lochia be duly evacuated; for which Purpose he is to direct his principal Intentions to the Removal of those

Causes which obstruct the Lochial Flux. Now it is sufficiently certain, that during a long and violent Labour, there is so violent a Commotion and Exagitation both of the solid and fluid Parts, that from the Quickness of the Pulse, the Heat of the whole Body, the Thirst, and Inquietude, we may justly conclude that a Fever is present, during which febrile Commotion, little or none of the putrid and bloody Recrements is evacuated from the Uterus. Hence, after the Labour, the Physician is to use his Endeavours to compose and mitigate this impetuous Commotion of the Parts. This Intention is best answered by keeping the Patient in a State of Rest, the Use of a temperate diaphoretic Regimen, and the Exhibition of diluent and gently cooling Medicines. But because during Labour, which is only performed by spasmodic and convulsive Strictures arising from the spinal Marrow, the Spasms, and painful Strictures, are by Consent, convey'd to the Intestines; and because these Strictures remain some time after the Labour, and in consequence of the same Consent, by constricting the muscular and nervous Fibres of the Uterus, obstruct the free Circulation of the Blood, the Physician is therefore carefully to allay and soothe them; For this Purpose,

Take of the Pulvis Marchionis, and Crabs-eyes, each one Dram; of diaphoretic Antimony, half a Dram; and of pure Nitre, sixteen Grains: Reduce to a Powder; of which the fourth Part is to be taken for a Dose, adding, if the hysteric Spasms are at the same time very violent, four or six Grains of the Powder of Castor, to be taken in the Water of common Chamomile-flowers distilled with Ale prepared of Wheat.

This Intention is, also, answered by the Oil expressed without Fire, from recent sweet Almonds, which either alone, or mixed with a fourth Part of Sperma Ceti, may be exhibited to the Quantity of an Ounce, or half an Ounce, in Broth prepared of Pullets, or in Water-gruel. Externally the whole Abdomen is to be anointed with a Liniment thus prepared:

Take of the Oils of Dill, Chamomile, and white Lilies, each one Ounce; of the Oil of Caraway, two Drams; or of the Oil of Camphire, one Dram: Make into a Liniment, for anointing the Abdomen; after the Use of which, apply a warm folded Cloth.

When the febrile Motion is thus composed, in order to promote the Lochial Discharge, there is hardly any more efficacious Medicine, than the Mass of Pills prepared in Imitation of *Becher's*, of bitter Extracts, resinous-temperate Gums, and Aloes duly corrected. On the second Day, therefore, after Delivery, let fifteen Grains of this Medicine, in the Form of Pills, other Circumstances being alike, be exhibited in the Morning or Evening, and continued for five or eight Days, according as the Circumstances of the Patient require. This is an highly mild and proper Evacuant; for by corroborating the Tone of the Intestines and Uterus, which is weakened by the excessive Distension, and at the same time, by gently stimulating, it frees the Abdomen and Intestines from Sordes, and the Uterus from stagnant and corrupted Blood, by which means it excellently prevents the Inflammation, the Fever, and other violent Symptoms arising from a Retention of the recrementitious Sordes. This Medicine is, also, of singular Use when the Secundines, or any Part of them, or any other foreign Substance, is to be expelled from the Uterus.

But if the Intentions of the Physician are not answered by these means; if a continual Fever preys upon the Patient; if her Abdomen is distended with Flatulences; if the Lochia are retain'd, and violent Spasms conveyed to the superior Parts, another Method is to be used; for the Redundance of Blood accumulated during Gestation, is to be diminished by Venesection, not in the Arm, but in the Foot; for Spasms often arise from an excessive Distension of the Vessels, and the Quantity of the superfluous Blood by distending the Compages of the Uterus, diminishes and prevents its systaltic and expulsive Power. Hence Venesection is of the greatest Importance to promote the Lochial Discharge, and prevent Inflammations. As in *France* Venesection is more often used for this Purpose than it ought, so in *Germany* it is totally rejected; so that many die of an inflammatory Fever of the Uterus, who might have been preserved by seasonable Venesection.

Besides Venesection, when an inflammatory Fever is already present, the stagnant Blood is to be put in Motion, the thick Humours rendered fluxile, and the Stagnation dissolved: In order to obtain this End,

Take of the Waters of Chervil, Carduus Benedictus, Scordium, Elder-flowers, Egyptian Thorn-flowers, and distilled Vinegar, each one Ounce and an half; of Crabs-eyes,

eyes, one Dram and an half; of diaphoretic Antimony, or Bezoardic Mineral, half a Dram; of the Spiritus Nitri Dulcis, or the Anodyne Mineral Liquor, twenty Drops; and of the Syrup of Carduus Benedictus, two Drams: Make into a Mixture; of which let the Patient take two or three Spoonfuls every two Hours.

For ordinary Drink let her use weak Broth prepared with Fowls, the Roots of Vipers-grafs, and Succory, together with the Shavings of Hartshorn, adding at Pleasure the Juice of Oranges. It is, also, expedient now-and-then to exhibit an Infusion prepared of the Herbs Pauls Betony, Scabious, Sow-thistle, the Flowers of Clary, and common Chamomile, together with the Seeds of Fennel; nor are we to omit the tempering and resolvent Powders prepared of Crabs-eyes, a Solution of Crabs-eyes, Nitre, and Sal Polychrestus. Powders of this Kind are commodious, interposed with *Becher's* Pills, or others like them, in order to promote the Lochial Discharge, and derive the Impetus of the Blood from the Head. Clysters are, also, to be used, and may consist either of sweet Whey, or Decoctions of the Flowers of common Chamomile, the Herbs Mugwort, Sage, Clary, and French Mercury, with an Addition of Honey, Nitre, and the Fat of Hens.

When out of a State of Child-bed, in Women of impure Habits, various Causes concur to produce an Inflammation, not so much in the Bottom as in the Neck of the Uterus and Vagina, besides the internal Remedies already mentioned, external Medicines are, also, to be used, such as Epithems applied to the Region of the Pubes, uterine Injections prepared of proper Ingredients, Pessaries, and, on account of the Vicinity of the Parts, Suppositories introduced into the Anus. An Epithem may be prepared thus:

Take of the Aqua Sclopetaria, four Ounces; of the Essence of Saffron, and camphorated Spirit of Wine, each two Ounces; and of Nitre dissolved in Elder-flower Water, one Dram; and, according as Circumstances require, let these be mixed with Vinegar of Rue, or of Scordium, and applied with several Folds of Linen Cloth.

For an Injection I commend either Womens, or Asses Milk boiled with Elder-flowers, Myrrh, and Saffron, adding a little Nitre. The most uneasy Symptom of this Disorder, which is a Tenesmus, is, besides by emollient Injections, excellently alleviated by Oil of sweet Almonds, or a Mucilage of the Seeds of Flea-bane, or Fenugreek; two Ounces of which, with an Addition of twelve Grains of the Extract of Saffron may be injected into the Anus; and all these Remedies are useful when the Inflammation has degenerated into a Suppuration.

It, also, frequently happens, that when a long-continued *Fluor Albus*, especially of the bloody Kind, is ill treated, or preposterously stopt, the Uterus is affected with a Tumor, Pain, and inflammatory Fever, which sometimes terminates in a Suppuration. In this Case the Cure is highly difficult and perplexed, especially when the Matter flows not from the external Glands, but the internal Substance of the Uterus. When this Disorder is chronical, I know nothing more efficacious than the mild *Empsen* and *Caroline* Waters, which not only effectually dissolve the stagnant Humours, but, also, corroborate the Part affected. But the Patient is to abstain from astrigent Baths, and from the stronger *Caroline* Waters, which on account of their calcarious and chalybeate Earth, are of an astrigent and repellent Nature. But Injections prepared of uterine and aromatic Herbs, boiled in sweet Water, are very beneficial. When the Vessels are thus relaxed, and the Humours diluted, we may with Advantage exhibit the *Pilule Becherianae*, which are the most considerable of all the uterine Specifics. Nor is *Hippocrates's* Method of curing an Ulcer in the Uterus to be rejected, which in *Lib. 1. de Morb. Mulier.* he gives us in the following manner: "When this Disorder happens, bathe the Patient in large Quantities of warm Water, and apply tepid Substances to the Part affected. But if Pains possess the superior Parts, the whole Body is to be fomented, and a purgative Potion exhibited; and, if boiled Whey can be had, let the Patient drink it for five Days: But if Whey cannot be had, let her drink boiled Asses Milk for three or four Days. After the Use of the Whey or Milk, let her drink Water, and use proper Aliments, such as tender and recent Mutton, the Flesh of Fowls, Beet, and Gourds; but she is carefully to abstain from all saline, acrid, and Sea Substances, as, also, from the Flesh of Goats." And certainly Whey, and Asses Milk, are highly beneficial, not only in obtunding the Acrimony of the Humours, but, also, in correcting the hectic Heats, with which Patients labouring under this Disorder, are greatly afflicted.

An Inflammation of the Uterus induced by an external Cause, and accompanied with a Fever, a Pain of the Groins, a difficult Discharge of Urine, and Spasms in remote Parts,

calls for Venesection, not only in due time, but, also, repeated first in the Arm, and then in the Foot. In this Species of Inflammation, it is, also, requisite the Body should be rendered soluble by Clysters, which in all Disorders of the Uterus, are of singular Use. Externally we are to apply a Plaister prepared of Melilot, two Ounces; Sperma Ceti, half an Ounce; Gum Ammoniac, two Drams; Saffron, one Dram; and Camphire half a Dram; not omitting the internal Exhibition of mild, diaphoretic, and discutient Medicines.

Since many Child-bed Women die of an uterine Fever, especially if they contain a large Quantity of gross impure Blood, hence it is certainly of great Importance, in order to prevent these capital Disorders, for pregnant Women, partly by a salutary Regimen, and partly by proper Remedies, to preserve both their Solids and Fluids in a due Temperature, Quantity, and Equilibrium of Motion; for such as is the Nature of the Patients, even of Child-bed Women, such is the Struggle of Nature against the Disease, and such is the Cure, in which Nature does more than Art. In order therefore to prevent this terrible Disorder, it is necessary that Women, during Gestation, should consult their Health both by seasonable Venesections, and proper Laxatives, especially Preparations of Rhubarb. They ought, also, to use a moderate Diet of a laudable Kind, preserve a due Tranquility of Mind, and drink diluting Potions, which have a Tendency to support and promote Perspiration. Besides, as Inflammations of the Uterus in Child-bed Women, especially those of sanguine Constitutions, and those who in the last Months have neglected Venesection, frequently proceed from hot and spirituous Liquors, aromatic Wines, and such as are impregnated with Saffron, both Nurses and Patients are to be seriously advised to abstain from these Liquors, which exagitate the Blood, and rather by Venesection, and the Use of Baths, for two or three Weeks before the Labour, to procure a free Circulation of the Blood through the Uterus, and its easy Discharge after Delivery.

In no Disorder are Commotions of Mind, especially by Frights and Anger, so prejudicial as in Inflammations of the Uterus. Nor is Refrigeration of the Abdomen and Groins in any Case so hurtful, as after Abortion and Delivery; for Child-bed Women, on account of the Solution of Continuity in their Fibres, the Dilaceration of the Vessels, and the Extravasion of the Humours, are to be considered as Persons severely wounded. But it is sufficiently known how easily these Causes may induce an Inflammation of the wounded Part, and consequently of the Uterus. Hence, not only Child-bed Women, but, also, those who labour under any Disorder of the Uterus, are to be carefully advised to abstain from such hot and spirituous Liquors.

In order to promote the suppressed Lochial Discharge, we are never to exhibit drastic Emmenagogues, such as Preparations of Saffron, Myrrh, Amber, Aloes, or hot Aromatics, or saline stimulating Medicines, much less, if immediately after their Labour, there is still an Impetus of the Motions; for these rather increase the Fever, heighten the Spasms, condense the Blood in the Uterus, by carrying off its moist Parts, which renders it unfit for Evacuation, and dry and obstruct the Emunctories more than they were before. But, when the Spasms begin to be relaxed, the Pains to remit, and the Pores to become open, then moderate Emmenagogues, and such Medicines as restore the Tone of the Parts, are to be exhibited. The best of this Kind are, Solutions of Amber, Myrrh, Rhubarb, and Saffron, not with Spirit of Wine, but with an aqueous and lixivious Menstruum; as, also, Baum-water, or gently spirituous Water of Mugwort, such as that which is distilled with Ale prepared of Wheat, exhibited frequently, though in small Doses.

Venesection is, also, one of the most considerable Remedies for recalling the Lochial Discharge; nor, if it is indicated, let the Physician be terrified from ordering it by the Violence of the Symptoms, or even when the Purples appear. See *PURPURA*. But when provident Nature by profuse Sweats, or Stools, in some measure, makes Amends for the Cessation of scanty Discharge of the Lochia, we are to abstain from such Medicines as excite the Lochial Evacuation.

When a viscid, yellow, and bloody Humour is evacuated, it is a pretty sure Sign, that the Substance of the Uterus is injured, and that an Inflammation and Ulceration are approaching. In order, therefore, to prevent an Inflammation, or remove it when already present, frequent Purgings with Rhubarb, Tamarinds, and Manna, are both safe and necessary, in order to divert the peccant Humours from the Uterus. This Practice is of such Importance to the Cure, that *Forestus*, in *Lib. 29. Obs. 48.* tells us, that he cured a Woman of Distinction of an Ulcer in the Uterus, by giving her every fourth Day, five Ounces of a Decoction of Sena, Epithymum, red Roses, and Indian Myrobalans, edulcorated with Sugar, ordering her at the same time, to have abstergent Decoctions injected into the Uterus.

Uterus. If an Ulcer of the Uterus is curable, after the Use of gentle Purgatives for some Days, a Decoction of Sanders, Marsh-mallows, Sarsaparilla, Mint, Epithymum, Liquorice-root, and Rose-wood, drank for twenty-five Days, with a sudorific Regimen, is of considerable Service. See *Sylvaticus*, Cent. 4. Obs. 48.

When an Ulcer of the Uterus resembles the Nature of an ulcerated Cancer, a putrid Sanies, together with corrupted Shreds of the Uterus, are evacuated with a fetid Smell, intense Pain, and a Train of violent Symptoms; and, in this Case, the Disorder is generally incurable; demulcent and lenitive Medicines are, however, only to be used. If any Hope of a Cure still remains, I recommend the drinking of Milk, especially that of Asles; as, also, the Use of temperate mineral Waters; such as the *Selteran Springs*, and those of *Wildungen*; interposing, Morning and Evening, a Bath of sweet Water with Bran, in which the Patient is to sit for an Hour, or longer. No acrid, hot, and stimulating Medicines, are to be exhibited internally. In Abscesses, and Ulcers of the Uterus, we are, also, cautiously to use Astringents and Repellents, since by these a Scirrhus is easily induced. Injections of Goats Milk, Saffron, and Elder-flower-water, produce excellent Effects. *Hippocrates* recommends the Use of Cabbage; but the Juice of red Beets, frequently injected warm, is better.

An exulcerated Cancer of the Uterus is frequently accompanied with an intense Pain, which destroys the Strength, and totally prevents Sleep. This Pain is best allayed by Anodynes; such as the Extracts of Saffron and Poppies, the *Pilula de Styrae*, the *Pilula de Cynoglossa*, the *Pilula Wildegansii*, the *Pilula Matthaei*, and the *Pilula Starkii*. *Riverius*, in *Prax. Cap. 10.* speaks in the following manner: "All these Things are sometimes insufficient to allay the intense Pain, which, on certain Occasions, absolutely deprives the Patient of Rest and Sleep. Hence we are frequently obliged to have Recourse to Narcotics, which, in this Disorder, are not hurtful, on account of the intense Heat of the Humours: And I myself knew a Woman labouring under a Cancer of the Breast, who, for four Months, daily took two or three Grains of *Laudanum*, from which she obtained great Relief." *Frederic Hoffman*.

UTRICARIA. The Name of a Plant which grows at the Cape of *Good Hope*, to which I find no medicinal Virtues ascribed. *Raii Hist. Plant.*

UTRICULUS. The Uterus is sometimes thus call'd.

UTRIFORMIS ABSCESSUS. The same as **OEDEMO-SARCOMA**.

UTRUS. A Name for the *Isatis*, Woad. *Marcellus Empiricus*, C. 23.

UTY Brasiliensis. The Name of a Tree which grows in *Brasil*, of no Use in Medicine. *Raii Hist. Plant.*

UVA CRISPA. See **GROSSULARIA**.

UVA GRUINA. Offic. *Vitis Idæa palustris Virginiana*, fructu majore, *Raii Hist.* 1. 685. *Vitis Idæa palustris Americana*, oblongis splendentibus foliis, fructu grandiore; rubro, pluribus intus acinis referto. *Pluk. Almag.* 392. *Phytog. Tab.* 320. f. 6. **CRANE-BERRIES.**

They are imported from *New England*, and are supposed to be excellent against the Scurvy: They are, also, of some culinary Service, among us.

UVA MARINA. A Name for the *Ephedra*; *maritima*; *major*; and for the *Ephedra*; *maritima*; *minor*.

UVA PASSA MAJOR. See **VITIS**.

UVA PASSA MINOR. See **VITIS**.

UVA URSI.

The Characters are;

The Calyx is very small, and, as it were, denticulated; the Flower is monopetalous, and Pitcher-shaped; and the Ovary in the Centre of the Calyx becomes a spherical Berry, containing a Multitude of oblong Seeds.

Boerhaave mentions but one Sort of *Uva Ursi*, which is;

Uva Ursi. Tourn. Inst. 599. *Boerb. Ind. A.* 2. 219. *Vitis Idæa*. Offic. *Vitis Idæa foliis carnosiss & velut punctatis, sive Idæa Radix Dioscoridis*. C. B. P. 470. *Raii Hist.* 2. 1489. *Radix Idæa putata, & Uva Ursi*. J. B. 1. 523. *Vaccinia Ursi, sive Uva Ursi apud Clusium*. Ger. 1230. *Emac.* 1416. **SPANISH WHORTLES.**

They grow in *Spain*, *Italy*, and other southern Countries; and are said, by *Dioscorides*, to be good for excessive Fluxes of the Belly, Menstrues, and all Kinds of Hemorrhages. *Dale*.

UVA FABRILES, in *Caelius Aurelianus*, imports Grapes dry'd in the Smoke of a Smith's Shop.

UVATIO. A Disorder of the Eye, the same as *Staphyloma*. See **OCULUS**.

UVEA TUNICA. The uveous Coat of the Eye. See **OCULUS**.

UVIFERA ARBOR TABACENSIS. *De Lact.* The Name of a Tree, the Wood of which is red, the Leaves round,

and the Fruit like Grapes; of a very grateful Taste. It grows principally on the Sea Coasts. *Raii Hist. Plant.*

VULCANUS. Fire.

VULNERARIA. See **ASTRINGENTIA**.

VULNERARIA.

The Characters are;

The Calyx is tubulated, and swelling; the Pod is short, full of a roundish Seed, and concealed in the membranaceous Calyx of the Flower.

Boerhaave mentions four Sorts of *Vulneraria*, which are;

1. *Vulneraria rustica*. See **ANTHYLLIS LEGUMINOSA**.

2. *Vulneraria rustica flore albo*. T. 391.

3. *Vulneraria; flore purpurascente*. T. 391. *Anthyllis, leguminosa hirsuta herba, flore suave rubente*. M. H. 2. 181.

4. *Vulneraria; pentaphyllos*. T. 391. *Anthyllis leguminosa, lato affinis, major, Hispanica vesicaria*. M. H. 2. 181. *Lotus pentaphyllos vesicaria*. C. B. 332. *Trifolium Halicacabum sive vesicarium*. J. B. 2. 17. 361. *Boerb. Ind. alt. Plant.*

It is called *Vulneraria*, from its Excellence in vulnerary Uses; for the Decoction of it, or the Herb itself, bruised and applied, deterses Wounds, prevents their Suppuration, and closes their Lips. *Hist. Plant. adscript. Boerhaav.*

VULNUS. A Wound.

A Wound is a recent and bloody Solution of the Union of a soft Part, by a hard and sharp Body in Motion, press'd against it, or resisting it.

In this Aphorism we have an accurate Definition of a Wound, which is, that it is a Solution of Cohesion in the Parts: But, in order to give it the Denomination of a Wound, it must be recent; by which Circumstance it is distinguished from an Ulcer, in which there is a Solution of Cohesion in Parts before cohering. By *Hippocrates*, however, as in *Lib. de Capit. Vulnerib. Cap. 12.* Ulcers and Wounds (*ἔλκη καὶ τραύμα*) are sometimes used promiscuously, and that in the same Chapter. It is, also, added, in the Definition, that it is a bloody Solution of Continuity: For if the Wound is so small that no red Blood is discharged, it hardly deserves Consideration, since the Skin can scarcely be pricked with the Point of a Pin, without producing an Effusion of some Blood. It is, also, added, that it is a Solution of Continuity in a soft Part, in order to distinguish it from a Separation or Division in the Bones, by Fracture or Fissure. And, lastly, in order to distinguish it from a Contusion, it is added, that the Solution of Continuity is made by a hard and sharp Body, which, in a small Surface, impresses its Motion on any Part of the Body: But an hard and sharp Body cannot separate the Cohesion of the Parts, unless, by Motion, or Pressure, it is apply'd to the cohering Parts, or unless the Parts of the Body are moved or pressed to the hard and sharp, and at the same time resisting Body: For it is sufficiently obvious, that the Effect must be the same, whether the Lancet is apply'd to the Arm, or the Arm to the Lancet.

Therefore the sensible Cause of a Wound is, the Hardness, Sharpness, and Motion, or Resistance of the wounding Instrument.

These Things are sufficiently obvious: For, unless the wounding Instrument was hard, it could not overcome the Force by which the Parts mutually cohere; and unless it was sharp, it would make a Contusion, instead of a Wound.

The Subject is any soft Part; and therefore, consequently, the Texture of the sanguiferous, serous, lymphatic, adipose, nervous, membranous, and tendinous Vessels, and the Canals formed of them.

It is obvious, from the Definition, that the Subject of a Wound is a soft Part; but modern Anatomy evinces, that the soft Parts of the human Body are a mere Congeries or Texture of Vessels: Hence there can be no Wound without a Division of many Vessels, and that of different Series: For no sanguiferous Artery can be divided, without the Vessels almost of all Kinds, being injur'd; for the Coats of this Artery consist of other smaller Vessels, whose Coats are, also, made up of other still smaller Vessels, and so on, till we arrive at the smallest. Hence, by a simple Wound of a sanguiferous Artery, the serous and lymphatic Vessels are wounded, as, also, the Follicles which yield that lubricating Substance, with which the internal Sides of the larger Arteries appear anointed: The Membranes, also, and muscular Fibres, constituting the muscular Coat of the Artery, are wounded.

Hence it is obvious, that, by a very slight Wound, all the Parts, enumerated in this Aphorism, may be wounded:

In this Subject the Cause already mentioned, produces a Separation of the coherent Parts, and an Effusion of the contained Liquid.

Since,

Since, therefore, there can be no Separation of Cohesion in a soft Part, without many Vessels being wounded, it is sufficiently obvious, that every Wound must produce a double Effect; for it separates the solid Parts before mutually cohering, and then it brings from the wounded Vessels that Fluid which was in them at the Moment they were wounded; as, also, that which by the Laws of Circulation, must soon be conveyed to the wounded Part through the divided Vessels. But since it is obvious, from the preceding Aphorism, that all Kinds of Vessels may be injured by a Wound; so it evidently appears, that all Kinds of Fluids may be discharged from the wounded Vessels.

Hence those Actions are injured, which depend upon the Cohesion of the Parts, and a determined Circulation of Liquids through the Vessels.

The entire human Body consists of Solids and Fluids. No Wound can be conceived, which does not destroy the Cohesion of the solid Parts, and interrupt the Circulation of the Humours through the divided Vessels: But all the Functions of the human Body depend on the Soundness of the solid Parts, and the due Motion of the Fluids through the Vessels. Hence there can be no Wound but what injures, at least, some Functions. Thus, that the Fingers of the Hand may be moved at Pleasure, the *Musculus Profundus*, and *Sublimis*, by which this Motion is performed, must be sound; now if by a Wound the Tendons of these Muscles are divided, the Motion depending on the Soundness of these Parts is of course destroyed.

In Physiology it is shewn, that, among other Things requisite to the Action of any Muscle, it is necessary there should be a free Influx of the Spirits through the Nerves: Now if the Nerve distributed to the Muscle should be divided, the usual Influx of the nervous Fluid into the Muscle is hindered, and its Action destroyed.

Those Wounds, therefore, are mortal, which are inflicted in those Parts whose Cohesion is inseparable from Life.

A mortal Wound is such as produces Death as its necessary Effect; but Death is present, when the Influx of the Blood into the Heart, and its Expulsion from it, are hindered: But that these two Effects may be produced, the Soundness of many other Parts is requisite. Every Wound, therefore, which destroys the Things requisite to the free Influx of the Blood into the Heart, and its Expulsion from it, must, of its own Nature, be mortal. The Characteristics of mortal Wounds, and in what Parts they are afflicted, shall be hereafter specified.

Some of these Wounds induce inevitable Death.

All those Wounds which by their Effects induce Death, agree in this, that they destroy the Reception of the Blood into the Heart, and its Expulsion thence: But there is, however, a considerable Difference between mortal Wounds; for some are inevitably mortal; so that though the Wounds are accurately understood, and the Parts wounded thoroughly known, no Attempts of Art hitherto known, can prevent Death from succeeding them, as the Effect does its Cause: Thus, for Instance, if by a two-edged Sword, thrust into a Man's Thorax, a large Wound is made in that Part of the Aorta where it emerges from the Pericardium, all the Blood discharged from the Left Ventricle of the Heart will flow through this Wound, and either be accumulated in the Cavity of the Thorax, or flow through the external Wound, but can never return through the Veins to the Right Ventricle of the Heart; whence inevitable Death ensues. Nor can this be by any Art prevented; for there is no Access to the Heart for applying Ligature, or Suture: And though this could be done, which, however, is impossible, the Aorta being ty'd, the Left Ventricle of the Heart could not empty itself. Hence the Circulation of the Blood, on which Life depends, would be suffocated.

But if after the Aorta is divided into two Branches distributed to each Thigh and Leg, it is wounded in any of these Branches, the Wound will, indeed, of itself, be mortal, because all the Blood will be discharged from this divided Artery; but yet it will not be inevitably mortal, because, by means of a Tourniquet, or Bandage, the Artery may be so compressed, as to emit no Blood, after which, it may be ty'd.

In the Reports given in by Physicians to Judges, these Circumstances ought carefully to be adverted to, and distinguish'd.

Others, if left to themselves, are mortal; but, by the Help of Art, may be so amended, as to remove the Danger of Death.

All the large Arteries distributed through the Limbs may, if wounded, discharge the Blood in such a manner, as to prove

mortal: Hence a Wound in such an Artery is, indeed, mortal; but, by Art, may be hindered from producing Death, as its Consequence. Hence it is obvious, that Physicians and Surgeons, who treat Wounds, and make Reports concerning them to Judges, ought to know the Directions and Distributions of the larger Vessels, and those Parts in which they may be most commodiously compressed, in order to prevent Death from the subsequent Hæmorrhage.

Yet, through Neglect, or Error, Wounds, in themselves not mortal, may be rendered so.

This most frequently happens to those who least deserve it; that is, to Soldiers in the Field of Battle. Many wounded Men have died of Hæmorrhages, which might have been stopp'd by a skilful Surgeon. Many have, also, dy'd by an Extravasation of Blood under the Cranium, who might have been preserved by a seasonable Use of the Trepan. A strong Contusion of the external Integuments of the Cranium, accompanied with a very small Wound, has, when neglected, often produc'd the most terrible Symptoms, and even Death; all which might have been prevented, if a proper Method of Cure had been pursued. Numberless Instances of this occur in practical Authors.

Not only Neglect, but, also, Errors in Practice, often render Wounds, of themselves not mortal, fatal to the Patient. Persons rarely die of Hæmorrhages, unless the large Arteries are divided; but those who suffer a great Loss of Blood, fall into a Deliquium, and then the Hæmorrhage stops: If they are thus left half dead, as it were, in a moderately hot Place, give them only small Quantities of Flesh-broths, at different times; and by this means drooping Life may be supported, till the divided Vessel contracts itself, and is even often consolidated. Thus many have been preserved, whose Death seem'd unavoidable.

But those who endeavour to recover those who have fallen into Deliquiums, in consequence of violent Hæmorrhages by spirituous Liquors, do not restore the lost Quantity of Fluids, but increase the Action of the Vessels upon the Liquids; by which means another Loss of Blood is produced, and the Cause of Death augmented. Many, after Engagements, being left for whole Days among the Carcasses of the Slain, with almost their whole Blood exhausted, have, however, afterwards revived.

Some Chymists inform us, that Arsenic, fixed with Nitre, is an excellent Remedy for stopping Hæmorrhages; but the Application of such a virulent and poisonous Remedy to a crude Wound, is highly dangerous; since the smallest Portion of it, received into the Veins, after violent Convulsions, might prove mortal.

Hence when, by public Authority, the Carcasses of wounded Persons are inspected, it ought first to be enquired whether the Wound is such as that Death must necessarily ensue; or whether by Surgery, as now known, Death might have been prevented; and then, whether the Death, succeeding the Wound, is to be ascribed to that Wound, or to other Causes.

The Effects of Wounds are various according to the Variety of Actions exercised, whilst the wounded Part was entire; and hence various Appellations of Wounds arise, which are readily distinguish'd by the Physician who is acquainted with those Actions during Health.

As many different Parts of the human Body as may be hurt by a Wound, so many distinct Functions may be injured, the Soundness of which depended on the Cohesion of the Parts divided by the Wound: But the Person who, from the high Improvements of Anatomy and Physiology, knows the various Uses of the several Parts of the Body, can, from a Knowledge of the Part wounded, determine the Injury which must succeed the Wound. Thus, when the Tendon of a Muscle is divided, it is obvious, that the Action of such a Muscle which depended on the Soundness of the Tendon, must be destroyed: Hence it is obvious, that there is a great Variety of Wounds, as to the Effects they produce in different Parts of the Body.

Nor is there a less Variety of Names, Forms, and Effects, in Wounds arising from the Diversity of the wounding Cause, with respect to its Figure, and Method of acting, whether by Puncture, Cutting, Striking, or Agitation; as, also, with respect to the Force with which it is applied, its Removal from the Wound, its remaining in it, and its poisonous Infection.

In this Aphorism are considered the Diversities of Wounds, so far as they depend on the wounding Instrument.

As for the Figure; if the Instrument be of a conical acute Figure, there will be a Puncture, which soon closes; in which Case,

Case, it is difficult to know the Deepness of the Wound: But if the Instrument is of the Figure of an acute Wedge, a Scissure will be produced.

As for its Method of acting, whether by Puncture, or Cutting; from these Circumstances arise a great Variety of Wounds; for, by Puncture, a narrow, though often a deeply-penetrating Wound, is produced: Whereas, when an Instrument, of the Form of an acute Wedge, is drawn through the soft Parts, then long tho' less deep Wounds are form'd.

As for Striking; in this Case the wounding Instrument penetrates with the greater Force, and is driven the deeper; and, unless it is very sharp, it may, at the same time, make a Contusion.

As for Agitation; it is to be observed, that, when a Wound is inflicted with a full-extended Arm, the Sword often passes without doing any great Harm between Parts a Wound in which would be very dangerous; but if the Sword, remaining in the Wound, is agitated and twisted about in it, far more Parts are injur'd; but this is to be learned from the Figure of the Wound: For if the Bulk of the Wound corresponds to that of the wounding Instrument, it has only been inflicted with a direct Thrust: But if, with a broad Sword, the Wound is made round, it is a Sign, that the Sword has been twisted about in it.

As for the Force of impinging, according to the different Degrees of Impetuosity with which the wounding Instrument is apply'd to the Body, the Wound will penetrate more or less deep.

As for removing the Instrument from the Wound, or leaving it in it; in the most violent Wounds it is sometimes expedient to leave the Instrument in the Wound, since the Parts wounded often so embrace the Instrument, as to prevent an Hæmorrhage, which, when the Instrument is withdrawn, often proves instantly mortal. By this means, Life is at least preserved for some time. Thus Virgil, in his *Æneid*, Lib. 10. when representing the Death of Pallas by Turnus, expresses himself in the following beautiful manner:

*Ille rapit calidum frustra de vulnere telum,
Una eademque via sanguisque animusque sequuntur.*

When the implacable Achilles is, in the 22d Book of Homer's *Iliad*, represented as having plunged a Spear in the Neck of Hector, he is said to leave the Instrument in the Wound, that he might have an Opportunity of insulting him in the Agonies of Death; but Hector expired as soon as the Spear was withdrawn.

This Diversity of Wounds principally happens from this Cause; when the Instrument is barb'd, or hook'd, so that it cannot be extracted without great Laceration.

As for the poisonous Infection; surprising Experiments evince, that there are some Substances, which, tho' they may be safely swallowed, yet prove infallibly and suddenly mortal; when apply'd to Wounds. In the Bites of Vipers, the venomous Juice, convey'd into the Wound by the Teeth of the Animal, infallibly kills Men, larger Animals, Hens, and Pigeons. When, at the Desire of the great Duke of Tuscany, Men of Learning were inquiring into the Nature of the Venom of the Viper, and with the Antients and some of the Moderns, asserted that it was lodged in the Bile of the Animal, a bold Viper-catcher convinced them of their Mistake; for he courageously drank the Bile, mix'd with half a Glass of cold Water, and sustain'd no Injury by doing so: Nor did the Viper's Gall, exhibited to various Species of Animals, do them any Harm; nor, when dropt into a recent Wound, did it produce any bad Effects. *Franc. Redi Observat. de Viperis.*

Others think it more probable, that the Poison of Vipers is lodg'd in the *Loculi*, or Bags, adjacent to their Teeth; in which there is a Liquor, in Colour and Taste resembling Oil of Almonds; and, when the Viper bites, the Jaws being compressed, this Liquor is necessarily infused into the Wound. But tho' the Poison, convey'd into the Wound by the Viper's Bite, produced such terrible Effects, the same Viper-catcher who drank the Bile, did not hesitate to drink the Liquor expressed from the *Loculi* of an angry Viper, and all the Foam and Saliva in its Mouth, after having diluted them in Wine, without sustaining any Injury. Neither did this Liquor and Foam produce any bad Effects, when exhibited to other Animals. *Redi.*

The Spears of the Inhabitants of Bantam, which, by a very slight Wound, prove mortal, when infused in Wine, or any other Liquor, for many Days, conveyed no malignant or poisonous Quality to the Liquor in which they had so long remained. *Redi.*

When the valiant Cato led his Army thro' the parched Libyan Deserts, his thirsty Soldiers would not venture to drink of a certain Fountain, on account of the great Number of Serpents it

contain'd; but their sagacious General persuaded them to drink boldly, and encouraged them, by his own Example, to do so. *Lucan. Pharsal. Lib. 9.*

If a Thread, wet with Oil of Tobacco, is, by means of a Needle, pass'd thro' any Part of a live Animal, such an Animal soon dies. In this manner was a Viper killed, in less than half a quarter of an Hour, by Redi; who, nevertheless, found, that the same Degrees of Malignity were not in the Oils obtained from all the Species of Tobacco.

When, therefore, there are anomalous Symptoms, which we cannot suspect to arise from the Wound, as their Cause, we are then to consider whether they arise from the venomous Infection of the wounding Instrument.

All these again vary; with respect to the Difference of the Part receiving the Wound, as to its Hardness, Softness, Connexion, Situation, Effect, contain'd Liquid, and Alteration.

In the two preceding Aphorisms are enumerated the Diversities of Wounds, as far as they depend on the Functions injur'd by the Wound; as, also, those Differences which depend on the Diversity of the wounding Cause: But in this are considered those Varieties of Wounds which arise from the different Natures of the wounded Parts.

As for the Hardness or Softness of the Part; a wounding Instrument will, with a small Force, penetrate the soft Integuments of the Abdomen; but it will require a far stronger Impetus, or Application, to divide the Cranium.

As for the Connexion of the wounded Part with others; when the Tendon of a Muscle is divided, the Motion of that Part to which it was naturally united, is lost; and this is accounted the Effect of the Wound. When a small Artery, remaining in the Socket after the Extirpation of a Tooth, discharges so much Blood as almost to prove mortal, this does not happen because so small an arterial Ramification is hurt, but because, being fix'd to the bony Surface of the Socket, it cannot contract itself; and by that means be closed. When, in the Flexure of the Cubit, by rash and unskilful Venesection, the *Aponeurosis* arising from the tendinous Part of the Biceps Muscle is hurt, the terrible Symptoms which ensue do not depend upon such a slight Wound, but upon the Connexion of that tendinous Expansion with other Parts.

As for the Situation of the Part; if only a small Ramification of the intercostal Arteries is so wounded; that the *Pleura* being, at the same time, perforated, the Blood flows into the Cavity of the Breast, the Lungs may, by the Corruption of the extravasated Blood, be inflamed and suppurated, and a mortal Consumption brought on, only because that Artery is so situated as that it can discharge Blood into the Cavity of the Breast. For, in other Parts of the Body, larger arterial Ramifications may be cut without Danger. A Wound in the internal Part of the Thigh is, on account of the large Vessels situated there, far more dangerous than an equal Wound in its external Part.

As for the Effect; many Parts of the human Body are of such a Nature, that, when they are injured by a Wound, or any other Cause, the Functions of other Parts are, also, disturbed; but Anatomists have not as yet found a Reason why, when the former are hurt, the Actions of the latter should be disorder'd. Thus, for Instance; after several Fits of the Colic, or Iliac Passion; there arises, in the *Colica Picro-mum*, a Palsy of the Arms, and frequently, if the Disorder proceeds, a true *Marasmus* of the superior Limbs. But no one, from the known Structure of the Parts, can account for such a Phenomenon. In the *Mémoires de l'Acad. des Sciences*, l'An. 1727. we are inform'd, that, after Wounds of the Abdomen, in which some Nerves of the Mesentery were cut, the Patient was subjected to intolerable Pains, and died; but, upon opening the Body, neither the large Vessels were found cut, nor any of the Viscera wounded: Upon cutting in a Dog the intercostal Nerve, and the eighth Pair, which, in that Animal, are included in one Vagina, or Covering, it appeared, that the Dog's Eye, on the same Side, was darkened; became less, and was inflamed; and, by repeated Experiments, it was evinced, that the Eyes are always sensibly changed, by that means. But this could not be accounted for from the Structure of the Parts, tho' it was confirmed by the Effects succeeding the Wound. Hence it is obvious, that there is a great Diversity of Wounds arising from the Effects which are observ'd to be produc'd by the wounded Part in other Parts of the Body. But an Observation of the Fact often informs us of such Events; when, from the known Structure of the Parts, we could not have demonstrated, that such Phenomena were to be apprehended.

As for the Liquids contained in the Part wounded; if the Gall-bladder, being wounded, discharges the Bile into the Cavity of the Abdomen, this Bile, becoming putrid, will soon produce

produce terrible Symptoms. If the Ureters should be cut, the Urine discharged from the Wound, will be accumulated in the Abdomen, and becoming corrupted may render all the abdominal Viscera putrid.

As for a Change or Alteration in the Appearance of the Parts; the Parts of the Body hurt by a Wound may, more or less, so degenerate from their natural Conformation, and by that means have their external Appearance surprisingly chang'd.

When the Muscles of one of the Sides of the Face become paralytic, there is a surprising Distortion on the opposite Side; because the Muscles, destitute of the *Æquilibrium* of their antagonist Muscles, retract the Parts of the Face. It is sufficiently obvious, that the like Effect may be produced by Wounds, when some Muscles of the Face, or other Parts, are hurt; or when the Nerves distributed to these Muscles are cut or divided.

As it is necessary to be acquainted with the Origin of this Multiplicity, so a subtle Distinction of Names is of no great Use.

It is not to be doubted, but Physicians and Surgeons, who undertake the Cure of Wounds, ought carefully to attend to what has been said in the three preceding Aphorisms; for upon these depend the Diagnostics and Prognostics of Wounds, which can be placed on no sure Foundation but that of a Knowledge of the Structure and Use of the Parts: For when we know the wounding Instrument, together with the Manner and Force with which it was applied, when we consider the Nature of the Part wounded, and know its natural Uses injured by the Wound, we foresee what is to be dreaded, and understand how far Art can remove the Misfortunes which have already happened, or prevent such as are to be expected. But it seems difficult by various Names so to specify the numerous Diversities of Wounds, that the Word affixed to each shall convey a distinct Idea of it to the Mind; and still more difficult so to impress these Ideas and Words in the Memory, as that they may be of Use. Thus *Paré*, that he might give the Differences of Wounds, has prefixed a whole Table to his Treatise on Wounds: But a Person who attentively considers, will easily see that these are not of great Use; and that the general Knowledge of those Things on which the so great Diversity of Wounds depends, is sufficient.

If, in an healthy and robust Body, a Wound is made in a visible Place, not irrigated by any large Artery, and not too tendinous, the following Phenomena arise, provided the Orifice of the Wound is defended from the Cold, from Air, and Exsiccation.

That something certain may be established, with respect to the Cure of Wounds, it is necessary to premise those Phenomena, which are observed to happen from the time in which the Wound was inflicted, till it is perfectly consolidated; and, when these are pointed out, in the Order in which they succeed each other, they afford an evident Knowledge of the Method used by Nature in restoring Parts separated by a Wound, to their former Cohesion.

In order, therefore, to avoid all Error and Confusion, we shall only here consider a Wound alone, and suppose the Body of the wounded Person in perfect Health in every other respect; otherwise the Phenomena observed would not be justly ascribed to the Wound alone, but might, in some measure, depend upon a Disease accompanying the Wound; for quite other Changes appear in a Wound when the Body of the Patient labours under a scorbutic, venereal, or rachitic Cacochymy: Besides, the Body is supposed robust; for in weak Habits the languid Circulation conveys the Humours to the Wound with a smaller Impetus: Hence, in such a Patient, the Pain, Heat, and Tension, are far less about the Lips of the Wound, than they are in an equal Wound inflicted on a strong, robust, and vigorous Person.

Besides, all these Things ought to be obvious to the Senses: Hence, in the external Parts of the Body, the Phenomena of Wounds are principally observable; and from a Sight of these we learn what happens in the internal Parts of the Body, when wounded. For this Reason it is, also, supposed, that no large arterial Vessel is wounded; for in this Case, the violent Effusion of Blood would hinder all the Phenomena from being accurately viewed.

It is, also, added, that a Wound ought not to be in a tendinous Place; for if the Tendon of any Muscle is wounded, and not entirely cut thro', the Muscle affixed to such a Tendon may, by drawing the wounded Tendon, produce terrible Symptoms, which do not so much depend on the Wound, as on the Muscle drawing the wounded Tendon. But we shall hereafter

describe those Symptoms which arise from a Division of large Arteries or Tendons by means of a Wound.

Besides, an Admission of the Air, especially when Cold, surprisingly changes the wounded Parts, and injures and dries the tender Vessels. Thus if, by a Wound, the *Cranium* is denuded, and the Bone exposed to the free Air for a considerable time, such a Wound will hardly be cured till there is a Separation of the bony *Lamina*, by Exfoliation. But this Circumstance does not depend upon the Wound: For if the denuded Bone had been immediately defended from the Air, such an Exfoliation would not have happened.

Under these Conditions, then, are enumerated, the Phenomena proper to Wounds alone, in the following Numbers:

1. The Parts between which the wounding Cause is forced, recede by degrees more and more from each other, tho' the Cause is removed, unless the Puncture is very small.

As soon as the wounding Instrument has divided the Cohesion of the Parts, the Distance of the Parts separated is equal to the Thickness of the Instrument: Hence, when the public Executioner, with a sharp Razor, flits the Face of Malefactors, there only appears, at first, a red Line; but, gradually, the Lips of the Wound recede from each other, so as frequently, in a few Hours, to be the Breadth of a geometrical Line distant from each other: For that Force by which the solid Parts cohere, proceeding to act, retracts the divided Lips; because in the Place where the Wound is, the Cohesion of the Parts is destroyed.

As for the Smallness of the Puncture; whilst a wounding Instrument by Puncture makes a small Wound, as soon as it has penetrated the Skin, and wounded the subjacent *Tunica Cellulosa*, unless the Patient's Body is much extenuated, the Wound appears very inconsiderable, or none at all; because the *Tunica Cellulosa*, by the Pressure of the Skin, in the adjacent Parts, immediately rises in the Wound, and closes it. Hence, when corpulent Persons are blooded, the Discharge of the Blood is often suddenly stopt by the Fat obstructing the Orifice of the Skin.

2. At first the Blood flows from a Wound with Impetuosity, but, by degrees, stops spontaneously.

If a great Artery is not wounded, nor such a one as, being affixed to a Bone, cannot retract, and close itself, the first Moment the Wound is received, the divided Vessels discharge the Blood with Impetuosity; but soon after, their Orifices being by their own Elasticity contracted, and concealed within the Lips of the Wound, the Hæmorrhage is quickly diminish'd, and at last ceases spontaneously. This evidently appears in Cutting for the Stone; in which Operation, when by a pretty large Wound the Skin and subjacent Parts are divided, an Ounce or two of Blood are discharged; but unless, by some unlucky Accident, a large Artery is wounded, the Hæmorrhage, which would otherwise greatly disturb the Operation, soon after ceases almost totally; for almost all the Blood evacuated from the Wound is discharged from the Arteries; for pretty large Veins, when divided, discharge but a small Quantity of Blood, unless there is some Obstacle placed between the Heart and the Wound, inflicted in the Vein: But the Arteries, by their Elasticity, easily contract themselves; by which means, the Blood is soon stopt.

3. Then a sanguineous Crust is formed in the Cavity of the Wound.

Since, then, as we have now observed, arterial Blood is almost only discharged from a Wound; and since such Blood, when extravasated, in the soundest and most robust Person, is naturally soon coagulated; hence, as soon as the Impetus of the discharged Blood begins to cease, such a *Coagulum* of the Blood is formed, generally called a *Thrombus*, or bloody Eschar, which adhering to the Lips of the Wound, perfectly covers its whole Surface. Thus Wounds are covered and defended by the exquisite and salutary Effort of Nature; and under this Covering, the Parts separated by the Wound are gradually consolidated: And because this *Thrombus* is, by the Heat of the Body, and the contiguous Air, more and more dried, there is a pretty hard Covering thus formed, which after the Cure of the Wound spontaneously falls off.

4. A diluted redish thin Liquor flows from it.

When this *Thrombus* begins to be formed, or when it is removed, after its Formation, Blood is not generally discharged, but only a thin Liquor tinged with a faint-red Colour, and resembling the Washings of new-killed Flesh. This seems to happen

happen because the Vessels destined for the Conveyance of the red Blood being divided, but gradually contracting, their Orifices discharge but little red Blood, whilst a greater Quantity of a thinner Fluid, which is not red, is evacuated from them.

5. Then the Lips of the Wound begin to be red, preternaturally hot, painful, tumid, and retorted, whilst the Bottom of the Wound becomes tumid and prominent. But especially the Fat rises into the Aperture of the Wound, and there soon degenerates.

When the divided Vessels by their proper Elasticity contract their Orifices, and are almost entirely closed, the Humours which used to flow through those Vessels, are stoppt: Hence there arises an Obstruction about the Lips of the Wound, and the Impetus of the succeeding vital Humours forcing the Fluids into the obstructed Vessels, dilates them near the obstructed Place; and hence arises a true Inflammation. For this Reason on the second and third Day the Lips of the Wound become red, whilst greater Heat and Tumor, the Concomitants of an Inflammation, appear. And if all these Symptoms are moderate, they prognosticate nothing bad, since they naturally happen in all Wounds. This is the Reason why a recent Wound is hardly accompanied with any Pain, but especially on the third Day, or sometimes sooner, an Inflammation arising, and the wounded Parts becoming tumid, a very considerable Pain is often perceived in the Wound.

Hence *Hippocrates*, in *Epidem. Lib. 2.* tells us, "That when severe Wounds are inflicted, if a Tumor does not succeed, it is a very bad Sign." The same is affirmed in *Aph. 66. and 67. Sect. 5.* where he observes, "That soft Tumors are good, but such as are crude, bad." For if no Tumor arises about the Lips of the Wound, it denotes that the vital Force is defective, and if the Tumor is excessive, the violent Inflammation lays a Foundation for dreading a bad Event.

The same Author, in his *Treatise de Fracturis*, not only observes, but lays it down as one of the most important Rules in Surgery, "That on the third and fourth Days, Wounds are by no means to be disturbed; and that we are at this time to abstain from all Searches by the Probe, and from every thing which is capable of irritating Wounds; for in general, most Wounds take a considerable Turn, and grow troublesome on the third or fourth Day."

For the like Reason, in the same *Treatise*, he advises, that when a fractured Bone sticks through the Skin, it is to be reduced on the same or following Day; but not on the third, and by no means on the fourth and fifth.

Thus *Simeon*, and *Levi*, the crafty Sons of *Jacob*, in order to revenge the Affront given them by *Sechem* the Son of *Hamor*, in despoiling their Sister *Dinah*, persuaded the the unwary *Hamorites* to submit to Circumcision; and on the third Day, their Wounds being so excessively painful, that they could make no Resistance, they slew them all both with Ease and Impunity.

As for the Retorsion of the Lips of the Wound, and the tumid prominent State of its Bottom: The *Membrana Adiposa* subjacent to the Skin is easily distended, and rendered tumid, as is obvious in fat and dropical Persons, and in an *Emphysema*, in which the Air entering the *Membrana Adiposa*, produces so surprising Expansions thereof. But the Skin covering the *Membrana Adiposa*, confines it very strongly; hence, when the Skin is divided by a Wound, the Lips of this Wound gradually recede from each other; and the *Membrana Adiposa*, which in the Place of the Wound is free from the equable Pressure of the Skin, soon rises and swells. Hence the Skin being on both Sides retracted from the protuberant *Membrana Adiposa*, the Lips of the Wound are retorted, and, in its Bottom, a tumid Prominence appears. But if the Impetus of the Fluids distending the Vessels remains the same, whilst the Causes resisting this Distension are lessened, the Largeness of the Vessels will be augmented. When, therefore, the Resistance of the Skin in a Wound is removed, the *Membrana Adiposa* rising in the Wound, will be more dilated, and grow out into what the Surgeons call *fungous Flesh*, and consequently degenerate very soon.

6. And, at the same time, a slight Fever, accompanied with Thirst and Heat, is excited.

This only happens when the Wound is considerably large; for in a small Wound these Symptoms are not generally observed; for as soon as the Symptoms enumerated in the preceding Number arise, a greater Heat is excited, not only in the Wound, but, also, in the whole Body, the Pulse becomes quicker, the Patient is afflicted with Inquietudes, and turbu-

lent Dreams; his Thirst is, also, increased, and his Urine more red than before. But all these Symptoms last as long as the Tumor, Pain, Heat, and Retorsion of the Lips of the Wound are present; and when these cease, the other terminate. Such a slight Fever happening to wounded Persons in this Stage of their Misfortune, is so far from being injurious, that it is beneficial, since by its means the Pus is formed, after which it generally ceases. In cutting for the Stone, the Extirpation of a Breast, or other Wounds of a like Nature, the Presence of such a Fever at the time specified, is always a good Sign.

Hence *Hippocrates*, in *Aph. 47. Sect. 2.* observes, "that during the Generation of Pus, Pains, and Fevers more readily happen, than when it is formed."

But here we only speak of such a Fever as at this time arises from the Wound as its Cause; for a Fever may happen to wounded Persons from various other Causes: Thus in large Wounds a copious Pus already formed, and in some measure reformed by the bibulous Veins, often induces an hectic Fever, which preys upon the Body.

7. Hence about the third or fourth Day, sooner or later, a tenacious, white, pinguious, equal Liquor, called *Pus*, is formed in the Wound.

When a Wound is inflicted, the Blood is immediately discharged; and afterwards, when the divided Vessels are more constricted, a redish Ichor. Then arises an Inflammation of the Wound with the Symptoms described. Then begins to appear in the Wound an unctuous Liquor, almost of the Consistence of fresh Cream, somewhat yellowish, entirely equable, without Smell, and of a mild Taste, almost like that of Chyle: This Liquor is called *Pus*, which if laudable, has all the now enumerated Qualifications. But such a Pus is never formed unless the Wound is covered; but a Pus of this Kind is generated under a Thrombus arising in the Wound, or a Plaster covering it. Hence Pus is not formed in the Vessels, but in the Wound, by the extravasated Humours cherished and changed by the Heat of the Body; for if all the Pus in a Wound is wiped away with soft Lint, about an Hour after the Surface of the Wound will every-where appear moist with a thin Liquor, which is not Pus. But if for twenty-four Hours the Wound is covered with a Plaster, the Pus will appear upon removing this Plaster. Hence Pus is formed out of the Vessels; but the Matter of which it is formed, is conveyed thro' the Vessels.

But Pus thus formed in a Wound produces happy Effects; for Nature uses this Method to disengage and separate from the live and sound Parts such as are mangled and half lacerated, and the inflamed Extremities of the Vessels, together with the infarcted Liquids lodged in the Lips and Bottom of the Wound. Besides under this Pus, when formed, all the lost Parts grow up afresh.

Hippocrates, who strictly followed Nature, in the Beginning of his *Treatise de Ulceribus*, tells us, that recent Wounds [*ἑλκεα νεότιστα*, which Words seem rather applicable to Wounds than Ulcers] and the Parts adjacent to them were not inflamed, if a Suppuration was speedily brought on. He afterwards adds, that a Wound inflicted with an acute Instrument, may be cured without a Suppuration; but that contused and mangled Flesh became putrid, and being converted into Pus, was consumed, after which new Flesh must necessarily be generated.

In the same Place he tells us, that Wounds are inflamed when they tend to a Suppuration; but they suppurate by such a Change and Heat of the Blood, as renders their Pus putrid. But by Putrefaction, he does not here seem to mean a malignant and truly putrid Degeneracy of the Humours, but only that Change of their State by which they are transformed into Pus, as is obvious to every one who reads the Passage attentively.

Hence laudable Pus is by Surgeons reckoned the best of Signs. And *Galen*, in *Com. Aph. 22. Sect. 5.* does not hesitate to affirm, "that no bad Accident can happen to an Ulcer which generates Pus;" for Pus is formed whilst laudable Humours are with a due Motion conveyed to the Wound; hence it has as its first Cause, the Actions of remaining Health; for in a cacochymic Body good Pus is rarely formed in a Wound, but an Ichor, which greatly degenerates from the Conditions of laudable Pus. Hence in such Patients, Wounds though slight, are not to be cured without the greatest Difficulty. For this Reason the ancient Greek Physicians called such Bodies *δυσανκτα*, that is, Bodies in which Wounds were not cured without great Difficulty. And *Hippocrates*, in *Aph. 8. Sect. 6.* tells us, "that Ulcers arising in the Bodies of dropical Patients are not easily cured." If, in consequence of a violent Fever, the Humours are moved with a great Impetus, the Wound appears dry without any Pus: If, on the contrary, the Strength

of Nature is languid, there is, also, a Defect of Pus. For this Reason Hippocrates, in *Pregnst.* reckons the Dryness of an Ulcer among the Signs of approaching Death.

8. At this time the Redness, Heat, Tumour, Pain, Retorsion of the Lips, and Fever, cease, or are diminished:

For all these Symptoms only arise, because the divided Vessels in the Lips of the Wound being contracted by their Elasticity, deny a free Passage to the Fluids convey'd to them. Hence arises a true Inflammation which brings on Redness, Pain, and Heat in the Part. The Membrana Adiposa in the mean time, free from the equable Pressure of the Skin, receives into its dilated Vessels foreign Humours, by which means it becomes tumid in the Bottom of the Wound, and retorts its Lips. But a Suppuration separates the obstructed Extremities of the Vessels, together with the stagnant Fluids lodged there. Hence, when Pus is formed, and the obstructed Vessels are again rendered pervious, a free Circulation of the Humours thro' them is restored. All these Symptoms, therefore, arising from an Inflammation of the Lips and Bottom of the Wound, are necessarily much diminished, or totally removed, by the Formation of Pus.

This Stage of a Wound is by Surgeons generally called the *Time of Digestion*; and when they see the tumid Parts subside, they generally say, that *the Pus fuses, and dissolves all the Parts.*

9. And the Cavity of the Wound, from the Bottom to the Top, from the Circumference to the Centre, is gradually filled with a new red live Matter called *Flesh*, whilst the Margins, becoming white, bluish, soft, and equal, are united.

When after a laudable Digestion, all the Parts which could not be reduced to their requisite Soundness, are separated from the live Vessels, then the Wound is said to be *pure*; and its whole Surface appears every-where equably moist and perspirable, whilst there is no Roughness nor Dryness either in the Lips or Bottom of the Wound. Then begins that Stage of the Wound in which it is consolidated; for under the Pus, which is a natural and mild Balsam, we daily observe the Bottom of the Wound to rise gradually, and a new Matter to proceed equably from the Circumference to the Centre. And when this Matter is viewed with Microscopes, it appears to be the tender and pulposus Extremities of Vessels. This is by Surgeons called *Incarnation*; not that muscular Flesh properly so called, is regenerated in this manner, but it has become customary to call this red and live Matter daily increased in a pure Wound, *Flesh*. This appears beautifully in Wounds with Loss of Substance, whilst, for Instance, by the Stroke of a Sword, the Skin, with a Part of the subjacent Membrana Adiposa, is carried off; for in this Case there naturally appears, first, in the Bottom of the Wound, a Congeries of sprouting Vessels; then the like Vessels are protruded from the Margins, and concurring and uniting with the others rising from the Bottom, by an admirable Artifice of Nature, restore the lost Substance; for in this Case, Art does nothing but remove Impediments, and prevent the Access of the Air, by covering the Wound; the natural Fabric of the Body performs all the rest. That these things happen in this manner is sufficiently certain; but by what Laws or Mechanism they are brought about, is hitherto unknown. Galen, in *Method. Medend. Lib. 3. Cap. 3.* beautifully expresses this in the following manner: "With respect to the Generation of Flesh, it is to be observed, that the Matter of it is laudable Blood; but the Artist, or Author, of its Formation, [*ἐμπνευστὸς τῆς καὶ τεχνητὸς*] Nature." In this Passage he treats of the Method in which a hollow Ulcer ought to be cured. The Antients were, however, ignorant of the admirable Structure of the minute Vessels of which our Bodies are composed. And the Moderns far more skilled in Anatomy, cannot help admiring how the elongated Mouths of the divided Vessels in the Wound, should concur, unite, and be concreted with the adjacent Vessels, and that in such a manner, that Arteries are united to Arteries, Veins to Veins, and Nerves to Nerves; so that a Substance exactly like that which was lost, is formed in the Wound. This peculiar Property of the human Body is loudly expressive of the infinite Wisdom of its all-powerful CREATOR.

Whilst these things happen in a hollow Wound, the Margins which were before red and tumid, begin to subside in an equable manner; they acquire a bluish Pearl-like Colour; and thus the first Rudiments of the Cicatrix are formed about the Margins, and are gradually increased toward the Centre, till the Wound is equably closed.

10. Lastly, the Wound becomes dry, and is covered with a Cicatrix.

When all the lost Parts are restored, and the Parts divided by the Wound, united, the Wound appears dry, though before a certain Moisture was observed all over its Surface.

If a large Quantity of Substance is not lost, nor by an excessive Suppuration much of the Membrana Adiposa and Skin consumed, all the Parts are so consolidated, that there hardly appears any Difference between the Place of the Wound, and the adjacent Skin, in which Case it hardly deserves the Name of a Cicatrix. But where a large Portion of the Skin is taken away, or much of the subjacent Membrana Adiposa consumed by the Suppuration, then the Place of the Wound will appear more white, solid, and often more depressed, than the adjacent Skin. In this Case it is called a *Cicatrix*, which is always less perspirable, tho' more smooth and shining, than the other Parts of the Surface of the Body. This is in a particular manner obvious after the Extirpation of a Breast or large Steatoma, where a considerable Portion of the Skin is removed; for in this Case the Cicatrix formed, or Surface of the Wound is smooth, shining, unmoveable, and adhering to the subjacent Parts.

Thus we have described the History of Wounds in a sound Body, and enumerated all the Phenomena, which from Experience we find to happen in a Wound from its first Infliction to its entire Consolidation. Hence we may deduce the best Method in which Wounds ought to be cured, which is, by imitating Nature's Method, which consists in removing such things as are hurtful, and supplying such as are defective. But it is to be observed, that we here speak of Wounds in which neither a large Artery, nor an highly tendinous Part, are wounded. We must, therefore, next consider, what Changes of Phenomena happen to a simple Wound, if such Parts should be wounded.

If an Artery, not too large, nor too near the Heart, is cut quite through transversely, the divided Parts retiring, and hiding themselves in the neighbouring solid Parts, by means of this Contraction, stop the Efflux of Blood; and the other Phenomena proceed as before described.

Whilst the Blood, by the Force of the Heart, is thrown into the Arteries which always become narrower, by acting on their Sides it removes them from the Axis of the Canal, and consequently increases the Capacity of the Arteries. But all other Circumstances being alike, it dilates the Arteries the more the greater Resistance there is about their Extremities. Hence an Artery when tied becomes very tumid between the Ligature and the Heart. But this Dilatation is resisted by the muscular and orbicular Fibres of the Arteries with a considerable Force, by which they are again contracted into their former Dimension, as soon as the impelling Force of the Heart ceases. When, therefore, an Artery divided by a Wound discharges Blood from its open Orifice, the Resistance of the Blood impelled from the Heart is diminished, and consequently the Cause of the Dilatation of the Artery is lessened. The Force, therefore, of the orbicular Fibres prevails, by which in every Moment the Artery is more contracted, and thus gradually the Orifice of the divided Artery is closed, if it is not excessively large. Besides, the longitudinal Fibres being by the same Causes more contracted, diminish the Length of the Artery: Hence an Artery, entirely divided, shrinks back, and lodging itself between the adjacent solid Parts, is by their Bulk and Weight more compressed and contracted. If a considerable Quantity of Blood is discharged from a Wound, the Strength being impaired, and the Impetus of the impelled Blood diminished, the Contraction of the divided Artery is augmented. When a great Toe was cut off by one Stroke of a Chissel, I saw two Arteries project, perhaps the Length of a geometrical Line beyond the Surface of the Wound; but when they had for a few Minutes discharged the Blood freely, they began to be retracted, the Hæmorrhage was lessened, and two Days after when the Dressing was removed, no Blood was discharged, the Mouths of the divided Arteries being closed up. But if an Artery, which is either very large, or very near the Heart, is divided, the Contraction of such an Artery is not able to resist the Blood impelled with so great a Force; hence the Hæmorrhage proves mortal; for the smaller the Artery is, and the farther distant from the Heart, the Impetus of the Blood impelled from the Heart is the more retarded, because the Resistance it meets with is greater.

If an Artery is wounded transversely, and not cut quite through, the Wound enlarges by a Retraction of the divided Fibres; hence a perpetual Hæmorrhage; and when that ceases, an Aneurism, from the Tenuity of the Cicatrix yielding to the Force of the circulating Fluid.

In this Case, for the Reasons already specified, a Wound inflicted on an Artery is, in consequence of the Recession of the divided Parts, more enlarged. But because some Parts

as yet cohere, the Extremities of the Artery cannot shrink back and lodge themselves in the adjacent Parts; nor can the orbicular Fibres be so contracted as to close the Wound of the Artery. Since, therefore, in this Part there is no Resistance, and a considerable one in the other entire Vessels, such a Wound will continue to discharge Blood till the Patient dies, or falls into a Deliquium. But it more frequently happens, that the Blood is discharged not in such a Degree as to prove mortal, but only to induce a great Weakness. Then there begin to grow gradually on the Part of the wounded Artery, as it were, the Rudiments of a Cicatrix, which are able to check the Effusion of the Blood moved by so weak a Force of the Heart: But afterwards the Strength of the Patient becoming greater, this Part remaining weaker than the other Parts of the Artery, is more dilated, and becomes protuberant. This is called an *Aneurysm*, or a *Dilatation of the Artery*, because the Artery in that Place no longer remains an equable conical Canal, but is distended into a Sack; for as the Largeness of Arteries depends on two Causes, that is, the Force with which the Blood propelled from the Heart endeavours to dilate the Arteries, and the Resistance of the Sides of the Arteries, and consequently as the Largeness of Arteries is in a Ratio compounded of the direct Ratio of the Impetus of the impelled Blood, and an inverse Ratio of the Resistance of their Sides, it is sufficiently obvious than when an Artery is rendered weaker in any Part, it must of course be more distended there. But because by such a Distention, such a Part will be still more weakened, the Reason is obvious why such large aneurysmical Tumors, of which we have many Instances in practical Authors, are often formed.

If a large Artery is wounded, and cut quite through, a perpetual Hæmorrhage will arise, till Fainting, or Death, is induced. The Parts below the Wound grow tabid, and are consumed by a putrid but slow Gangrene, or else drying, are entirely contracted.

In this Case the Blood is discharged with a full Stream, tho' not with an equable Celerity, but, as it were, by Starts, sometimes with a small, and immediately after with a greater Force; because at the time the Arteries are in their Diastole, the Force of the Heart alone urging the Blood, then expels it through the open Artery. But a great Part of the Impetus convey'd from the Blood to the Heart, is spent in dilating the Arteries: Hence only in the time of the Diastole of the Arteries, the Blood is propelled with that Excess, by which the Force of the Heart surpasses the Resistance of the Sides of the Arteries. But whilst, when the Action of the Heart ceases the Arteries are compressed, the Blood moves with a far greater Celerity through them, and when evacuated from the Body, is of a scarlet Colour. From these two Signs we know, that the Blood is discharged from an Artery; and not from a Vein. But a large Vein, except in highly plethoric Patients, when wounded, discharges but a small Quantity of Blood, which is always blackish, and less red than arterial Blood. If the Artery wounded is large, and very near the Heart, the Death of the Patient soon ensues, the whole Blood being in a short time expelled from the Wound. But the Effusion often only brings on a Deliquium; and if in this Case, the Patients are not invigorated by Wine, or Cordials, but left, as it were, half dead, there is some Hope, that during the Continuance of such a weak and languid Life, the divided Artery may be contracted and consolidated. *Boerhaave*, in his Prelections, used to give his Auditors a very memorable Instance of this Kind, which he himself saw.

A Countryman over his Bottle was wounded with a Knife under the Axilla; and the axillary Artery being divided, the Blood was discharged with a violent Force: Soon after the Patient falling down was thought to be dead, and was laid out as such. Next Day when the Persons appointed by public Authority to examine Wounds, and give in their Report to the proper Judges with respect to their mortal Nature, came to him, they found some Warmth about his Thorax, without any other Signs of Life. They deferred examining his Wound for some Hours, during which the Patient began gradually to recover, tho' every one imagined that he would soon die. But contrary to all Expectation he totally recovered, after continuing a long time in such a weak and languid Condition; only the Arm of that Side remained all his Life dry, and without Juice, almost like a Mummy. If, therefore, in an Artery so large and so near the Heart a Consolidation could be obtained, it is obvious, that we are not to despair in the most dangerous Wounds of Arteries, and, perhaps, in such Patients, if weak and languid Life was not augmented by stimulating, vinous and cordial Substances, more would be preserved than really are.

If a large Artery, running to the inferior Parts, is divided, and if the Ramifications of no other Artery are distributed to

these Parts, the total Influx of the vital Fluid into them must necessarily be destroyed: This is succeeded by a Mortification of those Parts, which in this Case may happen in a double manner; for either the Fluids contained in the inferior Parts, being no longer propelled by the Impetus of the arterial Blood, become stagnant and corrupted; in which Case a putrid, tho' slow Gangrene happens, because all the vital Impetus which moves the live Parts to these gangrenous Crufts, and consequently soon makes the Disorder spread, is here wanting: Or the Humours left in the inferior Parts, after the Division of a large Artery, by the proper Contraction of the Vessels, and Action of the adjacent Muscles, pass into the Veins, and return to the Heart; from which, however, nothing can be conveyed to these Parts. Hence the Vessels of these Parts being totally destitute of Fluids, collapse, and grow together. And as the most Part of the Bulk of the human Body depends upon Humours, so the Bulk of those Parts is surprisingly diminished, whilst they are dried and totally contracted, as appears in the Instances last-mentioned.

Those Nerves which are large and tense, when cut quite through, recede, and hide themselves, draw and extend their small Branches situated a little above the Wound, excite Pain and Obstruction in the neighbouring Nerves; but to the Parts below the Wound, cause a Stupor, Immobility, Emaciation, or a Gangrene.

We shall now consider those Phenomena which appear when large Nerves are wounded; for no Wound can injure the Skin without dividing numberless nervous Fibrils; but of these we do not treat, for we consider here only the large Nerves as they are demonstrated by Anatomists, and which are so many Congeries of other Nerves contained in a common Covering.

As for the *Recession or Shrinking of the Nerves*; that which in large Nerves may properly be called a *Nerve*, and which arises from the tender Pulp of the Brain does not seem possessed of such a Degree of Strength, as that when divided to be by its Elasticity capable of receding or shrinking back. But the Nerves which arise from the Medulla Oblongata, and Spinal Marrow, and, which at their Origins, are highly soft, are covered with tough Coats, that they may be safely convey'd to these Parts of the Body on which they are to perform their Offices. On these Coats depend the Strength and Elasticity of the Nerves. Hence small nervous Fibrils make a considerable Resistance to the Knife in dissecting Carcasses. And unless it was so, the Demonstration of the Nerves, especially where they are divided into small Ramifications, would be absolutely impossible. When, therefore, a large Nerve is divided, the separated Extremities, by the contractile Force of the Coats covering the Nerves, and of the Vessels distributed through these Coats, recede from each other, and conceal themselves under the adjacent Parts. But the larger a Nerve is, other Circumstances being alike, the thicker its Coats are; and as the small nervous Congeries, which united form the large Nerve, are, also, covered with their proper Coats, hence large Nerves when divided are retracted with great Force.

As for their *drawing and extending their small Branches a little above the Wound*; the Nerves, as well as the Arteries and Veins, are divided into Ramifications; but the Ramifications arising from the Arteries and Veins, every-where communicate with the Cavity of the Trunk whence they arise. Hence the Fluids are by a Continuity of Motion convey'd from the Trunk into the Ramifications. But it is otherwise in large Nerves, which send off smaller Nerves like Ramifications from them; for such a large Nerve contains numberless smaller Congeries of Nerves wrapt up in a common Covering, and these smaller Congeries consist of others still smaller. Nor have the Dexterity and Industry of the most curious Anatomists been hitherto able to find an End of this Division. But from a large Nerve in its Course, are every-where distributed such Congeries of Nerves, which are called *Ramifications of the large Nerve*, not because they are by a Continuation of Substance propagated from it, as in the Arteries and Veins, but because being before united with other similar Congeries, they constituted the Bulk of the large Nerve; but now going off from it, they run to their proper Places in order to perform their Offices. All the Nerves, therefore, which like Ramifications are derived from the large Nerve, are such as they are in that Place where the large Nerve arises from the Medulla Oblongata, or Spinal Marrow. But in the Arteries and Veins, the Ramifications take their Origins from that Part in which they run off from the Trunk of the greater Vessels.

When, therefore, a large nervous Trunk is divided, it by receding will, at the same time, draw with it the small Ramifications arising from it, a little above the Part where the Wound is inflicted. Hence by this violent Distraction of the nervous Fibres, intolerable Pains of the adjacent Parts to which

these Ramifications run, are produced; and hence there is often a more intense Pain in the adjacent, than in the wounded, Part. But that by such a simple Distraction of the nervous Fibres, intolerable Pain may be produced, is certain from numberless Observations. When a Phlegmon distending the Membrana Adiposa, is suppurating, it elevates the Skin, and distracts its Fibres with an intense Pain. But when the Pus is formed, and an Incision made in the Skin with a Lancet, the Pain forthwith ceases, whilst the distending Pus is discharged. An intense Pain is, also, produced by an inflammatory Tumor elevating the tense and nervous Membrane of the Auditory Passage. And in a Lues Venerea, a Tumor sometimes arising in the Substance of the Bone, distracts the Periosteum, and produces a Pain so intense, that the Patients are ready to lay violent Hands on themselves.

Besides, the Coats which cover the large Nerves, and the Ramifications running off from them, consist of numberless small Vessels, as is certain from anatomical Injections. The nervous Ramifications cannot, therefore, be distracted by the divided Trunk receding, but the Coats with which they are covered must, also, be distracted, and consequently the Vessels constituting these Coats, must be elongated. But it is certain that every Cause which distracts and lengthens Vessels, diminishes their Capacity. Hence may arise an Obstruction, and all its Effects.

As for the Stupor of the Part below the Wound; quite different Actions of the Nerves are observed in the human Body; for some give a Power of Sensation to the Parts to which they are distributed; others produce muscular Motion, whilst the Nutrition of the Parts and Life itself seem to depend on others. That these different Actions are performed by different Nerves, is sufficiently evinced by what happens in Diseases; for often Palsies of particular Parts are formed, and sometimes an Hemiplegia, in which one Side of the Body becomes incapable of Motion, and is entirely deprived of voluntary muscular Action, whilst the Sensation, Heat, and Nutrition of the Part affected remains. In this Case there is considerable Hope of a Cure. Sometimes together with a Power of Motion, Sensation is lost, and such a Stupor produced in the Part affected, that it appears no longer to belong to the Body, whilst the Patient perceives Obstacles acting on such a Part, as if he only touched them with a stretched-out Stick. This is a worse State of the Disorder. But when there is a Sense of Cold in a paralytic Part, and its muscular Substance begins to decrease, the Disorder is generally incurable, as is certain from many Examples of Palsies succeeding the Colica Pictonum. Tho' the Nerves subservient to so many different Functions, have distinct Origins in the Brain, yet being collected into large nervous Congeries, they are distributed to the several Parts. When such Nerves are, therefore, entirely divided, all the Functions depending on the Soundness of such Nerves are abolished. Hence arise the Stupor and want of Sensation in the Parts below the Wound, as, also, their Extenuation, and Privation of Motion, unless Ramifications rising from the Trunk above the Wound are distributed to the inferior Parts, or other nervous Trunks send off Ramifications to them.

The Reason will, perhaps, appear less evident, why a Gangrene of the Parts below the Wound often succeeds a total Division of a large Nerve. But a Gangrene is such a Disorder of a soft Part, as after the Cessation of the Influx of the vital Fluid into the Arteries, and its Efflux through the Veins, tends to a Mortification. If, therefore, a Gangrene succeeds the Division of a large Nerve, this vital Influx and Efflux of the Humours must have ceased; the Arteries, however, and Veins, are entire, and the Humours moving in them laudable, whilst the Nerves are only divided. But if it is considered, that the Motion of the Fluids through the Arteries depends on two Causes, that is, the Force of the Heart, and the Action of the Arteries, and if it is at the same time observed, that the Force of the Heart is, in a great measure spent in dilating the Arteries, and that consequently the principal Cause of the Motion of the Fluids through the Arteries is their own Contraction, which partly depends on their Elasticity, but more especially on the muscular Force of the orbicular Fibres, by which the dilated Arteries are contracted, and propel their contained Fluids, and as it is certain from Physiology, that the Action of a Muscle requires the Soundness of the Nerve convey'd to that Muscle, and that the nervous Trunks send off Branches to the adjacent Arteries, it will appear, that when the Nerve is destroy'd, the muscular Force of the Artery is, also, lost, by which it propel'd its contained Fluid: There will, therefore, only remain the Elasticity of the Artery, and the Impetus communicated by the Heart. But in the Veins the Blood moves with that Motion which it has whilst it passes from the Arteries into the Veins. It is, also, assisted by the Motion of the adjacent Muscles, which becoming turgid when they act, press the adjacent Veins, and by that means promote the Motion of the venous

Blood. But when the Nerves are divided, the inferior Muscles remain paralytic, and no Power of Action remains in them. When, therefore, the Impetus of the Blood convey'd from the Arteries into the Veins, is diminished, and the Action of the Muscles, adjacent to the Veins, defective, the Blood in the Veins begins to move slowly, to be accumulated, and become stagnant. And thus a greater Resistance arises to the Arteries, whose Action was before weakened. Hence at last the vital Motion of the Fluids through the Arteries and Veins is suffocated in the Parts below such a Wound, that is, a Gangrene is formed.

Thus appears the Reason of those Disorders which are observed to succeed the Division of large Nerves. But medicinal Observations evince, that after such Wounds, Gangrenes are formed in the inferior Parts.

Nerves which are tense, or tendinous, if pricked, or cut half through, excite Pains; sometimes at first obtuse, and sometimes acute; first in the wounded Place, afterwards in all the annexed and adjacent Nerves. Hence Heats, Tumors, a Redness extending pretty far round the Wound, Fevers, Deliria, Spasms, Inflammation, an Aperture of the inflamed Part, accompanied with an Evacuation of an acrid, thin, and often a very copious Serum: After these, Insensibility, Rigidity, Exsiccation, Immobility, or Gangrene, and Death: And indeed all these Symptoms are the more violent, the more strongly the Nerve is stretched above the firm Parts, or more strongly affixed to them, as, also, the more tough and tenacious the Coverings of the Nerve are.

These are the calamitous Cases in which from a slight Wound so terrible Symptoms often arise. It sometimes happens that in opening a Vein of the Arm, the Tendon of the Biceps Muscle is injur'd, or, which happens more frequently, the broad Aponeurosis, which arises from that Tendon, and covers the Muscles of the Cubit. At this very Moment an intolerable Pain is often perceived, which the Patient expresses with miserable Shrieking.

Sometimes, in the Beginning of such a Disorder, there is only felt an obtuse Pain, which a few Hours after is greatly increased, and affects the whole Arm as far as the Humerus. Sometimes, also, the subaxillary Glands become pretty soon tumid, and inflamed. The Patients often complain that they perceive in the Wound itself, as it were, a live Fire burning the Parts. On the Skin appear oblong red Spots, which are always a bad Sign. In a malignant *Paronychia*, where the Tendons of the Flexor Muscles of the Finger are affected, a red Zone running longitudinally according to the Direction of the Muscles which bend the Fingers, through the Skin of the Cubit, is by the skilful Surgeons looked upon as a very bad Sign: In the soundest Man, an acute Fever is often excited; and the Brain being disturbed partly by the Fever, and partly by the Vehemence of the Pain, Deliriums, Convulsions, and sometimes Death, ensue.

But tho' Death does not always succeed such Wounds of the Nerves, yet terrible Misfortunes are produced by them; for the whole Part becomes greatly tumid and inflamed, and an incredible Quantity of thin Liquor is continually discharged either from Blisters raised on the Epidermis, or from the Wound itself; but because the Patients perceive a burning Pain, they accuse the Acrimony of the Humour discharged, which, however, when tasted, is found to have no great Degree of Acrimony. Sometimes a Gangrene preys upon the whole Membrana Adiposa; and in this Case a mild Suppuration never happens, but sinuous Collections of ichorous Matter consume all the Fat lodged in the Interstices of the Muscles, and the pinguedinous Coats of the Tendons are destroy'd; hence afterwards the Skin adhering to the Muscles, and the Tendons and Muscles for want of the Membrana Cellulosa being concreted with the adjacent Parts, a Rigidity and Immobility of the Part are brought on, and the Use of the whole Member is lost. When by a violent Gangrene, or Suppuration, the Coats of the Nerves in which the Membrana Cellulosa is also found, are destroyed, the Use of these Nerves is lost, and an Insensibility, and Extenuation of the Parts brought on. In the soundest Constitutions, surprising Degeneracies of the Humours, excessive Pains, and a Loss of the Use of the Parts, are often induced by the slightest Puncture, or Wound, of a Nerve.

It is, also, to be observed, that all these Symptoms are the more violent, the more tense the wounded Nerve is. Hence arises the Danger of Punctures about the lost Phalanxes of the Fingers, where the strongest Tendons are inserted, and in the Palm of the Hand, where the tendinous Expansion of the Musculus Palmaris forms the tense and tendinous Part of the Palm. Besides, this Malignity is increased, if the nervous Parts wounded are covered with thick Coats, as is obvious in the most dangerous Species of *Paronychia*, where the Tendon

inserted

inserted in the last Phalanx of the Finger, being hurt by a Puncture, or inflamed by any other Cause, produces the most intense Pains, a Phrenitis, Convulsions, a Syncope, and often sudden Death; or, if the Patient survives this, after violent Agonies, the last Phalanx of the Finger becomes mortified, and falls off: And a Clinching of the Hand, which cannot by any Art be removed during the Patient's whole Life, shews the dire Remains of the Disorder. The Reason of so great a Malignity depends almost entirely on this, that the Tendons bending the Phalanxes of the Fingers are surrounded with a surprising Ligament almost of a cartilaginous Hardness; for if in the Beginning of such a Disorder, a skilful Surgeon, by a bold Incision, divides all the Parts to the Bone, and by that means cuts the Ligament surrounding the Membranes, the Pain is forthwith lessened, and all these terrible Symptoms are prevented.

The same Symptoms, with very little Alteration, happen, when Tendons are differently wounded, and these are extremely violent.

The Tendon of a Muscle, when examined, may be divided into as many Fibrils as the Muscle itself. Between these Fibrils are lodged numberless small Vessels, as is evident from anatomical Injections. But these Fibrils of the Tendons seem to be only Continuations of the muscular Fibres, which seem to derive their Origin from the Nerves which enter the Muscles. Hence it is not to be wondered at, that the Tendons, which are, as it were, the Offspring of the Nerves, should, when wounded, suffer the same Misfortunes with the Nerves. But as in a large Nerve there are found Vessels of all Kinds, and the cellular Membrane separating the nervous Fibres from each other, so the same is observed in Tendons. But because the Tendons are only subservient to the Motion of the Parts, and since, sides, the Nerves contribute to Sensation and Nutrition in many Parts of the Body, hence all the same Misfortunes do not happen to the Tendons when wounded, as happen to the Nerves. But in both Cases, there are many Phenomena in common; which, however, are observed to be generally more violent in the Tendons than in the Nerves.

Nerves, when entirely divided, unless their small Ramifications a little above the Wound are distracted by the Recession of the divided Trunk, do not create much Pain. But all the Uses which the inferior Parts received by these Nerves are destroyed. Thus, also, when a Tendon is entirely divided, the Motion of the Part which depended on the Integrity of that Tendon, is destroyed; but there is often no more Pain than that which accompanies a simple Wound, nor do any more violent Symptoms succeed. This I saw in a Man in whom the Tendons which erect the Fingers, were cut with a Knife. In the *Mem. de l'Acad. Royale des Sciences An. 1722*, there is a memorable Case which confirms this. A nimble Dancer endeavouring by a great Leap to raise his Body, broke the *Tendo Achillis* in both Legs, the Skin remaining entire. There were three Fingers-breadths between the Extremities of the Tendons. By a proper Ligature the Patient was restored to his natural State; nor at the time of the Rupture, nor during the whole Course of the Disease, did he feel any Pain.

In another Man, the Skin remaining entire, that Part of the same Tendon which arises from the *Gastrocnemii* Muscles, was broken, whilst that Part of the Tendon, which derives its Origin from the *Musculus Soleus*, lying under the *Gastrocnemius*, remained entire. In that Case, there was an intense Pain, with a strong Inflammation and Tumor of the Part. Hence it appears, that far worse Symptoms are produced when a Tendon is half divided, than when it is totally divided.

But violent Symptoms are produced by the slightest Wounds of the Tendons, and by only gently touching a Tendon divested of its Coat, the whole nervous System is in a Moment disturbed; which is surprising, since the Tendons when covered with their Coats, especially with that pinguedinous Membrane which by its soft Oil lubricates them, and renders their Action quick, may, without any great Pain, not only be strongly drawn, but, also, stitched together; for it is sufficiently known in Surgery, that the Extremities of divided Tendons are seized with Forceps, drawn together, retained in Contact by passing a Thread through them, and thus happily cured, whilst the Part affected is so disposed, as that the Muscles whose Tendons are cut remain flaccid. But when a Tendon divested of its Coats is but gently touched, terrible Symptoms are produced.

There is no Remedy more efficacious for preventing or mitigating the violent Symptoms arising from Punctures of the Nerves and Tendons, than black *Peruvian* Balsam gently warmed, and dropt into the Wound; then by the Application of a warm Spatula it is to be made to penetrate and diffuse itself through all the Parts of the Wound. Afterwards, the

whole Limb is to be wrapt up in soft Cataplasms, or Fomentations, or continually anointed with mild oleous Substances. If the Wound is so small as not to admit the *Peruvian* Balsam easily, it is to be a little dilated.

The Application of warm Oil is of great Use where the whole nervous System is irritated, and Convulsions dreaded, as we learn from *Galen's* own Case, as recorded by himself, in *Comment. 1. on Hippocrates de Articulis*.

And the Membranes of the Tendons and Nerves, which are frequently propagated to the adjacent Parts, are affected with the same Diseases.

All Membranes, when wounded, do not produce such violent Symptoms, but only such as are highly tense. The tendinous Membrane produced from the *Fascia Lata*, and the like Aponeurosis arising from the *Gluteus Musculus*, and surrounding the strongest Muscles of the Thigh, when hurt by a slight Puncture, are seized with intolerable Pain. The same happens in the Aponeurosis of the *Musculus Biceps*, which is sometimes hurt in taking Blood from the Arm. If the tense Membrane covering the Auditory Passage is distracted by an inflammatory Tumor, an intolerable Pain arises, and a Delirium and often Death succeed, as *Hippocrates* tells us in his *Prognost.* and *Coacæ Prænotiones*. But Wounds are to be most dreaded in those Membranes which are either Productions of the Tendons, or are possessed of an exquisite Sensation, and Capacity of Irritation on account of the great Number of Nerves dispersed through their Substance. Thus the *Periosteum*, when wounded, sometimes produces the most exquisite Pain.

A Knowledge of the Laws of Circulation, and a Consideration of the adjacent Parts, will teach us in what manner the lymphatic, adipose, venous Vessels, and the Vesiculæ, or small Cisterns, suffer in Wounds.

As for the lymphatic Vessels; the Vessels by Anatomists demonstrated under the Name of *Lymphatics*, are all of the venous Kind, as is obvious from the Motion of the Fluids through those Vessels from the Ramifications into the Trunks, as, also, from the Valves, which *Ruyssch* so evidently demonstrated in his *Dilucidatio Valvularum*, to *Blissius*, who denied that the Valves in these Vessels were ever demonstrated. These lymphatic venous Vessels, when wounded, produce no great Harm; for considerable sanguineous Veins, when wounded, discharge no great Quantity of Blood. But to these lymphatic Veins correspond similar lymphatic Arteries, which, when wounded and not entirely divided, may produce a perpetual and uneasy Effusion of Lymph in Wounds. But that there are numberless such Vessels in the Body may be concluded from anatomical Injections made into the Arteries; for in this Case those Vessels, in which there naturally appeared no red Blood, are filled with a coloured Matter. *Ruyssch* so filled the Tendons and Ligaments, that they became quite red; there were, therefore, in these Parts many such Vessels, which during Life were filled with a thin Liqueur, whose Colour was not perceptible: Perhaps, for this Reason, a Discharge of such Lymph is so frequently observed in Wounds inflicted about the Joints; and Surgeons often find large Quantities of this Lymph flowing both from Ulcers and Wounds about the Joints.

As for the adipose Vessels; that the Fat of the human Body may be mixed with the Blood, and with it move through the Vessels, is sufficiently certain; for in fat Persons labouring under an acute Fever we observe, that in a few Days the Fat is surprisingly diminished; and in such Diseases, oleous Drops have appeared in the Blood taken from the Veins. When *Malpighi*, as he tells us, in *Tr. de Omento, Pinguedine, & Adiposis Duobus*, observed oleous Streaks growing to the Trunk of the Vena Portæ in Frogs, upon compressing them, he saw plainly Drops of Oil in the Trunk of the Vena Portæ carried to the Liver along with the Blood. There seems, therefore, to be no Doubt concerning this. But it is a Doubt, whether such a pinguious Oil is by a continual Motion conveyed in proper Vessels like the other Humours, or whether it remains collected in small Cells, which by their recipient Orifices are united with the Arteries, whence this Oil is secreted, and which by their emittent Orifices communicate with adjacent similar Cells, as, also, with the Veins, which again receive and mix with the other Humours this Fat, secreted from the Arteries, and deposited in Cells. *Malpighi*, in the Work last quoted, seems to think that there are such pinguedinous Vessels, which by a continual Course convey this Oil, without the Interposition of any Cells: But in his posthumous Works he tells us, that the Fat is preserved, and accumulated in proper Cells, as in so many peculiar Laboratories; but that he durst not assert the Existence of adipose Vessels, tho' he had been very accurate in searching for them. But whether the Fat is lodged in such Cells mutually com-

Communicating with each other, or whether there are such Pinguinous Vessels, when either are wounded, their Contents will be discharged, become corrupted, and capable of producing many Misfortunes. *Ruyfch*, as he tells us, in *Epist. Anat. ad Boerh.* upon opening the Abdomen of an Horse which died after hard Running, found its whole Cavity full of a thin diluted Oil. It is certain, that the Fat is highly lax, easily protuberates into a Wound, and produces fungous Flesh, especially if fat Parts, when wounded, are treated with too emollient Applications.

As for the venous Vessels; provided these are not very large, they are not, when wounded, productive of very dangerous Symptoms; for a violent Hæmorrhage rarely happens from them, except in plethoric Patients, in whom it is not prejudicial, since it diminishes the Redundance of the Blood. But the adjacent Veins mutually joined by frequent Anastomoses, easily supply the Defect of the wounded Vein. But it is to be observed, that when a considerable Vein is known to be wounded, it is dangerous to apply those acrid Styptics which are sometimes used for stopping Hæmorrhages from Wounds, such as Vitriol, Alum, and Alcohol; for it is to be feared, lest these being received into the open Wound of the Vein, should enter the Blood, and produce Coagulations therein, which being conveyed through the Vein, which becomes continually broader, to the Right Ventricle of the Heart, and thence impelled into the Pulmonary Artery, may produce the most terrible Disorders.

As for the Vesicles; these are all glandular Follicles, in which the Humour secreted from the Blood by the Arteries, is collected into a membranaceous Cavity, and thence discharged through a proper Emiffary for particular Purposes. When these Vesicles are wounded, it is obvious their Use must be lost. But of how great Importance this Loss is, is only to be known from a Knowledge of the Use of those Parts. Thus, when the Vesiculæ Seminales are wounded, it is obvious the whole Business of Generation must be disturbed.

If a Wound lies exposed to View, its Presence and Nature is discoverable,

1. By the Sense, after wiping away the Impediments which hinder the Sight of it, and stopping the Flux of Blood.
2. By an anatomical Knowledge of the adjacent Parts.

Great Caution is requisite in a Physician or Surgeon called to a wounded Person, lest they should pass a Judgment of the Wound before they have carefully examined it; for whatever they rashly pronounce on such an Occasion may, perhaps, be afterward related to the Judges. If the unlucky Event should prove that the Wound was dangerous, though at first Sight they pronounced it but slight and inconsiderable, those who plead the Cause of the Guilty afterwards, brand the Character both of the Physician and Surgeon, as if the Misfortunes succeeding the Wound ought to be imputed to their Want of Skill. Prudent Surgeons generally ask the Physician present, what he thinks of the Wound, and of the Effects to be dreaded from it, by which means they save their Reputation. It is therefore proper, that all Physicians should embrace every Opportunity of seeing Wounds, and severe Operations, that thus they may gradually accustom themselves to look upon the Calamities of Mankind with Intrepidity. *Hippocrates*, in *Tr. de Flatibus*, tells us, "That the Physician should look upon dangerous Wounds, handle such as are disagreeable, and by the Calamities of others endeavour to prevent his own Miseries; for by Art the Sick are freed from the greatest Misfortunes, Diseases, Pains, Sorrow, and Death." These Misfortunes are alleviated by the salutary Art; but it often happens, that Physicians who are well acquainted with the Fabric of the Body, are by the Sight of the Wound, the Cries of the By-standers, and the Complaints of the Patient, so disturbed, as to pass a quite different Judgment from what they would have done, if they had considered all Circumstances with a calm and sedate Mind.

A Wound is not therefore to be examined precipitately, but with the greatest Attention of Mind; for at the first Dressing the Surgeon may safely do that which afterwards cannot be commodiously done; since on the succeeding Days the Wound often becomes so tumid, painful, and inflamed, that it cannot bear the Scrutiny of the Probe without great Pain and Irritation.

If a Wound is inflicted on a Part of the Body exposed to View, all Impediments which hinder the distinct Examination of the Wound are to be removed from it. Tepid Water with Honey, Wine, and a little Sea Salt, is to be used for washing the Wound, by which means the Thrombuses of concremented Blood are removed, and the whole Surface of the Wound is discovered. But so long as the Blood flows impetuously from the Wound, there is such an Inundation, that nothing can be distinctly observed. For this Reason the Hæmorrhage is to be stopped, which in the Limbs is easily done by compressing the

Trunks of the Vessels by a proper Ligature; and in other Parts of the Body, unless very large Vessels are wounded, the Hæmorrhage may be stopt with warm Alcohol of Wine.

As for an anatomical Knowledge of the adjacent Parts, nothing certain can be determined without it; for the Inspection of a Wound may discover its Largeness, Deepness, and Direction; but a Knowledge of the Parts adjacent to the Wound, is only to be obtained from Anatomy. *Eustachius's* Tables, in which the Situation of the large Arteries, Veins, and Nerves, as, also, the Origins and Courses of the Muscles, are so accurately marked, may be of great Use for this Purpose, that thus, knowing the Place of the Wound, we may be able to determine what Parts of the Body are wounded, and what Injury is to be dreaded from the Wound.

The Presence and Nature of a Wound, which is not exposed to View, is discovered,

1. By Anatomy; by the Situation of the Person when wounded; and the Manner and Force of the Stroke.
2. By an Impediment to the Action of a particular Part, subsequent to the Wound.
3. By the Humours discharged from the Wound, either within or out of the Body.
4. By the Affections which are consequent to the Wound, as Pain, Hiccup, Spasms, Tumor, &c.

The Knowledge of a Wound is far more difficult where the Whole of it cannot be viewed by the Eye. The Entry of the wounding Instrument into the external Integuments is seen, but how far it has penetrated, cannot often be discovered. It will, however, be of great Use to the Surgeon carefully to attend to the following Circumstances:

1. By Anatomy we know what Parts are situated in the Place wounded; but the Situation of the Patient at the time he received the Wound, and of the wounding Person when he inflicted it, will demonstrate the Way in which the wounding Instrument penetrated into the internal Parts of the Body. If the wounding Instrument can be had, it may sometimes be known from the Largeness of the Wound in the Integuments how deep it has been driven. All these things ought to be carefully inquired into, both from the Patient, and from those who were present when the Wound was inflicted. Thus, for Instance, if a Sword is passed in a perpendicular Direction between the sixth and seventh true Ribs, it will penetrate into the Cavity of the Abdomen: But if a Man receives a Wound with his Body reclined backwards, whilst the Sword is passed from the inferior Parts upwards, it may penetrate into the Cavity of the Thorax. But if when the Body is inclined forwards, a Sword enters the same Part, it may pass through the whole Abdomen, even to the Pelvis. Thus, also, a Wound inflicted on the Side may run a great Way under the Integuments, and above the Ribs, especially in fat Persons, without penetrating into the Cavity of the Thorax. When we examine into the Deepness of a Wound by means of the Probe, it is of great Importance to know the Situation of the Patient when the Wound was received, and to place him in that very same Situation; for unless this is done, it often happens, that the Membrana Adiposa stops up the Wound. Thus, in Venesection, especially in fat Persons, it often happens; that at first the Blood flows out with a full Stream, but immediately stops upon the smallest Change of Situation in the Arm, because the fat subjacent to the Skin interposes itself between the Orifice in the Skin, and that in the Vein.

2. As we know from Physiology the things requisite to the Soundness of the particular Functions of the Body, so we easily see from the Action either hindered, or totally abolished after the Wound, whether some or all of the Requisites necessary for that Action are destroy'd by the Wound. Thus if a Wound penetrating into the Cavity of the Abdomen is immediately succeeded by an excessive Languor of the vital Actions, if the Heart palpitates quickly, if the Pulse is quick and unequal, the Face and Lips pale, and the Extremities cold, we conclude, that in consequence of a Division of some large Vessels, a considerable Quantity of Blood is discharged into the Cavity of the Abdomen. If a Wound inflicted in the Neck is without a considerable Hæmorrhage succeeded by the like Symptoms, it is to be dreaded, lest the Nerves situated here, and running through the vital Viscera, are wounded. If after a Wound of the Head the same Symptoms happen, it is thought that the Cerebellum is wounded, or compressed by the extravasated Humours. When Wounds of the Head are succeeded by an Abolition of all the animal Functions, the same Misfortunes are thought to have befallen the Brain itself. If after a Wound of the Back the inferior Parts are deprived of Sensation and Motion, we conclude that the Spinal Marrow is wounded. The same holds true with respect to the other Actions of the Body.

3. If after a Wound of the Thorax a red frothy Blood is either discharged from the Wound, or vomited up, we know that the Vessels of the Lungs are divided. If from a Wound in the Abdomen Chyle is discharg'd; a Wound of the small Intestine is denoted; but if the Fæces, a Wound of the large Intestines is indicated. If Blood is discharg'd by the urinary Passages, we know that the Kidneys, Ureters, or Bladder, are wounded.

4. A Pain suddenly succeeding a Wound, denotes that the Nerves, Tendons, or tendinous or nervous Membranes, are wounded; but an Hiccough, and Spasms, may be produced by Wounds inflicted in different Parts. After excessive Hæmorrhages, an Hiccough, and Convulsions, often arise; and are, by Hippocrates, in *Coac. Prænot. & Aphor.* in such a Case, pronounced very bad Symptoms. Hippocrates condemns an Hiccough arising from the Iliac Passion. Hence it is very probable, that this Disorder may be consequent to Wounds of the Intestines. An Hiccough, also, succeeds Wounds of the Diaphragm, Oesophagus, Stomach, and Head: Hence this Symptom, when consider'd alone, always shews the malignant Effect of the Wound, tho' it does not always infallibly indicate the Part wounded.

Sudden Tumors, succeeding Wounds, either shew that the Humours are extravasated, and collected in preternatural Parts; or that the Air has enter'd into the Cavities of the Body, thro' the Wound, and is surprisngly dilated by the Heat. We have consider'd those surprisng Tumors succeeding Wounds of the Breast, whilst the Air entering the *Membrana Adiposa*, distends the whole external Surface of the Body in an incredible manner, under the Article THORAX.

From a Knowledge of what has been said, the Event of Wounds may be prognosticated. As,

1. The Death or the Life of the Person wounded.
2. The possible, impossible, entire, or partial Cure.
3. The easy, difficult, long, or short Cure.
4. The Effects of the Wound remaining after the Cure is perform'd, as Consumption, Insensibility, Immobility, Deformity, &c.

When, by the Assistance afforded by the modern Improvements in Surgery, and a due Examination of all the Circumstances mention'd in the two preceding Aphorisms, we find the Diagnostic of a Wound, which teaches us the Part wounded, and the Actions of the Body, either abolish'd, or hinder'd by it, we may then foretel the Event of the Wound; and those Symptoms which may proceed from the Wound, as their Cause, will become obvious. This is call'd the Prognostic of Wounds; in determining which, great Caution is necessary: For, as Celsus, in *Lib. 5. Cap. 26.* informs us, "It is the Part of a prudent Surgeon not to meddle with a Patient who cannot be preserv'd, lest he should be thought to have destroy'd him who fell the Victim of his own Disorder. But where there is great Dread, without absolute Despair, he is to acquaint the Friends of the Patient with the Difficulty of the Case, lest, failing of Success, he should be thought either deceitful, or ignorant. But as these are the Measures taken by prudent Surgeons, so Quacks give out, that slight Cases are of the last Importance, that their Cures may appear the more surprisng."

But it is to be observ'd, that there are some Cases, in which the most skilful Anatomists may be deceiv'd, in determining the Parts injur'd by a Wound: For the Situations of the internal Viscera have frequently been found very different from those which they commonly obtain. For Instances of this Kind, see *Journal des Sçavans, Janvier 1689. Act. Lipsiens. An. 1690. and Carol. Drelincourt. Opuscul.*

In these Instances such Phenomena happen'd in found Persons, and the Change of Situation in the Viscera obtain'd from the very Beginning of their Lives. But it is, also, certain, from Experience, that the Situation of the Viscera is frequently chang'd by Diseases. Thus, in *Mem. de l'Académie Royale des Sciences, l'an. 1716.* we are told, that, in a certain Woman, the Situation of the Stomach, as, also, of the other abdominal Viscera, was found surprisngly chang'd by frequent Vomitings. It is highly probable, that such Changes in the Situation of the Viscera are very frequent: For in those Carcasses, says *Vanswieten*, which I have either dissected myself, or seen dissected by others, many such Changes were observable. Thus I have seen the Spleen fallen down into the Pelvis, the Bottom of the Stomach reaching below the Navel; that Part of the *Intestinum Colon*, which lies below the Stomach, so far distant from it, as to be lodg'd below the Navel, and form an Arch, the convex Part of which lay towards the Pelvis; and the concave towards the Stomach.

Now the Errors which must necessarily happen hence in the Prognostic of Wounds, seem hardly to be avoidable, since these Things can neither be predicted, nor known, by any Signs.

Besides, the particular Idiosyncrasy of the Person wounded may greatly change the Effects of the Wound. Thus some are

so faint-hearted, as to fall into a *Delirium*, upon seeing the Blood flow from the Wound even of another Person. Hence Hippocrates, in *Prorrhetic. Lib. 2.* tells us, "That there are many Wounds inflicted in Places which are not dangerous, whilst, at the same time, the Wound itself is so painful, that the Patient is depriv'd of a free Respiration; whereas others, where there was no Danger, have, on account of the Excess of Pain, breath'd freely, but been seiz'd with a *Delirium*, and dy'd feverish: For whoever have Bodies prone to Fevers, or Minds easily subject to Commotions, suffer such Misfortunes. But the Surgeon is neither to be surpris'd, nor afraid, at these Things; considering that both the Souls and Bodies of People differ widely from each other, and are of great Efficacy in Wounds and Diseases."

By means of these Cautions we are to determine the Prognostic of Wounds; in which we are to examine,

1. Whether the Wound is such as to produce infallible Death as its physical Effect; or whether, after the Wound, Life may be preserved.

2. *With respect to the possible, impossible, entire, or partial Cure*; a Wound is said to be cured, when the Parts separated from their natural Cohesion by the wounding Cause, are again concreted, and united. Thus, if the Finger is transversely cut, in such a manner as only to cohere by a small Portion of the Skin, the Cure of such a Wound cannot be promised. The Patient may, indeed, be preserved, tho' without this Part of his Body: Besides, it often happens, that, after the Cure of the Wound, all the Uses are not restored to the wounded Part, which it had in its natural State; in which Case there is not a total, but a partial Cure. Thus if a considerable Nerve is totally divided by a wounding Cause, there will never be a total Cure of such a Wound; for all those Functions which depended on the Soundness of such a Nerve, will ever after be abolish'd.

3. *With respect to the easy, difficult, long, or short Cure*; unless these Things are mentioned at the Beginning, the Blame of a difficult, or long-protracted Cure, will be often thrown on the Physician, or Surgeon. A Cure is said to be easy, which is performed without great Pain to the Patient, or Trouble to the Surgeon. When the Tendon of the Muscle which erects the Thumb, being divided, shrinks back under the Integuments, such a Wound cannot be cured, and the natural Use of the Part restored, unless the Wound is dilated, the Extremities of the divided Tendon laid hold of with Forceps, brought into Contact, and retained in that State by proper Suture; but these Things cannot be done without Difficulty and Pain: Prudence requires, that these Things should not always be revealed to the Patient, but rather indicated to his Friends, lest the Misfortunes of a tedious Cure should be afterwards imputed to the Physician, or Surgeon.

Thus when a Wound with considerable Loss of Substance is inflicted, whilst a large Portion of the Skin and *Membrana Adiposa* is removed by the Edge of the Sword, a considerable Space of Time is required for the Restitution of what was lost: If a simple Division of the Skin and *Membrana Adiposa* is only made by the wounding Instrument, when the Lips of such a Wound are duly united, it will be pretty soon consolidated, provided the Body of the Patient is sound; but if he labours under a considerable Cacoehymy, the Cure will be far longer, and more difficult. These Things ought to be determined in making the Prognostics of Wounds, because many are of Opinion, that Surgeons, from a sordid View to Gain, protract the Cure of Wounds far longer than is necessary: But no honest Surgeon will ever be guilty of such a Piece of Wickedness.

4. *As to the Effects of the Wound remaining after the Cure is perform'd, as Consumption, Insensibility, Immobility, Deformity, &c.*; these Things are, also, to be carefully attended to: In Wounds which are not mortal, Judges generally proportion the Punishment of the Inflictor to the Injury which the Patient sustains from the Wound inflicted: Hence the Advocates for the Offender usually employ all their Cunning and Oratory in charging the Symptoms subsequent to the Wound, upon the Physician or Surgeon to whose Care it was committed. For this Reason, at the first Dressing, from an anatomical Knowledge of the Part in which the Wound is inflicted, and from the Functions injured after the Wound, those Misfortunes ought to be indicated; which will follow the Wound, tho' ever so well cured; or, if this cannot be certainly determined, a Caution is to be given with respect to the particular Misfortunes to be dreaded after the Cure of the Wound: For in no Cases are Surgeons more injuriously treated than in these; since after the Wound is cured, if the Motion of the Part is lost, they generally tell who cured the Wound, and not who inflicted it, ungenerously laying on the former that Blame, which is the just Portion of the latter. When the only Artery which is distributed to a Part is divided, we foretel that an Atrophy of the Part will succeed the Cure: If a large Nerve, distributed to a Part, is destroyed, we prognosticate the Insensibility, and often

the Immobility, of the Part. If a Wound cannot be cured till after a long and violent Suppuration, when, for Instance, the Parts of a wounded Bone ought to be gradually separated, the *Membrana Adiposa* being thus consumed, we prognosticate that there will be a deep and unseemly Cicatrix.

Unavoidable Death, arising from a Wound, may proceed from five Effects; so that the following Wounds will necessarily prove mortal.

In this Aphorism are enumerated those Wounds which necessarily, and, in Spite of the highest Art hitherto known, remove that Condition of the Body which is absolutely requisite, that the Commerce between the Body and Mind may continue, or be restored, and not necessarily be destroy'd. But from Physiology it is absolutely certain, that the muscular Action of the Heart, the Reception of the Blood into the Heart, and the Expulsion of the received Blood from it, are indispensably necessary. Hence, in N^o 1. are enumerated those Wounds, which hinder the Influx of the nervous Fluid requisite for the muscular Action of the Heart. In N^o 2. those Wounds are enumerated, which, in consequence of a Division of the Cavities of the Heart, hinder any Blood from being contained in it. In N^o 3. are enumerated those Wounds, which, in consequence of the Dilatation of the Orifices of the wounded Vessels, hinder the discharged Blood from returning to the Heart. But as in a human Creature, after it is brought into the World, the Right Ventricle of the Heart cannot evacuate the Blood contained in its Cavity, except thro' the Lungs, and as to this their Dilatation by Respiration is requisite, for this Reason, in N^o 4. are enumerated those Wounds which totally destroy Respiration. Then, lastly, since, by an inevitable Effect of Life and Health, many both of the solid and fluid Parts are daily lost, hence it is requisite, that, in order to preserve Life, as many Parts of the same Kind should be perpetually restored both to the Solids and Fluids, as were lost by the Energy and Activity of Life. But the Loss of all these is restored by the Aliments eaten, and by the natural Actions changed into a Substance similar both to the solid and fluid Parts of the human Body. For this Reason, in N^o 5. are enumerated those Wounds which destroy the Soundness of those Parts absolutely requisite to this Work.

To these five Heads we may therefore reduce all mortal Wounds.

First, Those which intercept the Influx of the nervous Fluid into the Heart, from the *Cerebellum*; such as Wounds of the *Cerebellum*, or Brain, so deep as greatly to injure the *Medulla Oblongata*; or when the Texture of the Vessels within the *Cranium* is so dissolv'd, as to admit of an Extravasation of their Contents, which destroy Life by Pressure or Putrefaction, and which cannot be come at by means of the Trepan, by reason of the Condition of the Place; as it happens in Wounds of the inferior Part of the Orbit of the Eye, the temporal Bones, the *Os Ethmoides*, and the Basis of the *Cranium*, those which deeply injure the spinal Marrow; or which divide the cardiac Nerves.

As the Heart is a true Muscle, so its Action requires all those Things, which from Experience we know to be necessary for the Action of the other Muscles of the Body. But it is certain from Experiments, that the Influx of the Spirits thro' the Nerves into a Muscle, is requisite to its Action; the same will, therefore, obtain in the Heart: It is, also, certain from medicinal Observations, that when by violent external Causes, the Blood is so extravasated within the *Cranium* as to compress the whole Brain, all the Sensations and Motions depending on the Will are totally abolished; whereas the Action of the Heart in the Beginning of such a Disorder, is rather increased, as is obvious from the Strength and Celerity of the Pulse in apoplectic Patients. But it is known from Anatomy, that the *Cerebellum* is very safely defended, since it lies under the Brain, and being covered with the *Dura Mater*, cannot be so easily compressed by the extravasated Humours, as the Brain itself. But when the same Causes continuing or increased begin to compress the *Cerebellum*, which being of a more solid Contexture, therefore more resists compressing Causes, then the Action of the Heart ceases, and Life is destroyed. Hence we know that the *Cerebellum* communicates, thro' the Nerves, the Spirits requisite for the muscular Motion of the Heart. Wounds, therefore, which greatly hurt, or totally destroy, the *Cerebellum*, are justly accounted mortal. This is confirmed by Experiments made on live Animals. Thus *Perrault*, in his *Mechanique des Animaux*, *Partie 2. Cap. 7.* informs us, that, when the Brain of a large Dog was cut like Chequer-work, almost for an entire Hour, he died the very Moment his *Cerebellum* was wounded. *Raymond Vieussens*, in his *Neurographia Universalis*, *Lib. 1. Cap. 20.* tells us, "That when, after opening the superior Part of a Dog's Head, the *Cerebellum* is cut into Pieces, and taken out of the *Cranium*, the Animal dies almost forthwith, tho'

"the Brain, and Trunk of the *Medulla Oblongata*, are by no means hurt." The same Experiment was made by *Bbonius*, in young Puppies, whose *Craniums* were as yet soft, and their Sutures gaping, by driving a Knife into the *Cerebellum*, upon which he saw them expire, after slight Concussions of the external Parts; but upon removing the *Cranium*, it appeared, that the Instrument, in one of the Animals, had perforated almost the whole Compages of the *Cerebellum*; whereas, in the other, it had only penetrated its medullary *Nucleus*.

Nor is it any Objection against the mortal Nature of Wounds of the *Cerebellum*, that *Wepfer*, in *Tr. de Cicutæ Aquaticæ Historia & Noxæ*, in Puppies whose Heads were cut off, saw the alternate Systole and Diastole of the Heart remain for several Hours: For here we treat of the durable Action of Life, and not concerning that surprising Property of the Heart, by which, when taken out of the Body, it continues its Motion after Death: For *Wepfer* by no means intended to deduce from his Experiments any thing contrary to this Doctrine, as he himself affirms.

But since it is certain, from Anatomy, that no Nerve is derived from the *Cerebellum*, but that the whole medullary Substance of the *Cerebellum* being collected, goes off into the *Medulla Oblongata*, from which the Nerves afterwards arise, it is sufficiently obvious, that considerable Wounds of this *Medulla Oblongata* must necessarily prove mortal. Now if we consider that the *Cerebellum* and *Medulla Oblongata* are so safely lodged that they cannot be wounded without a considerable Wound of the Brain itself, and of the large Vessels and Muscles, the mortal Nature of Wounds of these Parts will be still more obvious.

But Wounds of the Brain itself, tho' pretty large, are not always mortal; as is obvious, from many Observations specified under the Article *CAPUT*.

When sanguiferous arterial Vessels, or large venous Vessels, are by any Cause ruptured, they discharge their contained Blood, as, also, that which by the continual Force of the Heart, would have flowed thro' the Vessels, if sound. But the hard Bone of the *Cranium* cannot yield, and naturally the Brain exactly fills the Cavity of the *Cranium*; for which Reason, the extravasated Blood must necessarily compress all the Parts contained in the Cavity of the *Cranium*. Hence, immediately after an Extravasation of Humours within the *Cranium*, the Functions of the Brain begin to be abolished, and afterwards the same Cause continuing to act, the *Cerebellum* and *Medulla Oblongata* are compressed, and Life by that means is destroy'd. If the Blood extravasated from the ruptured Vessels, is not in so large a Quantity, as by its Compression to remove the Action of the Brain, *Cerebellum*, and *Medulla Oblongata*, it may yet prove prejudicial in another manner: For the Humours of the human Body when extravasated, are by a spontaneous Degeneracy corrupted, tho' more slowly where all Access of the Air is denied; but at last becoming putrid, and acrid, they bring on Inflammations and Suppurations of the Brain, by which they consume and destroy its tender Fabric. Hence, in practical Authors, many Observations prove, that Wounds and Contusions of the Head, which were thought very inconsiderable, have after a pretty long time brought on sudden Death. In Carcasses there has appeared a large Quantity of ichorous or purulent Matter, and often a considerable Consumption of the Brain, by this means. Instances of this Kind may be seen in *Bonatus's Sepulchretum Anatomicum*.

In such Cases, therefore, the principal Hope of Cure is placed in the Operation of the Trepan, in order to procure a free Discharge to the Humors; but if such is the Condition of the wounded Part, that this Operation cannot be performed in it, inevitable Death will follow: But the Places in which this Operation cannot be performed, are, principally, these following:

The inferior Parts of the Orbit of the Eye; that is, that Part of the Orbit of the Eye which constitutes the greatest Part of the Bottom of the *Cranium*, and which lies below the *Cranium*, but constitutes the superior *Lacunar* of the Orbit of the Eye; for this Part of the Orbit is formed by the *Lamella* of the *Os Frontis*, which in a prepared *Cranium* is pellucid, and hardly so thick as the Nail of one's Finger: But this *Lamella*, on which the anterior Parts of the Brain, together with pretty large Blood-vessels, lie, is, on account of its Thinness, perforated by a slight Wound, in which Case the extravasated Blood is lodg'd under the Brain, in the very Basis of the *Cranium*; for which Reason it cannot be evacuated by the Trepan. Hence it appears how dangerous Wounds, inflicted in this Part, are. *Ruyssch*, in *Observat. Anatom. Chirurg. Centur. Observat. 54.* gives us an Account of a Man, who was, with the Extremity of a Stick which was not very sharp, wounded in the Orbit of the Left Eye; and tho' the Wound appeared inconsiderable to those who had the Care of it, yet the Patient soon after died. And when, by public Authority, the Cause of his Death was enquired into, the *Cranium* being divided with a Saw, the Wound appear'd to have penetrated pretty deep into the Brain.

As for the inferior Parts of the temporal Bones; the Pits appearing in prepared Skulls, and excavated by the Pulsation of the Arteries of the *Dura Mater*, demonstrate, that considerable Arteries are distributed about the Temples: When, therefore, these are wounded, the extravasated Blood tends directly downwards to the Basis of the *Cranium*; and, on account of the large temporal Muscles situated here, there is no Place for the Trepan: All the Misfortunes are, therefore, to be dreaded, which are to be expected from an Extravasation of Humors producing unhappy Effects, either by their Compression, or Corruption.

As for the inferior Part of the *Os Ethmoides*; perhaps, at first, this Bone may seem to be so safely lodged, that it cannot be easily wounded: But if, when the Head is reclined backwards, a sharp-pointed Sword is driven up the Nostrils, it may easily penetrate as far as that Bone. Besides, if in the lateral Part of the Orbit of the Eye towards the Nose, a Wound is inflicted, it may by a gentle Force perforate that *Lamella* of the *Os Ethmoides*, which constitutes a Part of the Orbit of the Eye, and is called the *Os Planum*, and thus pass into the Cavity of the *Cranium*. *Bonetus*, in *Sepulchret. Anatom.* gives us an Instance of a Student of Law, who receiving a Prick of a Sword below the Orbit of the Left Eye, died apoplectic twenty-four Hours after. Upon laying open the *Cranium*, it appeared that the Wound had penetrated thro' the Orbit of the Eye and the *Os Ethmoides* near the *Crista Galli*, into the Right Ventricle of the Brain. The Basis of the Brain and Region of the *Cerebellum* were, also, full of Blood. It is sufficiently obvious, that there were no Hopes of a Cure in such a Case.

Other Wounds, penetrating into the Basis of the *Cranium*, prove infallibly mortal, for the same Reasons.

As to Wounds of the spinal Marrow; after nine Pairs of Nerves have arose from the *Medulla Oblongata* within the *Cranium*, all the rest of the medullary Substance of the Brain and *Cerebellum*, collected into one Trunk, and defended by the *Vertebra*, is stretched out to the *Os Sacrum*. From this spinal Marrow all the Members below the Head, and many of the *Viscera*, receive a great Part of their Nerves: If, therefore, a considerable Wound is inflicted in the superior Part of the spinal Marrow, its medullary Substance is destroy'd, and all the Action of the Brain and *Cerebellum* on the inferior Parts is remov'd; so far as it depends on the Soundness of these medullary Fibres: For the eighth Pair of Nerves called the *Par Vagum*, and the intercostal Nerves arising higher from the *Medulla Oblongata* within the Cavity of the *Cranium*, are distributed to many of the vital *Viscera*. Hence such a Wound is not succeeded by immediate Death, tho' Patients wounded in this manner all die sooner or later, according as the spinal Marrow is wounded deeper, or nearer its Origin. The Reason of this is sufficiently obvious; for the whole *Cerebrum* and *Cerebellum*, by their Fabric, secrete from the arterial Blood that highly-subtile Fluid, which, being thus secreted, is conveyed to all the Parts of the Body thro' the medullary Fibres, and the Nerves consisting of those Fibres collected together. Whilst, therefore, so long as the Quantity of the Liquid conveyed to the sound secreting Organ is the same, so great a Number of Vessels, which ought to contain and convey the secreted Liquor to its proper Places, is destroy'd, it follows, that the Function of the secreting Organ must first be disturb'd, and then destroy'd: Besides, large Blood-vessels are at the same time generally hurt. Hence the extravasated Humors easily reascend into the Cavity of the Brain, after the Cavity formed by the *Vertebra* is first full. But that such Wounds are mortal, is certain, from practical Observations. Thus *Bonetus*, in *Sepulchret. Tom. 3.* tells us of a Countryman who falling from a Tree had the second *Vertebra* of the Neck luxated near the *Atlas*, as afterwards appear'd in the Carcase. He liv'd for some Days in this manner, and then died: But others subjected to the like Misfortune, have died in a very short time.

Sennertus, in *Tom. 3. Lib. 5. Part 4. Cap. 3.* informs us, "That he knew a certain Butcher, who, when intending to kill Oxen, did not strike them in the usual manner, with an Ax in the Forehead, but thrust a small Knife into that Part of the spinal Marrow where the Head is joined to the *Vertebra* of the Neck; by which means the Animal immediately dropt down, as it were, apoplectic." *Galen*, also, observes, that Bulls in which the spinal Marrow is divided hard by the first *Vertebra* of the Neck, immediately fall down, and lose both Voice and Respiration.

In Puppies, the like Experiment was attended with the same Success.

Hippocrates, in *Lib. 1. de Morbis*, pronounces Wounds of the spinal Marrow mortal; and in *Prorrh. Lib. 2. Cap. 11.* he tells us, "That if the spinal Marrow is disordered, either by a Fall, by any other Cause, or spontaneously, the Patient loses the Use of his Limbs, in such a manner, as not to perceive when they are touched: Nor, in the Beginning of the Disorder, does he discharge his Excrements and Urine, un-

less with Difficulty: But when the Disease is of long standing, both Excrements and Urine are evacuated spontaneously, but the Patient dies soon after this." In this Place it is obvious, that *Hippocrates* treats of a Wound in the inferior Part of the spinal Marrow; notwithstanding which, he pronounces it mortal. But that some have escap'd; or, at least, led a very miserable Life for a long time after the spinal Marrow has been compressed by a Luxation of the *Vertebra* about the Loins, is certain from *Hildanus*, in *Observat. Chirurg. Cent. 5.*

But I know of no Instance in which any one has survived a Wound of the superior Part of the spinal Marrow.

With respect to a Division of the cardiac Nerves; thro' these is convey'd that fine Fluid separated, by the Fabric of the *Cerebellum*, from the purest arterial Blood, and which is requisite to the muscular Motion of the Heart.

In the *Pericardium* the Heart remains free, and adhering to no Parts except the Vessels, which either enter or run out from the Heart. Now all these Vessels with which the Heart is connected in the *Pericardium*, are free, moveable, and adhering to no adjacent Parts: The Nerves, therefore, which enter the Heart, must be convey'd to it along with the Vessels with which it is annex'd; for the Heart adheres to no other Part in the *Pericardium*: Hence the Nerves distributed to the Heart do not remain free, as one might possibly conjecture from anatomical Tables, but are applied to the Veins which convey the Blood into the Cavities of the Heart, and to the Arteries which receive the Blood expelled from the Heart. Physiology, from this surprising Position of the Nerves running to the Heart, explains its Systole and Diastole, whilst the same Cause which produces the Motion of the Heart, the Moment after, by the necessary Fabric of the Parts, destroys it. Hence, in one Moment of Life, the Heart is, as it were, contracted by a violent Spasm, and the next Moment becomes perfectly paralytic.

Hence it is obvious, that near the Heart the cardiac Nerves cannot be wounded, without wounding the large Vessels about the Heart; in which Case, inevitable Death will follow the Wound. But here we only consider simple Wounds of the Nerves of the Heart. But anatomical Observations inform us, that all the Nerves which are distributed to the Heart arise from the eighth Pair, the intercostal Nerves, or from the recurrent Nerves: But the Trunks of these Nerves may, in their Course, be wounded, and thus the Effects which these Nerves perform to the Heart, may be abolished.

Willis, in *Anatome Cerebri*, tells us, that, upon dividing the Skin in the Throat of a live Dog, he applied a tight Ligature to both Trunks of the *Par Vagum*; after which, the Animal immediately became torpid, and swell'd, and suffer'd convulsive Motions, accompanied with a great Tremor about the *Hypochondria*. This Symptom soon ceasing, the Creature lay, as it were, at the Point of Death, vomiting up its Aliments; but it liv'd after these Nerves were entirely divided for several Days, till it was almost destroy'd for Hunger.

But, upon opening its Body, the Blood coagulated within the Ventricles of the Heart, and in the large Vessels, was found formed into grumous Concretions. In Animals, however, which perish by Hunger, such Coagulations of Blood are not found. The Cause why the Life of this Animal was so long protracted, was by *Willis* deduced from the small Ramifications of the recurrent and intercostal Nerves distributed to the Heart.

Lower, in *Tr. de Corde*, tells us, that upon making the same Experiment, he observ'd, that the Heart began immediately to tremble and palpitate; and thus for a Day or two the Animal protracts a miserable Life, with a trembling Heart, and Sighs sent from his Breast: But so intense is the Pain of the Animal, that he cannot be confined, without very strong Ropes. But *Bhoni*, in his *Circulus Anatomico-physiologicus*, affirms, that an Animal which he treated in this manner expir'd in a Moment, by the Constriction of the Cords. *Vieussens*, in his *Neurographia*, tells us, that the Nerves of the eighth Pair, and those constituting the intercostal Pair, being transversely cut about the Neck, the Animal is forthwith seiz'd with a Languor, which is the Forerunner of approaching Death: He suffers tremulous Motions, his Strength gradually fails, and, in about twenty-four Hours he is deprived of Life. I made the same Experiment on a Dog, tying on each Side of the Neck, the eighth and intercostal Pairs: The Dog howl'd no more, but with a violent Effort utter'd a kind of obscure Noise: At certain Intervals he was seiz'd with an intolerable Madness, biting every thing which came in his Way with incredible Rage; but before he was seiz'd with the Paroxysm of his Madness, the Point of his Nose began to be surprisingly corrugated. He liv'd in this Condition from Six in the Afternoon till Eleven at Night; but I found him dead next Morning.

From all these Circumstances it is obvious, that a Division of the cardiac Nerves in Animals, is succeeded by Death sooner

or later; and that the Animal almost immediately labours under, as it were, the Agonies of Death; which happens from the Inability of the Heart any longer to expel the Blood contain'd in its Cavities. But we observe that, in some Diseases, Patients remain in such Agonies for two Days, or longer, because the Blood cannot be forced thro' the obstructed Arteries. The same seems, also, to have happen'd in these Animals, which after these Nerves were ty'd or divided, protracted their Lives for a considerable time: Perhaps, also, other small Nerves distributed thro' the Substance of the Heart, so long sustain'd its vital Motion. Thus in *Hist. de l'Academie des Sciences, An. 1734* we are told, that there was found a Ramification of a considerable Nerve, arising from the semilunar gangliform Plexus of *Viessens*, near the large mesenteric Plexus, ascending from the Abdomen to the Breast, and inserted into the Right Auricle and Basis of the Heart. Perhaps, also, the surprising Property of the Heart, by which, when divided from all the Vessels, it continues its Motion, might continue Life after the cardiac Nerves were destroy'd.

Thus it is known from Experiments, what happens in Brutes in consequence of a Division of the cardiac Nerves; but in Men it rarely happens that the Trunks of the eighth Pair, or of the intercostal Nerves, are wounded, but, at the same time, the Soundness of the adjacent Vessels is destroy'd, the wounding of which alone proves mortal: For the Trunks of the Carotids, and the large jugular Veins in the Neck, lie above these Nerves; and, behind, the lateral Processes of the *Vertebrae* hinder them from being easily wounded. Nor do I remember, says *Van Swieten*, to have found, either among Physicians, or Surgeons, a single Instance, in which the cardiac Nerves alone were wounded.

Secondly, Such as cause an Effusion of Blood from the wounded Cavities of the Heart; for which Reason deep Wounds penetrating its Cavities, are mortal.

As the Heart is a Muscle continually mov'd, and whose Parts so conspire, and are united, that one cannot want the Assistance of the other; and as it is the Fountain of Life, whence all the animal Functions flow; so many of the ancient *Greeks* and *Arabians* affirm'd, that Wounds of the Heart proved soon and infallibly mortal: But they seem to have asserted this rather from Theory, than from Experience.

There are some surprising Relations found in Authors, which, if true, would prove that Animals have liv'd without the Heart. Thus *Pliny* the Second, in *Lib. II. Cap. 37*. tells us, that the first Day *Caesar* the Dictator made a Procession in his purple Robes, and sat in a golden Chair, he twice found the Heart wanting in the Animals he sacrificed. *Plutarch*, also, and *Suetonius*, in their Lives of *Caesar*, affirm, that the Heart of the Sacrifice did not appear to him; which was look'd upon as a bad Omen; because an Animal cannot naturally subsist without an Heart. But the Haruspices often boldly imposed on the Credulity of the Multitude, that they might at Pleasure decree what was to be done. Hence these Testimonies are very suspicious; since they are so directly repugnant to the known Oeconomy of Animals.

For it is hardly credible, that the Heart was ever wanting in an human Creature, or in any other Animal, tho' the Incautious might be deceiv'd by the great Variety of the Situation, Figure, and Bulk, of the Heart, sometimes brought on by Diseases, as is certain, from practical Observations.

The celebrated *Boerhaave*, in the Year 1720. had a surprising Observation communicated to him by a skilful Anatomist in *Edinburgh*, which proves that there may exist in Nature, such Monsters as perplex the Knowledge of the Use of the Parts. This skilful Anatomist when carefully searching for the seminal Vessels, in a large, live, and robust Rat, found the Right Kidney double; but, upon opening the Membrane which cover'd it, the genuine Right Kidney appear'd; but the other Body, which he took for a Kidney, and which was included in its proper Covering, was of such a Bulk and Figure as the Heart of that Animal usually has, with its Base towards the superior, and its Apex towards the inferior Parts. This Heart when carefully examined had two Ventricles, divided by a kind of Partition; there was, also, a Left Auricle, Valves, and fleshy Columns; but there were not the least Traces of the Right Auricle, the *Vena Cava*, the pulmonary Veins and Arteries, nor the Aorta. Upon opening the Thorax, neither *Pericardium*, nor Heart, appear'd; but from the *Vertebra* of the Thorax, in the middle Space between the two Lobes of the Lungs, arose the Right Auricle, from which the pulmonary Arteries were distributed. The Vessels which return the Blood from the Lungs were united into one Trunk, forming the Aorta, which was afterwards distributed in the usual manner. The Animal was adult, and all the other *Viscera* form'd in the natural manner: There was, indeed, an Heart, furnish'd with

the usual Parts, but deviating from the natural Situation, and useless. Without the Action of the Heart, therefore, this Animal not only liv'd, but was sound, and agile.

It is sufficiently certain, from Experience, that some Animals have lived for some time after their Hearts have been cut out. *Galen*, in *Lib. 2. de Placitis Hippocrat. & Platon. Cap. 4*. tells us, that, in Sacrifices, the Victims, after their Hearts are taken out and laid on the Altar, respire, bellow strongly, and even run till they die by the Effusion of Blood. *Vesalius*, also, informs us, that he has seen Dogs, and especially Cats, after their Thorax was laid open, and all the Vessels of the Heart were constricted by a Ligature passed about the Base of the Heart, and the Heart itself was cut out below the Ligature, run a considerable Way, when the Cords, with which they were ty'd, were loos'd. After the Hearts were taken out of Puppies cut from the Uterus of a live Bitch, their Life remain'd for a Quarter of an Hour with a sensible Motion of their Members, and a certain whizzing Noise. It is, also, certain, from Zoology, that Worms and other Animals of a similar Species, have liv'd for a long time after their Hearts have been cut out; and after such Animals are divided into Parts, each Segment retains Life for a considerable time. But from the Observations of *Malpighi* and *Lewenboeck* it is certain, that Animals have, in their original State, liv'd the Life of Worms. Hence, perhaps, so long as these Animals remain in the Uterus, they retain something of their antient Tenacity, or Toughness of Life. *Boyle* in his Treatise *de Utilitate Philosophiae Experimentalis*, tells us, that a Frog, after its Heart was cut out, leap'd about, swam when put into Water, and with Agility jumping out of the Vessel full of Water, continued to leap about the Room for an Hour, and more.

Lord Verulam, in *Hist. Vita & Mortis*, tells us, that a certain Man, after the Executioner had cut out his Heart and held it in his Hand, was heard to utter three or four Words of Prayer; but that Author informs us, that the Criminal's Friends had given the Executioner a Reward for executing his Office quickly, and freeing the Malefactor from the racking Pains he would have otherwise been subjected to. Hence it is not very surprising, that, since the preternatural Cold a little constricted the divided Vessels, and since in these last Moments of Life, the Disposition of all the animal Organs was very intense, some Pressure of the Blood should as yet act for a few Moments on the Brain, by which Pressure on the Organs thus disposed, during that last Effort, the Criminal's Speech continued for a short time; especially if we consider, that the Lungs, after the Aperture of the Thorax, being collapsed and every-where contracted by a preternatural cold Air, expel'd their contain'd Air with a pretty strong Force. This Instance is not, therefore, repugnant to the Necessity of the Heart: But in the Experiment of *Vesalius*, where all the Vessels were ty'd, the contractile Arteries, their Elasticity being contracted by the cold Air, might force the Blood thro' the Brain and *Cerebellum*, and, consequently, continue Life for a considerable time.

The Experiments made on Frogs, Vipers, and Tortoises, which evince that these Animals may live a considerable time after their Heart is taken out, demonstrate, that the manner of Life in Animals cannot be limited by very general Rules, but that it is different in different Animals. So that it is not easy to give a general History of Life, since we can only draw our Observations from Experiments made.

But no certain Observations have evinced that the Heart was ever wanting in human Creatures, or that they have, for a considerable time, surviv'd the total Destruction of its Fabric: Hence the Reason is obvious, why considerable Wounds of the Heart are justly look'd upon as mortal. It is, however, certain, that all Wounds of the Heart are not mortal; and that they differ much from each other, according to the different Parts of the Heart in which they are inflicted.

For if, by a Wound, the Trunk of the coronary Vein or Artery, in the Base of the Heart, is divided, a speedy Death must inevitably follow; because, by a great Impetus, which is the strong Contraction of the Aorta, the Blood, which soon returns by the Veins, is, thro' the coronary Artery, transfus'd thro' the muscular Substance of the Heart; for at every Contraction of the Heart, the whole Heart becomes pale, because all the Blood is expressed: But the Moment after, when the Heart is in its Diastole, all the Vessels, running thro' its Substance, are fill'd.

But if a Wound has penetrated into the Right Ventricle of the Heart, the Blood will be discharg'd into the *Pericardium*, partly from the wounded Vessels of the Substance of the Heart, and partly from the Cavity of the Heart; and from the *Pericardium* it will be discharg'd into the Cavity of the Thorax, or flow from the external Wound: Such a Wound will be dilated, when the Heart is full; for at the time the Heart is constricted, the wounded Parts rather accede to each other: Nor, at that time, will there be a great Effusion of Blood. When the

Blood; however, is discharg'd, the Strength will be impair'd, tho' the Action of the Heart and Life still remain: But when the greatest Weakness is present, the Heart is almost at rest: If, at this time, there is no muscular Motion, the venous Blood will flow into the Heart with a calm Motion, and in a small Quantity. And if, in this Case, the Patient abstains from such Things as, by Nutrition, suddenly augment the Quantity of the Blood, and from Cordials which, by their stimulating Quality, always augment the Motion of the Fluids, it seems possible to preserve Life, and restore Health. For unless the Matter was confirm'd by practical Observations, in wounded Persons, and Women who have suffer'd Abortion, no one could believe with how small a Quantity of Blood, and how slow a Degree of its Circulation, a Man can live. Thus when, by a violent Hæmorrhage, the Quantity of Blood is greatly diminish'd, and the Strength impair'd, the Wound inflicted is hardly any more dilated, the Rudiments of a Concretion begin to be form'd, and gradually perfected, provided, by an increas'd Quantity and Motion of the Blood, those Parts are not broken which had begun to be concreted.

Besides, in Wounds of the Right Ventricle of the Heart it is to be observ'd, that the Lungs continue to act, and, by their Dilatation, prepare an easy Way for the Blood forced from the Right Ventricle of the Heart. Hence, in the time of the Systolic, on account of the free Passage thro' the Lungs, such a Quantity of Blood will not be express'd thro' the Wound. Hence arises a greater Opportunity of consolidating the Wound.

But Wounds of the Left Ventricle of the Heart seem to be far more dangerous; for if the Left Ventricle of the Heart is wounded, and not entirely perforated, such a Wound must necessarily be dilacerated, since the Left Ventricle of the Heart, by its strong muscular Force, in which it far surpasses the Right, presses its contain'd Blood into the Aorta, which makes a considerable Resistance, and dilates not only that, but all its Ramifications, throughout the whole Body: For the Fibres of the Left Ventricle of the Heart, being then distracted by the contain'd and resisting Blood, the Wound will be increas'd, till, penetrating into the Cavity of the Heart, it prepares a more easy Discharge for the Blood than thro' the Aorta, where there is a considerable Resistance: Or, if any Consolidation is begun here, it is to be fear'd, lest the Part being preternaturally weak, should be extended into an aneurysmatic Tumor, and the Action of the Heart be, by that means, disturb'd; so that Life may indeed be protracted, tho' with a Train of Miseries, which can only be terminated by Death.

But if the Left Ventricle of the Heart is perforated with a large Wound, a speedy Death infallibly ensues: But in all Probability, that Wound would, of all others, prove most suddenly mortal, which should divide the Beginning of the Aorta immediately above its Valves. But when the Left Ventricle of the Heart is perforated, the Valves of the Aorta sustain the Blood contain'd in the Arteries. Hence the whole arterial System remains full, after which, the Arteries, being contracted, propel the Blood; and thus Life may be sustain'd, for some time.

Medicinal Observations have evinced, that, after Wounds of the Heart, Men have liv'd for a considerable time, especially when only the Right Ventricle is perforated: Besides, some Observations evince, that a Consolidation of Wounds of the Heart is possible; Instances of which are found in *Thom. Barthol. Hist. Anatom. varior. Cent. 1. Hist. 77. Schenckius, Observat. Med. varior. Paré, Lib. 10. Cap. 32. Alst. Leips. An. 1705. and Miscellan. Cur. Dec. 2. An. 6.*

From all the Instances recorded in these Authors, we may conclude, that though Wounds of the Heart are always dangerous, yet they are not at all Times suddenly and infallibly mortal: It is, also, certain, that we ought not to despair in the most desperate Wounds, since, whilst a weak and languid Life is only sustain'd, such Consolidations of Wounds frequently happen, as could not have been expected.

Thirdly, Those Wounds which derive the Blood from the Heart, Brain, and *Cerebellum*, either into some Cavity of the Body, or out of the Body, and which cannot be cur'd on account of the Situation of the Places; such as large Wounds of the Lungs, Liver, Spleen, Kidneys, Pancreas, Mesentery, Stomach, Intestines, Uterus in pregnant Women, Bladder about its large Arteries, the Aorta, Carotid, Vertebral, and the like Arteries and Veins.

In the preceding Numbers of this Aphorism we have shewn, that those Wounds are mortal which destroy the Fabric of the *Cerebellum*, or which, by wounding the *Medulla Oblongata*, or the spinal Marrow near its Origin, or the cardiac Nerves, hinder the vital Influx of the Spirits secreted from the Blood by the Fabric of the *Cerebellum* into the Heart, and other Parts of the Body, from performing the Functions requisite for Life: But

that these vital Spirits may be separated by the Fabric of the *Cerebellum*, it is requisite that the Blood should, by the muscular Force of the Heart, be forced into the Arteries. Hence deep Wounds, penetrating into the Cavities of the Heart, are judg'd mortal. The whole Action of the Heart consists in receiving the Blood convey'd thro' the Veins, and propelling it into the Arteries, after it is receiv'd: All Wounds, therefore, which so injure the Vessels which convey the Blood to the Heart, or receive the Blood expel'd from the Heart, in such a manner that the Blood flows out of the Body thro' the open Wound, or is extravasated and accumulated in the Cavities of the Body, without returning again to the Heart prevent it from being convey'd in a due Quantity, and with a proper Impetus, thro' the Arteries of the Brain: Hence all the Functions of the Brain and *Cerebellum* must necessarily be disturb'd, and at last totally abolish'd. Nor is it of any Importance, whether the Vessels are wounded in their Course, before they are dispers'd thro' the Viscera, whose Fabric they constitute; or whether they are wounded in the Viscera with the like Effect, that is, such a considerable Effusion of the vital Blood as injures the Action of the Heart and *Cerebellum*. All the Wounds, therefore, of the Viscera, and Vessels enumerated in this Aphorism, are not absolutely mortal, unless under this Limitation: Besides, it is requisite that the Condition of the Wound made be such, that the Effusion of the Blood cannot be stop'd by Ligature, or the other Assistances of Art. Among the Wounds of this Kind are reckon'd, first,

LARGE WOUNDS OF THE LUNGS:

The Right Ventricle of the Heart receives all the Blood of the Body convey'd thro' the Veins, and propels it thro' the Lungs into the Left Ventricle: When, therefore, a large Wound is made in the Lungs, the Blood forc'd from the adjacent Heart will be discharg'd from the divided Vessels, and, consequently, will not return to the Left Ventricle of the Heart, but flow thro' the Wound made; or passing into the areal Cavity of the Lungs, it will be vomited up copiously; or, being extravasated into the Cavity of the Breast, it will hinder the free Expansion of the Lungs. Hence the mortal Effects of such Wounds are sufficiently obvious.

Medicinal Observations sufficiently evince the fatal Events of Wounds of the Lungs; Instances of which may be seen in *Bohnus de Renunciatione Vulnerum*. In practical Authors, Instances, also, occur, in which Wounds of the Lungs have been cur'd; but these Wounds have either been very slight, or such as that the Surgeon's Hand could have Access to them. See *Hildanus, Cent. 2. Obs. 32. and Cent. 1. Obs. 46.* It is, also, to be dreaded, that even slight Wounds of the Lungs may degenerate into Ulcers, which afterwards waste the Patient, by a slow Consumption. An Instance of this occurs in *Forestus, Obs. Chirurg. Lib. 6. Obs. 4.*

As for large Wounds of the Liver; the collected venous Blood of the abdominal Viscera is, by means of the *Vena Portæ*, convey'd thro' the Liver, and the Trunk of the *Vena Cava Ascendens* is inserted into the Liver, the Whole of which appears soft, and resembles a Sponge full of Blood. The hepatic Arteries, indeed, when compar'd with the great Bulk of the Liver, are very small; but considerable Ramifications of the *Vena Portæ* are distributed thro' the Liver. Hence it appears, that Wounds of the Liver are always very dangerous, and, if considerable Ramifications of the Vessels, distributed thro' the Liver, are wounded, always mortal, and that, for the most Part, very suddenly; because a large Quantity of Blood is discharg'd into the Cavity of the Abdomen, and thro' the Wound. Hence *Deliquium* and Death soon succeed. See *Hippocrat. Epidem. 7.* But it is sufficiently obvious, that those Wounds of the Liver are most dangerous, which are inflicted about the *Porta*, which are, for that Reason, pronounced incurable, by *Celsus*, in *Lib. 5. Cap. 26.* But the Wounds made in the thick Part of the Liver he asserts to be cured with Difficulty, though they are not absolutely incurable. *Hildanus*, in *Cent. 2. Obs. 34.* gives us a memorable Instance of the Cure of a Wound in the Liver; but, from the Description that Author gives, it appears, that the Wound did not penetrate to the large Ramifications of the hepatic Vessels. Tho' slight Wounds of the Liver are not forthwith mortal, yet they generally prove fatal at last. See *Tulpius, Observat. Medic. Lib. 2. Cap. 26.*

As for large Wounds of the Spleen; tho' *Democritus*, in *Epist. ad Hippocrat. de Natur. Human.* affirm'd, that the Spleen, which lies opposite to the Liver, was not only a useless, but, also, an hurtful Part of the Body; tho', by Experiments made on live Animals, it is certain, that the Spleen may be cut out, without destroying Life, or even greatly disturbing Health; and tho' *Mr. Boyle*, in his Treatise of the Usefulness of experimental Philosophy, tells us, that this has been done in Men; yet the Blood-vessels of the Spleen are so large, and so near the Heart, that mortal Hæmorrhages are justly to be dreaded after Wounds of the Spleen: Instances in which Wounds of this Organ have prov'd

prov'd mortal, may be seen in *Tulpius, Obs. Medic. Lib. 2. Cap. 29.* and *Bohnus, de Remunitione Vulnerum.*

But slight Wounds of the Spleen, as well as of the Liver, are not always absolutely mortal, tho' it is highly probable that they are always very dangerous.

As for large Wounds of the Kidneys; *Celsus, in Lib. 5. Cap. 26.* affirms, that Patients, who have their Kidneys wounded, cannot be preserv'd. The Person who considers the Largeness of the emulgent Arteries, will easily believe that a mortal Hæmorrhage may ensue, if the large Ramifications of these Arteries are divided, either in the Substance of the Kidneys, or at their Ingress into the Kidneys: And if, at the same time, the *Peritonæum* is wounded, the Blood will be discharg'd into the Cavity of the Abdomen; but if a Wound, inflicted in the posterior Part of the Body, wounds the Kidneys, whilst the *Peritonæum* remains entire, there will be a great Effusion of Blood into the pinguinous Coat lodg'd in the Interstices of the Muscles: Nor can the Blood flow so freely from the Wound in the Kidneys; nor is this Doctrine destroy'd by that Passage of *Hippocrates, de Intern. Affection. Cap. 15.* where he orders Section for the Stone in the Kidneys, in the following manner: "When the Pain is excessive, wash the Part aggriev'd with a large Quantity of warm Water, and apply tepid Fomentations; but when it becomes tumid, and protuberant, make an Incision hard by the Kidney [*κατὰ τὸν νεφρὸν*], and, having extracted the Pus, carry off the Sand by diuretic Medicines." For it is sufficiently obvious, that, in this Passage, he does not mean that an Incision should be made in the Kidney, and the Sand evacuated by that means.

That all Wounds of the Kidneys, however, are not mortal, may be seen in *Forestus, Lib. 25. Obs. 20.*

As for large Wounds of the Pancreas; if the Trunks, or large Ramifications of the Vessels running thro' the Pancreas, are divided, the Blood being discharg'd into the Cavity of the Abdomen, and becoming afterwards corrupted, the Effect of such a Wound may be Death: But as the Pancreas lies under the Stomach, it can rarely be wounded, but the Wound must, at the same time, pass thro' some of the other Viscera.

As for large Wounds of the Mesentery; how large the Blood-vessels, running thro' the Mesentery, are, and in what Order they are placed, *Eustachius, in Tab. XXVII. Fig. 2, and 3.* has beautifully demonstrated. Besides considerable Ramifications of the *Vena Portæ* and *Vena Cava*, large arterial Trunks, that is, the superior and inferior mesenteric Arteries, are, also, convey'd thro' the Mesentery. When, therefore, these Vessels are divided, by a wounding Cause, a mortal Hæmorrhage may ensue, and the Cavity of the Abdomen be fill'd with the extravasated Blood. An Instance of this is found in *Bohnus, de Remunitione Vulnerum*: *Ruyssch*, also, in *Adversar. Anatom. Decad. 2. N^o 4.* tells us, that Death follow'd a Rupture of the Vessels of the Omentum, whilst the whole Cavity of the Abdomen was fill'd with the Hæmorrhage. There is still another Danger attending Wounds of the Mesentery, which seems first to have been adverted to by *Ruyssch*: For that Anatomist, being for more than fifty Years employ'd, in *Amsterdam*, in inspecting the Bodies of those who were taken off by a violent Death, in order to make a Report to the Judges, with respect to the Condition of the Wounds, says, that he has frequently observ'd, that Wounds of the Mesentery prov'd mortal in two or three Days after the Patients had been rack'd with the most exquisite Pains: But, upon a careful Inspection, it was certain, that no other Part, of any Moment, was wounded. Besides, when Poulterers castrate Capons, if they see the Mesentery wounded, in the Operation, they immediately kill the Animal; because they know, from Experience, that it will soon die by such a Wound. The mortal Effect of such Wounds seems to depend on the wounding of the Nerves of the Mesentery. How great Influence the Nerves, dispers'd thro' the abdominal Viscera, have on the vital Functions of the human Body, is sufficiently obvious, from medicinal Observations in incarcerated Hernias, and Interceptions of the Intestines.

Perhaps something like this is hinted at by *Hippocrates*, in his *Coacæ Prænotiones*, when he tells us, "That those whose interior Nerves, whether small or large, are wounded, die, if the Wound is transverse, and large; tho' some escape, when it is small, and strait." *Cornarius*, instead of *ὅς ἐστι τὰ ἐντὸς*, reads *ὅς ἐστι τὰ ἐντὸς*; which Reading approaches near to this Opinion.

As for large Wounds of the Stomach and Intestines; we here consider such Wounds of these Parts as may, by a Rupture of their Blood-vessels, prove mortal, in consequence of the Effusion of Blood. For those Misfortunes, which succeed an Evacuation of the Contents of the Stomach and Intestines thro' the Wound, are treated of under the Article ABDOMEN. The Stomach, then, is surrounded by pretty large Vessels, which, about both its Orifices, descend towards its Bottom, and are, in their Course, by fre-

quent Anastomoses, join'd to similar Vessels rising upwards from the Bottom of the Stomach. Hence, when a considerable Ramification is divided, the Blood contain'd in all the other Vessels of the Stomach, will easily flow thro' the wounded Vessel. In practical Authors there are many Instances of Death succeeding Wounds of the Stomach; a memorable one of which accompanied with an excessive Hæmorrhage, is found in *Bonetus, Sepulchretum Anatomicum, Tom. 3.*

But the Intestines annex'd to the Mesentery, by its means receive their Vessels, which being applied on both Sides to the intestinal Canal, are, in that Part of the Intestines which is opposite to the Mesentery, mutually join'd, by Anastomoses. Wounds, therefore, of the Intestines, especially about the Mesentery, may divide pretty large Trunks of Vessels; by which means, large Effusions of Blood into the Cavity of the Abdomen, and Death, will happen. See *Bonetus Sepulchretum Anatomicum, Tom. 3.*

The Danger of Wounds in the large Vessels of the Stomach and Intestines, is much augmented by the continual peristaltic Motion of these Viscera; in consequence of which, such Wounds are never in a State of Rest: Perhaps, also, the like Misfortunes are produc'd by Wounds of the Nerves dispers'd thro' the Stomach, with those succeeding Wounds of the Mesentery.

In practical Authors, however, there are frequent Instances of Wounds of the Stomach and Intestines cur'd; so that all such Wounds are not to be look'd upon as mortal.

As for Wounds of the Uterus in pregnant Women; the Uterus, after a Woman has conceiv'd, and the impregnated Egg, by its increas'd Bulk, begins to fill the Cavity of the Uterus, is extended every Way, and in the like Proportion; all its Vessels are every way enlarg'd, and receive a greater Quantity of Humours. Hence the Uterus of a pregnant Woman is almost as thick as the Uterus, when contracted, in a Woman not pregnant; and yet it is distended to an incredible Bulk, by the Dilatation and Repletion of its Vessels. Hence *Hippocrates*, in *Lib. de Mulier. Morb. Lib. 1. Cap. 23.* tells us, "That when a Woman is pregnant, the Blood is gradually convey'd from the whole Body to the Uterus, and enlarges it." And hence he deduces the Reason why the Colour of pregnant Women is deprav'd; which is, that the pure Blood is daily convey'd from the Body of the Mother to that of the Fœtus. Hence it appears, that Wounds of the Uterus, when impregnated, are very dangerous; because its Vessels are distended by so large a Quantity of Blood. And this Danger is increas'd by the Fœtus, which, distending the Uterus, hinders it from contracting itself, and its Vessels. But if, immediately after a Wound inflicted in the Uterus, the Fœtus was suddenly excluded, there would be some Hopes that, in consequence of the Contraction of the Uterus, the Hæmorrhage might be stop'd, and the Wound consolidated; as it actually happens in the Cæsarean Operation. Instances of this may be seen in *Act. Lips. An. 1693.* and *Hist. de l'Acad. Royal. des Sciences, An. 1731.*

As for Wounds of the Bladder, about its larger Arteries; tho' *Hippocrates*, in his *Tr. de Morbis, Lib. 1. Cap. 3.* condemn'd Wounds of the Bladder as mortal, and affirms, that they could not be consolidated; yet it is certain, from frequent and undeniable Experiments, that, in Cutting for the Stone, Wounds of the Bladder are happily and successfully cur'd: Yet there is a Danger, lest the large Vessels running thro' the Bladder, being divided, produce an excessive Hæmorrhage. For the Vessels arising from the large adjacent Trunks of the Iliac Arteries discharge the Blood with a violent Impetus. The Origin and Course of these Vessels are found in *Eustachius, Tab. XII. Fig. 1.* This Danger is increas'd, because in those afflicted with the Stone, the Bladder is often thicker, and its Vessels more dilated, than in a natural State: But when these Vessels are divided, the Bladder, so long as the Stone remains in its Cavity, cannot totally contract itself; for which Reason they continue to discharge the Blood. But when the Stone is extracted, the Bladder contracted, and the Urine freely discharg'd thro' the Wound, the divided Vessels may be again clos'd.

As for Wounds of the Aorta; the Blood returning from the Lungs to the Left Ventricle of the Heart, is all forc'd into the largest arterial Vessel of the whole Body, which is call'd the Aorta, which being incurvated, tends downwards, and being incumbent on the Spine, and declining a little to the Left Side, as far as the *Os Sacrum*, is there divided into two equal Ramifications call'd the Iliac Arteries. During the whole of its Course from the Heart to the Part where it is divided, it retains the Name of the Aorta: Now it is sufficiently obvious, that when the Aorta itself is wounded, there are no Hopes of a Cure left, since, with a direct Impetus, it receives all the Blood from the Left Ventricle of the Heart, and there is no Access to the Hands of the Surgeon; for it lies conceal'd in the internal Parts of the Body incumbent on the *Vertebrae*: But such a Wound will prove the sooner mortal, the nearer it is to the Heart.

As for Wounds of the Carotids; these Arteries arise from the Curvature of the Aorta, which draws its Origin from the Left Ventricle of the Heart. This is at least the Case with the Left Carotid Artery, though for the most part, the Right arises from the Subclavian Artery of the same Side. These two Arteries on each Side of the Aspera Arteria, run down to the Larynx, where each of them is divided into two Ramifications, one of which lying principally towards the external Parts of the Head, is called the *external Carotid*, and the other which enters the Cranium, and is distributed through the Brain, is called the *internal Carotid*. Through their whole Course from their Origin out of the Aorta, or Subclavian Artery, to that Place where they are divided into two Ramifications, they are called simply the *Carotids*. In Mankind these Arteries are almost as large as the little Finger: Hence a large Hæmorrhage must necessarily happen when they are wounded, since being so near the Heart, they receive the Blood propelled from it with a great Impetus. It is true the Carotids, during this whole Course, are so near the external Integuments of the Body, that their Pulsation in the Neck may be easily perceived by the Finger. Besides, it is probable, that a Ligature may be safely applied to one of the Carotids, since a sufficient Quantity of Blood may be conveyed to the Head, by the means of the other, and the vertebral Arteries. In a Dog whose recurrent Nerves I had cut off eight Days before, I tied both Carotids, nor could I observe any Inconvenience produced by that means; for eight Days after I found the Animal brisk and lively. Then I tied the Jugular Veins without any observable Disadvantage to the Animal, and four Days after found him entirely in Health. But examining the Ligatures applied to the Carotids, I found them firm, and a thick compact Thrombus lodged between the Ligature and the Heart. Upon laying open the Brain I found no Change in it, but its Bulk appeared rather increased than diminished.

But if we consider the Difficulties which occur when the Carotid Artery is divided in a Man, it will appear, that such a Wound is justly to be called *mortal*; for an excessive Hæmorrhage may in a few Minutes put an End to the Patient's Life. But that such a Patient should be preserved, it would be requisite that a skilful Surgeon should be present the Moment the Wound is inflicted, in order to compress with his Fingers, against the resisting Aspera Arteria, both Extremities of the divided Carotid. Ligatures ought, also, to be applied to the Limbs, that thus the Veins being compressed, a smaller Quantity of Blood may return to the Heart, by which means the Impetus of the discharged Blood must be lessened. After these Measures are taken, both Extremities of the divided Carotid, are to be found out and tied; for it is not sufficient to tie that Part of the Artery which is next to the Heart, since the Blood would continue to flow through the other Extremity of the divided Artery, because the Carotids under the Basis of the Brain, are joined with each other, and with the Vertebral Arteries by pretty large Ramifications. From all these Circumstances it is obvious, that one Surgeon, tho' ever so dexterous, is not sufficient for Wounds of this Kind; but that two at least are absolutely requisite. Besides it is not probable, that the Extremities of the divided Artery can be found, without rendering the Wound larger by a Division of the Integuments. Hence the subsequent Death of the Patient would be imputed to the Surgeon, though he had acted with ever so much Care and Skill in the Discharge of his Office: But if the Patient should lose so much Blood, that falling into a Deliquium the Hæmorrhage should cease, such a Method may be tried.

As for Wounds of the Vertebral Arteries; the Vertebral Arteries arising from the Subclavian Arteries run on both Sides through the Perforations of the transverse Processes of the Vertebrae of the Neck towards the Cranium. In this Course they send off small Ramifications through the Joinings of the Vertebrae to the Spinal Marrow, and its Coverings; as, also, to the adjacent Muscles. When, therefore, these Arteries are divided, they cannot easily retract themselves and close their Orifices; and, as by their Ramifications sent off under the Basis of the Cranium, they communicate with the internal Carotids, hence the Blood conveyed through the Carotids, may be discharged from these Arteries when wounded. Hence it is obvious, that Wounds of them are exceedingly dangerous. In this Case there is no Opportunity of tying these Arteries when wounded, since their divided Extremities are concealed within these bony Perforations. The only Hope would be, if the Patient being extremely weakened by an Hæmorrhage, and a languid Life still remaining, the Extremities of the divided Artery could be consolidated by a small Quantity of mild and proper Aliment, without the Exhibition of Cardiacs. But that this is not absolutely impossible, is certain, from the Cures produced in Wounds of the Heart, and from a memorable Instance, in which the Patient lived after the Division of the Subaxillary Artery.

Now it is sufficiently obvious, that the same Danger attends Wounds of other large Arteries, such as the Emulgents or Iliacs, for Instance.

It is, also, certain, that Wounds of the large Veins are mortal, for the same Causes; but as most of the Veins lying near the Surface of the Body, may be more easily compressed, and as the Velocity of the Blood is not so great in the Veins, as in the Arteries, hence it is obvious, that all other Circumstances being considered, Wounds of the Veins are not so dangerous as those of the Arteries.

4thly, Those Wounds which absolutely prevent Respiration: Such as a Division of the Larynx, with a Retraction of the divided Parts; large Wounds of the Bronchia, broad Wounds which perforate both Cavities of the Thorax, and admit the external Air, and Wounds which penetrate the Diaphragm on both Sides of the Mediastinum, or which affect its nervous Parts.

In a Man, after it is brought into the World, that the Blood may pass from the Right to the Left Ventricle of the Heart, it is requisite that the Lungs dilated by the inspired Air, should make way for the Blood forced from the Right Ventricle through the Pulmonary Artery, into the Pulmonary Veins, and thence into the Left Ventricle of the Heart. Respiration is therefore so necessary to Life, that if it is destroyed but for a few Minutes, Life ceases. But in order to Respiration it is necessary the Air should freely enter and expand the Lungs. All Wounds, therefore, which hinder the Ingress of the Air into the Lungs, or their Dilatation by the Air are mortal: Of this Kind are the following:

A Division of the Larynx accompanied with a Retraction of the divided Parts: The Aspera Arteria consisting of cartilaginous Segments, being always open, and never capable of collapsing, nor of being easily compressed, preserves a free Passage for the Air into the Lungs. When, therefore, a Wound so divides this aerial Pipe, that the inferior divided Extremity shrinks back and conceals itself in the adjacent Parts in such a manner as not to admit the Air, the Patient's Life is gone. But if notwithstanding a very large Wound, a free Passage is preserved for the Air into the Lungs, such a Wound will not be mortal, as we find from incontestable Proofs. Frequent Instances occur to Physicians and Surgeons, in which Persons wearied of Life, have laid violent Hands on themselves in such a manner as to divide the Aspera Arteria, as, also, of Persons who have suffered that Misfortune by Robbers, who have nevertheless been afterwards totally cured. Instances of this Kind are found in *Tulpius, Observat. Med. Lib. 1. Cap. 50. Thom. Bartholin. Histor. Med. Cent. 5. Hist. 89. and Paré in Lib. 10. Cap. 31.*

As for large Wounds of the Bronchia; after the Aspera Arteria descends through the anterior Part of the Neck into the Thorax, about that Part where the Aorta, arising from the Heart, is incurvated, it is divided into two Ramifications, each of which is distributed to the Lobe of the Lungs on its respective Side. Then these Ramifications losing the Name of the *Aspera Arteria*, are called the *Bronchia*; and the Subdivisions of these Ramifications made in the Lungs, also, retain that Name. Since, then, the Office of the Aspera Arteria, and Bronchia, is to distribute the inspired Air through the aerial Cavities of the Lungs, the Air making its Way through large Wounds of these will be accumulated in the Cavity of the Thorax, and this Air being expanded by the Heat of the Place, will compress the Lungs, and by that means hinder the Whole of their Action. Hence ensue Suffocation and Death; especially if the Bronchia on both Sides are so wounded; for in this Case Respiration is totally destroyed. Hence *Hippocrates*, in *Casac. Prænot. 509.* tells us, "That the Patient dies, who having large Wounds so inflicted in the Aspera Arteria and Lungs, that in consequence of the Wound of the Lungs, less Breath is discharged by the Mouth than by the Wound." But the Danger of such Wounds is increased, because the Bronchia hardly seem capable of being hurt without dividing the Blood-vessels accompanying the bronchial Ramifications.

As for broad Wounds penetrating into both Cavities of the Thorax, and making Way for an Admission of the Air; so long as the Lungs are every-where contained in the Thorax exactly closed, they are always more distended than if they were every-where exposed to the free Air; for in this last Case they collapse, and are contracted into a smaller Space, especially by the contractile Action of the muscular Fibres, which connect the Segments of the Bronchia with each other; for in a natural State there is no Air between the Pleura and the Lungs; but a free Access of that Fluid into the Lungs is left through the Glottis. Hence the Lungs are more distended by the Air which enters by the Aperture of the Glottis, than they are compressed

compressed by the external Air acting on the Ribs and Diaphragm, because the arched Figure of the Ribs, and the Connection of the Diaphragm with the Ribs and Vertebrae, hinder the external Air from pressing the Diaphragm too far into the Cavity of the Breast, that thus there might be a proper Balance or Equilibrium, between the external Air, and that contained in the Lungs. This is the Reason why the Lungs always remain contiguous to the Pleura, even after Death, so long as the Thorax remains entire and close, as is sufficiently obvious, when, without wounding the Pleura, the Intercoastal Muscles are cautiously separated; for in this Case the Lungs appear contiguous to the Pleura, which on account of its Thinness, is generally pellucid: But when the Pleura is perforated, and the Air admitted into the Cavity of the Breast, the Lungs collapse, are immediately contracted into a smaller Space, and recede from the Contiguity of the Pleura. The Diaphragm before concave towards the Abdomen, highly tense, and thrust into the Cavity of the Breast, immediately becomes flaccid, and sinks downwards. From these things it is sufficiently obvious, that in a natural State the Lungs are every-where contiguous to the Pleura, and that no Air is lodged between the convex Surface of the Lungs, and the Cavity of the Pleura: Whilst therefore by Muscles subservient to that Purpose, the Ribs are elevated, and separated from each other, the Diaphragm contracted, and rendered plain, and consequently the Cavity of the Thorax enlarged, there would be a Space free from Air between the Pleura and the Surface of the Lungs. But the Air entering freely through the Glottis, so distends the Lungs, when the Breast is dilated, that they always remain contiguous to the Pleura, and thus Inspiration is performed. But when, in consequence of a Perforation of the Cavity of the Thorax, there is a free Access of the Air into that Cavity, the Pressure of the Air, which entered by the Glottis, is balanced; hence the Lungs will not be distended, but by their proper Contractility take up a smaller Space than before. If this happens in both Cavities of the Breast at one time, both the collapsed Lobes of the Lungs cannot be dilated by the inspired Air; hence the Right Ventricle of the Heart cannot force its Blood through the collapsed Lungs. Thus the Motion of the Heart will soon be suffocated, and Life, which depends upon it, destroyed.

This Doctrine has been sufficiently confirmed by numberless Experiments upon Dogs, and other Animals, made both by the Antients and the Moderns; particularly if the Orifices of the Wounds were larger than the Aperture of the Glottis: Though in case of smaller Wounds penetrating both Sides of the Thorax, Animals have been known to live some time.

As for Wounds penetrating the Diaphragm on both Sides of the Mediastinum; the Pleura lines both Cavities of the Thorax, but in such a manner, that each Cavity has its proper Membrane. The Cavities of the Thorax may therefore be conceived to be formed by the two Pleuras, resembling hollow Bladders, adjacent to each other, and adhering in the Place of Contact. The Duplicature of these two Membranes is called the Mediastinum, which divides the Cavity of the Thorax into two, but in such a manner, that the anterior Part inclines to the Left; for which Reason the Right Cavity of the Breast is larger than that of the Left, as is shewn in *Memoires de l'Acad. Royale des Sciences*, P. An. 1715. Since therefore the Mediastinum is not a simple Membrane, but formed of the two Bags of the Pleura adhering to each other, *Galen*, in *Tr. de Anat. Admin.* Lib. 7. Cap. 2. when describing the Membrane lining the Thorax, justly enough asserts, that of it are formed the Membranes dividing the Thorax [*ἡμετέρας διαπερσισσόμενης τῶν θώρακος*]. Now if a Wound is inflicted in the Diaphragm on each Side of the Mediastinum, the Air may by these Apertures enter the Cavity of the Thorax, and by that means hinder the Expansion of the Lungs, as we have already observed with respect to Wounds penetrating both Cavities of the Thorax.

But if we consider that the Liver and Spleen are situated near the Diaphragm, it is sufficiently obvious, that the Diaphragm can hardly be hurt in two distinct Places, without these Viscera being wounded. Hence Death succeeding such a Wound, cannot be ascribed alone to the Admission of the Air into the Cavities of the Thorax; for besides, these Viscera being pressed upon by the Action of the Diaphragm and abdominal Muscles, will block up the free Passage made to the Air by these Wounds. But such Wounds must farther be very large; hence such a Case seems rarely or never to happen.

As for Wounds dividing the nervous Part of the Diaphragm; the Middle of the Diaphragm is called its tendinous Centre, which is a pretty broad tendinous Space, or Aponeurosis, in which all the fleshy Fibres of the Diaphragm meet. It was formerly called the nervous Part of the Diaphragm, because the Antients called Tendons Nerves. It was for a long time believed, that by the Action of the fleshy Fibres of the Diaphragm, this tendinous Centre was every-where drawn downwards, and consequently that if a Wound should be inflicted

in this Part, every time the Diaphragm acts, the half-lacerated Fibres would be distracted, the Wound be augmented, and the Pain become so intolerable as to produce Convulsions and Death. But the celebrated *M. Senac*, in *Mém. de l'Acad. Royale des Sciences*, P. An. 1724. has demonstrated, that the Middle tendinous Part of the Diaphragm, on which the Heart included in its Pericardium is incumbent, does not descend in Inspiration, since the Motion and Situation of these would by this means be greatly disturbed, because the Pericardium with a pretty broad Surface adheres to this tendinous Part of the Diaphragm. This is, also, proved by the Structure of the Diaphragm, and its Connection with other Parts.

Wounds of the Diaphragm are succeeded by another Misfortune no less fatal, though not productive of so sudden Death, after the Patient has suffered the most exquisite Torments. And this happens when the Parts contained in the Cavity of the Abdomen are, by the Action of the Diaphragm and abdominal Muscles, forced into the Wound of the Diaphragm, dilate it, pass into the Cavities of the Breast, and thus by compressing the Lungs, and disturbing the Motion of the Heart, prove mortal sooner or later, after intolerable Agonies. Instances of this are found in *Paré*, Lib. 10. Cap. 32. and in *Sennertus*, Lib. 2. Part. 2. Cap. 13.

Hence appears the great Danger of Wounds of the Abdomen. *Hollerius*, however, in *Comment. in Aph.* 18. Sect. 6. *Hippocrat.* tells us, that in dissecting the Body of a Person who had been hanged, he saw a Wound in the fleshy Part of the Diaphragm, covered with a Cicatrix.

Fifthly, Those Wounds which prevent the Motion of the Chyle into the Heart, such as a Division of the Oesophagus, large Wounds of the Stomach, or small Intestines, an entire Division of the superior Intestines, and a Wound of the Thoracic Duct, or Receptacle of the Chyle.

In this Number are enumerated the Wounds of those Parts whose Soundness is requisite to swallow and digest the Aliments, and convey the Chyle prepared from them into the Mass of Blood, in order to restore those Parts which are daily lost by the Action of Life and Health.

As for a Division of the Oesophagus; an entire Division of the Oesophagus destroys all Passage of the Aliments to the Stomach; for that Wounds not entirely dividing the Oesophagus, have frequently been cured, is certain from various Observations in practical Authors. See *Schenckius*, *Observ. Med.* Lib. 3. Obs. 6. and *Bohnus de Renunciatione Vulnerum*. But when the Oesophagus, together with the Aspera Arteria, is totally divided, *Paré*, in Lib. 10. Cap. 31. tells us, that the Extremity of the divided Oesophagus is so retracted to the Stomach, that it cannot be united with the other Extremity, tho' in one Instance he by Suture so united the Wound of the Aspera Arteria, as to restore the Speech of the Patient, that he might discover the Person who wounded him; but he died on the fourth Day after. Another Instance of the same Kind is found in the same Place. But as the Oesophagus is covered with the Aspera Arteria, is incumbent on the Bodies of the Vertebrae, and has very large Vessels adjacent to its Sides, it is rarely wounded alone; for which Reason it is probable, that the Wounds of the adjacent Parts may in like manner prove the Cause of Death. To this Purpose *Boerhaave* gives us a memorable History in his *Atrocis nec descripti prius Morbi Historia*.

As for large Wounds of the Stomach; all the Aliments and Drink swallowed are received into the Cavity of the Stomach, by whose Fabric, the Affusion of the Humours, and their Continuance there, they are so changed, that being thence conveyed through the Intestinal Tube, they afford a Matter, which being resorbed into the small venous Ducts, mixed with the Blood, and farther elaborated, may restore what is lost from the Body by the Actions of Life. If, therefore, a large Wound is inflicted in the Stomach, its Contents will fall through the Wound out of the Body, or into the Cavity of the Abdomen; and thus all Nutrition will necessarily be destroyed. Besides, Wounds of the Stomach are dangerous, because its Substance is full of so many Arteries, Veins, and Nerves. But when Persons die of Wounds of the Stomach, soon after the Reception of the Wound, we cannot ascribe the succeeding Death to the Defect of Nutrition, but to the Wound made in the Substance of the Stomach. Two Instances of this Kind are found in *Bohnus de Renun. Vuln.* in which Death succeeded two Days after the Wounds were inflicted. But when Wounds of the Stomach prove mortal, because the Stomach cannot contain the Aliments taken, a slower Death ensues, and the Patient gradually wastes away for want of Nourishment. It has, also, sometimes happened, that such Wounds degenerating into fistulous Ulcers, have remained open for several Years, whilst the Patient could at Pleasure let his Aliments and Drink out at this Aperture, or retain them in it by closing the Wound by means of an external Apparatus. Two Instances of this Kind are found in

Schenckius

Schenckius, in Observationibus Medicinalibus rarioribus. In the *Philosophical Transactions*, No. 420. there are two remarkable Instances of perfect Cures produced in such Wounds of the Stomach, and which seem to evince, that all Wounds of the Stomach, even though large, are not absolutely mortal, when the Hands of the Surgeon can have Access to the Wound in order to unite it by Suture. Good Hopes may be entertained with respect to the Cure of small Wounds of the Stomach, provided it is not distended with Aliments or Drink; for in this Case the Stomach remaining contracted, its Wounds may be consolidated.

As for entire Divisions of the small and superior Intestines; such Wounds seem to be absolutely mortal; for the Extremity of the divided Intestine will discharge the Chyle into the Cavity of the Abdomen; and when this Chyle is corrupted, it will consume all the Viscera contained in the Abdomen, and hence certain Death ensues. But if either by Chance or Art, the Extremity of the divided Intestine grows to the external Margin of the Integuments, a Way will be made, through which by the peristaltic Motion of the Stomach and Intestines, all the Contents of the Intestine will be eliminated from the Body; for the Chyle conveyed from the Stomach thro' so large a Portion of the Intestinal Tube, and its Gyration and Windings, is by that means hindered from going out of the Body, before all that Part of it which is subservient to the Nutrition of the Body is resorbed by the Mouths of the lacteal and meseraic Vessels. If then the small Intestines are entirely divided in the superior Part, that is, where they are pretty near the Pylorus, the Body will necessarily be deprived of Nourishment, and the Patient will die of a slow Consumption, if the Contents are discharged through the Wounds of the Integuments; but if, falling into the Cavity of the Abdomen, they are there accumulated, they are there corrupted, and accelerate the Death of the Patient.

But Wounds both of the large and small Intestines in Parts more remote from the Stomach, as, also, such Wounds as do not entirely divide the Intestinal Tube, are always dangerous, though not absolutely mortal. Of this a memorable Instance is found in *Mém. de l'Acad. Royale des Sciences, l'An. 1705.* And in the *Philosophical Transactions* abridged, *Tom. 5.* we have an Account of a large Dog, in which the small Intestine was longitudinally divided, and upon replacing the Intestine without Suture, the Wound of the Abdomen was stitched up, and the Animal cured without any bad Symptom.

Various Observations of this Kind occur in practical Authors. It is, also, certain from many Instances, that Persons have survived total Divisions both of the small and large Intestines, when the Extremity of the divided Intestine was fixed to the external Wound, in order to procure a Discharge for the Fæces. But in this Case it is requisite the Length of the Intestine from the Stomach to the Part where it is divided, should be such, as that the Chyle prepared from the Aliments, and resorbed by the Lacteal and Meseraic Vessels, may be sufficient for the Nourishment of the Body.

As for Wounds of the Thoracic Duct, or Receptacle of the Chyle; all the Chyle resorbed by the lacteal Vessels from the Intestines, and a large Quantity of Lymph conveyed through the Lymphatic Veins, meet in this common Chanel. When this, therefore, is wounded, and discharges its contained Liquors, all those Effects cease which depend on a Mixture of the Chyle with the Blood for the farther Perfection of the Actions of the Vessels and Viscera, that is, Nutrition is destroy'd. It is true that the Orifices of the Meseraic Veins every-where open into the Intestines, reabsorb the thinnest Part of the Chyle and convey it directly to the Liver; but the white chylous Juice is only received by the Lacteals, and Life seems incapable of being sustained, if only the Meseraic Veins absorbed the thinnest Part, since by this means the Admission of the Chyle, properly so called, into the Mass of Blood, would be hindered. *Lower, in his Treatise de Corde,* has by beautiful Experiments demonstrated, that no Chyle is resorbed by the Meseraic Veins. And when the Entrance of the Chyle into the Blood is hindered, it is certain that Life cannot be long sustained.

It rarely happens in Mankind, that the Thoracic Duct alone is wounded; for it lies generally on the Middle of the Bodies of the Vertebrae, in the middle Space between the *Vena sine Pari* on the Right Side, and *Aorta Descendens* on the Left; so that the Aorta, for the most part, lies upon it; then rising higher, it runs upon the Bodies of the Vertebrae, under the Oesophagus, and under the Arch of the *Vena sine Pari*; thence above the Bodies of the Vertebrae, it inclines to the Left, proceeds under the Left Carotid, as far as the Middle of the last Vertebra of the Neck, and there being bent in the Form of an Arch, it tends downwards to the Left; and is terminated in the Left Subclavian Vein. During the Whole, therefore, of this Course, it is safely lodged, and adjacent to large Vessels, so that it can hardly be wounded without other Parts, the Wounds of which may be productive of Death.

Bonetus, in Sepulchret. Anatom. Lib. 4. has a remarkable Instance, in which from the succeeding Symptoms, the Thoracic Duct seems to have been wounded, tho' from the long time the Patient lived, it seems not to have been totally divided.

Wounds in their own Nature mortal, but curable by Art, are,

First, Wounds of any of the Contents of the Cranium, which are capable of being relieved by the Trepan.

In this Paragraph are considered those Wounds which prove infallibly mortal if left to themselves; but whose Effect, which is Death, may be prevented by proper Measures.

The Wounds of this Kind first specified, are those of the Encephalus, by which is meant every thing contained in the Cavity of the Cranium. Now it is certain from Anatomy and Physiology, that the Cavity of the Cranium is naturally exactly full. When therefore, by a Change of Figure in the Cranium, its Cavity is lessened; or when by a Rupture of the Vessels, the extravasated Humours are collected under the entire Cranium, the soft Fabric of the Encephalus is necessarily compressed, all the Functions depending on it are injured, and at last totally destroyed.

If, therefore, the Cranium pressed inward, or the extravasated Humours by their Quantity compress the Brain; or if the Juices becoming corrupted by their Continuance there, by their Acrimony corrode that tender Pulp on which Life and Health depend, Death will be the Effect of such a Wound: But if the extravasated Humours are lodged in such a Part of the Cranium, that they can be removed by an Aperture made with the Trepan, it easily appears that the Patient may be preserved. See *CAPUT.*

Two things are, therefore, requisite in such a Wound; which are, that the evident Cause of Death is found to be the extravasated Humour compressing the Brain; and that this Humour is lodged in such a Place, that it may be safely eliminated.

Secondly, Wounds of large Arteries or Veins, in Parts to which the Hands of the Surgeon cannot have Access.

It is absolutely necessary a Surgeon should know the Course of the large Arteries and Veins, especially in the Limbs; for large Trunks of Vessels wounded in the Cavities of the Body, will not admit his Hand. It is in a particular manner requisite, he should know those Parts of the Limbs where the large Arteries and Veins are so naked as to be easily compressed. Of this Kind in the superior Limbs, are the subaxillary Parts, and the anterior and superior Part of the Os Humeri, where the large Trunk of the Artery may be compressed almost to the naked Bone, and by that means Hæmorrhages from Wounds inflicted in the inferior Parts are easily stopt. In the inferior Limbs, similar Places are found in the interior and anterior middle Parts of the Thigh, as, also, under the Hams. In all these Places, Compresses strongly applied with a *Tourniquet*, so compress the Trunks of the Vessels as to hinder all Passage of the Blood. Thus mortal Hæmorrhages are prevented, and an Opportunity given the Surgeon, after the Suppression of the Blood, and the Dilatation of the Wound, if necessary, to find the wounded Artery, and apply proper Medicines, or Ligature, as he thinks fit. Hence, at present, no Wound of the Limbs seems absolutely mortal in consequence of an Hæmorrhage, which may be checked by a Compression of the arterial Trunks, especially in the subaxillary Parts, and in the Groins. And if the wounded Artery is lodged so deep, that it cannot be tied, the Amputation of the Limb is the only remaining Method to be taken for the Preservation of the Patient. But when Surgeons are ignorant of the Course of the large Vessels, they by Ligatures, and absorbent styptic Powders, such as *Gypsum*, hinder the Blood discharged from the wounded Vessel, from flowing through the Aperture of the Wound. And this Blood filling the whole *Membrana Adiposa*, and afterwards becoming corrupted, preys on all the Parts with a terrible Putrefaction, of which there are many melancholy Instances.

Thirdly, Wounds of the Viscera, to which the Surgeons Hands, and proper Medicines, can reach.

Unless it were certain from Experience, no one could believe that Parts, even of the vital Viscera laid bare by a Wound, may be cut off, left afterwards becoming corrupted, they should prove mortal. *Celsus, in Lib. 5. Cap. 26.* tells us, "That if any Part of the Liver or Lungs hangs out, it is to be cut off." There is a memorable Instance of this Kind recorded in *Tulp. Obs. Med. Lib. 2. Obs. 17.*

Fourthly, Such Wounds as are fatal thro' a Discharge of the Fluids, into those Cavities whence they may be taken without

out Danger of Life, as it happens in some Wounds of the Thorax, Abdomen, Ureters, Bladder, and Intestines.

Many Wounds prove mortal, not so much on account of the large Quantity of the extravasated Blood, as because that Fluid becoming corrupted by Time, and the Heat of the Part, by its putrid Quality corrupts and wastes the Viscera on which it acts. Thus, for Instance, when the Thorax is wounded, after a copious Hæmorrhage the Patient falls into a Deliquium, the divided Vessels contract themselves, and the Discharge of the Blood ceases. The Blood, however, remains in the Cavity of the Thorax, where becoming corrupted, and corroding the adjacent Lungs, it destroys the Patient by a slow Consumption. The same holds true in the Cavity of the Abdomen. But the Paracentesis may be instituted both in the Thorax and Abdomen; and thus the extravasated Blood may be eliminated, and all these Misfortunes prevented. But if a Wound is so inflicted in the Ureters, or Bottom of the Bladder, that the Urine flows into the Cavity of the Abdomen, it is sufficiently obvious, that in this Case, the Urine naturally disposed to Putrefaction, will far sooner become putrid, by which means all the Contents of the Abdomen will be greatly injured. But by perforating the Abdomen, all the Fluids collected in it may be evacuated; and by introducing a flexible Catheter into the Bladder, the Urine may be hindered from collecting itself in the Bladder, and distending it; hence the Bladder remaining always contracted, the Wound inflicted, will be the more easily consolidated. But if the Ureter is divided, after evacuating the Urine discharged into the Cavity of the Abdomen, a dry Diet is to be used; in which Case there are great Hopes, that the Extremity of the divided Ureter may be consolidated. The Use of the Kidney will indeed be destroyed by this means; but it is certain from many Observations, that the other Kidney may supply its Office, and that the Patient may enjoy perfect Health; for when the Cavity of one of the Ureters is obstructed by a Stone impacted in it, the Patient has often survived a great while, the other Kidney remaining sound, and in that Case having its Bulk, generally, greatly increased.

We know that the Urine flows from the Wound into the Cavity of the Abdomen, when little or no Urine is discharged, and the Abdomen is daily more and more distended by a Tumor.

The same, also, holds true in some Wounds of the Intestines.

A Wound of itself not mortal, may be prognosticated mortal, by these Causes:

First, By neglecting to purge off the discharged Pus, from which a purulent Tabes arises; or the extravasated Blood, which hence become putrefied.

Under this Class are comprehended such Wounds as are inflicted in those Parts, the Soundness of which may be removed without destroying Life, though such Wounds are sometimes succeeded by Death, not arising from the Wound as the Cause, but because by the Carelessness of the Patient, the Error of the Physician, some other Disease not arising from the Wound, or a Peculiarity of Constitution, such a Change is induced, as that the Functions requisite to Life are abolished. These Changes are produced by the four following things:

A Neglect to purge off the discharged Pus, from which arises a purulent Tabes.

From what is already said, it is obvious, that in every considerable Wound, Pus is not only formed, but is even requisite to a Separation of those things which would hinder the Consolidation of the Wound. Now if the Condition of the Wound is such, that the Pus formed in the Wound, falls into the Cavities of the Body, or, being too long left in the Surface of the Wound, is attenuated and resorbed by the open Orifices of the Veins, in this Case the whole Mass of Blood may be infected by a purulent Cacochymy, whence arise an hectic Fever, and a slow Consumption; now if it appears, that Pus lodged in any Cavity of the Body, might have been safely evacuated, or that the Resorption of the Pus, might have been prevented by a proper Depuration of the Wound, it is obvious, that the Death succeeding it is not to be ascribed to the Wound as its Cause, but to the Omission of purging off the extravasated Pus. When, after the Amputation of large Limbs, broad Wounds daily collect a large Quantity of Pus, a great Difficulty frequently happens in the Cure; for if often in a Day the Wound is cleansed, and the Pus wiped away, the Consolidation of the Wound is by that means prevented, and it degenerates into the Nature, as it were, of a Fontanel, and discharges an incredible Quantity of Fluids. Thus the Patients are wasted away by a true Consumption, while there is no

Fault either in the Fluids or Solids of the Body, because by the too great Formation of Pus, so much of the Nourishment of the Body is lost, that all the Parts are consumed. But if the Wound remains long covered, the Pus being, by its Continuance, and the Heat of the Place, attenuated and rendered more acrid, is resorbed by the open Mouths of the Veins, by which means it is mixed with the Blood, and induces a purulent Cacochymy and Consumption; or, being by a Translocation conveyed to some of the more noble Viscera, proves mortal; many Instances of which occur in Practice.

As for the Evacuation of the extravasated and putrefied Blood; Hippocrates, in *Aph. 20. Sect. 6.* affirms, "That Blood preternaturally discharged into the Abdomen, must necessarily be suppured." Galen, in his Comment on this Place, tells us, that some instead of *ἐς τὴν κοιλίαν*, read *ἐκ κοιλίας*, without the Article, by which an Effusion of Blood into any Cavity of the Body is denoted; and he adds, that this Opinion is confirmed by the Addition of the Word *preternatural*. Then the Sense of this Aphorism is, that Blood discharged from its natural Place into any Cavity of the Body, must necessarily be converted into Pus. Galen, in the same Place, tells us, that by Suppuration is meant every Corruption of Blood, but not a Conversion into Pus; properly so called. If a free Access is given to the Air, Blood discharged into any Cavity of the Body, is pretty soon putrefied, and proves mortal by corrupting the adjacent Viscera, or by being resorbed and destroying the tender Vessels of the Viscera by its putrid Acrimony. But if no Access is given to the Air, it may remain for a long time without Corruption, and sometimes being gradually attenuated, be again resorbed without any Harm, as it frequently happens after violent Contusions, when the Blood extravasated under the entire Skin, often remains for a Month and more, but afterwards gradually disappears without any farther Injury. When, therefore, Blood being discharged into the Cavities of the Body, and a free Access given to the Air, Death ensues, and in the Carcase it is not found, that the Wound is in its own Nature mortal, the Death of the Patient is to be ascribed to this Cause, if the extravasated Blood could have been safely evacuated by Art.

Secondly, By any Fault committed with respect to the Six Non-Naturals.

It is certain from Pathology, that the Non-naturals are divided into six Classes, Air, Meat, Drink, Rest, Retention, and Excretion, Sleep and Watching. They are thus called, because by the Use or Abuse of them, they are either natural Benefits, or preternatural Evils. The prudent Physician directs all these in a proper manner, and orders the Patient to abstain from such things as are injurious, and enjoins the Use of such things as are beneficial. Now, if by the Carelessness of the Physician, or the Obstinacy of the Patient, Faults are committed in the Use of the Six Non-Naturals, a Wound of itself not mortal, may be so changed as to bring on Death. Instances of this are found in *Paré, Lib. 10. Cap. 14. Hildan. Obs. Chirurg. Cent. 1. Obs. 20. ibid. Obs. 17. and ibid. Obs. 25.*

Thirdly, By a Neglect or Error of the Surgeon.

It is certain from many Observations, and confirmed by daily Experience, that Contusions and slight Wounds of the Head, when negligently treated, have produced terrible Symptoms, and Death. Many die of Hæmorrhages, who might have been preserved if the Trunks of the Arteries had, by proper Ligature, been compressed in those Parts, where they are almost naked. In Battles many of the Wounded die only because the Surgeons cannot take sufficient Care of so large a Number. The Death of wounded Persons is, also, frequently owing to the Error of Surgeons. Instances of which are found in *Paré, Lib. 10. Cap. 32. Hildan. Obs. Chirurg. Cent. 6. Obs. 80. and Hippocrates Epidem. Lib. 5. No. 22.*

Fourthly, By the Constitution of the Patient whether natural, morbid, manifest from the History of the particular Patient; or sometimes so singular, that it can only be discovered by this Effect. And this Constitution of the Patient is always to be had a due Regard to by the Physician in his Report to the Judges.

It is of great Importance in making Reports with respect to Wounds, to have a due Regard to the Temperament of the Patient, which, however, is often totally overlooked. In many Places, Physicians and Surgeons are, by public Authority, appointed to inspect the Bodies of those who are killed, and make a Report of what they have seen to the Judges. But they often do not consult the Physician or Surgeon, who before attended the wounded Person, in order to know his Temperament,

perament, previous Diseases, and the Symptoms subsequent to the Wound. But all these Things seem highly necessary, in order to make a faithful Report concerning the Wound: For some Persons have nervous Systems so capable of being irritated, that they are by the slightest Cause seized with Spasms, a *Tetanus*, or other like Misfortunes: Others, when they see the Blood flowing from another Person's Wound, fall into a *Deliquium*. Now it is probable, that in such Persons, violent Symptoms, and even Death, may be produced by a slight Wound; but whether the succeeding Death is to be ascribed to such a Wound alone, as its Cause, is hard to determine. Besides, in some Patients, towards the End of Life, hardly any Blood remains in the Body. Thus in phthical Patients, after Death only a few Ounces of Blood are sometimes found: Now if from such a Patient, by a slight Wound, the small Quantity of Blood should be evacuated, infallible Death will ensue; but that Death will not depend on the Wound alone. It is sufficiently known, that the *Lues Venerea*, and a malignant Scurvy, so corrode the Substance of the hardest Bones of the Body, that being rendered entirely carious, they may be broken by the smallest Force. If therefore, in such a Case, a Fracture of the *Cranium*, by a gentle Pressure, should be productive of Death, this Effect will not depend on the wounding Cause alone; but these, and other Circumstances of a like Nature, may be known from the Things observed in the Patient's Body before the Wound was inflicted. Perhaps there may be other Things latent, of which there never appeared any Sign, and which only discover themselves by the Infliction of the Wound: For when we consider what has been observed in the Bodies of Persons who have died suddenly, we find that Death has often been instantaneously produced by the most latent Causes; whereas before Death nothing of any Moment appeared injur'd. Now if in such a Person a Wound is inflicted a little before Death, the succeeding Death, which depends on a quite different Cause, would be unjustly ascribed to the Wound. Thus *Valerius Maximus, Lib. 9. Cap. 12.* tells us, "That in the End of Life, which is exposed to various and occult Causes, some Things are frequently, tho' undeservedly, called mortal; since they rather happen at the time of Death, than bring it on." Hence in such Cases it ought to be reported to the Judges, that the Wound was found such, that the Death succeeding it did not seem to be ascribed to the Wound as its Cause. Thus Physicians and Surgeons discharge their Offices faithfully, and the rest belongs to the Judges.

Upon this Doctrine depends the Report concerning Wounds, and a Determination of the Time in which they may prove mortal.

Judges, before passing Sentence on Murderers, generally order Physicians and Surgeons to examine the Body of the Person killed, in order to discover whether his Death was caused by the Wound: These Physicians and Surgeons accurately observe what Parts of the Body they find hurt by the Wound; and then by a common Consultation conclude whether the Wound was absolutely mortal; or whether, tho' mortal of itself, Death might have been prevented by Art; or whether the Wound has injured those Parts, the Soundness of which was not absolutely necessary to Life, and yet Death ensued, either from a peculiar Temperament of the wounded Person, or from the Carelessness or Neglect of those who had the Management of him. All these Circumstances are related to the Judges, and this is call'd giving a Report concerning Wounds, *Remunctio Vulnerum*. Hence it appears, how great Caution is necessary, since unskilful Surgeons, when examining a Carcase, rather make than inspect Wounds. We ought, as much as possible, to inquire into the Figure and Bulk of the wounding Instrument, the Situation of the wounded Person, and of him who gave it, at the Time it was inflicted; and into all the Symptoms which happened between the Reception of it and the Death of the Patient.

Besides, all those Things are to be consider'd which happen'd to the Patient, or were applied after the Wound was inflicted; then, by a prudent and cautious Incision, we are to investigate how far, and thro' what Parts the wounding Instrument pass'd: Thus from a Knowledge of the Use of the Parts wounded, we conclude whether the succeeding Death ought to be ascribed to the Wound inflicted, as its Cause, or not.

But it seems not to be easily determin'd to what Space of Time the Mortality of Wounds is to be limited. Many are of Opinion, that if the wounded Person survives nine Days, the succeeding Death is not to be ascrib'd to the Wound; and that if the Person dies before that Time, then the Wound inflicted is necessarily and absolutely to be accounted mortal: But a large Artery, divided either in the Arm or Leg, may, in a few Hours, or even sooner, put an End to a Person's Life, tho' this Wound was not absolutely mortal, but might have been cur'd by Art. Thus, also, extravasated Blood in the *Cranium*, if lodg'd in a Part from which it could not be extracted by Art, whilst its

Quantity is so small that, by Compression, it does not immediately disturb the whole Use of the Brain, may there remain for several Weeks, become gradually corrupted, and at last, by corroding the *Cerebrum, Cerebellum, and Medulla Oblongata*, produce Death; and such a Wound is justly to be reported as mortal, tho' the Person has surviv'd it so long. If the small Intestines are totally divided near the *Pylorus*, Life may be protracted for several Days, till, thro' a Defect of Nutrition, the Patient is gradually wasted away, and yet such a Wound is absolutely mortal. Hence it is obvious, that nothing certain can be determin'd with respect to the Mortality of Wounds, from the Time intervening between the Infliction of the Wound, and the Death of the Patient.

From the History of Wounds, also, already given, the Prediction of other Events which are to be foretold, will be easy.

In treating of the Prognostics of Wounds, we have determin'd those Things which, from a Knowledge of the Wound, might be foreseen, as its Consequences; we have, also, treated of the Life or Death of the wounded Person: The other Things relating to the possible or impossible, the easy or difficult Cure, and the Effects remaining after the Cure of the Wound, are evidently deduc'd from a perfect Knowledge of its Nature. For when we know from Anatomy, and the Doctrine of the Use of the Parts, what Parts are wounded, and what Functions are abolish'd or deprav'd, we may determine whether the Cure is possible or impossible, easy or difficult; or whether, after the Cure of the Wound, any of the Functions will remain injur'd. Thus, for Instance, if a Wound is inflicted on the Back of the Hand, the Physician, from Anatomy, knows that the Tendons of the Muscles which extend the Fingers are plac'd here; he therefore orders the Patient to stretch out his Fingers; and if he perceives that he is absolutely incapable of erecting his fore Finger, he concludes that the Tendon, compos'd of the united Tendons of the common extensor Muscle, and that of the *Musculus Indicator*, is divided: But if it is possible that the Extremities of the divided Tendon can be brought into Contact, and united, he may promise a perfect, tho' a difficult, Cure. But if this cannot be done, he may safely predict, that, after the Cure of the Wound, the Erection of the fore Finger will be always abolish'd, and never capable of being restor'd. In predicting Things of this Nature, both Physician and Surgeon ought to be very cautious; because all the Misfortunes which remain after the Cure of the Wound, will be ascrib'd to them, unless they have foretold that such Misfortunes will certainly happen, or, at least, are to be dreaded.

The Cause of the several Phenomena appearing when a Wound is inflicted in a visible Part of a sound and robust Body, is sufficiently obvious, to any one acquainted with the vital and animal Actions; and all these Symptoms have been already accounted for.

The exterior Coats of the Arteries, when prick'd, cut, bruise'd, broken, distracted, or corroded, whilst the internal Coat remains entire, are dilated, by the Impetus of the Blood, and form a Bag, or Sack, which often increases to the Bulk of an Egg, acquires callous Sides, has a Pulsation, is of a bright-red Colour, disappears upon Compression, but returns to its former State when that Compression is remov'd, enlarges its Artery, and by its Compression lessens the adjacent Vessels: This is call'd a true Aneurysm, the Causes, Signs, and Effects of which, are easily seen. An Aneurysm of the Heart, its Origin, Signs, and Effect, are hence to be accounted for, and understood.

We have already observ'd what Misfortunes follow when an Artery is entirely divided, or when a Wound penetrates into the Cavity of an Artery, so as not entirely to divide it: But in this Aphorism are consider'd those Misfortunes which are to be dreaded when Arteries are so wounded, that the Wound does not penetrate their Cavities, but only divides their external Coats. For it is certain, from Anatomy, that the Arteries, especially of the larger Kind, have pretty thick Coats, the exterior of which generally arises from the common Membrane, which lines that Cavity of the Body thro' which the Artery passes. Under this exterior Coat lies a thin cellular Coat, thro' which run many Vessels subservient to the Nutrition of the Arteries; under this lies the glandular Coat, which, perhaps, is no more than a Part of the former; and under the glandular lies the muscular Coat, which is thick, strong, separable into several Laminæ, and consisting of orbicular Fibres; and the last Coat, constituting the internal Cavity of the Artery, is thin, and compos'd of longitudinal Fibres.

Whilst the Blood is, by the Action of the Heart, continually forc'd into the full Arteries, they are observ'd to be manifestly and equally dilated thro' all their Circumferences; the Strength of

of the Coats composing the Arteries resists their too great Dilatation; and when the Action of the Heart ceases, by the Strength, especially of their orbicular Fibres, they are again contracted into their former Dimensions. Now if by the Separation of Cohesion, especially in the orbicular Fibres of any Part of an Artery (for Wounds of the external and cellular Coats are less dangerous) the Strength of the Sides is diminish'd, whilst the distending Cause remains, it will forthwith dilate the Artery more in that Part, change its equable conical Figure, and expand the weaken'd Part into a Sack; and this is call'd a true Aneurysm, which properly signifies no more than the Dilatation of an Artery.

The Cause, therefore, of an Aneurysm is, every thing which lessens the Cohesion of the Coats in any Part of an Artery; and it is certain, from frequent Observation, that this principally happens when Arteries are prick'd or cut: For in Venesection it frequently happens, that a Ramification of an adjacent Artery is wounded by the Point of the Lancet, a few Days after a Tumor begins to arise, which raises the Skin, has a manifest Pulsation, and is daily enlarg'd, unless it is in the Beginning check'd by the Application of Compress and Bandage.

As for Contusions of the Arteries; it has been frequently observ'd, that violent Contusions of an Artery have produc'd an Aneurysm; and a memorable Instance of this is found in *Lancisi, de Motu Cordis & Aneurysmatibus*: And I myself, says *Vanswieten*, saw a remarkable Example of the same Kind.

As for Distractions of the Arteries; in practical Authors many Instances occur, in which, after violent Efforts, lifting too heavy Burdens, excessive Sneezing or Coughing, the distracted Arteries have degenerated into Aneurysms. Of this an Instance is found in *Hist. de l'Acad. Royal. des Sciences, l'An. 1700*. It is, also, observable, that those Horses which are forc'd to strain hard in drawing great Weights up ascending Ground, have Aneurysms, and varicose Tumors, in the Veins of their posterior Legs. The like Misfortune is, also, sometimes observ'd, in Porters.

As for Corrosions of the Arteries; it is certain, that in some Diseases the Humours may so degenerate, that, becoming highly acrid, they corrode the hardest Parts of the Body; by the Scurvy the hardest Teeth are consum'd, and a *Lues Venerea* renders the largest and strongest Bones in the Body carious. A virulent Cancer, by its dire Contagion, consumes all the adjacent Parts. Thus in a Scurvy we often see, that when the Vessels are corroded, the extravasated Blood under the Integuments produces livid Spots, and mortal Hæmorrhages have been sometimes observ'd to proceed from the same Cause. Hence we may easily conceive how the Coats of the large Arteries may be so corroded as to be extended into an aneurysmatic Sack. Two Instances of this Kind are found in *Lancisi de Motu Cordis & Aneurysmatibus*.

By whatever of these Causes any Part of an Artery is weaken'd, it will in that Place yield more, and be expanded by the distending Blood: And as at every Pulsation of the Heart the distending Cause is afresh applied to the weaken'd Part of the Artery, the Capacity of the Aneurysm will be gradually increas'd. Hence Aneurysms are sometimes expanded to an incredible Bulk, especially if they happen in the large Trunks of Arteries. A memorable Instance of this we have in *Ruysschii Observat. Anatom. Chirurg. Cent. Observat. 38*: In the largest Aneurysms it frequently appears, that the Membranes of the extended Sack are very thick; whereas they might be suppos'd to be render'd thinner, on account of their Distraction. But this seems to happen because the Blood accumulated in such dilated Sacks, is concreted into polypous Masses, which being applied to the dilated Coat of the Artery, may greatly increase its Thickness.

We now come to inquire by what Signs an Aneurysm may be known, and distinguish'd from other Tumors; since it is certain from several Observations, that very skilful Surgeons in other Respects, have in this committed egregious Blunders, and by imprudently opening the Aneurysm, kill'd, instead of curing the Patient. An Aneurysm is, therefore, known to be present when the Causes already specify'd have preceded, and a Tumor arises in that Part where, from Anatomy, we know that a large Artery is situated; when a manifest Pulsation is perceiv'd in such a Tumor; and when, by a gentle Pressure, it disappears, or is greatly diminish'd, but immediately returns to its former Bulk when the Pressure is remov'd. But it is to be observ'd, that the Colour of the Skin is rarely chang'd by an Aneurysm, unless it is of long standing, or very large; for then the Skin being corroded or attenuated by the Distraction, its Colour appears red: Besides, in a small and beginning Aneurysm there is always a Pulsation; whereas when it has grown to a greater Bulk, the Pulsation is often not perceiv'd, partly because the Coats of the Aneurysm are become thicker, and partly because the Impetus of the Blood propel'd from the Heart cannot act so strongly on the Aneurysm, when large, as to elevate it at each

Pulsation of the Heart. But when an Aneurysm is compress'd, especially if it is large, and near the Heart, unless the Compression is made gently and gradually, there is great Danger lest the Patient should be suddenly suffocated, whilst the concreted Blood express'd from the Cavity of the Aneurysm so resists the Blood forc'd from the Heart thro' the Artery, that the Motion of the Heart is suddenly suffocated. Nor is a large Aneurysm, when compress'd by the Hand, to be all at once set at Liberty from the Compression, but gradually; otherwise the Patient falls into a *Deliquium*; because the Blood suddenly rushes into this empty Sack. For this Reason, upon compressing a large Aneurysm, the Patient immediately complains of an intolerable Oppression about his Breast. But when an Aneurysm happens in the internal Parts, it is not to be known without great Difficulty: But if the known Causes have preceded; if an unusual Pulsation is perceiv'd by the Patient; if the Motion of the Heart is disturb'd, and almost suffocated by an increas'd Velocity of the Blood arising from muscular Motion, or any other Cause, it is highly probable that there is an Aneurysm in the internal Parts.

The Misfortunes produc'd by an Aneurysm depend on this, that it, by its Bulk, compresses the adjacent Parts, and by that means disturbs and hinders their Action; that it changes the Cavity of the Artery, and destroys the equable Circulation of the Blood thro' it; by which means the Action of the Heart is at last greatly hinder'd. Hence it is obvious, that very various Disorders may be produc'd by an Aneurysm; but that all the Misfortunes arising from it are the worse, the larger, and the nearer the Heart it is.

Another Source of the Misfortunes arising from an Aneurysm depends on this, that the Fluid contain'd in the aneurysmatic Sack begins gradually to degenerate: For in a large Aneurysm the Blood is almost at Rest, or at least moves very slowly; hence the Blood has less Attrition and Heat, by which means it acquires a Disposition to that Degeneracy which happens from a Diminution of Motion and Heat; for polypose Concretions begin to be produc'd; and, when these are once form'd, they have a Power of associating to themselves similar Parts of the affluent Blood, by which means the former Mass is augmented, as is observ'd under the Article *FIBRA*: Hence in large Aneurysms, when dissected, very often much Blood is not found, but a surprising polypose Texture form'd of stagnant Blood, which by the Application of its own Substance so strengthens the weak Part of the Artery, that it does not soon break, but the Patient often lives a great while: At last the concreted Blood, together with the Blood stagnant between the *Lamina* of the polypose Substance, begins to be corrupted, and to acquire so remarkably a resolvent Acrimony, as totally to consume the adjacent Vessels, Membranes, Cartilages, and even the hardest Bones. Practical Authors abound with Observations of this Kind. But whilst the Blood continually acts on that corrupted Substance lodg'd in the Sack of the expanded Aneurysm, a putrid Cacochymy begins to be form'd; and hence an hectic Fever, gradually consuming the Body, arises. That large Aneurysms have terminated in this manner, is certain from Experience, unless by a Suffocation of the Circulation, or a Rupture of the Aneurysm, the Patients died before the Contents of the Sack acquir'd such a Degree of Malignity.

There is Danger of instantaneous Death from the Rupture of such an Aneurysm; for by this means the Patients die in a Moment, when they least expect it. Of this there is a memorable Instance in *Mem. de l'Acad. des Sciences, l'An. 1733*.

When an Aneurysm happens in the internal Parts of the Body, there is but small Hope of a Cure; all that can be done is, by weakening Life by means of Venesections, and a slender Diet, to diminish the Impetus and Velocity of the Circulation; For thus the Increase of the Aneurysm is as much as possible prevented. The greatest Rest both of Body and Mind, are, also, to be order'd, for the same Purpose. When there is Access to the Hands, if the Aneurysm has not already grown to a great Bulk, something may be hop'd from a prudent Compression; in which it is to be observ'd, that it is at the same time greatly expedient, gently to compress the Artery above the Aneurysm: Thus the Impetus of the Blood thro' the Artery is diminish'd, and when the Aneurysm is compress'd the Blood will not so easily regurgitate to the Heart. When nothing is to be expected from Compression, or when it has been us'd in vain, the Extirpation of the Aneurysm is the only Method remaining, which may be happily instituted, as we learn from Experience. *Ruyssch, in Obs. Anatom. Chirurg. Centur. Obs. 2*. gives us an Instance of this Kind, in which the Event was happy, tho' the Arm was already seiz'd with a Gangrene.

To this we may, also, refer an Aneurysm of the Heart, together with its Origin, Signs, and Effects. An Aneurysm of the Heart is a preternatural Dilatation of its Cavities. This Disorder frequently occurs in Practice, tho' it has not hitherto been very accurately describ'd. We may easily conceive, that

all those Misfortunes may happen to the Heart, which produce Aneurysms of the Arteries when their exterior Coats are destroy'd or weaken'd by Wounds, Contusions, Distractions, or Corrosions. For Observations made on Carcasses evince, that Wounds have penetrated to the Heart; and that Inflammations, Suppurations, and Erosions, have been found in it. A memorable Instance of this occurs in *Act. Phys. Med. Tom. 2.* But besides these Causes, other Circumstances occur, from which a preternatural Dilatation of the Heart frequently arises: For the Action of the Heart consists in forcing the Blood receiv'd from the Veins into its Cavities, into the Arteries; so that, by every Contraction of the Heart, its Cavities are totally evacuated: The Force of the Heart must, therefore, surpass the Resistance of the Arteries. But if this Resistance is so far increas'd as to surmount the Force of the Heart, that Organ cannot be totally evacuated; but the Blood being gradually accumulated in its Cavities, will dilate them. In the Heart is observ'd a surprising Property, by which, even after Death, it is excited to Contraction, by forcing Air, or tepid Water, thro' the Veins into its Cavities: Hence, when the Blood is not totally expel'd from its Cavities, the irritated Heart is frequently contracted, so as to expel its Contents, as appears evidently at the Point of Death, when the Heart is no longer able to expel the Blood into the Arteries: For then the Heart palpitates very quickly, till, being overcome by an invincible Obstacle, it at last ceases totally; but whilst the Heart endeavours, by its strong and frequently-repeated Efforts, to overcome the Resistance of the Arteries, the Fibres constituting the Sides of the Cavities of the Heart are strongly distracted, whilst the Fluid contain'd in the Cavities of the Heart, not capable of being express'd, is compress'd, and makes as great a Resistance as the hardest Body. Hence the Cohesion of the too much distracted Fibres of the Heart is weaken'd, and consequently the Dilatation of its Cavities is augmented.

Hence it is obvious that slight Causes are sufficient to render the Heart aneurysmatical: For whilst the Force of the Heart is able to surmount the Resistance of the Arteries, its Cavities remain in their natural Dimensions; but as soon as the Resistance of the Arteries begins to prevail over this Force of the Heart, its Cavities will begin to be dilated.

This Dilatation may happen either in the Right Cavity alone, when the free Circulation of the Blood thro' the pulmonary Artery is hinder'd; or it may happen in the Left Cavity of the Heart, when there is any Impediment in the Aorta; or when both these concur, a Dilatation will happen in both Cavities of the Heart. But it is to be observ'd, that an Impediment in the pulmonary Artery may produce a preternatural Distention of the Right Cavity of the Heart, whilst the Left Cavity retains its proper Dimension; but when the Left Ventricle is not able to expel its Blood, the pulmonary Veins cannot empty themselves into it: Hence neither can the pulmonary Arteries convey their Blood to the pulmonary Veins; by which means the Resistance to the Right Ventricle will be increas'd, so that it may be dilated by the same Causes. The Right Ventricle, which is far weaker than the Left, more easily yields to distending Causes: Hence all other Circumstances being alike, it will be more frequently distended, and dilated to a larger Capacity.

Many Observations evince, that in Carcasses the Heart has been found thus dilated, memorable Instances of which occur in the *Medical Essays, Vol. II. Hist. de l'Acad. des Sciences l'An. 1735.* and *Lancisi de Subitaneis Mortibus.*

Every thing therefore which increases the Resistance to the Blood forc'd from the Cavities of the Heart may produce a preternatural Dilatation of it; too great a Quantity of Humours in plethoric Persons, an Increase of the Circulation in acute Diseases, an Obstruction of the Blood thro' the Extremities of the Arteries by an inflammatory, atrabiliarious, or polyposse Condition, Faults of the Arteries, by which the Blood cannot pass freely thro' them, such as their excessive Callosity, their Degeneracy into a cartilaginous, or even a bony Substance, and Aneurysms of them, are the principal Causes why the Cavities of the Heart are distended beyond their natural Dimensions. It, also, happens, tho' rarely, that Air contain'd in the Cavities of the Heart surprisingly distends them. An Instance of this is found in *Ruyssch. Epist. Problem. 16.* In this Case perhaps the Blood, by an intensely quick animal Motion, or by Diseases, sends off its contain'd Air, which being collected in the larger Cavities, and rarefy'd by Heat, distends all the Parts.

That this Misfortune is present, or at least to be dreaded, may be known, if continual Palpitations of the Heart are present; if the Signs evince that the Lungs are so obstructed as not to allow a free Passage for the Blood; if the Pulse is very hard and full, with an intolerable Anxiety upon an Increase of Motion; then we justly conclude that such an Obstacle is lodg'd in the Aorta.

Then the Circulation is surprisingly disturb'd, and so various and astonishing Phenomena appear, as seem to surpass the Laws

of Nature; the Pulse is in every respect unequal, sometimes defective, and immediately after strong and brisk; Respiration becomes highly difficult, and Convulsions are often produc'd, whilst the Heart is at Rest, and immediately after contracted by a violent Spasm; thus for a Moment the Motion of the Blood thro' the Arteries of the Brain ceases, and immediately after is mov'd with the greatest Velocity; by which means the Secretion and Motion of the Spirits are greatly disturb'd; all the Senses, both external and internal, are often disturb'd; there is an intolerable Anxiety; and there is a violent Struggle between Life and Death, till the latter puts an End to the Patient's Misery.

Hence it appears why, after a long-continu'd Asthma, and violent inflammatory Diseases of the Breast, such terrible Disorders often remain.

When this Disorder is once form'd, no Recovery can be hop'd for, since a Weakness of the Heart being at the same time produc'd, the Difficulty of removing the Obstacle is increas'd: Hence the terrible Disease is augmented, together with all its Symptoms, especially if Life is pretty vigorous.

The Whole of what can be done by Art is, for some time to prevent the Increase of the Disorder, and by that means render Life more tolerable than it would otherwise be: This is done by keeping the Patient so easy and quiet, that the Motion of the Heart may not be greater than is absolutely necessary to the Continuation of Life. Hence great Rest, both of Body and Mind, is requisite; great Quantities of thin Fluids ought, also, to be drank, the best of which are Whey, Milk, and Water,edulcorated with Honey, and Spaw-waters mix'd with Milk; but the Aliments ought to be mild, thin, and exhibited in small Quantities at proper Intervals, that only a small Quantity of mild Chyle may be mix'd with the Blood. All stimulating Substances are, also, to be carefully avoided, and such Medicines used as dilute the Blood, open the Vessels, and lubricate the Passages; that there may be a quick and expeditious Circulation of the diluted Humours through the lubricated and opened Vessels.

If by the same Causes an Artery wounded in the like manner, remains infirm after the Cure, the same Misfortunes happen.

When in the most violent Diseases, and obstinate chronical Pains, especially of the Head, Surgeons open the temporal Artery, they are always careful, after a proper Quantity of Blood is discharged, so to secure the Wound of the Artery, by a Plate of Metal, or something of a like Nature, that the Force of the Blood distending the Artery at each Pulsation of the Heart, may not extend the Rudiments of the beginning Cicatrix beyond the equable Dimension of the Artery, and produce an Aneurysm: And if this Compression of the wounded Artery is neglected, such a Misfortune will almost always happen. This is frequently observed when unluckily in the Flexure of the Cubit, the adjacent Artery is opened with the Vein, and the Wound not secured by a proper Pressure; which is, also, far more difficultly obtained here than in the Temples, where the wounded Artery may be so pressed to the hard Cranium, that no Dread of a future Aneurysm remains. Hence in this Place, especially, we may safely institute Arteriotomy, which is perhaps too much abstain'd from by Physicians, tho' it may be safely perform'd by a skilful Surgeon; and, as *Severinus, de Efficac. Medic. Lib. 1. Part 2.* evinces, has often removed Disorders, after all other Means have been tried in vain.

When from the same Causes all the Coats of the Artery are destroyed together, and the Artery pours out its Fluids into the adjacent distended Parts, from whence it can find no Passage, there is formed a Collection of extravasated Blood, which is perpetually increased, and without any determinate Measure. This Tumor is soft, has scarcely any Pulsation, is livid, does not disappear by Compression, soon putrefies, and by that means causes a Gangrene of the neighbouring Parts. This is a spurious Aneurysm, the Cause, Signs, and Effects, of which, are known by this Description.

If an Artery is so wounded that the Cohesion of its Sides, being destroy'd, the Blood contain'd in its Cavity may be discharged, whilst this Blood is pent up by the entire Skin, or Fat, or Blood coagulated in the Wound; it will make a Way for itself in the *Membrana Adiposa*, which it will fill, and often raise to a large Tumor: For the distending Mass will be increased by the Blood continually flowing from the ruptured Artery, till the Skin can yield no farther, or the adjacent Parts hinder the farther Collection of the Blood in the *Membrana Adiposa*, or a Thrombus of coagulated Blood closes up the Aperture of the wounded Artery. After violent Contusions, such large Tumors often arise, and are of a livid, and often of a totally black Colour, in consequence of the extravasated and coagulated

coagulated Blood appearing through the Skin. In scorbutic Patients, after the Vessels are corroded, the like Misfortunes often happen; but as this generally happens in the smaller Arteries, the Part is not raised to a very great Tumor, but flat black Spots are form'd. That enormous Tumors are, however, sometimes produced by this Cause, is certain from an Instance recorded in *Severinus de Efficac. Med. Lib. 1. Part. 2.* which Observation evinces how large a Quantity of Blood may be collected in the *Membrana Adiposa*, and how long it may remain without Corruption after it is extravasated, provided a free Access is not given to the Air.

Because such a Tumor has some Signs in common with a true Aneurysm, Surgeons have given it the same Appellation, tho' for the sake of Distinction they have given it the Epithet of spurious; for in a true Aneurysm the Coats of the Artery, tho' weakened, remain coherent, and hinder the Discharge of the Blood; but in a spurious Aneurysm the ruptured Coats afford a free Passage for the Blood. The Antients used a less ambiguous Word, and called such a Disorder *Eccymosis*, which, according to *Galen*, in *Method. Medend. Lib. 4. Cap. 1.* generally happens with a Contusion and Rupture of the Vessels; tho' he, also, tells us, that it sometimes happens from an Anastomosis, a Transudation, or a Corrosion. Small Tumors, arising from extravasated Blood under the entire Skin, are still so called by Surgeons: And if from the Laceration of a large Artery a considerable Tumor is produced, especially if any Pulsation is perceived in it, it is generally called a spurious Aneurysm.

So far as I know, no mention is made of an Aneurysm in *Hippocrates*; and that Definition of an Aneurysm given by *Galen*, in *Tr. de Tumoribus præter Naturam, Cap. 11.* seems rather to agree with what we call a spurious Aneurysm. For he tells us, "That the Disorder of an opened Artery is called an Aneurysm. This happens when the Artery, being wounded, the adjacent Skin is brought to a Cicatrix, whilst the Wound of the Artery is neither united, covered with a Cicatrix, nor stop'd by Flesh." But the Signs by which he distinguishes this Disorder from other preternatural Tumors, rather agree with a true Aneurysm. For he adds, "Disorders of this Kind are known by the Pulsations of the Arteries; and when they are compressed, the whole Tumor disappears, the Substance producing it returning into the Arteries; and this Substance is a thin yellow Blood mixed with a large Quantity of fine Spirits. But this Blood is much hotter than that contained in the Veins, and when the Aneurysm is wounded, bursts out with such Violence, that it can hardly be stop't."

The Cause, therefore, of a spurious Aneurysm, may be every thing which destroys the Continuity of the Sides of an Artery, whilst the Skin remains entire; or in case there is a Wound, whilst the Aperture of the Skin is so closed up as to hinder the free Evacuation of the extravasated Blood: Hence, being congested in the *Tunica Cellulosa*, it distends the Part by a Tumor.

It is of great Importance to distinguish between a spurious and a true Aneurysm. Hence their respective Signs ought to be accurately known. We know that a spurious Aneurysm is present, from the preceding Causes, especially violent Contusions, because the Tumor increases far more quickly in a spurious than in a true Aneurysm. Besides, the Tumor is not circumscribed by very distinct Limits, because it is every-where dispersed thro' the *Tunica Cellulosa*; but in a true Aneurysm the Circumference of the Tumor is limited by the dilated Coats of the Artery: Add, that a true Aneurysm, at least in the Beginning, before it grows to a great Bulk, has a manifest Pulsation corresponding to that of the Arteries; whereas a spurious Aneurysm has not so manifest a Pulsation, tho' this Sign is sometimes fallacious, as is obvious in the Instance referred to in *Severinus*. A true Aneurysm, unless very large, totally disappears when pressed, because the Blood is forced into the Cavity of the Artery; but this does not happen in a spurious Aneurysm, which when pressed, yields indeed, but the Tumor is then augmented in the adjacent Parts. In a true Aneurysm, at least in the Beginning, the Colour of the Skin is rarely or ever changed; whereas in a spurious Aneurysm, the Blood extravasated under the Skin tinges it with a preternatural Colour.

The principal Effects of a spurious Aneurysm are, that the extravasated Blood, by its Bulk, hinders the Action of the adjacent Parts, and at last, by its Continuance, becoming corrupted, may acquire such an Acrimony as may produce the most violent Inflammations, Gangrenes, and Corrosions. But if the Access of the Air is hindered, the extravasated Blood may remain long uncorrupted, especially if antiseptic Fomentations are applied. For the Cure of this, and other Disorders of a like Nature, see *CONTUSIO*.

Other Effects of a large wounded Artery are easily understood, from Physiology; as, also, the Phenomena of a Nerve wounded.

All these are before explained.

But that the Cause may appear plain of those surprising Effects which arise from a Puncture, or partial Division of the Nerves; the following Considerations, from Anatomy and Theory, are to be adverted to.

Nothing is more surprising in medicinal Observations, than that in the soundest Person the gentle Puncture of a Nerve so disturbs all the Parts of the Body, that nothing of his former Health remains: For intense Pain, an acute Fever, *Deliriums*, violent Convulsions, Inflammations and Suppurations, a Gangrene, and sometimes Death, succeed a very slight Wound of the Nerves: Besides, it is certain from Experience, that very inconsiderable Changes induced on the Nerves, sometimes surprisingly disturb all the Actions of the Body.

Thus tickling the Soles of the Feet produces great Changes in the Body; for almost all the Muscles and Tendons of the Body are forthwith agitated, Laughter is forcibly extorted, and the Strength immediately destroyed. There have, also, been Instances in which Convulsions and Death have been produced by so slight a Cause, and even a feigned Attempt to produce this uneasy Titillation has produced the like Phenomena, in Persons who have before experienced it. The simple Agitation of a Feather in the Nares or Fauces, the Crawling of Worms in the Stomach, or the Fluctuation of Phlegm, thereby inducing a slight mechanical Change on the Nerves dispersed thro' these Parts, greatly disturb the whole Body.

Tho' from the hitherto known Structure of the human Body the surprising Effects arising from a Change of the Nerves in the human Body cannot be accounted for; yet from such a Knowledge we acquire great Light in those Disorders which succeed Wounds of the Nerves. Hence we are from Anatomy and Theory to consider the following Things:

Every visible Nerve is a Congeries of smaller Nerves mutually connected by extremely fine Membranes, Arteries, and Veins, with interwoven Lymphatics, and then all covered with a common Membrane.

Thro' all these Vessels composing a Nerve, their proper Liquid flows perpetually from the Heart, *Cerebrum*, *Cerebellum*, and *Medulla Spinalis*. These Vessels have always a considerable contractile Force.

As for visible Nerves; we have only treated of such as can be viewed by the Eye: For, as is already observed, Anatomists have found that these may be separated into other smaller Nerves, which are still so many Congeries of Nerves as yet smaller. *Lewenboeck*, in *Tom. 3. Epist. 36.* informs us, that he found a Nerve no larger than an Hog's Bristle to consist of at least thirty other Nerves, each of which was covered with its proper Membrane: He afterwards observed the same thing in far smaller Nerves. He, farther, observed minute and tender Blood-vessels running between these nervous Fibrils. Anatomical Injections, especially in young Carcases, sufficiently evince, that a large Number of Vessels run thro' the Substance of the Nerves; all visible Nerves, therefore, derive the smallest Part of their Bulk from the nervous Substance properly so called, which draws its Origin from the medullary Substance of the *Cerebrum* and *Cerebellum*, collected into the *Medulla Oblongata*, and spinal Marrow. Slender Coats covering the small Fibrils, connecting Membranes, and Vessels of all Kinds dispersed thro' them, constitute the principal Part of every visible Nerve: Thus these inconceivably tender Vessels are defended, and safely conveyed to those Parts of the Body, where, laying aside their thicker Coats, they ought to perform the Functions of Nerves. The optic Nerve, furnished with Coats from both Membranes of the Brain, in its Course appears tough and firm; but when, laying aside its Coats in the Bottom of the Eyes, it is expanded on the Retina, it is so soft, that unless it was sustained by the equable Pressure of the circumambient Liquid, it would fall into a kind of shapeless Mucus. But it is certain, from anatomical Injections, that numberless arterial Vessels run thro' the Middle of the Retina.

All the Vessels which constitute a visible Nerve, receive proportional Liquids propel'd by the Force of the Heart and Arteries; nor are we to doubt the Existence of those small Vessels which constitute the Coats covering the nervous Fibrils, since anatomical Injections evince, that arterial Ramifications convey the impell'd Fluids thither. But that the Nerves themselves, properly so call'd, are pervious, and that there is a perpetual Motion of a subtle Liquid thro' them, cannot be demonstrated to the Senses: But if we consider that the medullary Substance of the *Cerebrum* and *Cerebellum*, which is all continuous to the cortical and vascular Substances, is spent in constituting the nervous Fibrils, and is continuous to them; that so large a Quantity of the purest arterial Blood is convey'd to the

the Brain; that when the medullary Substance of the *Cerebrum* and *Cerebellum* is either destroy'd or compress'd, the whole Function of the Nerves arising thence is abolish'd; that when the Nerves are ty'd in their Course, all their Action is destroy'd under the Ligature, but remains entire above it, it will be sufficiently obvious that the nervous Fibrils receive an highly subtle Fluid secreted by the Fabric of the *Cerebrum* and *Cerebellum*, and convey it, during the Whole of Life, thro' highly-distinct Canals, to all the Parts of the Body; that the different Operations of Sensation and Motion may be perform'd.

Every wounded Nerve, therefore, suffers, not only as it is a Nerve, but, also, because it contains all Kinds of Vessels, the Soundness of which, and their Action depending upon it, is injur'd by the Wound.

But because in their Origin from the medullary Substance of the Brain, the nervous Fibrils, being distinct, are in their Course cover'd with their proper Membranes, and thus remain separated from their adjacent Fibrils; and as the whole Congeries of Nerves constituting the visible Nerve is cover'd with a pretty thick Coat; the Reason is obvious, why every visible Nerve appears tough and hard, tho' that which is properly call'd a Nerve arises from the soft Pulp of the Brain. The whole Contractility, therefore, of a visible Nerve, by which its divided Extremities retire from each other, depends on the Coats covering the nervous Fibrils, and the Vessels dispersed thro' them.

When therefore the Parts of a Nerve are intirely cut thro' and divided, they recede from the Place of the Wound, towards the fix'd Parts to which they are connected, and hide themselves in the surrounding Solids, by which they are compressed; and by this means their own Orifices, and those of their Vessels, are closed; so that no other Damage happens, besides what is already mention'd.

If such a Nerve as is describ'd in the preceding Aphorism is intirely divided, the Coats covering all the Fibrils, as, also, the Covering surrounding the Whole of them, collected together by their Elasticity and Connection with the other Parts, are retracted on both Sides: But as considerable Arteries, when divided and retracted, are by the Pressure of the adjacent Parts, under which they are lodg'd, and their own Contractility, so closed up, as to discharge no Blood, it is sufficiently obvious, that the tender nervous Vessels, and those distributed thro' their Coats, are forthwith closed, and can no longer transmit the Humours convey'd to them. All the Functions, therefore, which depend on the Soundness of these Vessels, will be destroy'd, and the Symptoms before-enumerated will happen.

If a Nerve is cut, or prick'd, in such a manner that some of the small Fibres are dissolv'd which compose the large Nerve when united, the dissolv'd Parts receding, will draw the smallest Fibres which connected the small Nerves to each other, and to the Vessels; from whence there will arise a perpetual and slow Laceration, and therefore a very great, acute, and continual Pain: But the Parts still cohering, will alone sustain the Force which the entire Nerve sustain'd before. They will therefore be more distracted and lacerated, and consequently afflicted with a more acute Pain. By their Distraction they will, also, be so compressed, as to prevent the Circulation of their Fluid. When the one Part divided, and the other cohering, are thus affected, the intermediate Vessels are compressed; hence the Blood, Lymph, and Spirits, are compressed, acted upon, and accumulated; for which Reason there is an Inflammation produc'd by the Blood, Lymph, and Spirits, about the Parts.

Hence the adjacent Nerves and Tendons, together with their Coats, as, also, the Muscles and Vessels, are stretch'd, constricted, and convulsed; by which means the Membranes of the *Cerebrum*, *Cerebellum*, and spinal Marrow, are contracted and vellicated, and the Action of the Brain is disturb'd.

Hence naturally follows a Series of all the Phenomena before enumerated.

If a visible Nerve, consisting of many small Nerves, cover'd with their proper Coats, and inclosed in a common Membrane, is so wounded, that some of these nervous Fibrils, by their Union constituting the large Nerve, are divided, whilst others remain entire, all those Functions will be destroy'd which depended on the Soundness of those Fibrils, whose Cohesion is now abolish'd. Besides, as has been already observ'd, these separated Extremities of the Fibrils will more recede from each other: But this cannot happen without a Distraction and Laceration of the slender Membranes connecting the nervous Fibres mutually applied to each other, and thus an acute and continual Pain will be produc'd. But the Fibrils left intire, will now alone sustain all that Force which before they bore united, whilst by the various Actions of the Muscles, the Flexions and Extensions of the

Joints, and the Pulsations of the Arteries, the Situation of the Parts is chang'd: They will, therefore, be necessarily more distracted; whence an intense Pain will, also, be produc'd. For if we suppose an intire Nerve to consist of an hundred nervous Fibrils collected into one Congeries, and that by a Wound fifty of these are divided, the remaining entire fifty will be more than doubly distracted by the same Causes; because half of the Cohesion, by which they resisted the distracting Causes, is remov'd: It is shewn under the Article OBSTRUCTION, that every Cause which distracts and lengthens the Vessels, lessens their Capacities, and may consequently produce an Obstruction; whence numberless Misfortunes may arise. Thus we begin to perceive what Misfortunes arise from Nerves wounded, but not intirely divided; for the divided Parts receding on both Sides, will contract the Orifices of the divided Vessels, and hinder the free Passage of the Humours thro' them. The Fibrils, as yet cohering, are less able to resist the distracting Causes; hence they will be elongated, and lessen the Diameters of their Vessels: By this means the free Circulation of the Humours thro' those Vessels will be hinder'd; and by the Impetus of the succeeding vital Fluid on the obstructed Places, an Inflammation will be produc'd, not only in the large Blood-vessels, but the same may, also, happen in the other decreasing Series of Vessels, as far as those of the smallest, that is, the nervous Kind. What enormous Symptoms may happen from this, is evinc'd by the Gout, the Rheumatism, and arthritic Pains; in which Disorders an Inflammation of the tender Vessels produces the most racking Tortures: But an Inflammation once form'd, may be succeeded by all its different Terminations, which are very various, according as the Inflammation is in larger or smaller Vessels. After a Phlegmon, a mild Suppuration happens: An exulcerated Erysipelas in the small Vessels, discharges a thin ichorous Fluid: A true Rheumatism never suppurates; and a Gout lodg'd in the most subtle nervous Vessels, consumes the most solid Parts into a kind of Calx. Hence numberless other Misfortunes may arise.

As for the adjacent Nerves; such is the Frame of the human Body, that when one small Nerve is wounded, the adjacent Parts, and sometimes those considerably distant, are affected. When the external hard Crust of a Tooth, being divided or corrupted, lays bare the tender nervous Fibrils dispersed thro' the Substance of the Tooth, the Access of the cold Air alone afflicts with an intolerable Pain, not only the affected Tooth, but, also, the whole Side of the Head in which it is fix'd: So that the adjacent Parts are frequently raised to a considerable Tumor. But when the pain'd Nerve is destroy'd, by the Application of Alcohol, or the Extirpation of the Tooth, all the Pain ceases. In *Hildanus*, and other practical Authors, there are various Instances in which the slight Puncture of a Nerve or Tendon, has not only immediately affected all the adjacent Parts, but, also, so far disturb'd all the Functions of the Body, as sometimes to induce Death. But whether the Propagation of a Disorder in one Nerve to all the adjacent Nerves, and to the Brain, happens by a Continuation of the Membranes covering the Nerves, and which are esteem'd Productions of the Meninges; or whether it happens from the Irritation of the nervous Substance, properly so call'd, and which arises from the medullary Substance of the Brain, we shall not here dispute: It is sufficient for our Purpose, that, after Wounds of the Nerves, these Misfortunes ensue, and perhaps both these Causes may concur to their Production. Thus the Membrane lining the Pelvis of the Kidneys is, by a continu'd Course, convey'd to the Ureters, Bladder, and Urethra; and when a sharp Stone, lodg'd in the narrow Part of the Pelvis, vellicates this internal Membrane, a Pain, and troublesome Strangury, are often perceiv'd in the Extremity of the Urethra. When, in Venesection, the tendinous Membrane covering the Muscles of the *Humerus* and *Cubitus*, is wounded by the Point of the Lancet, soon after Pain, Inflammation, and other terrible Symptoms, are produc'd throughout this whole Membrane.

He who compares the Phenomena before-mention'd with what has been said in this and the two preceding Aphorisms, will easily see why so many, and so terrible Disorders, are produc'd by Wounds of the Nerves.

Hence, also, we understand what Sort of Puncture, Laceration, or Wound of a Nerve, is so dangerous, and why; as, also, why the same Things happen, with respect to Tendons, Membranes, and many Kinds of Vessels.

The more tense the Nerve is, and the fewer Fibres of the wounded Nerve remain entire, the greater their Distraction will be, the more violent Symptoms will be produc'd, and the more intense Pain will be present: But such terrible Disorders do not accompany a Nerve, which is by no means tense, and which is entirely divided. But that the like Misfortunes should happen to the Membranes, is not surprising, since they have many Nerves dispersed thro' their Substance; as, also, to the Tendons, which being

Continuations of the muscular Fibres, and consequently seem to arise from the Nerves, as has been already observ'd. The same will, also, happen in the Vessels form'd of a Convolution of the Membranes; thro' which, also, are disseminated the Nerves subservient to Sensation, Motion, and Nutrition.

Having already treated of the Definition, Causes, Effects, Diagnostics, Prognostics, and other Circumstances, of a simple Wound; it now remains that we consider its general Cure.

In order, then, to the healing of a Wound, it is necessary,

First, To take away whatever being left there, hinders its Union, whether it proceeds from the Liquids and Solids corrupted, from the wounding Instrument, or any other Cause.

Secondly, To supply what is lost by a Regeneration of what is taken away.

Thirdly, To unite the separated Parts, and keep them in Union.

Fourthly, To form a Cicatrix as like as possible to the natural Skin.

A Cure is such a Change of a living Body, as removes that Condition which is call'd a Disease, and restores that the Removal of which produc'd the Disease. But a Wound is a recent and bloody Solution of Continuity in soft Parts, made by an hard and sharp Body. The Cure, therefore, of a Wound, is the Restoration of the natural Cohesion of the Parts separated by the wounding Cause. Now whether there is a simple Division of Parts, before cohering; or whether there is a great Loss of Substance, made by the wounding Cause, the remaining Life in the Patient, by an inimitable Artifice, unites what is separated, and restores what is lost. Physicians and Surgeons remove whatever can hinder this salutary Effort of Nature, and supply what can assist it; and this is all that Art can do. Let those who think they can do more, attempt the Consolidation of the slightest Wound in a Carcase; let them apply the most celebrated vulnerary Balsams, and cherish the Part with an Heat equal to that of a sound Body; and still the Event will evince, that the Nature of a created Body is alone sufficient for a Cure, and that, without that Nature, nothing can be produc'd by Art. In the following Numbers are recounted all those Things which are always requisite to the Cure of Wounds.

1. Every thing lodg'd in a Wound of a Nature foreign to the Parts of the human Body, can never adhere to them, and will, so long as it remains there, always hinder the Union of the separated Parts. When the elevated Skin is divided by the Lancet, and a Ball of pure Gold put into the Wound, its Lips will never unite; but, for many Years, there will remain an Ulcer, daily discharging Pus: But if that foreign Body is remov'd, its Lips, unless become quite callous by their continual Attrition with the hard Body, will in a few Days be consolidated. It is no matter whether that foreign Body is a Part of the wounding Instrument, or something else, which has penetrated the Wound along with it; or whether the extravasated Humours, or solid Parts, are so chang'd by the wounding Cause, as to lose those Properties requisite to their being again united to the live Parts. In Battles, Balls discharg'd from Guns, when they penetrate the Cloths, often carry into the Wounds large Portions of the Cloths; by which means the Consolidation of such Wounds is often protracted for several Months, and often for several Years. A memorable Instance of this occurs in *Memoires de l'Acad. Royale des Sciences, l'An. 1731*. It is therefore obvious, that such Things are, if possible, to be remov'd.

2. If a Wound is accompanied with great Loss of Substance, the Lips cannot be united and consolidated till the lost Substance is restor'd by a new Regeneration; for they are, as yet, too far distant from each other: And tho' they should be forcibly brought into Contact by Suture, or adhesive Plaisters; yet under the united Lips there would still remain a Cavity, in which the extravasated Humours would be collected, and form a sinuous Ulcer.

3. The Parts of the Body between which the wounding Cause is forced, gradually recede more and more from each other; but that a Wound may be cur'd, it is requisite the separated Parts should be again render'd contiguous. Here Art assists Nature, by uniting the separated Parts, and so fortifying them, that they may remain in that State.

4. But this cannot often be done when a strong Suppuration has consum'd a large Portion of the *Membrana Adiposa*; or when a considerable Quantity of the Skin is carried off by the Wound: For, in this Case, the Cicatrix is always more solid, smooth, and shining, than the adjacent Skin.

These are the general Intentions to be pursu'd in the Cure of all Wounds; and how these Intentions may be obtain'd, shall be hereafter specified.

Impacted Fragments of Metals, Stones, Wood, Glass, Balls discharg'd from Guns, Thrombuses of Blood, morti-

fied Flesh or Membranes, and broken Bones, are first of all to be remov'd, if they are discover'd.

Such Cases frequently occur in modern Battles, when warlike Machines, loaded with various Fragments of Stones and Metals, are exploded upon the Enemy, and render the Cure of the Wounds highly difficult: All these, if left in a Wound, when the Wound begins to swell, and be inflam'd, confuse the Parts they touch, render them callous, augment the Inflammation, and at last make them degenerate into fistulous Ulcers, not to be cur'd unless they are extracted by Art, or discharg'd by a Suppuration excited in the adjacent Parts. The same Caution is to be observ'd, if Thrombuses of concremented Blood, or solid Parts of the Body, cut off, and remaining free from all Connection with the live Parts, are lodg'd in the Wound: But if the Fragment of a Bone as yet coheres with the live Parts, there is some Hope that it may be again united with them. But it is to be always observ'd, that if the Extraction of such foreign Bodies, lodg'd in a Wound, cannot be made, without the Dread of more terrible Misfortunes, then they are rather to be left, and their Separation committed to Nature.

But how we may determine whether they are to be remov'd, or left, will be shewn in the next Aphorism.

We are to judge whether any Body is to be left, or taken away, by considering the Nature of the Wound, of the wounded Part, of the impacted Matter, the Strength of the Patient, and the Symptoms that will follow.

In Wounds, especially those of a dangerous Kind, great Caution is requisite, in determining whether foreign Bodies, lodg'd in the Wound, are to be remov'd, or left: If after a due Consideration of all Circumstances, it appears that the Patient will, by an Extraction of such Bodies, live more commodiously, or longer, then they are certainly to be remov'd: But if from Anatomy, and the Functions injur'd, the Condition of the Wound appears such, that certain and sudden Death is justly to be dreaded, they are to be left, lest the succeeding Death of the Patient should be imputed to the Physician or Surgeon: For it is prudent not to meddle with Patients whose Cases are absolutely desperate. If the wounded Part cannot be reach'd with Instruments, in order to the Extraction of foreign Bodies lodg'd in it, such Bodies are, in like manner, to be left. Thus, for Instance, foreign Bodies lodg'd about highly-tendinous Places, large Nerves, or the Brain itself, cannot be remov'd without the greatest Danger. But some Bodies, according to the different Matter of which they consist, may be more safely left in Wounds, than others. Thus numberless Observations evince, that leaden Balls have without any Inconvenience been lodg'd for many Years in the Body, and afterwards often made surprising Ways for their own Discharge: But if they had been made of Iron, or Copper, becoming corrupted by the Rust, they would have far more irritated the Parts they touch'd. We ought, also, to have a due Regard to the Strength of the Patient: For if the Weakness of his Pulse, the Coldness of his Extremities, and the cadaverous Paleness of his Countenance, evince that his vital Strength is already much impair'd, we ought in Prudence to abstain from searching the Wound with surgical Instruments: For surprising Instances evince, that foreign Bodies left in Wounds have afterwards spontaneously discharg'd themselves, tho' they could not before be extracted without the greatest Danger. A memorable Instance of this occurs in *Journal des Scavans, l'An. 1735. Avril*. Many other Observations occur in practical Authors, which sufficiently prove that it is sometimes expedient to leave foreign Bodies in Wounds, since they will afterwards be excluded by the Assistance of Nature alone.

From what has been said we may determine the Instrument, and Manner by which such foreign Bodies are to be remov'd.

We must first examine whether by the Wound made, a Part of the wounding Instrument left may be extracted, without a Dilaceration of the Parts; or whether the Wound ought to be dilated; or whether the Body may be more commodiously extracted, by making a fresh Wound in the opposite, or any other Part. Thus feather'd Darts cannot be extracted from the Wound they make, without a great Dilaceration of the adjacent Parts: Hence, in such a Case, the Wound is rather to be dilated, or, if it is possible, the Dart is to be protruded thro' the opposite Part, after making a new Wound. Forceps, of various Bulks and Figures, are describ'd by surgical Authors, for extracting foreign Bodies from Wounds; but they are not all at once, and with a great Impetus, to be extracted; since it is more expedient, after the Dart is laid hold of by the Forceps, gently to agitate it, in order to know whether in any Part it is so fix'd, that it cannot be extracted, without a great Dilaceration:

ration: For in this Case it is rather to be left. But since in Battles Gunpowder has been used, the Balls discharg'd from Guns could not be commodiously extracted by the Surgeon's Forceps; hence they invented other Machines, especially a spiral Perforator, so conceal'd in a hollow Pipe, that it might be safely pass'd to the Bottom of the Wound, till it reach'd the Ball there lodg'd; then, by gently twisting about the Perforator, they so fix it in the soft Lead, as to extract it.

After a Wound is depurated in this manner, if any thing is taken away from the Body, it ought to be restor'd, by a Regeneration of Matter similar to that which was lost. This comes to pass,

First, If the arterial, lymphatic, and nervous small Vessels, are in such a Condition, as to receive and transmit their own laudable Liquids. And,

Secondly, If this laudable natural Liquid is carried into these Vessels in a fit Quantity, and with a proper Impetus.

After all foreign Bodies are remov'd from a Wound, we are to consider whether the Wound is such, that only a simple Division of Parts, before cohering, is made by the wounding Instrument; or whether some Part of the Substance of the Body is carried off by the wounding Causes. In the former Case nothing more is requisite, but an Union of the separated Parts; but in the latter it is necessary there should be a Regeneration of the lost Substance. Tho' it is commonly believ'd that Parts of the Body cut off will no more grow to the Parts to which they before adher'd, tho' applied to them, yet some Observations evince, that this is not always to be despair'd of. Instances of this are found in *Garengot's Operat. de Chirurgie, Tom. 3.*

Observations of this kind prove the Possibility of *Talipotius's* Method of restoring some lost Parts of the Body; such as Noses, Ears, and Lips. An Instance of this kind is given by *Paré, in Lib. 23. Cap. 2.* and another by *Hildanus, Centur. 3. Obs. 31.*

But such Instances rarely occur; when, however, some Part of the Substance of the Body is carried away by a Wound, the adjacent Vessels, being lengthen'd, by a surprising Artifice of Nature, again form or restore that which was lost. But that this may be done, two Things are requisite:

I. By the inevitable Effect of Life and Health, some Parts of the Body are necessarily lost, and these are restor'd by the Aliments converted into our Nature by the Action of the Vessels and Viscera. There is therefore in a sound Body, such a Property, as enables it, from the ingested Aliments, to supply as much as was lost, and of the same Qualities: But all this is perform'd by the vital Motion of laudable Humours thro' Vessels that are sound, and proportion'd to the Liquids. It is therefore requisite the Vessels should have these Conditions, by which they may receive, convey, and return such Liquids, as in Health flow'd thro' these Vessels. Hence if, by too strong Compression, or powerful Desiccatives, the Vessels are too much contracted, the Surface of the Wound will become dry, and inflam'd; nor can the Vessels transmit those Fluids which, in Health, mov'd thro' them. If, on the contrary, the Wound is treated with too emollient Substances, the relax'd Vessels will yield to the impel'd Fluids, and consequently be dilated so as to admit Humours which ought not naturally to be in them; and the Vessels, thus expanded beyond their natural Capacity, by their contain'd Fluids, will form fungous Flesh, which will always retard the Cure of Wounds. The happy Restitution, therefore, of the Substance lost by a Wound, so far as it respects the Vessels, depends upon procuring a due Strength to those Vessels, so that they may neither too greatly resist, nor too easily yield to the impel'd Fluids. But as, in order to restore the lost Substance, all the Vessels, constituting the Surface of a Wound, must be elongated; hence it will be expedient the Parts should be kept a little more soft and relax'd, than in a natural State. When a Surgeon daily views the Surface of a Wound, he may see whether a greater or smaller Degree of Softness is requisite to the Regeneration of what is lost: For if the Surface of the Wound appears dry, and of a deep-red Colour; and if a little Pus is generated, he immediately knows that the Vessels in the Surface of the Wound too strongly resist the impel'd Liquids, so as not to transmit them: But if, in every Point of the Wound, an equable Humidity, and moderate Heat, appear; if the Bottom of the Wound begins daily to be equally elevated, and its Sides equally extended to the Centre, he sufficiently perceives that the Vessels have a due Degree of Laxity, so that they may yield to, and be elongated by the impel'd Fluids. But if a Wound is overflow'd with too much Humidity, and its Sides and Bottom are suddenly and unequally raised, we conclude, that the Vessels are too much relax'd. Hence Medicines opposite to this become necessary.

These are the Things to be observ'd in a Wound, with respect to the Vessels, in order to the Regeneration of lost Sub-

stance: We shall now consider what is requisite in the Fluids, in order to produce the same Effect.

2. The Substance lost by the Wound is to be regenerated; but this Substance consists of Fluids and Solids, or containing Vessels, and contain'd Fluids: There must, therefore, be convey'd to the Part of the Wound a Matter in which are lodg'd the Parts requisite to the Regeneration of the lost Substance. But a natural and laudable Liquid, according to the Laws of Health, mov'd thro' the Vessels, contains in itself all the Parts requisite for this Purpose; for by its means are daily restor'd, both in the Solids and Fluids, the Parts lost from the Body by the Actions of Health; for Aliments do not nourish till they are by the Fabric of the Body chang'd into a Quality like that of the human Fluids, and, losing their own Nature, assume that of the Body. It is therefore requisite that so much Health should remain as is sufficient, from the Aliments taken, to produce laudable and natural Humours. Hence the Reason is obvious, why the Restitution of lost Substance is highly difficult, and often absolutely impossible, in cacoehymic Habits, but very easy in good Constitutions: It is, also, requisite there should be a due Quantity of this good and natural Liquid, so as equably to fill all the Vessels. Hence appears the Reason why the Cure is difficult in Patients who, by an Hæmorrhage, have lost a large Quantity of laudable Fluids; and this Difficulty is still augmented, because it is principally by the due Quantity of laudable Humours that the crude Aliments are chang'd into our Nature, and mix'd with the good Juices. Nor are these Circumstances alone sufficient; but it is, also, requisite, that the natural Liquids should be, with a proper Impetus of Motion, convey'd thro' the Vessels: For when this Motion is languid, Nutrition is defective, or at least deprav'd; as evidently appears in weak Habits. When the Fluids are with too great a Velocity carried thro' the Vessels, the Body is destroy'd, but not recruited; as appears in Animals fatigued by too hard Labour, and in those Diseases where the Velocity of the Circulation is too great.

All that Art can do is, to render the Vessels such as they were in Health, and procure a Circulation of laudable Fluids thro' them with a due Force: The rest will be perfected by Nature, who is generally sufficient for her own Purposes.

By this means there will be an Impletion, Humectation, Extension, Elongation, of the wounded, retracted, obturated, compress'd, and almost juiceless Canals; an Implication of them with the adjacent Vessels; an Application to others, which are near them; and this is brought about by the Assistance of the reticular Plexuses; and at last, by the Help of a good Fluid, Conglutination is accomplish'd.

It is already demonstrated, that Arteries, even of a considerable Bulk, when divided, are gradually contracted, and closed up; and that, in consequence of this Circumstance, unless they are very large, the Hæmorrhage stops spontaneously: It is therefore sufficiently evident, that when small Vessels are divided, they are closed by the same Causes, and the Effusion of the Humours is, by that means hinder'd. Hence, by the Action of the Fluids on the obstructed Orifices of these Vessels, are produc'd an Inflammation, and slight Fevers; by which the Humours, being forc'd with a considerable Force into the constricted Extremities of the Vessels, protrude, elongate, and open them; or, by a benign Suppuration, separate from the live Parts the totally dry and mortified Extremities of the Vessels. But these Vessels no longer confin'd by the Skin, are, by the Force of the Liquid mov'd thro' them, gradually extended and elongated, and their Mouths, being open'd, they discharge their Liquids into the Cavity of the Wound: Hence the whole Surface of the Wound appears moist with Pus, and rough, as it were, with small *Papilla*, which are gradually more and more elevated, and are only the pulposus Extremities of the protuberating Vessels; and when this happens equably in all the Circumference of the Wound, the Mouths of the growing Vessels mutually meet each other, are applied and united, and thus the lost Substance is restored. If, after the Wound is clean, the mucous Congeries of the growing Vessels is daily deterg'd by the Surgeon, that which ought to restore the lost Substances is destroy'd; hence the Cure is retarded, and the Surface of the Wound degenerates into the Nature of a fordid Ulcer. The Whole, therefore, that Art can do, in order to the Regeneration of lost Substance, consists in procuring to the Vessels, and the Liquids mov'd thro' them, those Qualities which are requisite to perfect Health; and taking care that the Impetus of the Fluids mov'd thro' the Vessels, be neither too strong, nor too languid: All the rest is perform'd by Nature, as is already observ'd.

But this Conglutination seems to happen by the Application of a new Substance, and not by the Interposition of a soldering Juice, which, like Glue, unites the divided Extremities of the Vessels.

Vessels. For we observe, that if the Vessels free from the Skin and *Epidermis* are contiguous, they forthwith grow together. Thus the Edges of the Eyelids, if excoriated, have in one Night's time been found to grow so strongly together, that there has been a Necessity for dividing them with a Lancet. The Fingers, also, when left contiguous, after the *Epidermis* has been destroy'd by Gunpowder, have grown very firmly to each other; so great is the Tendency of the open Extremities of the Vessels to unite with others like themselves.

And whilst these are with an equal Force happening from every Point, especially of the Bottom and Sides, the Cavity of the Wound, from every Part to the Centre, is fill'd with solid and liquid Matter, like those which were lost.

If all the Extremities of the Vessels in the Bottom and Sides of the Wound are equally open'd, the Motion of the Humours thro' the Vessels will act equally on all the Parts: Hence, if there is not a greater Resistance in one Part than in another, there will in every Point be an equable Elongation of the Vessels; but if there is a greater Relaxation in one Part, than in those adjacent, the Vessels will be there more distended, and elongated: Thus there will be form'd a fungous Excrescence, which, by compressing the adjacent Vessels, will hinder the equable Consolidation of the Wound. But whilst, from all the Circumference of the Cavity of the Wound, the lengthen'd Vessels meet each other, and are united, such a Structure of the Vessels is restor'd, as regenerates the lost Substance. But tho' we cannot affirm, that this regenerated Substance is precisely the same with that which was lost, yet it is certain, from all the Phenomena, that it is highly similar to it; since Experiments evince, that not only large Blood-vessels, but, also, those of the small perspiratory kind, are thus regenerated: For if the mucous Congeries of growing Vessels in the Cavity of the Wound is rudely touch'd with a linen Cloth, red Blood is discharg'd; and if that Congeries is but gently touch'd, a thin Fluid is evacuated. If a polish'd Plate of Metal, or a Looking-glass, is applied, there will be form'd on the smooth Surfaces of these Bodies a moist Spot, which will soon disappear, without leaving any Sordes; a sure Proof that there is such a Congeries of Vessels, which contain and emit a subtle exhaling Fluid. Hence we may, with a great deal of Probability, conclude, that since in the regenerated Substance there are Blood-vessels, and small exhaling Vessels; there are, also, intermediate Series of decreasing Vessels to be found in it.

But this Regeneration of lost Substance in the human Body has its proper Limits; for no one ever saw so much as the least Articulation of the Finger restor'd after it was cut off. The Vessels, indeed, on the Surface of the Wound, are so concreted, as to form a Cicatrix; but the Part remains defective during the whole Remainder of the Patient's Life. Hence the lost Substance of the human Body seems possible to be regenerated, when, from all the Circumference of the Wound, the elongated Vessels can concur and unite in its Centre. But when, by a simple Elongation of the Vessels remaining in the main'd Part, so many organical Parts are to be restor'd, after they are cut off, Nature proves defective, and, by a good Cicatrix, secures the Part. Philosophers are, however, justly surpris'd that an Advantage denied to the human Species should be granted to some other Animals. Thus the celebrated *Reaumur*, in *Mem. de l'Academie des Sciences*, l'An. 1712. has shewn, that the Claws of Crabs and Crayfish, when totally separated from their Bodies, may grow again, and that oftener than once: Nor has it, as yet, been evinc'd by Experiments, whether, in these Animals, the Power of producing new Members can be exhausted. Thus we see, that, in physical Affairs, particular Observations teach us a great many Things; but that general Conclusions, deduc'd from a few known Observations, often prove fallacious.

Therefore to this End is requir'd first a proper Diet, that the Chyle, Serum of the Blood, and nutritious Matter, may be mild, glutinous, not easily putrefying, but of easy Digestion and Assimilation. Farinaceous Decoctions, either crude or fermented, Emulsions, Milk, Broths, ripe Fruits boil'd, and mild Pot-herbs, are particularly proper, if given in small Quantities, and often repeated; above all Things taking care to guard against Repletion, Hunger, and Thirst.

The Parts of the lost Substance regenerated are restor'd by the Fluids convey'd to the Wound; but the Liquids flowing thro' the Vessels are either crude, in consequence of the Aliments not being totally chang'd into our Nature; or such as, by the Action of the Vessels and Viscera, having lost their own Nature, have assum'd all the Properties of our Fluids. The

Chyle, by the chylopoetic Organs form'd from the Aliments, is for many Hours convey'd thro' the Vessels along with the Blood, as is obvious, from the Experiments of Mr. *Lower*. Hence such a crude chylous Juice is, together with the other Humours, convey'd to the wounded Part, and that in a greater Quantity than to the other Parts of the Body; because there is less Resistance in the wounded Part. Hence it has been observ'd, in large Wounds, that almost the whole nutritious Matter has been discharg'd from them, in consequence of which, the Body, depriv'd of its daily Recruits, has wasted away of a slow Consumption. Unless, therefore, by a proper Diet, mild Chyle is produc'd, the Wound will, by the acrid Chyle, be daily irritated, and cur'd with great Difficulty. But we here speak of considerable Wounds; for slight Wounds do not require so great Caution: Besides, the open Orifices of the Vessels discharge into the Cavity of the Wound a large Quantity of a Liquid, which, after its thinner Part is reforc'd, or dissipated, is converted into Pus: If, therefore, the Chyle convey'd hither with the Blood, consists of such Parts as naturally incline too much to a putrid Degeneration, the extravasated Humours will by their Stagnation, and the Heat of the Place, degenerate into a putrid ichorous Matter, but will not be chang'd into laudable Pus: Such Things are, therefore, to be avoided. But since Rest is necessary to wounded Patients, and since, at the same time, as is shewn under the Article *FIBRA*, muscular Motion, and Exercise of Body, contribute much to the Assimilation of the crude Aliments to our Nature; hence it is obvious, that we ought not to exhibit to such Patients Aliments of hard Digestion, but such as may be easily digested and assimilated; otherwise a large Quantity of crude, and very little concocted, Juice is convey'd to the Wound. But the Regeneration of lost Substance in a Wound can only be obtain'd from such Humours as are concocted, and converted into our Nature.

We shall now enumerate the Aliments which, by their mild Quality, and easy Assimilation, are principally subservient to this Intention. Oats, then, Barley, Buck-wheat, and Rice, boil'd with Water, or the Broth of Flesh, yield such a mild and easily-digested Nourishment; nor do they putrefy. From the Meals of these, excellent Aliments are, also, prepar'd, by a gentle Fermentation, by which means the farinaceous Lentor is taken away. Hence well-fermented Bread, especially Biscuit, and weak Flesh-broths without any Fat, are of singular Service in Cases of this Nature. Emulsions of soft farinaceous Seeds, prepar'd by Trituration with Water, have almost the Nature of Chyle. Milk, diluted with an equal Quantity of Water in the Winter-time, but in the Summer mix'd with more Water, may be used for common Drink: Milk, also, gently boil'd with farinaceous Substances, yields a mild Aliment. Ripe Summer Fruits, by their grateful Taste, and mild cooling Quality, are of singular Service; but they are to be gently boil'd, in order to remove all their stultent Qualities. All soft Pot-herbs, such as Lettuce, Endive, Spinage, Skirret, Vipers-grass, Carrots, Goats-beard, and Parsneps, boil'd in Broth, are excellent.

But tho' all these Things are salutary, they may, nevertheless, prove noxious, if exhibited in too large a Quantity: For by this means the Body of the Patient will be oppress'd, a large Quantity of crude Chyle will be mix'd with the Blood, and the Condition of the Wound chang'd. But if the Quantity of the Aliments to be taken is so divided, that some of it may be taken every two Hours, it will easily be assimilated, and the Humours convey'd to the Wound, will always have nearly the same Properties: But when the Patients take a large Quantity of Aliments only twice a Day, the Blood, loaded with a large Quantity of crude Chyle, will at one time be convey'd to the Wound; but at another time the Blood, when the Chyle is subdu'd, will have another Quality: So that, by this alternate Vicissitude, the Condition of the Wound will be disturb'd. Hunger is equally to be avoided with excessive Repletion; for Hunger denotes that the Body requires fresh Supplies: And all the Humours, unless qualified by a fresh mild Chyle, will become more acrid, and half putrid. For the acrid and putrid Urine, and the cadaverous Breath of Persons who have suffer'd Hunger for a long time, sufficiently evince this Degeneracy of the Humours. But we ought, in a particular manner, to take care that the Patients should not be afflicted with Thirst; for Thirst denotes the Dryness of the Body, or a Stagnation of the Fluids, or something of an acrimonious Nature mix'd with them: But all these are highly prejudicial to a Wound, since, in order to the Restitution of the lost Substance, an equable Humidity, in every Point of the Wound, and a free Circulation, and mild Quality of the Fluids, are absolutely requisite. Hence moist Aliments, and the liberal Use of mild Liquors, are requir'd: For, by this means, the whole Body will be moisten'd in all its Parts, the Fluids will be more diluted, and capable of a freer Circulation; and the acrimonious Particles, which would otherwise

wife prove injurious; being diluted by the large Quantity of Drink, will be eliminated by Sweat, or Urine.

A Consideration of the Temperament of the Patient, the Season of the Year, the usual Way of Living, and the Nature of the concomitant Disease, will direct us in the Choice and Preparation of these Things, that they may be useful to the Patient.

All the Directions laid down, with respect to the Diet, vary according to the different Constitutions of the Patients, so that no general Rule can be given: When, in the time of War, large Numbers of wounded Men are in the Hospitals, many of them die, who might otherwise have been preserv'd, only because the same Aliments are given to all; for the Whole that is requisite here is, that the remaining Health be preserv'd in the wounded Person, or restor'd, if it is defective. But every Person has a kind of Health peculiar to himself; hence, tho' different Persons may have their Solids and Fluids compos'd of highly different Parts, yet they may both be sound: This is call'd the constitutional Sanity; to which we are, therefore, carefully to advert. For Physicians, by their proper Signs, distinguish the hot and the cold, the moist and the dry, the bilious, the sanguine, the phlegmatic, and the atrabiliarious Constitutions; and observe, that various, and even opposite, Aliments are proper for Persons of different Habits: So that each may preserve a perfect Health. Thus, for Instance, when the Constitution of the wounded Person is known to be aqueous, and cold, thin diluting Drinks are to be avoided, and corroborating and rousing Substances exhibited: But if the Humours are thick and compact, the solid Parts tense and firm, the Constitution is said to be hot and dry; and then these Things are beneficial, which would have been hurtful in the other Case. Hippocrates, in *Tr. de salubri Victus Ratione*, tells us, that "Those who are of a fleshy soft Habit of Body, and of a reddish Colour, ought for a great Part of the Year to use a dry Diet; for their Constitution is moist: But such as are of hard slender Constitutions, or of a yellowish or blackish Colour, ought to use moist Aliments for a considerable time; because their Constitutions are dry."

But the various Seasons of the Year require a different kind of Life in the same Person: For, during the Summer Heats, Degeneracies of the Humours quickly happen; but in the Cold of the Winter they are brought on more slowly: For the Flesh of Animals can, in the Winter Cold, be preserv'd for several Weeks without Corruption; whereas the same Flesh would have been wasted to a putrid Gore, in a few Days, during the Heat of the Summer. Hence the sagacious Antients carefully distinguish'd the various Methods of Life, according to the various Seasons of the Year. Thus in the Winter they recommended liberal Eating, generous Liquors, but in a small Quantity, eating few Pot-herbs, and only such as were of an heating and drying Nature, and all roasted Aliments: But in the Summer they recommended a large Quantity of thin Drink, boil'd Aliments, and a large Quantity of Pot-herbs. In the Spring they order'd the Quantity of Drink to be gradually increased, but to be more diluted; instead of roasted Meat, they substituted that which was boil'd: They, also, gradually lessen'd the Quantity of the Aliments, lest a great Change should be suddenly induc'd on the Body; and thus they proceeded to their Summer Diet. Then, in the Autumn, they increased their Aliments, and diminish'd their Drink, tho' they order'd it to be more generous, till at last they came gradually to their Winter Diet. But as Battles generally happen in the Summer-time, and Flesh-broths are then only given to the wounded Persons, they are often in a very languishing Condition, and earnestly desire acidulated Drinks, and ripe Fruits, which, however, they are often forbid.

Besides, the various Ages of Patients indicate different Regimens, with respect to Diet.

Custom, also, which justly deserves to be call'd a second Nature, is, in this Case, to be consider'd. If the hardy Ploughman, accusom'd to live on coarse Bread, and salted or smok'd Flesh, in order the better to sustain his daily Fatigues, is wounded, and constrain'd to live on Flesh-broths alone, his Strength will be soon impair'd. Hence more solid Aliments safely may, and even ought to be exhibited to such a Patient. Thus Hippocrates, in *Aphor. 50. Sect. 2.* tells us, "That Things we have been long accusom'd to, tho' worse, are usually less troublesome than those Things we are not accusom'd to." The same Author, also, in his *Treatise de Victu Aetiorum*, tells us, that People easily bear Aliments they have been accusom'd to, tho' they are not naturally good; whereas they ill bear those Aliments they have not been accusom'd to, tho' they are not of themselves bad. He, also, asserts the same concerning Drink. Hence the prudent Physician ought to make a due Allowance for the Custom of the

Patient; tho' in so doing he should run counter to the general Rules of his Profession.

As for the Nature of the concomitant Disease; we have hitherto treated of the Methods to be pursu'd, when a healthy Person is wounded: But if there is a considerable Cacochymy before the Infliction of the Wound, such a Regimen, with respect to Diet, ought to be order'd, as is most contrary to that Degeneracy of the Humours which is to be dreaded from the Disease, or the Cacochymy accompanying the Wound. If, for Instance, a putrid scorbutic Cacochymy is present; or if, by a violent Fever, all the Parts tend to a Putrefaction; we use scarcely any thing but Preparations of Milk, Oats, Rice, and acescent Summer Fruits: But we ought carefully to abstain from Eggs, Flesh, and Broths prepar'd of them. If a languid mucous Sordes is lodg'd in the whole Body, the languid Strength of the Patient is to be excited, by roasted Flesh, Wine, and Aromatics.

From all these, accurately known, and mutually compar'd, we conclude what Meats and Drinks are to be exhibited, and in what manner they are to be prepar'd: For a great Diversity of the same Aliment arises from the different Method of its Preparation. Recent Veal, when boil'd, yields a Broth which may be exhibited even when there is some Dread of a putrid Degeneracy in the Humours, especially if it is mix'd with a small Quantity of Lemon-juice; but if the same Flesh, left for some Days in the open Air, is boil'd, it yields a Broth which becomes putrid much sooner: But when Veal is roasted, it is still more dispos'd to Putrefaction; because its Salts and Oils are render'd more acrid by the Fire. Crude farinaceous Substances are hurtful to People of phlegmatic Constitutions, but they may be used when fermented. The same holds true with respect to many other Preparations of Aliments.

Whatever is acrid, or too much augments the Impetus of the Blood, is to be carefully avoided; for which Reason, saline, aromatic, and acid Substances, together with acrid Pot-herbs, and Wine, are bad for Wounds.

So mild and benign is the Disposition of our Humours in Health, that the Blood itself, and all the Liquors secreted from it, except the Bile and Urine (which, however, owe their Acrimony chiefly to Rest and Stagnation), that, instil'd into the Eye, they excite no Pain: Wherefore, since the Loss of Substance, which we suffer in Wounds, is to be regenerated and recruited by Supplies from these Humours convey'd to the Part affected; it seems highly to deserve our Care, that nothing acrid or stimulating, or that is easily susceptible of an acrimonious Quality, be receiv'd into the Body: For acrid Things are noxious to Wounds, by irritating the crude Parts, and, by their Stimulus, exciting a greater Motion in the Humours, and so increasing the Impetus of the vital Liquid upon those extremely tender Vessels which repullulate in the Wound; whence they often degenerate into a fungous Flesh; or an Inflammation, excited by that Increase of Motion, renders the Superficies of the Wound imperforable, by obstructing the Capillaries, whence the Cure is further retarded: For whatever is thus affected, must again be separated by undergoing a Suppuration.

All Stimulants, therefore, by whatever Title recommended, are in their own Nature prejudicial to Wounds, the Body of the wounded Person being supposed to be in Health. But if, for Instance, the Patient at the same time labour'd under a putrid Cacochymy, an Ingestion of Acids would be of Service, instead of being detrimental. But we would not be understood as if a few Grains of Salt, or some Drops of Juice of Lemon, added to Broths, would hurt the Patient; for the Addition of so small a Quantity might be useful, by way of Precaution, against a Degeneracy of these Liquors towards a Putrefaction; and can by no means prove Stimulants of the vital Forces: For if some such thing was not mix'd with the Broths, the Patient would in a short time abhor them.

The Use of Wine is disapprov'd, for the same Reasons, unless where Custom, or a Languor, demand the contrary: For Multitudes indulge themselves every Day in drinking Wine, and other spirituous Liquors; and if they should be compel'd to abstain from them, would immediately languish, and be disturb'd in all the Functions of their Body. For such Subjects, therefore, a moderate Quantity of Wine, either pure, or diluted, as Custom, or the Measure of Strength, shall seem to require, cannot but be proper.

Meats, also, subject to Putrefaction, Broths too thick, with alcalescent Herbs, as Radishes, Cresses, Cabbage, and the like, are improper, and prejudicial.

We are not only to attend to the Nature of Aliments at the time of their Ingestion, but to the Mutations to which they are subjected by the Heat of the Body during their Residence in the internal Parts. For, as we before observ'd, the nutritious Humours, which are generated of the Aliments, will be convey'd to

to the Wound, and there be partly discharg'd thro' the open Orifices of the Vessels, into its Cavity: If these Aliments, therefore, are in their own Nature very subject to Putrefaction, it is to be fear'd that the Humours which take their Course to the Wound will be converted not into good and laudable Pus, but into a putrid Ichor: And since Fish, especially Sea-fish, will very soon putrefy, nor can be kept unless season'd with much Salt; for this Reason they are forbidden. Thick Flesh-broths, Jellies prepar'd of Shavings of Hartshorn, or Scrapings of Ivory, will, within the Space of four-and-twenty Hours, in Summer-time, dissolve into a putrid kind of Liqueur. To this it may be added, that such thick Broths oppress the Stomach, and are not easily digested. It is a Property in some Plants, after a spontaneous Putrefaction, not to become aced, as do Multitudes of others, but to be resolv'd into a fetid, volatile, pinguious Alkali. In some Plants there is an acrid, alkaline, volatile Salt, to be found even before Putrefaction; as in Radishes, Mustard, Cresses, and the like; which are all hurtful to Wounds; because they are too much inclin'd to putrefy, and irritate the Part with their acrid Stimulus. But the greatest Danger is from those which are subject to putrefy; because all our Humours have a natural Tendency to a putrid Degeneracy. But those Vegetables which in their own Nature are aced, resist the spontaneous Degeneracy of our Humours; whereas the former conspire with it, and promote it. See the Catalogue of calefcent Plants, which are injurious in this Case, under the Article **ALKALI**.

Foods difficult to be converted into Chyle and Blood, as are those harden'd by Salt, Smoak, or the Air, or abounding with Fat, as Bacon, fat Fishes, as, also, Geese, Ducks, and the like Birds, which feed on Fish; with viscid Aliments, as grofs, leguminous, crude, farinaceous Foods, and Eggs, are bad Aliments.

They who daily exercise their Bodies with hard Labour, feed heartily on the hardest Meats, and very well digest them, but care not for lighter Food, which, indeed, would not supply the Strength necessary for sustaining the Body under so much Toil and Fatigue as they are oblig'd to undergo. But they who lead an idle Life, find themselves very much disorder'd after eating Meats of hard Digestion; whence it may be taken for a general Rule of Diet, with respect to Persons in Health, that *the harder the Labour, the harder must be the Food*. For hard Meats, which are not easily converted into good Chyle, add Weight and Inertness to a Body at Rest: And since Rest is necessary in Wounds, such Foods will not, in that Circumstance, admit of a good Digestion, and due Assimilation, which latter is absolutely requir'd, in order to the Regeneration and Restoration of the lost Substance in the Wound. But here some Allowance is always to be made for Custom, since they who have all their Life-time been accusom'd to such hard Meats, cannot, without Difficulty, be brought to live on lighter Foods.

The Flesh of Animals and Fishes, harden'd with Salt, or in the Smoak, or dried in the Air, are far more difficult to be converted into good Chyle and Blood, than if they were fresh and new; but fat Things are most prejudicial in this Case, as being always very difficult of Digestion, and being long retain'd in the Body, contract a very bad sort of rancid Acrimony. If a weak Person eats plentifully of Bacon at Dinner, he will be subject, in the Evening, to Eructations of a fat Oil, which burns the Fauces, and, being thrown into the Fire, kindles up a Flame; so long is this pinguious Substance retain'd in the Stomach undigested; and, tho' fluid, is not transmitted thro' the *Pylorus*. The same is true of fat Fishes, as Eels, Salmon, and others, and particularly of the Livers of Fishes; in which there is such a Redundance of Oil, that it may be expressed pure: And tho' this mild kind of Oil be extremely grateful to the Palate, it is very speedily converted into a very noxious rancid Matter. Hence a skilful Surgeon will know whether his Patient has indulg'd himself in such Food, by an immediate Alteration in the Wound for the worse: For the oleous Particles, being convey'd to the Wound, there obstruct the Capillaries, and, being render'd more acrid by Settlement and Heat, excite an Inflammation difficult to be resolv'd. And because this oily Matter very much abounds in many Fishes, whose external Superficies is defended by its Transudation, and their Bodies secur'd from Diffuence and Maceration in the Water in which they live; hence Birds which feed on Fish are difficult of Digestion. For tho' Aliments receiv'd are, by the natural Functions, converted into the Nature of the Receiver, yet there often remains something of its former Qualities; whence we observe such different Tastes in the Flesh of Animals, according to the Variety of Foods in which they live. Ducks, Geese, and the like Birds, if they live only on Fishes, their Flesh will have the nidorous and ungrateful Smell of Fish; and tame Hares, fed upon Cabbage-leaves, will have an abominable Faetor at the Table: The Patient, therefore, is directed to abstain from such Foods.

Again; all the grosser Kinds of leguminous Foods, or Pulse, and crude, farinaceous Vegetables, generate a viscid Chyle, whose Viscidness, by hard Labour and Exercise, may be subdu'd; but in Persons at Rest is productive of numerous Disorders.

And, in the last Place, Eggs, tho' justly recommended as an Aliment proper for restoring weak Bodies, if they are recent, and diluted in Broths, and especially their Whites; yet as they are subject to Putrefaction, are, in such Cases, sparingly to be used; but if they are harden'd by Boiling, they are observ'd to be difficult enough of Concoction.

To the due Cure of Wounds are conducive such Medicines as remove the Impediments to Consolidation, and are generally exhibited in the Form of a Decoction. These Medicines are various, according to the Variety of the Impediments which are to be remov'd; for none will suit all Cases.

We have hitherto treated of such things as are to be observed in a Regimen of Diet for Wounds, to the end that good Liquids, being convey'd through sound Vessels to the wounded Parts, may procure a Restoration of the lost Substance. But the wounded Person was there supposed to be healthful in other respects; and, therefore, if there be either in the Body of the Person affected, or in the wounded Part itself, any corporeal Circumstance which proves an Obstacle to a Regeneration of the lost Substance, it is to be removed. Inquiry, therefore, is to be made about this Impediment, whether it be seated in the Fluids or Solids, or in both; whether it lies in the Wound itself, or in such things as are convey'd to the Wound by means of the Circulation; or, whether the Humours by too impetuous, or too remiss a Conflux to the Part, disturb or hinder a Regeneration. Since, therefore, the Nature of such an Impediment may be so various, and even so far, that the Consolidation of a Wound may be impeded by opposite Causes, it plainly appears, that there can be no such thing as an universal Remedy, and that they are vain Boasters who pretend to it. *Helmont*, under a false Persuasion that Pus was generated in a Wound by an Acid, would have every vulnerary Potion contain an occult Alkali, and that of the volatile Kind. *Blas humanum*, No. 53. Others cry up their own Nostrums; and hence it is that we are over-stock'd with such a Variety of celebrated Formulæ of vulnerary Decoctions. But let there be only a just Motion of good and laudable Fluids through the Vessels to the Wound, and the thing is done which was required. The Art of Medicine, therefore, can do no more than remove or correct an Impediment, when it is known, by proper Remedies: And this is the full Extent of its Power; all the rest of the Work is perform'd by Nature. But those vulnerary Remedies were generally prepared in the Form of Decoctions, because by this means the Virtue of the Medicines diluted with Water might conveniently mix with the Blood, and be equally distributed through the whole Body. The various Sorts of Medicines required in these Decoctions are comprised under the following Heads:

For this Reason they are chosen, as the Nature of the Case requires, out of Attenuants, Inspissants, Mitigants, or Stimulants, such as are endued with a singular Virtue of correcting the contrary Quality, Aperitives, Laxatives, and Astringents, and consequently oftentimes out of Opposites.

Attenuants: If it appears by Observation of Signs, that the Impediment to the Cure depends on too great a Spissitude of the Humours, which incommodes their Course through the Vessels, it is plain, that the proper Vulneraries in this Case, are all such Remedies as divide and attenuate the Humours to such a Degree as to facilitate their Passage through those Vessels, in which, by the Laws of Health, they are to flow. It has been demonstrated under the Article **OBSTRUCTION**, that this Immeability, or Incapacity of Circulation of the Fluids, may proceed from various Causes, for which several Remedies are recommended under the same Article, by which these Causes may be removed or corrected. Hence again arises a vast Variety of vulnerary Medicines with regard only to their Way of Action by Attenuation. For quite other Remedies are required for attenuating an inflammatory Spissitude, than what are adapted to an atrabilious Tenacity, or cold glutinous Lensor of the Humours, by which they are incapacitated for Circulation. The following vulnerary Decoction and Drink are of an attenuating Virtue:

Take of the Leaves of Spurge-laurel, Male Speedwell, Rue, each one Handful and an half; Root of Avena, one Ounce; Flowers of the Lesser Centaury, two Pugils: Boil them in three Pints of Water, and with it mix Salt of Carduus Benedictus, one Dram; Syrup of the Five opening Roots, three

three Ounces. The Dose is four Ounces, four times in a Day, warm.

Inspissants.] In too great a Thinness, or aqueous Languor of the Fluids, inspissating Remedies take place. But this Thinness of the Humours is either attended with an Acrimony, as it often happens in the Scurvy, where the thin and acrid Blood is frequently extravasated from the Capillary Vessels, and forms scorbutic Ecchymoses, [See ECCHYMOSES.] and in this Case very soft and glutinous Inviscants are required; or else this Tenuity and Incompactness of the Humours is owing to the Weakness of the Vessels, and their not acting with sufficient Force upon the contained Fluids; and then the proper Remedies are all such vulnerary Inspissants as augment the Force of the Vessels; and of these we have treated under the Article FIBRA. And hence it appears, also, that opposite Remedies are recommended under the same Head, *Inspissants*; for such Medicines as are proper in the former Case, would be very prejudicial in this last. The following is a vulnerary inspissating Drink:

Take of Orpine, *Consolida major & minor*, Mallow, Pellitory of the Wall, each one Handful: Boil them in three Pints of Water, and mix with it two Ounces of Syrup of Marshmallows. The Dose is four Ounces warm four times in a Day.

Mitigants.] These are such Remedies as by their soft and particularly oily Particles, involve and obtund all the acrid Corpuscles in such a manner as to render them unactive. Hence the Medicines here meant, are not such as are induced with a singular Quality opposite to a certain kind of Acrimony, but such as by a soft Viscidity obvolve, or envelope and mitigate all manner of acrid Particles. Such especially are all those Remedies which the Shops call *Emollients*, which mitigate the Acrimony of the Fluids, and soften and lubricate the solid Parts of the Body.

A vulnerary mitigating Drink:

Take of Seeds of White Poppies bruised, three Ounces; Flowers of Mullein, two Ounces; Leaves of Bugle, two Handfuls; Root of Scorzonera, two Ounces; Root of Liquorice, an Ounce: Boil them in three Pints of Water. The Dose is four Ounces warm four times in a Day.

Exciting Remedies, or Stimulants.] When the vital Forces are in a languishing State, and a Coldness, Inertness, Paleness, and a mucous State of the Humours are predominant, without Signs of an attending Acrimony, then all such Medicines as by a grateful aromatic Stimulus increase and quicken a languishing Motion, are proper to be advised; of which Nature are Aromatics, Wine, and the like.

A vulnerary stimulating Drink:

Take Roots of Masterwort, and Swallow-wort, each one Ounce; Leaves of Rue, Scordium, each one Handful; Seeds of Burdock bruised, ten Drams; Seeds of Cardamom bruised, four Drams; Flowers of Lavender, and the Lesser Centaury, each two Ounces: Boil in three Pints of Water, and exhibit four Ounces warm four times a Day.

Such as are endued with a singular Virtue of correcting a contrary Quality.] This Disorder must first be known and discovered, before we can fix on an opposite Remedy endued with this singular Property; and the Fault here must lie either in the Solids or Fluids, or in both. As to the Solids, the Disorder may consist in their too great or little Cohesion; for Remedies in these Cases, consult the Article FIBRA.

Vulnerary Drinks endued with a singular Virtue of correcting their opposite Quality:

1. For a Corrective of a glutinous Quality, see the Attenuating Drink prescribed above.
2. For a peccant Acid:

Take of Mustard-seed, half an Ounce; Root of wild Radish, Leaves of Hedge-mustard, and Cresses, each two Ounces: Give them a slight Boiling in two Pints of Water, covering the Vessel. The Dose is two Ounces four times in a Day.

3. For an Alkali:

Take of the Root of sharp-pointed Dock, two Ounces; Leaves of Sorrel, two Handfuls; Root of Wood-forrel,

one Ounce; Flowers of Borage, twelve Drams: Boil them slightly in two Pints of Water, and exhibit as the preceding.

4. For a peccant oleous Quality:

Take of Tamarinds, two Ounces; Crystal of Tartar, six Drams; Roots of Grass, five Ounces: Boil in two Pints of Water, and with the strained Liquor mix two Ounces of Rob of Elder; exhibit as before.

Aperitives.] By this Name are called all those Remedies which promote a free Circulation through all the Vessels; for which Purpose are required a due Mobility of the Fluids, and a just Aperture of the Vessels. Medicines for these Effects are, also, various, as they are adapted either to the Diseases of the Solids or the Fluids, which obstruct the free Passage of the Humours through the Vessels.

Laxatives, Astringents.] Either of these will be found necessary with regard to the undue Measure of Strength or Weakness in the solid Parts.

From the Premises it appears, that there is no such thing as a general Remedy, which is of Virtue sufficient for removing all these Impediments; but that there are particular Medicines accommodated to each Case.

In our Choice of these Medicines we are directed by the Nature of the Disease, and the general Titles of the Medicines, under the two foregoing Aphorisms.

When we are acquainted with the Age, Sex, Temperament; and Way of Life, of the Patient or wounded Person, and the Diseases which may have preceded, or now attend the Wound, we thence furnish ourselves with Indications of what ought to be done, and by what Remedies. To illustrate the Matter by an Example: If a Person of a close Contexture of the Solids; and an atrabilious Tenacity of Blood, happens to be wounded, the Wound will be dry, and not discharge good Pus; and if it be in the Summer-season, the Patient very hot and thirsty, and makes but little Urine, and that high-coloured, and of a rank Smell, in that Case Decoctions of Avens, Borage, Bugloss, and the like remarkably mollifying and demulcent Herbs in Whey, or pure Water, with an Addition of Syrup of Violets, Juice of Lemons, Rob of Elder, or the like; drank in good Quantities, with an Application of warm Cloths dipt in the like emollient Decoctions to the wounded Part, will in a short time change the State of the Wound, the Dryness will be corrected, the diluted Humours will take their free Course thro' the relaxed Vessels, and the Wound will be happily cicatrized. But if another Person happens to be wounded in the Winter-time, who is of a pale and cold Complexion, and appears all over bloated from a lax Contexture of the Solids, and a mucous Coldness and Inactivity of the Humours, and has besides lived an idle Life, his Wound will appear pale, cold, and somewhat swelled, and will continue in the same State without much Alteration. If the Patient in this Case be treated in the same Manner as the other wounded Person, he would become much worse, both as to his Wound, and the Condition of his whole Body. But if, on the contrary, you treat him with Infusions, or small Decoctions of the Roots of Avens, Masterwort, Elecampane, Angelica, Contrayerva, *Virginian* Snake-weed, and the like, with a moderate Addition of Wine; he will in a few Hours begin to be heated, and to sweat; and the Colour of his Wound will be changed from pale to red, and a new Life, as it were, will return into the flaccid Parts, the lost Substance will be regenerated, and the Wound will be consolidated. If the wounded Person be very hot and feverish, after Venesection administered, Decoctions of Tamarinds, Sorrel, and the like, will be of Service. But where we cannot attain to so clear a Knowledge of the latent Impediment, and the vital Forces are in a pretty firm State, and capable of putting in Motion a large Quantity of such Decoctions, in this Case we exhibit Decoctions of China Root, Sarsaparilla, Scorzonera, Skirrets, and the like; for these are Remedies which dilute, attenuate, dissolve without Violence, relax and open the Vessels; and by that means cause a just and equable Circulation; and a plentiful Elimination, by way of Urine and Sweat, of many Corpuscles, which by their Stay would be very injurious to the Body; this is all that can be done in the present Circumstance.

A dry and moderately warm Temperature of the Air, free from putrid Exhalations, and frequently renewed, is always best for Wounds.

When Multitudes of wounded Persons lie sick together in Hospitals, in one Room, the Air is filled with putrid Exhalations

tions, whence the Sick are very much incommoded, and many of them die, who might otherwise have been saved; for which Reason those Places ought frequently to be aired by opening the Windows, that fresh Air may be admitted, and the putrid Vapours dissipated. Suffumigations are much recommended for this Purpose; but fresh Air is more comfortable to the Patients. But a Want of fresh Air is most of all prejudicial in Wounds of the Head, as we are taught by Observation. Moreover such a Temperature of the Air is required, as is qualified for cheering and refreshing the Patient by its mild, and, as it were, vernal Warmth. For a cold Air is always hurtful to Wounds; for the Parts which are stript of their Integuments by the Wound, are immediately sensible of the Cold, to which they are unaccustomed, and are very much incommoded by it. Hence it is that we are told by *Hippocrates*, 5 *Aph.* 20. that "Cold is biting to Ulcers, hardens the Skin, excites Pain without Suppuration, and produces Blacknesses, feverish Rigors, Con-vulsions, and a Tetanos." But besides a Warmth, a Dryness of the Air is, also, required, since an hot and moist Air is very much disposed to Putrefaction; for in such a Season the Flesh of slaughtered Beasts is soon corrupted, and dissolves into a putrid Sanies. We know indeed how to procure a Temperature of the Air by artificial Means, in what manner we please, according to the Exigencies of the wounded Patients; for by kindling a good Fire, particularly of aromatic Woods, we diminish the Cold of the Air, and correct its Humidity. If the Season be too hot and dry, by sprinkling the Floor several times in a Day with cold Water, or strewing the same with the green and flourishing Branches of the Elder, Lime, or Willow-trees, dipt in Water, we can procure a very grateful Refrigeration of the Air. Such a Temperature of the Air, as the present Exigence requires, is demonstrated by the Thermometer and Hygrometer.

The Belly is to be kept soluble by the Use of Emollients, Laxatives, and Eccoprotics.

We speak not here of such Medicines as cause an Evacuation of the Belly or Intestines in a violent manner, for this is not the thing here required; but the Intention to be answered is, that the Patient may go to Stool without much forcing and straining himself. For we see Persons who discharge their hard Fæces with great Difficulty, hold their Breath with strong Efforts, and have their Faces strained and red, and sometimes even livid. By such Efforts an Hæmorrhage may possibly return to the Wound, and those Parts which began to unite in a Coalition be again dilacerated, especially if the Wound be inflicted on the Parts near the Anus. Hence it is prudently ordered, that such Patients as on account of extracting the Stone, or for a Fistula in Ano, are to have a Wound inflicted on those Parts, should, some Days before the Operation, have their large Intestines evacuated by some gentle Cathartic and Clysters, so that no Fæces may remain; after which, for some time, they are allowed nothing but Broth of Flesh, sufficient to sustain Life, but scarce leaving any Fæces in the Intestines; so that after the Operation is performed, they can live for a long time commodiously enough without going to Stool. Hence we are told by *Hippocrates*, *Lib. i. de Morb.* that Costiveness is bad for a wounded Person.

The Belly is evacuated without much Straining, if the Fæces be soft, and the intestinal Tube sufficiently lubricous to admit an easy Descent of the Fæces. Hence it is, that, in lean and slender Bodies, the Belly is often costive; for in such Subjects every thing that is soluble in the Fæces is exhausted by the strong Force of the Intestines, whence they become very dry, compact, and hard; and at the same time the Intestines, for want of being sufficiently lin'd with a soft smeetic Matter, afford but a difficult Passage for the Fæces. For this Reason, very fat Broths, very soft Greens, emollient Decoctions, and mild expressed Oils, by mollifying the Fæces, and lubricating the Passages, will answer this Intention. The like Substances injected in Form of Clysters have the same Effect, and are of particular Service in Adhesions of the hard Fæces to the last Intestines, or near the Anus; for, in that Case, they give immediate Relief: Whereas other Exhibitions require a longer Time for their Conveyance to the affected Places. And it is often to be fear'd, that a sudden Tenesmus, or Desire of going to Stool, being excited, the wounded Person will be obliged to strain hard, and make strong Efforts, for the Excretion of the indurated Fæces.

EMOLLIENT REMEDIES, for the Purpose aforesaid, are,

1. Fat Broths, of fresh or unsalted Beef.
2. Mollifying Greens boiled in Broth, a Catalogue of which you have under the Article FIBRA.
3. Emollient and moistening Drinks and Clysters, specified under the aforesaid Article.

4. Oils, especially such as are expressed and recent, particularly Oil of sweet Almonds, and Oil of Olives.

Laxatives are almost the same as Emollients.

After the Exhibition of these emollient and lubricating Substances, or, as it is often practised, in Conjunction with them, are given such Things as, by their gentle Stimulus, promote the Excretion of the abdominal Fæces, without disturbing the Body, or rendering the Excrements liquid: For after taking Purgatives, the Belly is always observed to be bound. But such Medicines as are for our Purpose, are called *Eccoprotica* [see that Article], Eccoprotics, because they only expel the gross Fæces contained in the Intestines.

ECCOPROTICS are,

1. Ripe, Summer, acido-dulcid, pulpos, and succulent Fruits; particularly Winter-cherries, Berries of Elder and Dwarf-elder, Figs, all Sorts of Garden-cherries, Cloudberries, Berries of the Stone-bramble, Strawberries, Jujubes, Apricots and Peaches of the common Sort, white and blue Garden-plums, Damask Prunes, common Prunes, Prunellas, and red Plums, white, black, and red Currants, Blackberries, white and red Raspberries, Sebestens, Tamarinds, all Kinds of Grapes, Cranberries, and Gooseberries.
2. The recent Juices and Musts of these Fruits.
3. Cassia, two Ounces; Manna, two Ounces; Tamarinds, two Ounces; Pulp of Tamarinds, two Ounces; Juice of pale Roses, one Ounce; roasted Aloes, six Grains; Raisins, four Ounces; Galbanum, half a Scruple; Roots of Polypody of the Oak, an Ounce and an half; Rhubarb, a Scruple and an half; Infusion of Rhubarb, one Dram; Syrup of Marshmallows, three Ounces; Syrup of Succory with Rhubarb, one Ounce and an half; Syrup of Fumitory, two Ounces; solutive Syrup of Roses, one Ounce and an half; simple Syrup of Violets, two Ounces; simple Honey diluted in Water, two Ounces; *Pilule Ruffi*, six Drams.

Whether the Remedies above-mentioned are really *Eccoprotics*, that is, Evacuators merely of the abdominal Fæces, in the strict Sense of the Word, seems a Question; for all of them, exhibited in a large Dose, purge the Fluids by Stool. Thus the recent Juices of Summer Fruits, and the Musts made of them, Manna, Cassia, Honey, Tamarinds, taken in large Quantities, or repeated Doses, not only cause a Discharge of the abdominal Fæces, or Contents of the Intestines, but most effectually fuse the Humours, and evacuate them by Stool; and such Medicines are properly called *Cathartics*. The ancient Physicians made a just Distinction in this Case; for *Aesclepiades* was of Opinion, that *Cathartics* caused a Colliquation of the Body [*συσχένει τὸ σῶμα*], and then evacuated the colliquated Matter, which existed not before. *Galen, de Natural. Fac. Lib. i. Cap. 13.* And *Thessalus*, as appears from his own Words cited by *Galen, Lib. adversus Julian. Cap. 8.* concludes, that Matter was converted into Corruption by the purging Medicine, and then excreted either upwards by Vomit, or downwards by Stool; and proves the same by an Instance of an Athleta, of a good Habit of Body, in which all things were disposed according to Nature; and yet, after a Cathartic exhibited, the same Person voided very corrupt Matter by Stool, which doubtless in so sound and robust a Body, did not exist before. *Galen*, who believed that Cathartics attracted things in the same State as they were pre-existent in the Body, is very earnest in his Invectives against this Opinion; but his Arguments seem not satisfactory. Certain it is, that Scammony, given to the soundest Person, fuses the Blood into a putrid Water, which is evacuated by Stool; and the whole Body may be quite emaciated by its repeated Use; so that the Paleness, the collapsed Vessels, and the Decay of Strength, are a sufficient Proof, that there was no Evacuation of corrupt Matter which was pre-existent, but that the good Humours were corrupted by the virulent Force of the Medicine, and discharged from the Body.

Since, therefore, all those Medicines which have the Name of *Eccoprotics*, when given in large Quantities, have a cathartic Virtue; and since Numbers of Cathartics, exhibited in small Doses, only irritate, by a gentle Stimulus, in such a manner as to procure an Expulsion of the Fæces contained in the Intestines alone, it appears, that this Effect may be obtained, if both the one and the other be exhibited only in small Doses, so as to cause no great Disturbance in the Body, nor induce any considerable Alteration in the Humours, but only keep the Belly in a soluble State, which is the sole Intention to be answered in this Case.

Hippocrates, also, carefully distinguished an Evacuation of the Fæces alone from Purgation in his Book of *Prognostics*, where, after he had treated of the Matter discharged by Spit,

he says, "For whatever in these Places cease not upon Expectoration, nor a Discharge of the abdominal Faeces, [*περὶ τῆς τοῦ κοιλίου ἐκκρίσεως*] nor Phlebotomy, nor Diet, nor Purgations [*καθάρσεις*], will be sure to excite a Suppuration."

Sleep is to be procured by Anodynes, moist Food, and Narcotics.

Nature has but one Way to repair the Waste, or Defect, of that very subtle Fluid, I mean the Spirits, and that is, by maintaining only a vital Motion during a total Cessation of animal Motion, or, in other Words, by a quiet Sleep. When a Person is fatigued with hard Labour, or spent with Meditation, and makes a Repast on very wholesome Food, unless at the same time he refreshes his Body with gentle Sleep, he will find himself oppressed with a Dulness of Spirits, and an Heaviness of Body. But after a good and quiet Rest by Sleep, what an Agility of Body, and what a Serenity of Mind, immediately succeeds! and what a Clearness and Perspicuity of Thought and Apprehension does the Student experience, when he addresses himself to his Morning Meditations, after a full and quiet Night's Sleep! Hence, though by an Ingestion of Meat and Drink, we are able to restore what, by the established Laws of Life and Health, is daily lost from the Body, yet Sleep is the principal Time for the Accomplishment of this End, and for rendering the Aliment fit to succeed in the Room of the lost Substance. For a stronger Respiration with a more potent and equable Action of the Heart and Arteries in the time of Sleep, perfects and disposes all the Humours in such a manner as to render them extremely well qualified for restoring what was lost, whilst the changing, applying, and consolidating Causes, act with so great Liberty. This was perhaps meant by *Hippocrates, de Insomniis*, where he says, "For the Soul is waking, and since it is employed in ministering Supplies to the Body, has no Leisure for itself, but furnishes Recruits for every Part of the Body, particularly the Senses of Seeing, Hearing, Feeling; for Walking, Acting, and all bodily Motions are accompanied with Cogitation; but is not employ'd about itself. And when the Body is at Rest, the Soul is in Motion; and extending itself into the several Parts of the Body, has the Government of them as of its own House, and discharges itself all the Actions of the Body." Hence it appears how pernicious long Watching is to wounded Persons, and how necessary Sleep is to the Regeneration of the lost Substance, and the Consolidation of the Wound. If Sleep, therefore, be wanting, it is to be procured by means of Anodynes which remove Pain; for Watchings, especially in wounded Persons, proceed from Molestation by Pain, though anxious Cares, or violent Passions of the Mind, may produce the same Effect. But Remedies which remove Pain operate three different Ways; for they act either by removing the corporeal Cause which makes such an Alteration in the Body, as to occasion in the Mind that troublesome Perception called Pain; or by effecting such a Disposition in the Part of the Body to which the dolorific Cause is apply'd, that it can either not at all, or but weakly be affected by it; or, in the last place, though the Cause of the Pain be not removed, and the Condition of the Part affected remains unaltered, they operate, however, by taking off the Sense of the Pain. Thus, for Instance, when a Part under an Inflammation is pained, the Cause of the Pain is an inflammatory Blood, which, on account of its Denseness, is incapacitated for Circulation, and sticks in the Vessels, and by the Impetus of the vital Liquid presses with great Force upon the obstructed Vessels. Every thing, therefore, which is capable of rendering the impacted Blood moveable in such a manner as that it may flow with a free Current through the obstructed Vessels, will remove the Pain by removing the Cause. But if by an Application of very soft Cataplasms, or Fomentations, the solid Parts are relaxed to such a Degree, as easily to give Way to the distending Causes without Danger of a Rupture, though there remains the same inflammatory Denseness of the Blood, and the same protrusive Impetus of the vital Liquid, yet the Pain will either cease, or at least be very much diminished. And, in the last Case, when neither of the former Effects is produced, but the Cause of the Pain remains, and the Condition of the Part affected continues the same, yet let there be exhibited a Grain or two of Opium to a Patient not accustomed to it, and all Sense of the Pain will cease, tho' the exciting Cause continues to act. Hence all Remedies which one or other of these three Ways are the Means of removing Pain, ought to be called *Anodynes*. But established Custom has now appropriated that Name to such Medicines as either remove the Cause of Pain, or cause such an Alteration in the pained Part that it shall not be affected, or at least in a very slight measure, by the same Cause. And as for those Remedies

which only take away the Sense of Pain, without affecting any Mutation either in the Cause of the Pain, or in the Part affected, they are called *Narcotics*, that is, *Stupefactive*. In former times, however, stupefactive Remedies were called *Anodynes*; for *Caelius Aurelianus*, treating of the Tooth-ach, says, that "Many of the antient Physicians at the time of the Paroxysm, prescribed the Application of such Medicines as the *Greeks* called *Anodynes*, and which we may call *Removers of the Pain*, which, as they are to be used in the Night-time, remove the Sense of Pain, but not the Pain itself." And *Celsus*, in *Lib. 5. Cap. 25.* tells us, that "Those Medicines are called *Anodynes*, which, by Sleep, alleviate Pain; but that it is wrong ever to use such Medicines, unless absolute Necessity calls for it."

Besides, the Causes of Pain in a Wound are, the Distraction of the Parts as yet cohering, whilst the Lips of the Wound are retracted; the Tension of the nervous Fibres from a Retraction of large divided Trunks, which, also, draw the small lateral Nerves; or, a Distraction of the Fibres which remain entire, when tense Nerves are half divided or punctured: An inflammatory Tumor of the Bottom and Lips of the Wounds, and the Acrimony of the Humours discharged into the Cavity of the Wound, and irritating the raw Parts. Anodynes, therefore, are all those Medicines which by diluting, relaxing, moistening, correcting, or obtunding Acrimony, and resolving distending Tumors, remove the Cause of the Pain; or so change the Part affected, as that it is not by the Cause of the Pain so stimulated, as to excite in the Mind the ungrateful Perception called *Pain*.

ANODYNES are,

1. Diluents.
2. Laxatives.
3. Moistening Substances; for all which, see *FIBRA*.
4. Correctors of Acrimony.
5. Such as resolve distending Tumors. See *FIBRA*.

As for a moistening Diet; all farinaceous Seeds bruised may, by a strong Pressure, yield a large Quantity of Oil; and the same Seeds, when triturated with Water, yield Emulsions, in which the mild Quality of the Oil remains, without any Dread of a rancid Corruption. From these, therefore, or Decoctions of such farinaceous Seeds with Water, Milk, or Broth, we have a moistening Diet in which Water predominates, but so adheres to the farinaceous Lensor of the Seeds, that it does not easily slip out of the Body, but remains long in it. Such Food, long persisted in, alleviates the most obstinate Pains, by relaxing all the Solids, and rendering the Quality of all the Humours mild.

As for Narcotics; if the Pain neither remits, nor yields to the preceding Medicines, or is so intense that it cannot be borne without great Injury, till the Cause of the Pain is remov'd; then there are such Medicines as, without removing the Cause of the Pain, destroy the Sense of it in the Mind: For the highest Cause of Pain may be lodg'd in the Body, without any Sense of Pain in the Mind; as is obvious in apoplectic Patients, who are not sensible of the Application of live Fire to any Part of their Bodies. There are many Substances of a narcotic Quality, such as Henbane, Nightshade, Dutoy, and many others; but the Use of all these is suspected, especially if exhibited internally; because they greatly disturb the Operations of the Mind. The Use of Poppies is, by numberless Experiments, found to be far safer. As the *European Poppies* are of small Efficacy, a pretty large Dose of them must be exhibited. The Juice of the *Asiatic Poppy*, known in the Shops by the Name of *Opium*, if exhibited prudently, and in a due Quantity, excellently soothes Pain; which, however, if its Cause is not remov'd, will return a few Hours after, when the Efficacy of the Medicine ceases. *Galen*, in *Method. Medend. Lib. 12. Cap. 8.* tells us, that *Opium* proves hurtful, by its cold Intemperature. Many others have embraced the same Opinion, and for that Reason have either used it with great Terror, mixing it with the hottest Substances, in order to correct this formidable Coldness, or absolutely condemn'd it as a deleterious Substance. The Person who has once tasted the hot Bitterness of *Opium*, will easily believe that a cold Quality is unjustly ascrib'd to *Opium*; but this excellent Medicine has long been branded with this Mark of Infamy; so that many Physicians have not only rejected, but even abhorred the Use of it. A great Part of the Fame and Reputation *Paracelsus* acquir'd was owing to the surprising Cures he perform'd by his *Laudanum*. The Inhabitants of *Asia*, especially such of them as are by their Religion debarred from the Use of Wine, daily use large Quantities of *Opium*, without any Injury: They, also, who most condemn *Opium*, use it, without any Dread, in the grand official Compositions, as the *Theriaca*, *Mithridate*, and *Philonium*, in all

V U L

of which there is a large Quantity of *Opium*: Others, with a sordid View to Interest, secretly give *Opium* disguised with other Medicines, that they may seem, by other *Arcanums*, to do that which is owing to *Opium* alone. It is true, most Physicians were once of Opinion, that the medicinal Efficacy of Mithridate, the *Theriaca*, and other Compositions of a like Nature, did not depend on the concurring Force of all the Ingredients, but that, from a certain Union of them all, a new and highly-efficacious Medicine was produced: For which Reason, they recommended old *Theriaca*, and preferred it to that which was newly prepared. Tho' this Opinion seems pretty specious, yet any Person, who considers the Matter, will easily perceive, that there is an hot Quality in these grand Compositions, but that their principal Virtues depend upon *Opium*. The Mithridate of *Damocrates*, older than any of the rest, consisted of so many different Ingredients, that *Pliny*, in *Lib. 29. Cap. 1.* said, "Some of the Gods must have been Author of such a Fraud, since the Craft of Man could never have invented such a Medicine, which discovers a ridiculous Ostentation of Art, and a monstrous Pretence to Science." But *Andromachus*, who liv'd under *Nero*, and was one of his principal Physicians, retain'd most of the Ingredients in the Mithridate of *Damocrates*, and added some others, especially the Flesh of Vipers, and thus made a new Antidote, which, from that Circumstance, he call'd *Theriaca*. He wrote a small Greek Poem, dedicated to *Nero*, in which he gives a Description of his *Theriaca*, which he calls *γαλήνη*, that is, *Tranquil*. Nor is this to be wonder'd at; for the cunning *Andromachus* added a third Part more of *Opium* to his *Theriaca*: So that the Mithridate of *Damocrates* began to lose its Credit, and the *Theriaca* alone was highly extol'd, and has ever since retain'd its Reputation: A sure Proof that *Opium* was not only daily used, but, also, produc'd salutary Effects, even in the Times when it was condemn'd almost by all Physicians.

All the officinal Preparations from the Flowers, Leaves, and Juice of the Poppy, may be so exhibited, as only gently to obtund the Senses, or, by a larger Dose, to induce a profound Sleep, or, by an unskilful Use of them, a mortal Apoplexy. It often happens, that a small Dose of them alleviates Pain without inducing Sleep, but a gentle Ease of Body and Mind is produced, which cannot be describ'd, even by those who have experienc'd it. But this Medicine, tho' exhibited in the same Quantity, does not produce the same Effects on all Patients. Whilst, therefore, a Physician is ignorant of the particular Constitution of the Patient, it is expedient to dissolve a few Grains of *Opium* in some proper Vehicle, and give it in Spoonfuls every Quarter of an Hour, till the Sense of Pain is alleviated: But the same Quantity of *Opium* exhibited all at once, produces a greater Effect than when it is given in separate Doses. They who have often used this Remedy, are no longer reliev'd by it, unless its Quantity is gradually augmented: And it is certain, from undeniable Observations, that by gradually augmenting the Dose, some Persons have, without any Injury, daily taken incredible Quantities of *Opium*. Narcotics are always attended with this Disadvantage, that they render the Patient costive; but this Symptom is easily remov'd by a gentle Clyster: Such Medicines, however, externally applied to the Part affected, afford great Relief. Hence Cataplasms and Fomentations of emollient Herbs, with the Addition of the Leaves of Henbane and Garden-poppies, are of great Use.

Narcotics are such Medicines as blunt the Quickness of the Senses; and are either,

1. The most mild Purgatives; such as the bruised Seeds of white Poppies, two Ounces;

The Syrup of white Poppy-heads, one Ounce and an half;

The Syrup of *Diacodium*, one Ounce and an half; and

The Syrup of wild Poppy-flowers, three Ounces:

Of all which various safe Medicines may be prepar'd. Thus,

For a mild Draught.

Take of the distilled Water of wild Poppy-flowers, three Ounces; of the distilled Water of Bean-flowers, one Ounce; of the distilled Waters of Peony and Elder-flowers, each one Ounce and an half; of the distilled Water of the Flowers of the Lime-tree, one Ounce; and of the Syrup of wild Poppy-flowers, one Ounce and an half: Mix for a Draught.

The same, somewhat more hypnotic.

To the former Mixture, instead of the Syrup of wild Poppy-flowers, add the same Quantity of the Syrup of *Diacodium*, or of the Syrup of white Poppy-heads.

A mild Emulsion may be prepared thus:

Take of sweet Almonds, Pine-kernels, and the Seeds of white Poppies, each one Ounce; and of the distilled Water of

V U L

wild Poppy-flowers, a sufficient Quantity: Make into an Emulsion; with ten Ounces of which mix one Ounce of the Syrup of wild Poppy-flowers.

The same, a little more paregoric.

To the former Emulsion add, instead of the Syrup of wild Poppy-flowers, the same Quantity of the Syrup of *Diacodium*, or of the Syrup of white Poppy-heads. Or,

2. Stronger Narcotics: Thus,

For PILLS.

Take of the purest *Opium*, two Grains: Make into three Pills; of which let the Patient take one for a Dose, taking a second an Hour after, if the first produces no Effect; and the third after that, if the two first prove ineffectual.

For a POWDER.

Take of the purest *Opium*, a little dry, two Grains; and of red Coral, and Pearl-sugar, each half a Dram: Mix into a Powder, to be divided into three Doses; to be exhibited in the same manner with the preceding Pills.

For a PRESERVE.

Take of the preceding Powder of *Opium*, one Dose; and of Marmalade of Quinces, one Dram: Make into a Bolus; to be used and repeated in the same manner with the preceding Preparation.

For DROPS.

Take of the best *Opium* dried, one Dram; and of rectified Spirit of Wine, one Ounce: Make into a Tincture; the Dose of which may be thirty Drops, in two Ounces of distilled Baum-water, and half an Ounce of the Syrup of wild Poppy-flowers. Or,

Take of *Opium*, a little dried, one Dram; and of the Spirit of Vinegar, one Ounce: Make into a Tincture; the Dose of which may be thirty Drops, in two Ounces of the distilled Water of wild Poppy-flowers, and half an Ounce of the Syrup of wild Poppy-flowers.

A hot MIXTURE.

Take of the Tincture of *Opium*, prepar'd with rectified Spirit of Wine, seventy Drops; of the Syrup of white Poppies, six Drams; and of the distilled Waters of Citron and Orange-peel, and Cinnamon, each two Ounces: Make into a Mixture; of which let the Patient take one Spoonful every Half-hour, till the Pain is allay'd.

A cold MIXTURE.

Take of the Tincture of *Opium*, prepar'd with Spirit of Vinegar, eighty Drops; of the Syrup of Mulberries, six Drams; and of the distilled Waters of Borage, and wild Poppies, each three Ounces: Make into a Mixture; to be used, in the same manner with the former.

An Emulsion may be prepared thus:

Take of the bruised Seeds of white Poppies, two Ounces: With Barley-water reduce to an Emulsion; with ten Ounces of which mix of the Syrup of *Diacodium*, one Ounce and an half; of the Tincture of *Opium* prepared with rectified Spirit of Wine, twenty Drops; of distilled Cinnamon-water, two Drams; and of distilled Citron-peel-water, ten Drams: Of this Preparation let the Patient take an Ounce and an half every Half-hour, till the Pain begins to be alleviated.

An Epithem may be prepared thus:

Take of the Tincture of *Opium*, prepared with Spirit of Vinegar, three Drams; of the distilled Waters of Elder and Rose-flowers, each three Ounces; of the Vinegars of Elder and of Roses, each half an Ounce: Mix all together; to be applied with Cloths to both Temples.

It is of great Service, in Cases of this Nature, so to apply Demulcents to the Part affected, as to remove the Cause which deprives the Patient of Sleep, which is the Pain in the Part affected. This Intention is answered by the following Preparations, applied tepid, and preserved in the same State of Tepidity, till the Pain is alleviated. A Cataplasm may be prepar'd thus:

Take of the recent Leaves of Garden-poppies, one Handful; of the recent Leaves of black Henbane, half an Handful; and of the recent Leaves of Marshmallows, four Handfuls;

VUL

Handfuls : Boil in new Milk, and towards the End add of the Meal of Linseed, one Ounce; and of the recent expressed Oil of Linseed, two Ounces: Make into a Cataplasm.

A Fomentation may be thus prepar'd:

Take of the thin expressed Juice from the preceding Cataplasm, three Pints: With which mix half a Dram of pure *Opium*, for a Fomentation.

The Patient's Mind is to be kept serene, Venery is to be avoided, and Rest enjoind.

As violent Commotions of Mind are capable of inducing strange Changes on the Body, and disturbing all its Functions, they must always prove hurtful to wounded Patients: But a calm Serenity of Mind, undisturb'd either by the Consciousness of Guilt, or the Dread of Want, and supported by the cheering Hopes of future Prosperity, is of great Service to wounded Persons: An Excess of Joy is equally prejudicial with other Commotions of Mind. *Sanctorius*, and others who have wrote on the statical Part of Medicine, have observ'd, that Cheerfulness renders the Body highly perspirable, and sensibly lighter than at other Times: But this denotes a free Circulation thro' all the Vessels, and an expeditious Exercise of all the Functions, that is, perfect Health.

Venery is to be avoided; nothing more throws the nervous System into Commotions, than the Use of Venery: Hence it is, by the unanimous Consent of Physicians, accounted prejudicial to wounded Patients; and the fatal Event has been prov'd, by melancholy Instances. Hence, in the Diet of wounded Persons, all those Things are to be avoided, which may stimulate to Venery; such as Oysters, Crabs, and Lobsters.

That Rest is absolutely necessary to wounded Persons, is sufficiently obvious: For by Motion those tender Vessels which are regenerated in the Wound, under the Appearance of a soft *Mucus*, are destroy'd.

There are two Circumstances requisite to the Regeneration of lost Substance in a Wound; that is, that a laudable Fluid should, in a due Quantity, and with a proper *Impetus*, be convey'd to the Wound; and that the Vessels, receiving the Humours convey'd to it, should only receive and transmit such Liquids as, in a State of Health, ought to be convey'd thro' them. Hitherto we have treated principally of those Things which ought to be observ'd in the Diet, and the Use of Remedies, that a good Disposition of the Fluids, convey'd to the Wound, may be produc'd. We now come to treat of that Disposition of the transmitting Vessels in a Wound, which is requisite to the Restoration of the lost Substance, and the Union of the separated Parts.

That the Canals may be kept in a due Condition, and the Fluids in the Wound preserv'd from corrupting, and by that means hindering the Actions above-mentioned, the Part is to be defended from the Air; the Wound is to be fomented with mild balsamic Vulneraries, fill'd with Lint for the sake of an equable Compression, and treated with such Medicines as are friendly to the Nerves.

After the Infliction of a Wound, the Extremities of the divided Vessels are retracted, lessen'd, and resist the Fluids forc'd thro' them: Then an Inflammation begins to be form'd in the Bottom and Lips of the Wound; this is succeeded by a Generation of Pus; and whilst this happens, the Extremities of the open Vessels are gradually protruded from the Bottom of the Wound upwards, and from all its Circumference towards the Centre; and these Extremities resemble a tender *Mucus*, of which is regenerated the Substance lost in the Wound. It is therefore obvious, that, to this Purpose, it is requisite these pulpos Vessels should retain a due Softness; and that the Humours, discharg'd from the Vessels into the Cavity of the Wound, should be of a mild Quality. For if, by a spontaneous Degeneracy, they should acquire an Acrimony, the pulpos Substance growing again, will be destroy'd. Both Intentions are in some measure answer'd by preventing a free Access of the Air: For it is certain, from Experience, that the Parts of Animals may, for a very long time, be preserv'd from Corruption, if they are carefully kept from all Access of the Air; whereas they often become putrid in a few Days, when expos'd to the free Air. *Boyle*, in his Treatise of the Usefulness of Experimental Philosophy, tells us, that the roasted Flesh of Goats and Fowls, cut in small Pieces, immersed in melted Butter, and kept in a close Vessel, were preserv'd free from Corruption, and retain'd their natural Taste for above six Months, in a Ship returning from the *East-Indies*, tho' the Air was intensely hot. Besides, the Air, acting freely on a Wound, dries and destroys the ten-

VUL

der Extremities of the growing Vessels; so that these, becoming mortified, *Sordes* are produc'd in a Wound, before pure; and these *Sordes* must be separated, before a Consolidation can happen. For this Reason, many have imagin'd that something of a poisonous Quality was lodg'd in the Air, when they saw that so great Changes were produc'd in Wounds by its free Access to them. For this Reason, also, the most skilful Surgeons order Wounds to be dress'd as seldom as possible.

The whole Surface of the Wound ought, therefore, to be so cover'd, as to be defended from the Air: This is best done by vulnerary Balsams, especially of the native kind; which, by their thick Unctuousity, adhere to the Parts, and contain in themselves a mild Aromatic, and at the same time an Acid, which resists Putrefaction, but which is, however, so sheath'd up in a pinguious Substance, as not to prove prejudicial by its Acrimony: For by a chymical Analysis all native Balsams yield an acid Liquor, and a fragrant, thin, aromatic Oil; whilst a tough Resin remains in the Bottom of the Vessel. When these native Balsams, gently warm'd, that they may spread equably, are in a small Quantity applied to the Surface of a Wound, they cover the tender Vessels, prevent the Access of the Air, hinder the drying of the Parts, and preserve the extravasated Humours from Putrefaction. Hence it is obvious, that only a small Quantity of these Balsams is requisite; and that those Surgeons act preposterously, who incumber Wounds with too large a Quantity of them: For they are heterogeneous Bodies in a Wound, which, by the Interposition of their Bulk, hinder the Concretion of the Parts. Most native and artificial Balsams act almost in the same manner.

The mild vulnerary Balsams for pure Wounds, are,

1. The native Balsams of *Capivi* and *Gilead*, Liquidamber, that of *Mecha*, *Opobalsam*, the Palm Balsam, those of *Peru* and *Tolu*, and that of Turpentine.
2. Simple artificial Balsams, such as rectified Oil of Wax, the thick Oils of Turpentine, Linseed, St. John's-wort, Roses, Nightshade, sweet-scented Trefoil, and fresh Butter.
3. Artificial compound Balsams. Thus,

Take of the Flowers of Sulphur, four Drams; and of the Oil of Linseed, or Olives, four Ounces: Boil over a gentle Fire, till the Sulphur is totally dissolv'd.

Take of the best *Gum Elemi*, cut small, one Part: Dissolve over a gentle Fire, and add an equal Quantity of pure native *Venice* Turpentine: Pass the Solution thro' a linen Cloth, and add two Parts of the Marrow of Beef, boil'd, and separated from its Membranes. This, like the *Limentum Arcaei*, is an universal Balsam.

Take of the Wood of red Sanders, one Pound; and of common Water, four Pints: Boil for two Hours; strain and infillate to the Consistence of a thick Extract, with which mix two Drams of Dragon's-blood reduc'd to a fine Powder. Mix a little of this with the preceding Balsam, till it acquires an agreeable red Colour; and this is the red Balsam.

Take of the Oil of Olives, one Pound and an half; and of the Wood of red Sanders, half an Ounce: Boil gently, till the Oil is of a deep red Colour; then strain it boiling-hot thro' a linen Cloth, and dissolve in it of yellow Wax, one Pound; and of the best Turpentine, one Pound and an half. This resembles the Balsam of *Lucatellus*, and is render'd still better by the Addition of one Ounce of *Peruvian* Balsam.

All these are to be dropt warm into the Wound, which is to be cover'd with a Pledget dipt in the Balsam; and the Dressings are to be renew'd every twenty-four Hours.

We are, also, to consider, that the equable Covering of the Skin is wanting in the Wound: Hence the pulpos growing Vessels, cover'd with a soft Balsam, and fomented with a moist Warmth, will easily yield to the distending Liquids, will be augmented in all their Dimensions, and, being dilated, will admit foreign Humours. Hence the whole Surface of the Wound will degenerate into a flocculent Substance call'd fungous Flesh. This will be prevented, if such a Degree of Pressure is applied to the Wound as is sufficient to supply the Defect of the Skin which before compressed it: This may be done by filling the Cavity of the Wound with soft and dry Lint, slightly anointed with a mild Balsam, in that Part where it touches the Surface of the Wound; then let the Lint be so secur'd, by a Plaster or Bandage, as by a gentle Pressure to prevent the excessive Dilatation of the Vessels; guarding, at the same time, against too strong a Pressure, which might destroy the tender Vessels, or suffocate the Motion of the vital Humours thro' the Parts. By

such a gentle Pressure the *Membrana Adiposa*, every-where in the adjacent Parts confin'd by the Skin, is hinder'd from rising in the Wound, where it would degenerate very soon.

Plaisters are of Use to retain these Things in Wounds, and are hardly of any other Service than that produc'd by their safe tenacious Quality.

This will not easily be believ'd by those Surgeons who generally ascribe the happy Cure of Wounds to their Plaisters; and in this Case almost every one pretends to an *Arcanum* of his own: But if the before-enumerated Conditions of a Wound are present, it is cur'd, whatever Plaister is applied, provided it contains nothing in itself which may prove hurtful by disturbing the begun Work of Nature, or by removing the Conditions requisite to the Regeneration of the lost Substance, by its excessive *Stimulus*, or any other Cause. That it is so, is obvious, from this, that altho' every Surgeon has his favourite Plaister, known only to himself, yet they are all equally successful in their Cures, if the other Remedies have been in the same manner applied to the Wound. It is true, Plaisters, applied to the Skin, may, besides their requisite Tenacity, contain such Ingredients, as being mov'd, and render'd active by the Heat of the Body, may insinuate themselves into the bibulous Vessels, and by that means considerably affect not only the Part to which they are applied, but, also, the whole Body: Such as blistering Plaisters, mercurial Plaisters, and many others. But such Plaisters we do not here consider, since, in this Case, it is only requisite the Dressings applied to the Wound should be retain'd in their Place; for which Intention Tenacity alone is sufficient. Hence Plaisters, prepar'd of Lead, or its various Calxes, boil'd in Oil to a due Degree of Tenacity, are of great Use; because they are easily borne by those whose Skins are inflam'd by the Application of almost any pinguious Substance. Such are the red Lead Plaister, *Diapalma* Plaister, the *Emplastrum Diapompholygos*, the Cerufs Plaister, the red defensive Plaister of *Vigo*, and many others, which in this Case produce the same Effect.

The red defensive Plaister is prepar'd thus:

Take of the Oil of Roses, and white Wax, each six Ounces; of *Armenian Bole*, and Dragon's Blood, each an Ounce and an half; and of the Powder of red Roses, half an Ounce: Mix all together over a Fire, and agitate till cold.

The same End is, also, answer'd by the *Emplastrum Defensivum Cœruleum*, and the red Lead Plaister.

The Fluids convey'd to the Wound, and extravasated in it, the half-mortified Fibres, and the obstructed and tumefied Vessels, produce in the Wound Pus, Ichor, Sordes, and fungous Flesh.

At the renewing of each Dressing, the Wound is to be carefully view'd, in order to observe whether there is any Change induc'd on its Surface, which may hinder the Regeneration of the lost Substance, and the Consolidation of the Wound: For if all the Parts are red, clean, and equably moist, we know that the Vessels and Humours have the due Conditions requisite to the Cure: But if the Wound is dry, or fordid, we certainly know, that it cannot be consolidated till these Sordes are remov'd, and the Humours equably convey'd thro' the Vessels in every Point of the Surface of the Wound. But these Impediments to the Consolidation arise either from the extravasated Fluids degenerating into a foreign Nature, or from an Obstruction and Tumefaction of the Vessels, or from both these Causes together: For many Parts in a Wound may be partially divided, and yet adhere to the sound Parts, tho' they are totally depriv'd of the vital Influx of the Fluids. Hence they are mortified, and ought to be separated from the sound Parts; for so long as they remain there, they, like an heterogeneous Body, hinder the Consolidation of the Wound: But after the Orifices of the Vessels, on the Surface of a Wound, begin to discharge their Humours, these collected Humours, by their Stagnation, the Heat of the Place, and the Dissipation of their thinner Parts, are chang'd into a mild unctuous Liquid call'd Pus; which, tho' always a good Sign, as we have already observ'd, may yet prove hurtful, when too long left in the Wound; for then it is corrupted, and becomes acrid: But if the Surface of the Wound is moist with a thin Ichor, but not with a laudable Pus, there will never be a good Consolidation so long as this Symptom is present. But this is understood, if such a thin Sanies appears in the Wound after it has been cover'd with a proper Dressing for twelve Hours, or more: For if, an Hour after all the Pus is remov'd, the Wound is uncover'd, no Pus will appear, but a far thinner Liquid; which, however, when left

there, will be converted into Pus. But by Ichor we here mean that thin Liquid, generally of an acrid Quality, which, by its Continuance in the Wound, will never be converted into a laudable Pus, but always become more and more acrid. But such an Ichor is either form'd from an Extravasation of such Fluids as cannot be converted into laudable Pus; or from Pus too long left in the Wound: For in this Case it is again attenuated, and becomes acrid. For when a suppurated Part of the Body is, at a proper time, laid open with a Lancet, a laudable and thick Pus is discharg'd: But if such a Part remains too long before it is open'd, the contain'd Pus is again attenuated, and, upon opening the Place, a thin Sanies is discharg'd, instead of a laudable Pus.

Sordes are form'd in a Wound, either by the half-divided Parts, or the mortified Parts, as yet not separated from such as are sound, or by the Vessels dilated and distended with a stagnant Liquor; in which Case, the Surface of the Wound does not appear pure and red, but white, almost like Bacon. And unless these Sordes are separated from the live subjacent Parts, they are chang'd into a yellow, and sometimes a brown Colour, and denote the worse Degeneracy, the more their Colour recedes from white, and inclines to brown.

Fungous Flesh is principally form'd, when the Surface of the Wound is not compress'd with a Force equal to that with which the entire Skin compresses the adjacent Parts: Hence the *Membrana Adiposa* rising, swells, and soon degenerates into fungous Flesh, as is already observ'd; and especially if, by a Fever, the *Impetus*, and Velocity of the Circulation, are increased: For, in this Case, the dilated Vessels rise, if not prevented by a due Compression. For we see that almost every Part of the Body, when the equable Pressure upon it is remov'd, rises into a Protuberance, which makes less Resistance than the Part in its natural State did. Thus in Wounds of the Head, or after the Application of the Trepan, when a Part of the *Cranium* is remov'd, and at the same time the *Dura Mater* divided, the Substance of the Brain rises in surprising *Funguses*. If the Integuments of the Abdomen are divided by a Wound, and the *Peritoneum* at the same time is left entire, unless the Part is secur'd by a proper Bandage, soon after the Contents of the Abdomen, being press'd into the less-resisting Place, and the *Peritoneum* being dilated, will produce an *Hernia*. The Origin, therefore, of fungous Flesh, in a Wound, is the natural Consequence of the Diminution of the equable Compression.

So long as all these are present in a Wound, they will hinder its Consolidation; for they are heterogeneous, and consequently ought to be remov'd: And how this is done, is shewn in the next Aphorism.

These Things are generally remov'd by the Help of Digestives, Abstersgents, Corrosives, Exsiccants, and often by Compression.

When skilful Surgeons see the Surface of a Wound so degenerating that it is not every-where red and moist, but white, yellow, or brown Sordes appear, they know that the best Balsams are not sufficient: Nature, indeed, alone, by a benign Suppuration, endeavours to separate these corrupted Parts; but the subjacent live Vessels, incumber'd with these adhering Sordes, are not able easily to remove them: Hence these half-mortified Parts, adhering long to them, are corrupted, and degenerate into a worse Quality: Then they apply such Remedies as mollify these sordid Parts, but at the same time resolve them by their saponaceous Quality, and by their gentle *Stimulus* irritate the subjacent live Parts, that there may be a more easy Separation of those Sordes from the vital Vessels to which they adhere. These are call'd Digestives, a chirurgical Word, taken from the Digestion of the Stomach. For this Purpose, Surgeons take any native Balsam, such as Turpentine, for Instance; this they triturate with the Yolk of an Egg, so as to subdue the oleous Tenacity of the Balsam to such a Degree, that it may be diluted in Water; then they add a certain Quantity of Honey, which, by its saponaceous Quality, divides and resolves Concretions. Such a Medicine, laid upon a Pledget, they apply to the sordid Surface of the Wound: The Sordes, thus soften'd and resolv'd by the saponaceous Quality of the Medicine, are, by the Formation of a laudable Pus, separated from the sound Parts, and the Wound is render'd pure. *Hippocrates*, in *Tract. de Affectionibus*, beautifully represents the Use of such Medicines in impure Wounds, in the following manner: "Pinguious Substances are improper for Parts that are either inflam'd, sordid, or inclining to Putrefaction; for cooling Medicines are adapted to inflam'd Parts; and for such as are sordid, and inclining to Putrefaction, acrid Remedies, which cleanse by exciting a certain *Stimulus*, are most conducive." And in his *Treatise de Locis in Homine*, he informs us, that the laudable Humours convey'd through the Vessels to the Wound, remove the Sordes, soften'd, and render'd capable of a more

more easy Separation by such Medicines: His Words are, "If an Ulcer is to be clos'd or filed, the Parts are to be rendered tumid; for the Flesh regenerated by the nutritive Juices in Conjunction with the Assistance of Nature, propels and forces out that sordid Flesh, which by the Medicine was disposed for a Separation."

A Digestive may be thus prepared:

Take of Native Turpentine, one Ounce; and one Yolk of an Egg: Mix intimately; and then incorporate with half an Ounce of Honey of Roses.

As for Abstergers; these are somewhat more acrid than Digestives. If, therefore, to Digestives we add a little Aloe, Myrrh, and Venice Soap, we have an Absterger, which only differs in Degree from a Digestive, since it is somewhat more stimulating.

As for Corrosives; these are far more acrid than the preceding Medicines, and mortify the Parts they touch, since they induce a Crust on the Surface of the Wound to which they are applied; and under this Crust the vital Vessels by their Motion, and the Fluids conveyed to them, gradually separate and expel the mortified Parts. All these Medicines, indeed, totally deprive the Sordes, adhering to the live Vessels, of a vital Influx of the Fluids; but by this means alone we can never obtain a Separation of the mortified Part, which Nature alone produces by a benign Suppuration. But Corrosives are of this Use, that in a Moment, and, as it were, by a single Touch, they prevent the Influx of the Humours into the obstructed and dilated Vessels which produce the Sordes in Wounds, and which obstinately resist the Efficacy of milder Abstergers. Hence they induce a kind of gangrenous Crust on the Surface of the Wound, to which Crust the softest Digestives are now-and-then to be applied, that the Eschars formed by the Corrosives, being softened by their means, may, by the Action of the live subjacent Vessels, be separated from the sound Parts to which they adhere; and thus the Surface of the Wound be rendered pure. Hence it is obvious, that the prudent and rare Use of Corrosives is requisite, unless after the Eschars are fallen off, the Wound still appears impure. Those Surgeons are, therefore, in the Wrong, who believe that a Wound can be cleansed by Corrosives alone, since they only hinder the Increase of the Sordes, by converting them into a mortified Eschar, which ought afterwards to be softened and separated by a Suppuration. Besides, by a too frequent Application of Corrosives, the pure and live Parts are affected in the same manner, by which means the Sordes are increased, not diminished. *Galen*, in *Methodo Medendi. Lib. 3. Cap. 6.* furnishes us with a beautiful Instance of this Kind.

Corrosives are divided into various Classes, according to their different Degrees of Acrimony. Those are most efficacious which consist of an highly strong Acid united with a metallic Glebe. Among these the most useful is the Lunar Caustic; for it consists of an highly concentrated Spirit of Nitre, and the purest Silver mutually united; and as this Corrosive is of a solid Consistence, and may be moulded into any Form, it may be applied more safely than almost any other Corrosive; for other Corrosives applied to a Wound act equally on all its Surfaces; but this may be applied to each Point in it, and by a momentaneous Touch produces an Eschar. Hence the Effect of this Corrosive is greater or less, according as it is applied for a longer or shorter time; and as often all the Parts of the Surface of a Wound are not covered with equally thick Sordes; hence they do not require an equally strong Action of a Corrosive. And this Caution is best of all observed by the Application of the Lunar Caustic.

First, The mildest Corrosives are burnt Alum, the Ashes of green Wood burnt, *Mercurius Dulcis*, white precipitate Mercury, and White Vitriol.

Secondly, Stronger Corrosives are red precipitate Mercury, Colcothar of Vitriol, and *Vigo's Troches* of red Lead. And

Thirdly, The strongest Corrosives are Butter of Antimony, the *Lapis Infernalis*, corrosive Sublimate Mercury, Oil of Tartar per Deliquium, and Oil of Vitriol. The stronger Corrosives are, the more prudently they ought to be used.

The following may serve as a Formula:

Take of Aloe, and Myrrh, each one Dram; of the Salt of Tartar, two Drams; and of common Water, two Ounces: Mix and boil them to an Elixir.

But the Eschars formed by Corrosives, are to be softened by the Application of the mildest Remedies, that they may be soon separated from the subjacent live Parts; and when they are fallen off, it appears, whether the repeated Use of Cor-

rosives is necessary, or whether the Wound may be rendered pure by mild Digestives, and Abstergers.

As for Exsiccant Medicines; when a Wound is moistened with a large Quantity of too thin an Humour, then such Medicines as absorb the Liquids, and corroborate the Vessels, are highly beneficial. Of this Kind are the earthy bibulous Substances reduced to an impalpable Powder, left by the Roughness of their Parts, they should irritate the raw Wound, such as the Ashes of burned Bones, Mastich, Olibanum, and Sarcocolla, which not only absorb the Fluids, but, also, corroborate the Vessels.

An Exsiccant may be prepared thus:

Take of Verdegrise, five Ounces; of crude Alum, one Ounce; of strong Vinegar, seven Ounces; and of pure Honey, fourteen Ounces: Boil up into an Ointment.

The following Substances are, also, exsiccant: Alum gently calcined, Quick-lime-water, Blood-stone, Mastich, Dragon's blood, and Gum Sarcocol.

As for Compression; this Method is principally expedient when Sordes are formed by the dilated Vessels degenerating into a fungous Excrescence: for after such a spongyous Flesh is destroy'd by Corrosives, a similar Excrescence will soon be produced afresh, unless the Luxuriancy of the Parts is prevented by a due Compression, as is obvious from the so frequent Regeneration of fungous Excrescences of the Brain. For this Reason, skilful Surgeons often fill the Wound with nothing but dry Lint, which they secure by a moderately tight Bandage; or they sometimes, also, use a thick Pledget, one Side of which is applied to the Surface of the Wound, whilst the superior Part, being covered with some vulnerary Balsam, prevents the Access of the Air.

These things are to be used till a white, mild, viscid, smooth, equal, and inodorous Pus is formed; under which the Sordes are absterged, the contused and tumid Parts consumed, and those corrupted by the Air separated, the Cavities filled, and the divided Parts conglutinated.

All the Medicines, mentioned above may check the Vessels when too easily distended, and convert the half-mortified Parts, together with a Part of the live Vessels, into a gangrenous Eschar; but they cannot separate this Crust from the subjacent live Parts; for this Nature alone performs by means of a Suppuration; nor is there any other Way in which it can be done. But the Sign of a Suppuration is the Generation of Pus, as is already observed. When, therefore, a laudable Pus appears in a Wound, we know that the Vessels are so disposed as to transmit their proper Fluids, and that these Fluids have the Properties requisite to Health. We have already spoke of the things requisite, that the Humours conveyed to the Wound, should be of a laudable Kind. But here we only treat of those Impediments which are lodged in the Wound itself, and hinder the Regeneration of the lost Substance, and the due Consolidation of the separated Parts; for so long as these Sordes are lodged in the Wound, they will hinder the Cure as much as any other foreign Body would. But when by proper Medicines laudable Pus is formed in a Wound, we know, that by this means all that may be separated from the live Vessels which could hinder the Cure of the Wound. But this Pus ought not only to have the Conditions here specified, but ought to be of the same Kind, and in an equal Quantity in every Point of the Surface of the Wound; for it often happens, that the whole Surface of the Wound is not covered with Sordes, but only a certain Part of it. In this Case the pure Parts will yield a laudable Pus, and the others will discharge a Liquid of a different Quality. The Pus will not, therefore, be every where of the same Kind, but various in different Parts of the Wound. And in this Case, the sordid Places alone require the Application of the Medicines specified above, but which are improper for the pure and live Parts of the Wound.

Under this Pus, whatever half-lacerated Substance adheres to the live Parts, and all the Extremities of the obstructed Vessels, together with the obstructing Matter, are disengaged and separated, and the pervious Vessels freely transmit the Humours. Hence all the Tumor of the Lips of the Wound arising from an Obstruction of the free Circulation of the Humours, begins to disappear; the Parts that were contused, or corrupted by the Admission of the Air, separate; the tender Vessels, covered with a laudable Pus, as with a mild and natural Balsam, are elongated, meet those adjacent to them, are united with them, and form a new Texture of Vessels, by which the lost Substance is regenerated in the Wound, and the separated Parts united.

The Whole, therefore, that Art can do, is to remove the Impedi-

Impediments which hinder the Generation of a laudable Pus in the Wound, and Nature alone is sufficient for the rest.

Then such things as generate Flesh, are to be applied, which are mild Digestives.

These Remedies are by Surgeons called *Sarcotics*, though, strictly speaking, there is only one *Sarcotic*, which is Nature herself, restoring the lost Substance under the mild Pus. This, as is already observed, is beautifully described by *Galen*, when he says, that the Matter of the Flesh to be generated is laudable Blood; and that the Producer or Author of such Flesh is Nature. All other Remedies, to which an incarnating Quality is ascribed, only remove Impediments, and afford Assistance; and they are none else than such as by a due Pressure confine the Vessels, and procure the same Disposition of them, which they generally have in a State of Health. These Effects they produce by preventing the Access of the Air, by cherishing the Parts, and so confining the extravasated Humours; that they may by a due Continuance be converted into laudable Pus.

For a Wound, when pure, is injured by the Application of every acrid Substance, since by this means the tender Vessels beginning to grow, are destroyed; and when these are mortified, new Sordes are produced from them, which must be again separated. Hence, in this Case, mild vulnerary Balsams are only proper: But we know, that the Cure of a pure Wound proceeds well if there is a reddish Colour in the Wound; for too red a Colour denotes an Inflammation; if there is a due Quantity of laudable Pus; if the Bottom and Lips of the Wound grow equably; if nothing is raised above the equable Surface; if the Lips of the Wound are not higher than the adjacent Skin, but appear equal and not corroded; and, if in the Lips of the Wound a pale-bluish Colour begins to appear, which indicates that a Cicatrix is forming.

Sarcotic, or incarnating Medicines, are the vulnerary Balsams.

Take of yellow Wax, black Pitch, and common Rosin, each half a Pound; and of Linseed-oil, two Pounds: Mix all duly together. This is the *Basilicon*, or *Tetrapharmacum*: Or,

Take of yellow Wax, six Ounces; of the Oil of the Flowers of St. John's-wort obtained by Infusion, two Pounds and an half; to which, when fused over a gentle Fire, add of dried Resin of the Pine triturated, and of the best common Colophony, each one Ounce and an half; when they are melted, take them off the Fire, and straining them through a Linen Cloth, add two Ounces of the best Venice Turpentine, stirring them with a Stick. When they begin to thicken, sprinkle into them of the best Mastich, and Olibanum, each one Ounce; and of Saffron finely triturated, one Dram. This is the *Unguentum Aureum*.

But if when those things are done which answer the first Intention, it appears, that none of the Substance of the Body is taken away, the Lips are to be united in such a manner, that the Parts naturally united, may again be applied to each other, and retained in that Situation.

The general Intentions to be pursued in the Cure of every Wound are already enumerated, and it has been observed, that all heterogeneous Bodies, whether left in the Wound by the wounding Instrument, or form'd by a Corruption of the Fluids or Solids, ought to be removed, because they hinder the Union of the separated Parts. It has, also, been shewn how, by what means, and with what Cautions, these foreign Bodies ought to be removed. If, therefore, after these Measures are taken, it appears, that some of the Substance of the Parts is lost, that is first to be restored, before there can be an Union of the separated Parts. And how this Restitution of the lost Substance is to be obtain'd, has been, also, shewn. But if there is only a simple Division of Parts before cohering, made by the wounding Cause, without any Loss of Substance, or any foreign Body left between the separated Parts, the Intention of Cure is, of all others, the most simple; and that is, so to apply the spontaneously receding Lips of the Wound to each other, and to retain them in that Situation, that there may be such a Situation of all the Parts, as there was before the Division. The Union of the Parts thus disposed, is very soon performed by Nature alone, even in the largest Wounds, if the now mentioned Conditions are present. In this Case, the best vulnerary Balsams interposed between the Lips of the Wound, are injurious, because they are heterogeneous Substances, which can never unite with the Parts of the Body. But the Application of the Parts separated, to each other, is only requisite, without the Interposition of any other Remedy.

How easily wounded Parts grow, not only to those with which they were naturally united, but, also, to those with which they never before cohered, may be seen in some memorable Instances recorded by *Hildanus*, *Cent. 6. Obs. 7. Schenkii, Observ. Medicin. Lib. 6. Obs. 23.* and *Celsus, Lib. 5. Cap. 28.* If, therefore, this Concretion is so easy in Parts which never before naturally cohered, it is much more to be expected, when Parts before united again become contiguous.

The first of these is done,

First, By procuring to the Part the same Situation it had whilst in a State of Rest, before it was wounded.

Secondly, By a gentle and equable Compression of the Parts to each other, that they may be contiguous to each other in every Part of their Surface, and remain at Rest.

1. It is of great Use to know the Situation of the Parts in a Man at Rest, and especially in an healthy Man when sleeping; for then all voluntary Motion ceases, and the Parts of the Body left to themselves, are disposed in their most natural Situation. It will then appear, that no Articulation of the Body is extended, but that they are all gently bended; for in a sound Person, when sleeping, the Fingers are never extended, nor are the Legs ever stretched out in a strait Line with the Os Femoris, but all the Articulations are gently bended. The same holds true with respect to the rest; for the Muscles which bend the Articulations, are generally found stronger than the Extensors; for which Reason the Articulations, when at Rest, always appear gently inflected. This, also, appears in a perfect Palsy, in which Case all voluntary Motion ceases; for if the whole Arm is paralytic, the Fingers are always found inflected, and remain in that Condition; so that after the Palsy is cured, it is often impossible to extend the Fingers, because the Ligaments of the Articulations are become rigid, and the Flexor Muscles not elongated for so long a time, are by their proper Contractility shortened. Hence the Extensors of the Fingers cannot surmount these Obstacles. *Hippocrates*, who carefully observ'd the natural State of the Parts of the Body, in order to know how far in Diseases it receded from it, and to distinguish their various Degrees of Violence, has in his *Prognostics*, when treating of the Manner in which the Patient lies, beautifully taken notice of this in the following manner: "The Patient should be found by the Physician lying on his Right or Left Side, with his Arms, Legs, and Neck, a little inflected, and his whole Body moist; for in this manner many sound and healthy Persons lie." When this is neglected in the Cure of Wounds, the Parts often grow together in another Situation than they had naturally, or an unseemly Deformity arises from the distracted Parts, or the natural Motion of the Parts is often much depraved. A memorable Instance of this is found in *Hildanus, Cent. 1. Observ. Chirurg. Obs. 83.*

In the first Dressing of a Wound this is carefully to be attended to; for the raw Parts, when united, are soon conglutinated. Hence the Error committed cannot be corrected, without a cruel Division of the concreted Parts.

2. The Parts of the Body separated by a Wound, by their proper Contractility, gradually recede more and more from each other, as is already observed. But that they may be again agglutinated, it is requisite they should remain in Contact. Hence by an artificial Pressure, that Force is to be surmounted, by which they endeavour to recede from each other. But it is in a particular manner to be observed, that this Union of the Parts ought to be made in the whole Surface of the Wound; for if the Lips of a deep Wound are contiguous, whilst the subjacent Parts are at a Distance from each other, there will remain in the Wound a Cavity, in which the extravasated Humours will be collected, and make the Wound degenerate into a sinuous Ulcer. This is performed by the Application of Compresses, and a proper Bandage, so compressing the adjacent Parts, that the Lips of the Wound may be contiguous in the Bottom, as well as in the Skin itself. But it is requisite this Compression should be moderate, lest there should be too great an Angustation of the Vessels in the compressed Parts, by which means an Inflammation, and all its Consequences, may be produced. It is, also, requisite there should be a perfect Rest of the wounded Part. Hence the wounded Limb is to be secured in such a manner as that it may be immovable; for often during Sleep, or thro' the Carelessness of the Patient, the Motion of the wounded Member changes the Situation of the Parts, by which means the Lips of the Wound are separated, and the concreted Parts dilacerated. Hence the happy Event of the Cure is destroyed.

The Parts are retained in Union,

First, By adhesive indented Plaisters, with Loops or Eyes at their Extremities, applied on both Sides of the Wound, and

and drawn together by Threads; these are used in long transverse Wounds of the Skin, and the more lax Parts.

According to the Diversity of Wounds, various Methods are requisite to keep the contiguous Parts in a due Union, and this is done,

1. By what Surgeons call the *dry Suture*, in order to distinguish it from Sutures made by the Needle; they take some adhesive Plaster, capable of adhering strongly to the sound Skin. For this Purpose they use common Glue, Hing-glass, or any other Substance of a proper Tenacity. This they spread upon strong Linen Cloths which will not easily yield; these, when gently warm'd, that they may adhere the more strongly, they apply on both Sides at some Distance from the Lips of the Wound. Then at Pleasure they draw together these Plaisters by Threads affixed to them, and the Skin adhering to these Plaisters, is on both Sides so drawn together, that the Lips of the Wound may become contiguous; and as these Plaisters do not cover the Wound, the Surgeon can commodiously see whether the united Lips of the Wound have their natural Situation; and if they deviate from it, this Deviation may be easily corrected. As the Bulk of Wounds varies, so a different Number and Figure of these Plaisters are requisite. In small Wounds, whose Lips are at a small Distance from each other, such digitated Plaisters are sufficient without Loops. But in large Wounds, whose Lips recede much from each other, it is safer to apply Plaisters which may be drawn together by Cords fixed in their Loops. See *Tab. XXV.* with the Explications; and the Article *SUTURA*.

But it is sufficiently obvious, that only the Skin is drawn together by these Plaisters, whilst, if the Wound is deep, the subjacent Fat being highly moveable and lax, will not follow the Skin. Hence such Plaisters are generally only of Use, where the Skin alone is divided, and the Parts being sufficiently lax, can easily follow it. Hence they are principally of Use in slight Wounds of the Face, and Integuments of the Head; as, also, in slight Wounds of any other Parts of the Body.

When the Lips of the Wound are united by an adhesive Plaster, we must apply a Pledget dipt in some vulnerary Balsam, in order to prevent the Access of the Air. And leaving the Plaisters on, we are daily to view the external Surface of the Wound, in order to discover whether every thing is right.

Adhesive Plaisters may be thus prepared:

Take of the Diapalma Plaster, a sufficient Quantity; and a little Olive-oil: Dissolve together for a Plaster.

Or,

Take of common Pitch, a sufficient Quantity: Spread on a Linen Cloth, and apply.

Secondly, The Parts are retained in Contact by Bandages, and the Application of Compresses, that the divided Parts being equally applied to each other, may remain in that State, and be united, which is easily obtained by a proper Method of Compression. And this Method is proper in longitudinal Wounds.

Superficial Wounds do not require this, but only deep Wounds, in which it is requisite, that the Parts in the Bottom of the Wound should be as contiguous as the external Surface, before a good Cure can be obtained. In the right Application of these, the Skill and Dexterity of the Surgeon are principally known. Bandages rolled round any Part, equally compress the Surface thereof. But by the Application of Compresses, the Compression of the Bandage, though remaining the same, may act more upon some Places than others. By this means we can determine and regulate the Degree of Compression, so as that all the Points of the Surface of the Wound may become contiguous. But it is sufficiently obvious, that this Method is of no Use, unless the Parts adjacent to the Wound are soft, and consequently capable of yielding: If, for Instance, a deep Wound is longitudinally inflicted in the Thigh, by the Application of Compresses to both Sides, and the Use of a proper Bandage, the soft Parts may be equally compressed, so that the divided Parts in the whole Surface of the Wound may again be rendered contiguous. In other less fleshy Places, this is not so easily obtained. But in such Places rarely Wounds happen so deep as to require this. *Hippocrates*, in his *Treatise de Medici Officina*, when treating of the various Uses of Dressings, seems to point at this Method in the following manner: "But when any Parts are divided, they are to be contracted, but the Contraction is to be made at a certain Distance from the Lips of the Wound, and the Compression is to be made gradually, at first very small, then greater, and its greatest

"Degree is to be terminated by the mutual Contact of the Parts divided."

Though this Method is, of all others, most successfully used in longitudinal Wounds, yet it may, also, be sometimes used to Advantage in transverse Wounds of the Parts. A memorable Instance of this is found in *Mem. de l'Acad. des Sciences, l'An. 1722.*

Thirdly, The Parts are retained in Contact by Sutures made with Needles of Steel, which in small Wounds may be strait, but in large Wounds crooked, with a sharp Point, and waxed Thread in their Eyes. These Needles are to be introduced at a sufficient Distance from the Wound, and are to pass to its Bottom in such a manner, that the Point may emerge at an equal Distance on the opposite Lip of the Wound. Then taking the Needle quite through, the Thread is to be so drawn as to retain the Lips of the Wound in Contact; and after the Application of a slight Compress, a Knot is to be tied on it. This Method is to be repeated as often as the Length of the Wound requires, beginning either at the Middle, or one of the Ends of the Wound. Then the Lips are to be anointed with some proper Balsam, and applying slight Compresses over the Knots, the Whole is to be covered with a Plaster.

This Union of the Parts separated by a Wound, is called the *bloody*, or *true Suture*, since the Conjunction of the Parts by adhesive Plaisters hardly deserves the Name of a *Suture*. In this Case it is particularly requisite, that the Union should be made with as little Pain, and Irritation of the Parts, as possibly may be; for when such an Operation is roughly performed, it is often succeeded by a violent Inflammation, which hinders the Union of the Parts brought into Contact. For this Purpose, pretty strong Steel Needles are requisite, though not too brittle, lest they should break. A conical Figure in these Needles would be prejudicial, because the gradually augmented Thickness would make them pass with Difficulty through the Parts. Hence such are used, whose anterior Part being prismatic with sharp Edges, easily passes through the Flesh, and makes Way for the rest of the Needle which is conical or cylindrical. In Wounds which are not deep, strait Needles of this Kind are sufficient; but in deep Wounds, crooked ones are necessary, that being protruded to the Bottom of the Wound, the Points may the more easily emerge. A different Curvature of these Needles is requisite, according to the different Depths of Wounds: Unless the Eyes of these Needles had on each Side a Groove for containing the Thread, whilst the Needle was drawing through their Eyes, the Threads protuberating on each Side could not follow, without a Dilaceration of the Parts. The Thread is to be waxed, that it may easily pass through the Parts, and not imbibe the Humours; for tumefied Threads would compress the Parts through which they pass. Besides, the Humours resorb'd by the Thread, becoming acrid by their Continuance, and the Heat of the Place, may irritate the Parts. The Needle with a Thread in it is to be entered at a sufficient Distance from the Wound, lest there should afterwards be a Dilaceration of the Parts, if it was entered too near the Wound. These Needles ought to be thrust to the Bottom of the Wound, and then protruded upwards, that they may again emerge at an equal Distance on the opposite Side of the Wound; for unless they penetrate to the Bottom of the Wound, the superior Parts will be brought together, whilst the inferior will remain at a Distance; and form a Cavity in which the extravasated Humours being corrupted by their Stagnation, will of the pure Wound form a fistulous Ulcer. Hence the Parts united must again be divided.

When the Threads are passed through, by a gentle Compression of the Hands, by which, as *Celsus*, in *Lib. 5. Cap. 26*, expresses it, "the Skin, as it were, spontaneously follows its Guide," the Lips of the Wound are to be rendered contiguous, and retained in that Union by drawing the Threads together. But in order to avoid Pain, and the Dilaceration of the Parts as much as possible, Compresses, especially of waxed Linen, left by imbibing the Humours they should prove injurious, are to be applied before the Knots are tied. According as the Length of the Wound is greater, or its Figure more or less angular; more or fewer of such Sutures are required; for if the Stitches, as *Celsus* in the Place before quoted, informs us, "are at too great a Distance from each other, they do not retain the Parts in Contact; but if they are too near each other, they excite an intense Pain, because the oftener the Needle passes through the Parts, the more of them are galled by the Thread, and the greater Inflammations arise, especially in the Summer." A Pledget dipt in a mild vulnerary Balsam is laid upon the Wound. Then by a proper Bandage, or the Application of a Plaster, the whole Apparatus is retained in its due Situation.

If a violent Inflammation, or an intense Pain, do not arise, the Wound is to be left in this Situation for two or three Days; then removing the Bandage, or Plaster, we are to observe, whether from the Smell any Corruption is formed by the extravasated Humours, and if it is so, the Pledget is to be cautiously removed, and another dipt in the like Balsam applied; or a few Drops of the Balsam may be dropt upon the old Pledget, so that it may be still left on the Wound. When it appears, that the Lips of the Wound are grown sufficiently firmly together, the Threads are gently and prudently to be drawn, in order to know, whether they may be commodiously taken out; and this, for the most part, is very easily done; and the small Wounds left are soon filled up.

But if a violent Inflammation, and intense Pain, and an excessive Tension of the Parts succeed the Suture, it is better to cut it again, and cure the Wound without Suture; for unless this is done, a Train of terrible Symptoms will succeed; and when it is too late, force the Surgeon to do that, which if it had been seasonably done, might have proved more beneficial.

The various Kinds of Sutures, and the different Methods of performing them, are described by the Authors who have wrote on chirurgical Operations, and under the Article SUTURA.

These Sutures are proper in Wounds that are recent and not bloody; but, however, without any violent Hæmorrhage; in simple Wounds, without any Contusion, or Fracture of the Bones; full, that is, without any Loss of Substance, transverse, oblique, or angular Wounds.

But they are prejudicial in Wounds attended with any considerable Hæmorrhage, old, sanious, purulent, sordid, contused Wounds, those with Loss of Substance, such as are covered with Crusts, such as are dangerous in consequence of a Wound of some large Vessels, such as are very deep, such as are greatly inflamed, such as are poisoned, and such as are inflicted in Parts which necessarily move.

In this Aphorism is determined for what Wounds Sutures are beneficial, and for what they are prejudicial.

They are proper, then, for recent bloody Wounds: For if the Wound has been inflicted for some time, and especially if there has been a free Access of the Air to it, the Extremities of the Vessels in the Surface of the Wound will be mortified. Hence they must be separated from the live Parts by a Suppuration, nor can they grow together; so that it would be to no Purpose to make an Union by Suture.

They are proper in Wounds not accompanied with great Hæmorrhages: Because the extravasated Blood will distract the Lips brought together by Suture; hence a Dilaceration, Pain, an Inflammation, and all its Consequences, will be produced.

They are proper in simple Wounds: That is, Wounds in which there is no Contusion, or at least a very inconsiderable one. Hence Hippocrates, in *Traët. de Ulceribus*, informs us, that Wounds made with a sharp Instrument may be cured without Suppuration; but if a Contusion is present, they are to be so treated as to bring on a Suppuration as soon as possible; for it is necessary the contused Flesh should become putrid, and be converted into Pus.

They are proper in full Wounds: That is, Wounds in which there is only a Division of the Cohesion without any Loss of Substance; for if any Part is taken away by the Wound, the separated Parts cannot be rendered contiguous without distracting them from their natural Situation. Hence such a violent drawing together of the Parts will always be succeeded by an unseemly Cicatrix, and an Injury of the Functions.

They are proper in pure Wounds: That is, Wounds in which nothing of an heterogeneous Nature is left by the wounding Cause, in which there are neither Sordes, grumous Concretions of Blood, nor fungous Flesh; for all these must be separated and eliminated from the Wound before a Consolidation can be expected.

Sutures are, also, proper in transverse, oblique, and angular Wounds: Because in these Cases, neither adhesive Plaisters, nor artificial Application of Bandages and Compresses, are sufficient to render the Parts contiguous, and retain them in Union.

But Sutures are prejudicial in Wounds where there is a large Hæmorrhage: Unskilful Surgeons, whilst without any Distinction they unite all Wounds by Suture, often do a great deal of Harm; for what Advantage is it to unite separated Parts, when after they are united, they cannot grow together; or when the extravasated Humours, retained by the Lips of the Wound, must afterwards be evacuated by cutting the Suture? A shameful Instance of this Kind is given by *Paré*, in *Lib. 10. Cap. 32.* Unless, therefore, the whole Surface of the Wound is pure and sound, and no Substance lost, Sutures will always be injurious. Besides, if a Wound is inflicted in a Part of

the Body, through which large Blood-vessels or considerable Nerves run, nobody will dare to force a Needle deep into such a Part, except one, who being ignorant of Anatomy, is not apprised of the Danger. There is the same Danger when the Wound is too deep, because the Needle may easily hurt the Tendons, and membranous Parts; and when these are injured, violent Symptoms generally succeed. Besides, when a Wound is very dry, the divided Parts cannot be so brought together, as to be contiguous in all the Points of their Surface, unless the Threads passed through the Parts, are strongly draw'd together. Hence a Dilaceration, and violent Inflammation, are greatly to be dreaded. If an Inflammation has seized the wounded Part, and if it is roughly treated by Suture, the Inflammation will frequently be so increased as to bring on a Gangrene, and the obstructed Extremities of the inflamed Vessels, together with the obstructing Matter, must, by a mild Suppuration, be resolved and separated, before the Surface of the Wound can be pure and fit for Union.

If the wounding Instrument is infected with Poison, so as to produce anomalous, malignant, and virulent Symptoms, unless a particular Antidote, capable of destroying the Force of the Poison, is known, the whole Hope of a Cure consists in increasing the Afflux of the Humours to the wounded Part by Suction, or the Application of Cupping-glasses, and thus eliminating the virulent Matter; or by the actual Cautery, the infected Part is in a Moment to be destroyed, lest the Infection should be communicated to the rest of the Body. It is, therefore, sufficiently obvious, that Suture retains the virulent Matter of the Wound, which ought to have been expelled with all possible Expedition.

It is, also, sufficiently evident, that an absolute Rest of the Parts, united by Suture, is requisite; for if these Parts are moved, the same will happen as if the Threads passed thro' them were continually drawn. Hence a perpetual Irritation, Pain, Inflammation, and all their Consequences, will happen. We can check all those Motions which depend on the Will; but those Motions which are absolutely necessary to the Continuation of Life, will always continue; and this is the Reason, why Wounds of the Thorax do not admit of Suture, especially if they are inflicted on the convex Surface of the Ribs; for at every Inspiration the Breast being dilated, the united Parts will be distracted with the most intense Pain. For this Reason, also, when Surgeons by Suture unite Wounds of the Abdomen, lest the Viscera should be expressed through the Wound, they so secure the Abdomen by Swaths, that the Patient respires almost without moving it. The Rashness, therefore, and Imprudence of those Surgeons, who indiscriminately stitch up every Wound like a Piece of torn Cloth, are greatly to be condemned.

Fourthly, The Parts are retained in Contact by a Needle passed through the Lips of the Wound, and a Thread so wrapt about it as to hinder them from receding from each other, but keep them united. This Method is proper in large and gaping Wounds of the pendulous Parts of the Body.

The former Suture was performed by Thread passed through the Holes made by the Needle, and then bringing the Lips of the Wound together by a drawing of the Threads. But in this Method, the Needle is not taken out of the Parts perforated, but left in them, and then a Thread is on both Sides so wrapt about, that the Lips of the Wound perforated by the Needle, and brought together, may remain contiguous. This Method was principally used in the Cure of the Hare-lip, that is, when that Part of the superior Lip, which is under the Nose, is divided. But afterwards Surgeons, with great Success, ventured to unite large and gaping Wounds of the pendulous Parts of the Body by the same Suture: But because in the Hare-lip the Parts are divided from the Birth of the Patient, hence the callous Surface is on both Sides cut off with a Pair of Scissars, and in the superior Angle a slight Wound is, also, made with the Scissars, that the Parts to be united may acquire the Nature of a fresh Wound; for if any thing of a callous Nature is left, there will never be a laudable Union of the Parts there. Then when the Lips of the Wound are duly applied to each other, the Needle is entered at the Distance of four Lines from the Wound, and forced thro' the Middle of the Substance of the Lips, till on the opposite Side the Needle emerges at the like Distance from the Wound. Thus the Needle is left in the Wound, and the Parts are retained in Union, by wrapping a Thread cross-ways about it. According to the different Largeness of Wounds, more or fewer of these Needles are used, that in every Point the separated Parts may be rendered perfectly contiguous. But lest the sharp Points of the Needles left in the Wound should hurt the Patient, they are to be cut off by the Scissars, and small Pieces of Sponge are to be laid under the Extremities of the Needles, be-

cause these accommodate themselves far better to the Figure of the Parts than Compresses. But that such Needles may be passed through the Parts expeditiously, and without Vacillation, they are fixed in an Handle, because by the Fingers of the Surgeon alone they cannot be so surely convey'd through the Parts. Besides, in order to avoid those Misfortunes which might arise from the sharp Extremities of the Needles remaining, (for hard Steel cannot be cut by Scissars without great Force, so that by this Concussion the Situation of the united Parts may be changed) Surgeons use Steel Needles, but whose posterior Parts are made of pure Silver: Then passing the Needles through the Parts, they leave the Silver Part in the Wound, cutting off the Steel Part, together with a certain Portion of the Silver which is cut with a far less Force than Steel. The same Operation is, also, excellently performed by pretty large Steel Needles, which can be firmly held by the Fingers alone, and whose cloven-Tops contain Silver Pins blunt at both Ends, which are left in the Wound, and secured by Threads passed about them. See *Garengeot, Traité des Operations de Chirurgie, Tom. 3.*

When the united Parts are firmly grown together, these Pins are to be taken out, and the Wounds left by them are easily consolidated.

The last Intention is answered by taking care, that the Parts correspond to each other just in the manner they did in Health; and that they are thus retained in such a manner as not to be too much pressed, nor too much relaxed, by avoiding all burning, styptic, and astringent Applications, but especially by taking care, that the Pressure be equal on all the Parts of the Wound.

All these Ends are obtained by doing as is above directed, and then applying mild desiccative Medicines; and, lastly, by washing the Cicatrix with spirituous Liquors.

We have already enumerated the four general Intentions of Cure in Wounds; and having considered the first three, we now come to treat of the fourth and last, which is, after having restored the lost Substance, and united the Parts separated by the wounding Cause, to induce a Cicatrix as like to the natural Skin as possible; for if there is only a simple Division of the Parts made by a very sharp Instrument, and the divided Parts are immediately united in their natural Situation, they will so grow together, as that no Mark of the inflicted Wound will be left; and in this Case the Wound is cured without a Cicatrix; for a Cicatrix after a perfect Cure of a Wound, is that Mark by which the Part of the Integument where the Wound was, is distinguished from the adjacent Skin. The most perfect Cure, therefore, of a Wound is, when no Mark of it remains. But when this cannot be obtained, the Beauty of the Cure consists in rendering this Mark as like as possible to the adjacent Skin; for when by the wounding Cause, or a Suppuration succeeding the Wound, any Part of the Substance of the Body is lost, something new will be generated in its stead, and this new Substance will never have absolutely the same Qualities with that which was lost. Hence it may be distinguished from the adjacent Parts.

The Beauty of a Cicatrix depends principally on the three following Circumstances:

1. If the Cure is such, that the united Parts are in the same Situation they had before the Wound was inflicted.
2. If the Cicatrix does not rise beyond the equable Surface of the adjacent Skin. And,
3. If the Cicatrix is not hollow.

The first is obtain'd by taking care that the Lips of the Wound, by means of adhesive Plaisters, Suture, or proper Bandage, may correspond to each other as in Health. The second is obtain'd, if, by a moderate Pressure, the Defect of the confining Skin is supplied, lest the Vessels, depriv'd of this Covering, being distended by their Liquids, should rise above the equable Surface of the Skin; for when this is neglected, or the Wound treated with very emollient Medicines, a Ridge is form'd, and an unseemly Cicatrix produc'd. And the third is obtain'd by procuring a laudable Restitution of the lost Substance. An hollow Cicatrix generally happens, because the Pressure of the adjacent Skin forces the *Membrana Adiposa* into the Place of the Wound, and makes it rise, which there degenerating into *Sordes*, and fungous Flesh, is by a Suppuration consum'd, so as not to grow again. Hence the soft Fat, which ought to support the Skin, being destroy'd, the Cicatrix will remain depressed and hollow. Hence it is obvious, that a deep and hollow Cicatrix cannot, often, be prevented, when, for Instance, the Fat is destroy'd by the wounding Instrument, or a violent Suppuration. Thus *Hippocrates*, in *Aph. 45. Sect. 6.* tells us, "That if Wounds continue a Year, or longer, Abscesses will necessarily happen in the Bone, and cause deep and hollow Scars." And in *Tr. de Ulceribus, Cap. 4.* he tells us, "That if a Part of the Bone is remov'd, either by Burning, Cutting, or any other Method, the Cicatrices of such Wounds will be hol-

low." It is sufficiently known, what deep and unseemly Cicatrices remain after the *Membrana Adiposa* is consum'd by venereal Ulcers.

Hence the Reason appears, why, if the Surgeon intends to form a beautiful Cicatrix, he ought to avoid burning, styptic, and astringent Medicines: For by means of all these the live Vessels are either destroy'd, or so constricted, as not to transmit the Fluids; but a Suppuration coming on, the mortified or obstructed Extremities of the Vessels must be separated. Hence there will be a Loss of Substance, a Consumption of the Fat, and consequently a proportionably hollow Cicatrix. Hence it is, also, obvious, how much the Beauty of the Cicatrix is assisted by an equable Pressure, which prevents the rising of the too much distended Vessels.

The Signs of a beginning Cicatrix are these following: The Margins of the Wound or Ulcer, about to be consolidated, begin to appear more white and solid, and this Whiteness is gradually convey'd from all the Circumference to the Centre: In the mean time, in the open Surface of the Wound a like Whiteness begins to appear here-and-there; and if this Surface equably meets the Edges of the Lips, a laudable Cicatrix is form'd: A pure Wound, also, before moist in every Point of its Surface, becomes dry in those Places where the white Rudiments of the Cicatrix appear. Hence those cicatrizing or epulotic Medicines are always most commended, which are gently drying and corroborating. Hence Plaisters prepar'd of Lead, or its Calxes, and the fine Powders of Colophony, *Olibanum*, and *Sarcocolla*, are generally with Success applied to Wounds or Ulcers tending to a Cicatrix.

Cicatrizing and epulotic Medicines are these following; the red desiccative Ointment, the *Unguentum Diapompholygos*, the *Unguentum Calcis*, the *Unguentum Nutritum*, the white Ointment of Roses, the *Emplastrum Album Coctum*, the *Emplastrum de Lapide Calaminari*, or the grey Plaisters, the *Emplastrum de Minio Rubrum*, the *Sparadrapum of Gualtherus*, Colophony from boil'd Turpentine, and reduc'd to Powder; Frankincense, *Olibanum*, and Mastich.

Hence we may perceive the Vanity, and foolish Boasting, of those who pretend, that, by their *Arcanums*, they can cure all Kinds of Wounds, without leaving a Cicatrix. Prudent and skilful Surgeons, after a large Loss of Substance, or a long Suppuration, will never foretel that the Cicatrix will be beautiful; and of this the Patient ought always to be admonish'd, lest he should ascribe the Deformity of the Part to the Carelessness of his Surgeon.

It is, also, expedient, now-and-then to foment the Cicatrix with the Spirit of Rosemary, the *Spiritus Matricalis*, or some other of a like Nature; for all these spirituous Liquors have a Power of rendering the Flesh of Animals firmer: For the Part of the Cicatrix remains weak, being only cover'd with a thin Pellicule; so that it is more easily hurt than the adjacent Parts. Hence it is often expedient, that the Part, after its Consolidation, should for a considerable time be cover'd with a mild lead Plaister, or a Piece of soft Alum Leather; lest, by the Attrition of the Cloths, or the Injuries of the Air, the Wound should again break out.

HÆMORRHAGE CONSIDER'D AS A SYMPTOM OF WOUNDS.

If a large Quantity of Blood flows from a Wound, by the Causes already specified; it is to be stop'd,

First, By the actual Caustery.

Secondly, By Corrosives.

Thirdly, By Astringents.

Fourthly, By tying up the Artery.

Fifthly, By cutting quite thro', or entirely dividing the wounded Artery. And,

Sixthly, By Bandage, and pyramidal Compresses.

Having consider'd the Things belonging to the general Cure of Wounds, we shall now treat of some Symptoms incident to them, which are often so violent, as greatly to endanger the Life of the Patient. Hence it is requisite these Symptoms should be remov'd, or at least greatly diminish'd, before the Cure can be attempted. The principal Symptoms of this kind are, Hæmorrhages, Pain, and Convulsions.

A large and impetuous Discharge of Blood from a Wound, always denotes that large Vessels, containing red Blood, are wounded, and especially arterial Vessels: Because Veins, unless large, or render'd tumid by the Application of a Ligature, rarely discharge much Blood, and never with so great an *Impetus* as that which flows from the Arteries. If there is so great a Loss of Blood, that fatal Effects are justly to be dreaded from it; and if there is no Hope that by a Debilitation of the vital Force, or the Contraction of the Artery, it will spontaneously stop, then we are to have recourse to the Methods known in Surgery, in order to stop the Eruption of the Blood. But most of the Means which check the Effusion of the Blood, retard the Cure of

of the Wound : For the Extremities of the Vessels, being destroy'd by the actual Cautery, Corrosives, Ligatures, or Compressions, must be separated, before the Consolidation of the Wound can be obtain'd.

Various Means are used for stopping Hæmorrhages ; but all of them act either by constricting the Orifice of the divided Vessel, or by coagulating the Blood in the Extremity of the Vessels, or by producing both these Effects at once.

1. The most instantaneous Method of stopping Hæmorrhages is reckon'd that of touching the Vessel, discharging the Blood, with a red-hot Iron ; for, by this means, the Blood is forthwith burnt into a thick Mass, no longer capable of Resolution : So that it closes up the Orifices of the open Vessel. The Vessel itself is, at the same time, shrivel'd up, and constricted, by the Action of the Fire ; by the Concurrence of which two Effects, the Blood is stoppt. This Method was long used by Surgeons ; for which Reason, in the Amputation of Limbs, and in other Operations where a great Hæmorrhage was dreaded, they had always actual Cauteries, of various Figures and Sizes, in Readiness ; that, by their Application, they might stop the Blood.

Thus, by the later Greeks and Arabians, by *Paulus Ægineta*, *Avicenna*, and others, Hæmorrhages were suppress'd by the actual Cautery, after the Amputation of Limbs. *Guido de Cauliaco*, and after him some others, used boiling Oil for the same Purpose. *Vesalius*, in *Chirurg. Mag. Lib. 5. Cap. 12.* in the Amputation of Limbs, orders the Flesh to be cut with a red-hot Knife, that by this means the Hæmorrhage may be stoppt. But this Method is attended with so many Disadvantages, that it is scarcely ever used ; for it is a difficult Matter to procure a due Degree of Heat to the Iron ; since, if it is too hot, that which is burnt is often carried off with it ; and if it is not sufficiently hot, the Hæmorrhage is not stoppt by it. Besides, actual Cauteries produce intense Pain, a violent Inflammation, and all its Consequences ; and all that which is destroy'd by the Burning, must afterwards, by a Suppuration, recede, and be separated from the live Parts. Hence there is great Danger, lest, the Eschar falling off in a few Days, the Hæmorrhage should return ; in which Case, it is stoppt with greater Difficulty than at first : For the cauterized Vessel, when the Eschar is fallen off, will be shorter ; for which Reason it cannot at all, or at least without the greatest Difficulty, be laid hold of, and ty'd. Hence the cruel Application of the Cautery must be again repeated, whilst the same Danger remains, lest the Hæmorrhage return, after the new Eschar is fallen off. Hence, after skilful Surgeons knew how to stop Hæmorrhages by a Compression or Ligature of the Vessels, the actual Cautery was more rarely used. And *Galen* himself condemns the Use of Escharotics, as unsafe in stopping Effusions of Blood. For in *Method. Medend. Lib. 5. Cap. 4.* he tells us, " That as much of the Part as is burnt into a Crust, so much of the natural Flesh is lost and remov'd " when the Crust falls off : For which Reason the Wound " appears naked, and without Flesh ; and in many, after the " Separation of the Eschar, a Profusion of Blood has happen'd, " which could not be suppress'd without great Difficulty." Hence *Galen* is against the Use of Escharotics, except in the greatest Necessity ; and he affirm'd, that they were principally useful where the Hæmorrhage proceeds from the Corrosion of the Vessels, by a putrid Blood : For, by this means, the Blood is stoppt, and the spreading Putrefaction forthwith destroy'd, by the Action of the Fire.

2. The Application of live Fire, by means of hot Irons, or the Use of boiling Oil, were call'd, simply, Cauteries, or actual Cauteries ; but there are some highly acrid Remedies which destroy the Parts to which they are applied, and burn them into Eschars, in the same manner as the Application of Fire does : These, from the Similarity of their Effects, were, also, call'd Cauteries ; but because they did not actually contain Fire, they were distinguish'd from the others by the Epithet potential : They are, also, call'd Corrosives, because, by corroding, they consume and destroy the Parts to which they are applied ; but the Eschars, form'd by these, must, also, be separated, and fall off : Hence arises the same Danger of a fresh Hæmorrhage as if actual Cauteries had been applied. Besides, as all Corrosives are highly acrid, they often greatly irritate the adjacent nervous or tendinous Parts, whence it is certain violent Symptoms sometimes arise. The most celebrated Remedy of the Antients, for this Purpose, was, *Cyprian Vitriol*, form'd into a small Ball, or reduc'd into a fine Powder, laid upon Lint, and applied to the Orifice of the divided Vessel : The Blood, almost by the single Touch of this Vitriol, is coagulated into a *Thrombus*, which, like a Covering, closes up the divided Vessel, constricts it, and burns its Extremity into an Eschar ; but a Ball of Vitriol cannot remain applied to the Orifice of the Vessel, unless secured by a proper Bandage, which alone might prove sufficient.

Corrosives are, white Vitriol, the *Lapis Infernalis*, and Oil of Vitriol.

Under the Article *FIBRA*, Astringents, so far as they strengthen the Cohesion of the solid Fibres of the Body, are consider'd ; but here we only treat of the Use of Astringents in stopping Hæmorrhages : This Effect, then, they produce, either by constricting the Orifice of the divided Vessel ; or by coagulating the Blood as it flows out, so as to close up the Orifice of the Vessel ; or by producing both these Effects at once : Besides, there are, also, other Remedies, which, tho' they do not in a great measure coagulate the Blood, nor constrict the Vessels, yet stop the Hæmorrhage, and in this respect only deserve the Name of Astringents. Such are volatile Mill-dust, the Powder of Plaster of *Paris*, and other bibulous Bodies, which absorb every Liquid they touch, and, with it, grow into a pretty hard Mass, which is capable of closing the divided Vessel, and stopping the Hæmorrhage. But if large Arteries are divided, these Powders will be carried off by the *Impetus* of the discharg'd Blood ; so that they are not much to be trusted to. Hence, after the Amputation of large Members, when Surgeons applied these bibulous Substances to the Surface of the Wound, both Night and Day a Servant was order'd to press the whole Apparatus with his Hand, that they might remain firmly applied. Hence it is obvious, that little is to be expected from these bibulous Substances, unless they are secur'd and assisted by a proper Compression.

Among the Remedies which act by coagulating the Blood, or constricting the Vessels, the most celebrated is *Alcohol*, especially when warm, which in a Moment converts the Serum of the Blood, notwithstanding its Fluidity, into a scissile Mass, and at the same time strongly contracts the solid Parts of the Body. Hence the soft Parts of Animals, preserv'd in *Alcohol*, become hard, and are diminish'd in Bulk : By both these Effects *Alcohol* may effectually stop Hæmorrhages. But the Extremity of the divided Vessel, being, by the Application of the *Alcohol*, contracted and indurated, will afterwards be separated ; and the *Thrombus* of Blood, harden'd by the *Alcohol*, will either be remov'd spontaneously, or protruded by the *Impetus* of the Blood acting upon it. Hence the Hæmorrhage will return, unless, by a proper Bandage and Compression, the *Thrombus*, form'd by the *Alcohol*, is retain'd in the Orifice of the divided Vessel. Besides, by the Heat of the Body, the volatile *Alcohol* is immediately dissipated : Hence its Action is only momentaneous, unless it is continually applied afresh, and its too sudden Exhalation prevented, by the Application of a Bladder anointed with Oil. It is therefore obvious, that the Use of *Alcohol* is not safe without a proper Compression. *Vanfweiten* gives a memorable Instance, in which the Blood flowing from a very small Artery could not be stoppt by *Alcohol*. Hence it is obvious, that if Hæmorrhages from small Arteries cannot sometimes be stoppt by *Alcohol*, it may, also, often prove fallacious, in Cases where large Arteries are divided.

Oil of Turpentine, unless hot, scarcely stops Hæmorrhages. The soft Parts of Animals, immersed in this Oil, become hard, tho' slowly ; but Oils require a far greater Degree of Heat, before they boil, than Water : Hence warm Oil of Turpentine, by burning the Solids, and coagulating the Blood, may stop an Hæmorrhage ; in which Case, it will act like an actual Cautery, which is already described. But highly strong and acrid fossil Acids, such as the Spirits of Nitre and Sulphur, are Corrosives, of the Use of which we have already treated. But the other mild Astringents, such as Dragon's-blood, the Bark and Flowers of Pomgranates, and others of a like Nature, seem not to be so efficacious, that much Good can be expected from them alone, in stopping Hæmorrhages. Hence, also, it appears, what Judgment we are to form of the many slyptic *Arcanums* so much extol'd by many Surgeons. Small Arteries, and even such as are considerably large, when entirely divided, close spontaneously, especially when the vital Principle is weaken'd by a liberal Hæmorrhage. Many of these boasted Specifics were acrid Corrosives, and others of them milder Corrosives, which were, by Bandage, pressed to the wounded Vessel : Hence the Blood was often stoppt rather by the Compression alone, than by the Application of the Remedy. Whilst *Petit*, as he tells us in *Mem. de l'Acad. des Sciences, l'An. 1735.* about the End of the last Century, made many Experiments, with respect to these *Arcanums*, he found, that slight Hæmorrhages might sometimes be stoppt by them ; but that, in the Amputation of Limbs, they did not produce the desired Effect. Hence it is obvious, that those who boast of such *Arcanums*, are not rashly to be trusted.

Astringents are,

1. Those Substances which contract the Vessels, such as *Alcohol*, Spirit of Turpentine, recent Juice of unripe Quinces, Dragon's-blood, Puff-ball, and *Crocus* of *Mars*.

2. Those Substances which coagulate the Blood ; such as *Alcohol*, Spirit of Nitre, Spirit of Sulphur, calcin'd Vitriol, Sugar of Lead, the Bark and Flowers of Pomgranates, and the Blood-stone.

4. If the Surgeon's Hand can have Access to the divided Artery, so as that it may be ty'd, the Hæmorrhage will soon be stopt, by the Application of a Ligature. This Method was commended by *Galen*: For, in *Method. Medend. Lib. 5. Cap. 3.* after having enumerated various Methods of stopping Hæmorrhages from Wounds, he adds, "Another Method of closing the Extremities of the Vessels is, by applying a Ligature to them, or by compressing and constricting them with the 'Fingers.'" But he seems to have used this Method only in Wounds: For, so far as I remember, he has not describ'd the Amputation of sphacelated Limbs. In Amputations of the large Limbs, where violent Hæmorrhages are dreaded from a Division of large Arteries, *Celsus*, in *Lib. 6. Cap. ult.* makes no mention of the Ligature of the Vessels; tho' in *Lib. 5. Cap. 26.* when describing the Cure of Hæmorrhages from large Wounds, he tells us, that when all other means have been tried in vain, "the Veins, discharging the Blood, are to be laid hold of, and about the Part where the Wound is made, so ty'd in two Places, that they may unite, and have their Orifices closed up." After *Galen*, all Physicians and Surgeons stopt the Hæmorrhages, succeeding Amputations, with Caustics; and *Vesalius*, in *Chirurg. Magn. Lib. 5. Cap. 12.* when describing this Operation, orders the Flesh to be cut to the Bone with an ignited Razor, and the large Vessels to be afterwards burnt with ignited Irons. As *Paré* abhor'd this cruel Method, and observ'd that many, on whom it was practis'd, died, and that only a few escaped, after the most intense Pain, he was the first, as he informs us, in *Lib. 12. Cap. 35.* who ty'd the Vessels after Amputations, drawing them out with a Forceps, and with a double Thread tying them together with a Portion of the adjacent Flesh: But if the Ligature slipping off, the Hæmorrhage return'd, he with a Needle perforated the fleshy Parts adjacent to the divided Vessel, and, by drawing the Thread upon a Compress applied, he closed the Orifice of the divided Vessel, as he tells us in the same Book, *Cap. 33.* Afterwards, almost all Surgeons, neglecting actual and potential Causteries, used Ligatures, which they applied two Ways; for they either drew out the Extremity of the divided Artery with a Forceps, and ty'd it by passing a Thread about it; but if the Thread was too tightly applied, it often gradually cut the Artery; in consequence of which, the ty'd Extremity fell off too soon, and the Hæmorrhage not only return'd, but was more dangerous than before; because the Vessel, being render'd shorter, could not be so easily closed by a new Ligature: Hence *Dionis*, in his *Cours d'Opérations de Chirurgie, Demonstrat. 9.* after the Thread is passed about, and a Knot ty'd on it, orders, that one End of the Thread should, by a Needle, be pass'd thro' the Substance of the Vessel, in order to hinder the Ligature from falling off too soon. But this Method, as being too difficult, was afterwards rejected. But if a slight Ligature is applied to a naked Artery, the Blood, continually acting on the Part ty'd, protrudes the Ligature, and makes it fall off: So that *Paré's* Method prevail'd, which is, tying the Artery together with a Part of the adjacent Flesh; for thus the Extremity of the Artery is excellently closed; nor is there any Danger of the Ligature's slipping off so easily. It will be sufficiently obvious, that tying the Vessels is preferable to burning them, if we consider the following Circumstances: Whilst by live Fire, or potential Caustics, the Extremity of the Vessel is burnt, and the Blood in it coagulated, the burnt Parts produce an Eschar, which covers the Orifice of the divided Vessel; to this Covering there adheres a *Thrombus* of coagulated Blood, which fills the Cavity of the divided Artery; and when the Eschar falls off, the *Thrombus* alone, lodg'd in the Cavity of the Vessel, sustains the *Impetus* of the impel'd Blood: But the Extremity of the Vessel, being open by the Separation of the Eschar, will easily transmit the *Thrombus*, which will therefore be expel'd, and make a free Passage for the Eruption of the Blood: But whilst the Vessel is closed by Ligature, its Sides will be brought together, and hence the *Thrombus* beyond the Ligature will touch it with a narrow Apex, whilst its broader Basis will block up the Cavity of the Vessel. After, therefore, by a Suppuration, the Part ty'd, together with the Thread, falls off, tho' the Artery is not, as yet, totally consolidated, yet the *Thrombus*, being broader at its Base, cannot be transpress'd thro' the narrow Extremity of the contracted Artery: Perhaps the narrower Part of the *Thrombus* may come out, but its larger Part will close up the Vessel, and stop the Hæmorrhage. Mr. *Petit*, in *Mem. de l'Acad. des Sciences, l'An. 1731.* has beautifully explain'd this, and illustrated it by the Addition of a Figure of the *Thrombus*.

This Method is, therefore, far more safe than any of the rest, tho' it is not absolutely free from Disadvantages; for it is often succeeded by an intense Pain, and violent Inflammation, whilst the Arteries are ty'd, together with the adjacent Flesh, especially if the divided Nerves are at the same time comprehended within the Ligature. Hence convulsive Motions often happen in the

Part, by which the Ligature may be destroy'd, and the Hæmorrhage return.

5. The entire Division of the Artery is principally useful when the wounded Artery, being neither too large, nor too near the Heart, is only partially divided; for, in this Case, the Hæmorrhage will proceed, because the Fibres being retracted by their own Elasticity, the Wound of the Artery will be enlarg'd: But if such an Artery is entirely divided, we have already shewn, that its Extremities recede, and are conceal'd under the adjacent Parts, where, by their own Contractility, and the Pressure of the contiguous Solids, they are entirely closed, and the Hæmorrhage is, by that means, stopt. When, therefore, the Blood continually flows in a small Quantity from a Wound, the Place of the Wound whence the Hæmorrhage seems to proceed is to be scarified with a Knife, in order to make a total Division of the wounded Artery. *Galen*, in *Tr. de Curandi Ratione per Venæsectionem, Cap. ult.* tells us, that he used this Method with Success, "in a Man who by a Wound in the *Malleolus* had the Artery wound-ed, in such a manner, that the Hæmorrhage did not cease, till *Galen*, being call'd, made a total Division of the Artery." He afterwards adds, that the Wound was cur'd without an *Aneurysm*, which is greatly to be dreaded in such a Wound of an Artery, whilst the weak Cicatrix is, by the Blood, extended into a dilated Sack.

But it easily appears, that such an entire Division is not safe, unless the Artery is small, and not near the Heart: For, in this Case, the Hæmorrhage would not cease; tho' the Artery was entirely divided; but the divided Vessel must be closed up by a Ligature, or some other Method.

It has happen'd, that an Artery wounded, and not entirely divided, has been so secur'd by Compression, that the Blood has stopt; but, in this Case, so strong a Compression of the Artery is not always requisite, as entirely to abolish its Cavity: Such a Compression is sufficient, as hinders the free Efflux of the Blood from the Wound of the Artery, and retains the bloody *Thrombus* between the Lips of the Wound, which is the principal Impediment to the Discharge of the Blood; and which, afterwards, growing firmly to the Margins of the Wound, restores the Soundness of the wounded Part. An Instance of this is found in *Mem. de l'Acad. des Sciences, l'An. 1735.*

6. Compression of the divided Vessel is, of all others, the best, and most natural Method, of stopping Hæmorrhages, and that which all Men spontaneously use when they see the Blood flowing from a Wound, that is, by compressing the wounded Part with their Fingers. But this Compression may act either perpendicularly on the open Surface of the divided Vessel, or it may be applied to the Sides of the Vessel, and thus render them contiguous to each other: In the former Case the Efflux of the Blood is hinder'd; but as the *Thrombus*, form'd by the coagulated Blood, is of the same Bulk with the Orifice of the Wound, when the Compression is remov'd, it is easily expel'd, by the *Impetus* of the Blood acting upon it: Hence, in this Case, the Pressure ought to act upon the divided Vessel till the *Thrombus* of coagulated Blood is concreted with the Sides of the Vessel, which does not happen soon: But such a Compression, when strong, and long applied, may produce many bad Symptoms; an Inflammation, for Instance, and all its Consequences.

But if the compressing Cause acts on the lateral Part of the divided Vessel, its Sides will come together, and, being render'd contiguous, will grow together in a pretty broad Surface: And as the *Thrombus* of coagulated Blood, lodg'd behind the compress'd Part, is almost cylindrical, it cannot be forc'd out by the Sides of the Vessel, tho' a perfect Union is not, as yet, form'd. It is therefore sufficiently obvious, how much this Method is preferable to all others: For if the Aperture of the Vessel is only closed, the Hæmorrhage ceases. But this is excellently obtain'd by such a Compression, and the contiguous Sides of the Vessel will soon grow together, without any Necessity for a Separation of the mortified Parts, which must happen after the Application of actual and potential Caustics, and even after the Ligature of the Vessels: Besides, when the Vessel is ty'd, there is only an Union of its Sides in a small Surface, where the Thread is plac'd: But, by a lateral Pressure, the Sides of the flatten'd Vessel are united in a greater Surface; for which Reason they will adhere more firmly, and make a stronger Resistance to the Action of the Blood attempting its Discharge. But the Parts never sooner and better grow to each other, than when they are divided by a recent Wound; for, in this Case, only the Union of the Parts is requisite, and Nature performs the rest. But this is most perfectly obtain'd by this Method; whilst to the raw Wound, not irritated by Corrosives or Ligatures, such a Compression is applied in those Parts where large Vessels are divided.

But that the Hæmorrhage may be happily stopt, and the Wound at the same time cur'd, it is principally requisite, that the Pressure should act only on the Sides of the divided Vessel; but not on the rest of the Surface of the Wound. Hence Surgeons

geons prepare a small Ball of Paper, long chew'd between the Teeth, or of Lint, which they apply to the Part of the Wound which ought to be compress'd; upon this they lay one somewhat larger, and over it one still larger, and so on, till the Apparatus is so prominent, that, by a Bandage, it may be commodiously press'd to the divided Vessel; for thus an inverted Pyramid, as it were, is form'd, whose Apex, being applied to the Side of the Vessel, only communicates the Pressure of the Bandage applied, to that Part of the Wound where it is requisite. *Petit*, in *Mem. de l'Acad. des Sciences, l'An. 1731*. has describ'd and represented, by a Table, a beautiful Instrument, by the Application of which, the divided Vessel might be safely compress'd, and the Trunk of the Artery above the Wound contracted at Pleasure: The Compression, also, of the divided Vessel, may be augmented or diminish'd, at Pleasure, by the Use of the same Instrument, the Sureness, Safety, and Use of which, he has there confirm'd, by a memorable Example: See TORCULAR.

It is therefore obvious, that an artificial Compression of the Vessel stops the most dangerous Hæmorrhage, when other Remedies have been try'd to no Purpose; and that this alone is sufficient, in all Cases; whereas the other Remedies are only useful in particular Circumstances. But this Compression acts best, if, being apply'd to the Side of the divided Vessel, it compresses its open Orifice, tho' in the most difficult Cases a perpendicular Pressure on the Surface of the divided Vessel has sometimes happily stop't Hæmorrhages; a memorable Instance of which is found in *Mem. de l'Acad. des Sciences, l'An. 1732*. It sometimes, also, happens, in the Amputation of a Leg, that the Artery which perforates the superior and posterior Part of the *Os Tibiæ*, and sometimes runs an Inch thro' the Substance of the Bone, being divided, continues perpetually to discharge the Blood, if, being lodg'd in that bony Canal, it is by the Saw divided with the Bone. It is sufficiently obvious, that in this Case a Ligature can be of no use: And in the last-quoted Part of the *Mem. de l'Acad. des Sciences*, we have an Instance, in which Compression alone, by Lint apply'd to the Orifice of the divided Vessel, remov'd so dangerous a Symptom.

But in Cases of this kind a stronger Compression is requisite, than if, by lateral Compression, the Sides of the flatten'd Vessels were render'd contiguous; because the Largeness of the divided Vessel remains always the same. Hence the *Thrombus* of concremented Blood, closing up the divided Vessel, may be easily expell'd, unless it is retain'd by a strong Compression.

In this Case Revulsion is of no Service, unless the wounded Arteries are small, and there is a *Pletthora*. The same is true with respect to Aliments, Drink, and internal Medicines: What has been said of an Hæmorrhage, may be apply'd to a Flux of Ichor; tho' the greatest Help we have, in this Case, is from the thicker Balsams.

In this Case Revulsion is of no Service. *Galen*, in *Method. Medend. Lib. 5. Cap. 3*. when laying down the Method of stopping Blood discharg'd from Wounds, tells us, that this is done "by closing up that which is divided, and by deriving and translating what was carried thro' it, to some other Part." But as he was ignorant of the modern Doctrine of the Circulation of the Blood, it is not to be wonder'd at, if he embrac'd the Opinion, that Revellents may be of great Use in stopping Hæmorrhages from Wounds. But if a large Artery is divided, Venesection in another Part of the Body will be of no Use, since the Blood will certainly flow thro' the open Wound of the Artery, till the Patient dies, or, at least, falls into a *Deliquium*. I saw, says *Vanswieten*, an Instance, in which repeated Venesection could not stop the Hæmorrhage arising from the drawing of a Tooth. It can therefore be of no Use when a large Artery is divided, since it cannot prevent the Efflux of the Blood from so small an Artery; nor can any Good be expected from other Revellents, which act by any Friction or Irritation of the Parts distant from the Wound, since they are rather injurious, because they increase the Motion first in the Part, and then in the whole Body.

But where there is a large Quantity of Blood, and when that Quantity is not sufficiently diminish'd by the Hæmorrhage, Venesection may be beneficial, where the wounded Vessels are small; that the Quantity and *Impetus* of the Blood being diminish'd, the wounded Vessels, when not too much distended, may contract themselves.

As for Aliments and Drink; when an Hæmorrhage is stop't by the Remedies specified in the preceding Aphorism, we ought always carefully to avoid such Aliments and Drinks which can suddenly too much increase the Quantity and *Impetus* of the Blood till the wounded Vessel is sufficiently consolidated: And in this Respect a proper Regimen with regard to Diet, is of great Importance. But it is sufficiently obvious, that nothing can be expected from it, in order to stop the Hæmorrhage; for an excessive Loss of Blood requires a present Remedy: And

tho' it should be granted, that Meat and Drink could contribute any thing to this Effect, yet too great a Time is requir'd, before the Chyle, produc'd from the Aliments, can come to the Wound. The same holds true with respect to Medicines taken internally, which are, by some, falsely said to be efficacious in stopping Hæmorrhages: For it appears, from what has been said, that the strongest Astringents cannot so stop a dangerous Hæmorrhage, that they may be safely trusted to, even tho' applied in large Quantities to the divided Vessel. Nothing is, therefore, to be expected from them whilst, being taken internally, mix'd with the Blood, and chang'd by the Force of the Body, they are, by the Action of the Circulation, convey'd, in a small Quantity, to the wounded Part: For, in this Case, they will pass thro' the open Orifice of the Wound, along with the Blood. Besides, all the Remedies capable of stopping an Hæmorrhage, produce their Effect by constricting the Vessel, or by coagulating the Blood, or by doing both these at once. If, therefore, these Remedies, when mix'd with the Blood, and flowing thro' the Wound, had such a Quality, they would prove mortal, by constricting the minute Vessels of the Lungs, or coagulating the Blood, and so hindering its Passage thro' the Lungs, before they could come to the wounded Part. When small divided Arteries, by their proper Contractility, and a Diminution of the *Impetus* of the Blood, in consequence of the Loss of it, are spontaneously closed, as is already observ'd, then the stopping of the Hæmorrhage, which is owing to quite different Causes, is ascrib'd to the Use of such Remedies, many of which are greatly extol'd, and may be safely exhibited, since they neither do Harm, nor Good. No prudent Surgeon will, however, confide in them, and, neglecting more efficacious Remedies, expose his Patient to the greatest Danger.

As for a Discharge of Ichor; it sometimes happens that Wounds, even of a slight kind, are accompanied with a terrible copious Discharge of thin Lymph, the large arterial lymphatic Vessels being probably wounded; since it is hardly to be supposed that the venous lymphatic Vessels, being divided, could discharge so large a Quantity of Lymph; because the sanguiferous Veins, when wounded, unless they are very large, discharge but a very small Quantity of Blood, unless a Ligature, or some other Obstacle, is plac'd between the Heart and the Wound. But we ought carefully to distinguish that Flux of Ichor which arises from Wounds of the lymphatic Vessels, from that which succeeds Punctures of Nerves and Tendons, or violent Inflammations: For, as we have already observ'd, far other Remedies are requisite in the latter, from those proper in the former Case. Here we only treat of that Flux of Ichor which arises from Wounds of the Vessels; in which Case, the Remedies proper for stopping Hæmorrhages, may be beneficial. We have already observ'd, that an artificial Compression of the Vessel was the safest, and most efficacious Method of stopping Hæmorrhages, even of the most violent kind. It is, also, certain from Experience, that the same Method may remove a Flux of Ichor: Of this we have a memorable Instance in *Ruyfch. Observ. Anatom. Chirurg. Centur. Obs. 41*. But when a Flux of Ichor succeeds the Puncture of a Nerve, such a Compression would soon make the inflam'd Parts pass into a Gangrene. Excellent Effects are, also, produc'd by the native Balsams, especially of the thicker kind, which, by their oleous Lentor, are capable of closing up the Wound of such a Vessel, and are observ'd to be friendly and salutary to the wounded Parts, tho' they are only used in Punctures of the Nerves and Tendons: And when these are applied pretty warm to the Wound, as they generally are, perhaps the tender Vessels, by the greater Heat, contract and close themselves.

PAIN CONSIDER'D AS A SYMPTOM OF WOUNDS.

If any nervous Fibre, arising from the Brain, is so extended as to threaten its Dissolution, the Idea of Pain is produc'd.

Pain is a Perception, in the Mind, of something which produces Uneasiness, and to which we have naturally such an Aversion, that, with our utmost Efforts, and even without the Concurrence of our Will, we mechanically attempt the Removal of that which we believe to be the Cause of the ungrateful Perception: For a sound Person has a Power which he can by no means remove from himself, of perceiving certain Ideas, on account of a Change induc'd on some Nerves. If an ignited Iron is apply'd to any Part of the Body of a Philosopher, wrapt up in the most profound and abstruse Meditations, the Train of his Thoughts is immediately chang'd, and that ungrateful Perception, call'd Pain, forthwith excited in his Mind. But it is impossible, by Words, to explain what that Perception in the Mind is, since it is only known to him who endures the Pain; for there is not form'd in the Mind a Representation of any Object different from the Thought of the Pain, but there is a perceiving Power present: For no one, when in Pain, imagines that

there

there is without himself any external Object similar to that Pain which he feels; but all affirm, that they themselves are in Pain.

The Idea of Pain, properly speaking, leaves in the Mind no Remembrance of itself; for the Person who is in Pain, and is next Moment freed from it, is sensible, indeed, that the Cause of Pain was present; but he has no longer an Idea of Pain, nor can he, by any means, excite it in his Mind, without the Presence of a fresh Cause of Pain, which, first changing his Body, may induce a proportionable Change on the Ideas of his Mind.

But what that Change of the Body is, and in what Parts it happens, from which the Idea of Pain arises in the Mind, we may know from Experiments: For it is demonstrable, that only the Nerves arising from the Brain are capable of being so affected, as to excite the Idea of Pain in the Mind: For if a Nerve, which is alone distributed to any Part of the Body, is destroy'd, such a Part may be cut, or burnt, without exciting the Idea of Pain in the Mind, tho' all the other Parts remain sound: But all the Nerves in the Body arise either from the *Medulla Oblongata*, which contains the medullary Substance of the *Cerebrum* and *Cerebellum*; or from the spinal Marrow, which is a Continuation of the *Medulla Oblongata*, and, besides, contains a medullary Substance, arising from its own cortical Part: Yet that Affections of those Nerves only, which arise from the medullary Substance of the *Cerebrum*, are capable of exciting the Ideas of Pain in the Mind, is obvious from this, that in all those Disorders in which the Action of the *Cerebrum*, by means of the Nerves, is remov'd, no Pain is felt. Persons excessively drunk, or perfectly apoplectic, in consequence of the Humours extravasated in the Brain, have no Sense of Pain, tho' live Fire is apply'd to the Parts of the Body; the same, also, frequently happens to Patients under excessive epileptic Fits: Hence it appears, that a Change of those Nerves alone which arise from the Brain, is capable of exciting the Idea of Pain in the Mind: But this Change of the Nerves arising from the Brain, which is capable of exciting the Idea of Pain, seems to be such a Dissolution of them as if long continu'd, or render'd very intense, would produce a Solution of Continuity in these Nerves: For if the healthiest Person, who has no Pain in any Part of his Body, and has no Fault either in his Solids or Fluids, is prick'd under the Nail of the Finger or Toe, with the smallest Pin, an excessive Pain, capable of rendering the Patient convulsive, immediately arises, only from such a mechanical Change of the nervous *Papilla*: Nor is it of any Importance what the Cause is, or how it acts; for, provided it so disposes such a nervous Fibre arising from the Brain, that it is very near to a Rupture, without breaking (for when the Nerve is destroy'd, the Pain ceases), that ungrateful Perception call'd Pain will be excited in the Mind.

But that the chang'd Condition of the Nerve may produce the Idea of Pain in the Mind, it is requisite the Action of this Nerve on the Brain, and of the Brain on it, should remain free and uninterrupted by any Obstacle: For if the Nerve, in its Course, is ty'd, tho' its Extremity should be distracted, lacerated, or cut, the Sense of Pain will not be excited in the Mind. The same will happen, if, whilst the Nerve remains free in all its Course, the Functions of the Brain are injur'd: Hence it is obvious, that, by this Change of the Nerve, something is chang'd in the Brain; and that, from this Change in the Brain, the Idea of Pain arises in the Mind. It therefore seems highly probable, that the Idea of Pain may sometimes arise in the Mind, tho' no Change happens in the Nerves; that is, when the Brain, from any other Cause, receives such a Change as it would have receiv'd, if a nervous Fibre, in any Part of the Body, had been so dispos'd, as to be in Danger of a Dissolution. This is confirm'd by practical Observations; for it frequently happens, that those who, by the Calamities of War, or other Misfortunes, lose their Legs, complain of a Pain in the Toes of the Leg they have lost: And in some it has been observ'd, that a Sense of such a Pain was the Sign of imminent Convulsions; the Brain, which is the Origin of all the Nerves, being chang'd. Nor does this happen only soon after the Amputation, but a long time after. See *Miscellan. Curios. Decur. 1. An. 2. and Hildan. Obs. Chirurg. Cent. 3. Obs. 15.* Whilst, therefore, in some Persons, the Brain, which is subservient to Sensation and Motion, and from which all the Nerves arise, is more easily affected than in others, the former will be obnoxious to many Disorders and Pains, which they ascribe to external Causes, but which really derive their Origin from the too easy Mobility of the common Sensory.

Hence, when Sydenham, as he tells us, in *Dissert. Epistolar.* perceiv'd that Venesection, Purging, and some other Measures, were of no Use in those surprising Disorders which proceed from a disturb'd Motion of the Spirits, he concluded, "That as the exterior Portion of a Man's Body consisted of Parts obnoxious to the Senses; so, without doubt, his interior Frame is to be consider'd as consisting of a due Series, and, as it were, Fabric of Spirits." But this interior Frame, being intimately

"join'd, and, as it were, united with the Constitution of the Body, is more easily or difficultly chang'd from its proper State, according to the greater or less Strength of the constituent Principles we receive from Nature." Hence, in such Disorders, when Pains, in various Parts of the Body, resembled the most different Distempers, he justly accus'd the Irregularity, and inordinate Motion, of the animal Spirits alone, and apply'd the Whole of his Care and Skill only to sooth and regulate them; by which means, he knew, from Experience, all the Pains, and Variety of Symptoms, which in this Disease imitated the most different Distempers, were mitigated. This is sufficiently confirm'd by this, that, in delicate Constitutions, Perturbations of Mind alone are able to produce a Train of terrible Symptoms, tho', immediately before, no manner of Change was discover'd in the Solids and Fluids.

If, therefore, we should suppose that all the perceiving Points in the Body remain, and that all the not-perceiving Points were abolish'd, we should have an Idea of that interior Frame mention'd by Sydenham; but, by this means, a great many Parts of the Body would be taken away. The whole Heart, so much agitated and inflam'd in the most acute Distempers, is not itself sensible of Pain, but an uneasy Sense of Anxiety arises; the whole Lungs are often consum'd by a purulent *Tubercle*, without any Pain: The same, also, happens to the Kidneys, tho', at the same time, the *Pelvis*, and interior Membrane of the Ureters, when indispos'd, are subject to intense Pains. The whole Liver is sometimes consum'd by an Abscess, without any Pain; but if the exterior Membrane of the Liver is affected, an intense Pain is present.

The Idea, therefore, of Pain, in the Mind, follows such a Disposition of a nervous Fibre in the Body, as endangers its Dissolution; tho', at the same time, it seems highly probable, that the Idea of Pain may be excited, tho' no Change happens to the Nerves, but only to the Brain, from which these Nerves derive their Origin. Nor does this appear only in those Nerves which, as it were, guard the Body, and, being dispers'd every-where, warn the Person to remove or avoid every thing, which, being about to act, or at present acting, would destroy the Part: But we, also, observe, that the same infallibly happens in other Nerves, from a Change of which, the most distinct Ideas arise in the Mind, and such as are equally lively with any others, tho' no external Object has acted on the Organs of Sense; but a Change is only induc'd in the common Sensory by Diseases. Thus phrenetic Patients see strange Objects, and frequently hear terrible Noises, tho' there is no external Object to excite these Ideas, by inducing a Change of the Nerves. The same happens in melancholic *Deliriums*, and maniacal Ravings.

The Pain is the more intense, the nearer the Fibre is to a Rupture; and the gentler, the nearer it is to its natural Tension.

Since, from the Definition of Pain, it is obvious, that Pain is perceiv'd when a nervous Fibre is so dispos'd as to be in Danger of a Dissolution; it naturally follows, that the Pain is the more intense, the more the Cause, exciting it, distracts the Fibres; provided the Cohesion, as yet, remains: For when the Cohesion is destroy'd, the Pain ceases; and, on the contrary, the less the Distraction of the Nerve is, the less will the Sense of Pain be. This is obvious, in the Racks us'd by Judges, in order to extort from Malefactors a Confession of their Crimes: For, hanging the Person up by the Hands, they apply to his Feet Weights, which are gradually increas'd: Hence, by the greater Distraction of the Parts, the Pain is gradually increas'd, to the greatest Degree; but as soon as these Weights are remov'd, the Pain is diminish'd. Many Nerves, in the human Body, are so lax, that they bear Extension without any Pain; but when the Nerves, dispers'd thro' the *Periosteum*, are stretch'd upon the Bones, the smallest Increase of Tension produces the most intolerable Pain: Hence arise those excessive Pains, whilst, in a *Lues Venerea*, bony Tumors distend and dilacerate the incumbent *Periosteum*. Hence arises the Severity of that sort of Torment us'd by Executioners, when, by a Screw, they force the *Periosteum* on the Spine of the *Tibia*, to the hard Bone, gradually augmenting the Pressure. For the same Reason, the most intense Pains happen in the smallest Nerves: For the largest Nerves have but a small Part of their Bulk which may be call'd truly nervous. Hence it may easily happen, that such large Nerves may be distended without a Distraction in their nervous Fibrils, but only in the callous Coats covering those Fibrils. But when a Nerve is small and tense, and especially when it is destitute of such Coats, an intense Pain is produc'd in it by the slightest Cause. This is obvious in the Tooth-ach, when the adamantine Crust of the Tooth, being corroded, and the minute Nerves dispers'd thro' the internal Substance of the Tooth, destitute of their Coats, are, by the Action of the Air, seiz'd with intolerable Pain, which cannot be allay'd till the affected Nerve is destroy'd, by

an increas'd Distraction, the Application of proper Remedies, of the Drawing of the Tooth.

Hence it is obvious, that the greatest Degree of Pain, in the same Part, is but short; but a less Degree may continue long, and be increas'd, or remit.

Since Pain supposes such a Condition of a Nerve as endangers its Rupture, that is, a Solution of its Continuity; and since the Pain is the more intense, the nearer the nervous Fibre is to a Rupture; it is obvious, that the greatest Pain is then present, when the nervous Fibre is breaking; but when it is broken, all the Pain ceases, which before arose from the too great Distraction of this Fibre. The greatest Pain, therefore, denoting that the nervous Fibre will soon break, will be short; because, when the Fibre is broken, it ceases. Thus, when a Wound is inflicted with a sharp Razor, a short and momentaneous Pain is only produc'd; and, in the Gout, the Violence of the Paroxysm is observ'd to end the sooner, the more intense the Pain is; when a Tooth becoming carious, the Nerves dispers'd thro' its Substance are divested of their Coats, sometimes, by Suction, such Nerves are distracted, and such an intense Pain is produc'd, that the most robust Man cannot bear it, even for a few Moments: But when the nervous Fibrils are broken, the Pain soon ceases. The Drawing of a Tooth is attended with great Pain, which immediately ceases, after the Operation is over: The highest Pain will therefore soon destroy the affected Nerve, or so affect the Brain, as that all Perception of Pain ceases: On which Occasion, a Syncope, or an Abolition of all vital Motion, generally happens. Nor can the most racking Pains proceed any farther; for Persons in such a Condition, like a Carcase, feel no more. Thus it is certain, from many Experiments, that Malefactors, condemn'd to the Rack, become immediately, as it were, dead; and are no longer sensible of the most exquisite Torments.

It seems to be repugnant with this Circumstance, that violent Tooth-achs torment People for several Days, or even Weeks: But the Reason of this is, that the small Nerve which enters the Tooth, and is divided into minute Fibrils, is distributed thro' all its Points: Hence tho', by the greatest Pain, one such Fibril is destroy'd, the Misfortune proceeding to the others may long protract the excessive Torments.

But as a milder Pain supposes a smaller Tension of the affected Nerve, and consequently less Danger of a Rupture, it is sufficiently obvious, that such a Pain may be long protracted: And as between the natural Tension of a Nerve, and the greatest Distraction, next to a Rupture, numberless intermediate Degrees may be conceiv'd, it appears, that such Pains may continue long without the Destruction of the affected Nerve, and be increas'd or diminish'd according to the greater or less Degree of Distraction. But these Pains, which happen in Parts of the Body pretty near the Heart, and are accompanied with a violent Fever, soon cease; the affected Part being destroy'd: But in Parts remote from the Heart, and free from a great Agitation of the Humours, long-continu'd, and often returning Pains, may happen; without a sudden Destruction of the affected Parts. A violent and inflammatory Iliac Passion often takes off the strongest Man, in a few Hours: But the Gout, by repeated Paroxysms, often racks the Patient for twenty Years, before it destroys the affected Nerves; in which Case, the Pain in the Extremities is diminish'd, or ceases: But the Matter which before prey'd upon the Limbs, is convey'd to the internal Parts, and produces the most terrible Misfortunes.

The Cause, therefore, of Pain, is every thing capable of producing such an Extension or Disposition of a Nerve.

Under the general Name of the Cause of Pain is comprehended every thing which so distracts or disposes a Nerve, before not affected with Pain, as that it is in Danger of a Rupture: Nor is it of any Importance, whether this is done by Pressure, Distraction, or Corrosion; since the Effect will always be the same; that is, the Idea of Pain will be excited in the Mind. With respect to Intensity, or Duration, there may be a Difference between the Pains excited by different Causes, but in other respects the Effect will be the same.

Hence it is obvious, that a great Variety of Causes may excite Pain in the healthiest Body: But that the latent Cause of Pain may be regularly trac'd by the Physician, and, when known, remov'd, we ought to reduce the hitherto-known Causes of Pain to certain Classes; which is done in the next Aphorism.

To this, then, belong,

First, The Force of natural Contraction sustain'd by fewer Fibres, whilst some are divided.

Secondly, Whatever, by over-filling a Vessel form'd of a Contexture of nervous Fibres, distends it. To this belong an

Obstruction, a Plethora, a redundant Cacochymy, and an Increase of the circulatory Motion.

Thirdly, Whatever distracts the nervous Fibres; as Luxations, Tumors, and external Force. And,

Fourthly, Whatever wounds, or corrodes.

1. This is already treated of, when, speaking of the worst Species of *Paronychia*, in which this happens, when the Tendon of the Flexors of the Finger being affected, an intense Pain is produc'd: For the Bone of the last Phalanx of the Finger often falls off, after the Patient has suffer'd the most racking Pain: But before the Bone can fall off, the Tendon affix'd to it must be separated from it, which is not done all at once, but by a slow Distraction; for no Parts of the Body, so small as the Fingers, have so strong Muscles affix'd to them: And, in this Disorder, those Muscles being contracted, the Fingers always appear bended. When, therefore, the Tendon begins to be separated from this small Bone, the remaining Fibres sustain the whole Force of the contracted Muscles, and are, by a slow, but continual Laceration, torn from the Bone to which they adhere: Hence an intense Pain often so disturbs the whole Brain, that an acute *Phrenitis*, Convulsions, and often Death, succeed. No Degree of Patience is able to support those Torments, by which the Parts are gradually torn from the live Bones. A singular Instance of this we have in the Conduct of *Philotas*, mention'd by *Quintus Curtius*, in *Lib. 6. Cap. 11*:

2. It is shewn, under the Article *FIBRA*, that the large Vessels consist of Membranes which contain Vessels of all Kinds, even the least in the Body, such as the Nerves: Every thing, therefore, which distends the Sides of the large Vessels, will, by a Parity of Reason, distract the Nerves dispers'd thro' them: But from such a Distraction, as is before observ'd, arises the Idea of Pain in the Mind. It may be doubted, whether all the Vessels in the Body have in their Membranes perceiving Nerves; since, as we have already observ'd, many of the *Viscera*, which are, from Anatomy, known to consist of a Congeries of Vessels, are, however, often gradually consum'd and destroy'd, almost without Pain. Hence this will only be true so far as the Membranes, constituting the Vessels, have Nerves arising from the Brain, and subservient to Sensation, distributed thro' their Substance: But that this happens in many Vessels, is obvious; because no Point in the Surface of the Body can be wounded by the Point of the smallest Pin, without a Discharge of the contain'd Humours from the wounded Vessels; and a Perception of Pain: The principal Causes which distend the Vessels furnish'd with nervous and perceiving Fibres, are these following:

Obstruction: This always supposes a Blocking-up of the Canal thro' which the Fluids ought to be convey'd by the vital Motion: Hence it necessarily follows, that the Fluids convey'd to the obstructed Place of the Vessel, and not able to make their Way thro' it, must dilate, attenuate, and at last resolve or open the Sides of the Vessel, as is shewn under the Article *OBSTRUCTION*. It is therefore obvious, that the nervous Fibres constituting the Sides of the obstructed Vessels, becoming highly tense, and at last breaking, may excite the Idea of Pain, which will have various Degrees of Intensity, according to the different Degrees of Distraction: When, in a Pleurisy, the Arteries, obstructed by the stagnant Blood lodg'd in the intercostal Parts, are distended by the succeeding Blood, an intolerable Pain is produc'd, and is always the more intense, the greater the *Impetus* is with which the Blood acts on the obstructed Parts. Hence, when this *Impetus* is lessen'd by Venesection, the Pain either ceases, or is diminish'd. Hence Obstruction, properly speaking, is not the Cause of Pain; but the succeeding Blood, by dilating the obstructed Vessel, excites the Pain.

As for a Plethora; it is shewn, under the Article *PLETHORA*, that a Redundance of laudable Blood not only distends the Vessels, but may, also, produce a Rupture in them: Hence all the Degrees of Pain which can arise from a preternatural Tension, or a Rupture of the Vessels, are excited by this Cause alone. This is sufficiently evinc'd by violent Head-achs arising from Repletion alone, and which are happily cur'd by Venesection. Women, also, before their excessive Plenitude is remov'd by the menstrual Discharge, from this Cause perceive Pains in various Parts of their Bodies; which, however, are happily remov'd, when the redundant Blood is evacuated thro' the dilated Vessels of the Uterus.

As for a redundant Cacochymy; every Degeneracy of the Humours from the Conditions requisite for Health, is comprehended under this Name: Now too great a Distention of the Vessels may be produc'd by a Congestion of other Humours, as well as by a Redundance of laudable Blood: Hence, also, Pain will be excited, in consequence of the Distraction of those nervous Fibres which constitute the Membranes of the Vessels. Here we do not treat of that Acrimony which degenerating Fluids may acquire, and by which they may excite Pain, by corroding or irritating the Parts. When a stagnant aqueous *Colluvies*, congested

gested in the *Membrana Adiposa*, in an *Anasarca* of the Legs, the Pain arises from this Cause alone.

As for an Increase of the Circulation; it is shewn, under the Article SANGUIS, that an Increase of the Circulation alone, by an Augmentation of the Heat, produces a greater Rarefaction of the Fluids: Hence follows a greater Distention of the Vessels; and the thicker Parts of the Fluids, entering the dilated Vessels, produce Obstructions, Distractions, and Inflammations. But all these cannot happen without a Distraction and Dilaceration of the nervous Fibres dispers'd thro' the Membranes of the Vessels: Hence it is sufficiently obvious, that Pain is excited by that means. In Fevers, by an increas'd Motion of the Blood alone, a Pain of the Head and Limbs may be produc'd, which again ceases when the Fever is diminish'd, or remov'd.

Every thing which forcibly distracts the Parts of the Body, diminishes their Cohesion, and may, consequently, induce a Solution of Continuity, if this Distraction is continu'd, or augmented: But, according to the Definition of Pain, such a Condition of a Nerve as threatens the Solution of its Continuity, excites the Idea of Pain in the Mind: A Distraction, therefore, of the Parts furnish'd with nervous Fibres, by whatever Cause, will produce Pain. Hence when Bones, luxated from the Cavities which naturally contain'd them, distract the Ligaments securing the Articulation, an intense Pain is produc'd, which, upon the Reduction of the Bone, immediately ceases, unless the Ligaments distracted by the Luxation, or the adjacent compress'd Parts, are already inflam'd: A sufficient Proof, that the Pain, happening after a Luxation, arises only from this Distraction of the Ligaments. Hence *Hippocrates*, in *Tr. de Articulis*, Text. 29. tells us, that they who have the *Humerus* luxated and reduc'd without Pain, or any Inflammation of the adjacent Parts, and for that Reason are negligent, ought to take great care that the reduc'd Bone do not again slip out: For which Reason he orders Physicians to warn them of this; because, in such Cases, the Luxation returns far more easily than if the Parts were inflam'd.

Hence it is obvious, that the Effect will be the same if a Tumor, form'd by whatever Cause, distracts the Parts: For in an inflammatory Gout, and some other Disorders, such as a *Spina Ventosa*, or an *Exostosis*, a Distraction of the Nerves dispers'd thro' the Ligaments of the Joints produces exquisite Pain. How great Pain may be excited by external distracting Force, is obvious, from the Method of racking Malefactors; in which, by the Application of Weights, or the Use of Pulleys, the Parts of the Body are distended.

Every Wound, as is obvious, from its Definition, is the Solution of Continuity in a soft Part; but when the wounding Instrument divides Parts before united, that Condition of a Nerve is produc'd by which its Dissolution is threaten'd: Pain is therefore excited; but it is only momentary, if the Parts are divided by a quick Action of the Instrument; yet there is Pain at the Moment the Wound is inflicted: But the Pain which arises some time after the Wound is inflicted, depends on the Distraction of the Parts, in consequence of the Recession of the Lips of the Wound from each other. Hence this Pain succeeds the Wound inflicted, but does not arise from the Wound as its immediate Cause, but from the Change induc'd on the Wound from the Contractility of the Parts: For a Nerve, next to Rupture, produces the Idea of Pain in the Mind; but when the Nerve is totally divided, the Pain ceases. Hence, when a Wound is making, Pain is produc'd; but when it is made, it ceases.

All Corrosives, apply'd to the Body, and render'd active by the Heat thereof (since, except Fire alone, they hardly act upon a Carcase) divide and destroy the Parts, by numberless minute Wounds. Hence, as is evident, a pretty intense and long-continu'd Pain is produc'd.

Hence the various Causes of Pain in a Wound are known.

If the things hitherto taken notice of are apply'd to a Wound, it appears, that a great Number and Variety of Causes, exciting Pain in a Wound, may happen: For the wounding Instrument, at the time the Wound is inflicting, is the Cause of Pain. The Parts of the wounding Instrument, left in the Wound, may produce Pain: The Lips of the Wound, receding from each other, half-divided Nerves, and large Nerves divided, retracted, and distracting the small Ramifications above the Wound, may excite the most intense Pain. When the Lips of the Wound are afterwards inflam'd, render'd tumid, and retorted, and, at the same time, the Celerity of the Circulation is increas'd by a slight Fever, new Causes of Pain are present. When the Humours, discharg'd into the Cavity of the Wound, acquire an acrid Quality, they excite Pain, by corroding and irritating the Parts: The same Effect will, also, be produc'd, by the Application of acrid Substances, of whatever kind. When, by a Suppuration, the obstructed Extremities of the Vessels are gradually sepa-

rated from the live Parts, Pain is, in like manner, produc'd, but ceases when the Pus is form'd: All these Things are to be carefully distinguish'd, that, knowing the Causes of Pain in a Wound, we may apply proper Remedies.

Hence, also, we understand the Effects of a Wound; which are, Inquietude, Jactation, Watching, Fever, Heat, Thirst, Dryness, Convulsions, and Gangrene.

When Pain is present in the Body, its Effects succeed, which are principally observ'd to be these following:

Inquietude and Jactation: When we perceive Ideas, there arises in the Mind a certain Change, which is either grateful, or disagreeable, or, sometimes, rather totally void both of Pleasure and Pain: Thus, when a Person thinks that a Circle is divided into two equal Parts by its Diameter, the Idea affords neither Pleasure nor Pain; but if the Hand, when cold, is put near a moderate Fire, all say that this is pleasant; and if live Fire is apply'd to the Hand, all will affirm, that this is displeasing. In what manner this happens, perhaps, cannot be explain'd, tho' every one finds such Things in himself. But the Sense of Pleasure and Pain, which accompanies the perceiv'd Idea, produces some Effects in us which the strongest Efforts of Reason cannot overcome, whatever arrogant Philosophers have asserted to the contrary. For the Will endeavours by all means to retain the grateful Sensation present to the Mind, and to destroy the ungrateful one; and then succeed mechanical Motions not determin'd by the previously-conscious Mind, but truly necessary and physical, by which we endeavour to remove or avoid that which excited the ungrateful Perception in the Mind. This is a certain Ingredient in the human Nature, of which it cannot divest itself. If a Philosopher, involv'd in profound Meditations, receives a Prick of a Pin in his Finger, he will immediately draw back his Hand, tho' there is not in his Mind any Consciousness of that Motion excited: Hence the Sense of Pain, like a faithful Guardian, advises us, as it were, to remove that which would destroy the Body. Thus we see that Men in Pain, by a various Position of the Parts of their Bodies, and often by a continual Agitation, endeavour to find such a Situation as may remove, or at least diminish the Sense of Pain. Hence arises the Inquietude and Jactation in excessive Pains: But when, by the least Motion, the Pain is increased, the Patients remain immoveable, as is obvious, in the most racking Gouts, and Rheumatisms.

As for Watchings; when an healthy Person has all his Senses lock'd up by a natural Sleep, he is rous'd and awak'd by all those Things, which strongly affect the Organs of Sensation: Much more, therefore, will Sleep, when not present, be prevented by Pain, which so efficaciously affects the Brain. For this Reason, the antient Physicians, in lethargic Disorders, pull'd the Hairs from the Nostrils, lash'd the Limbs with Nettles, and apply'd acrid Substances to the Parts of the Body; that, being rous'd by the Sense of Pain, the excessive Drowsiness might be remov'd.

As for a Fever; this almost always succeeds excessive Pains, even in those Diseases which naturally have no Tendency to a Fever; such as a Gout, and *Lues Venerea*: For when such an intense Pain racks the Patient, some Degree of a Fever is generally present.

Hence *Hippocrates*, in many Passages, acknowledges Pain to be among the Causes of Fevers: For in *Prænot. Coac.* No 75. he tells us, "That from violent Pains arise long-continu'd Fevers." And in No 31. *ibid.* and in *Lib. 1. Proorrh.* he informs us, "That malignant Fevers arise from Pains of the *Hypochondria*." When the Articulation of the *Humerus* slips towards the posterior Parts, he tells us, that it is intensely painful, and excites the most violent Fevers. And in his *Tr. de Fracturis* he informs us, "That unless any luxated Articulation is speedily reduc'd, a Fever will, in the healthiest Person, be produc'd by the Pain."

Since, therefore, a Fever almost always succeeds an intense Pain, we may easily understand how Heat is the Effect of an increased Circulation by the Fever; and Dryness, the Effect of a Dissipation of the Fluids by a brisker Circulation, may arise from Pain: But when Dryness and preternatural Heat are present in the Body, Thirst always forces the Patient to alleviate these Symptoms by copious Drinking.

As for Convulsions; these principally happen in those, the Whole of whose nervous Systems is highly delicate, and susceptible of the smallest Impressions: Hence Infants are so often subject to Convulsions, on account of Gripes in the Intestines, arising from an Acid.

As for a Gangrene; this is such an Affection of a soft Part, as, in consequence of an Abolition of the vital Influx and Efflux of the Humours, tends to a Mortification. Hence, with respect to a Nerve in great Pain, a Gangrene is such a State of that Nerve, by which it tends to a Mortification, since it will

soon be totally ruptured in consequence of its violent Distraction. When a violent Pleurisy, accompanied with intense Pain, is not suddenly relieved, or when Respiration is by the Violence of the Pain so hindered, that the Patient is in Danger of being suffocated, livid Spots appearing on the Part affected, denote a mortal Gangrene. In an inflammatory Iliac Passion, after the most intense Pains, a Gangrene in a few Hours arises, upon which the Pain ceases, but Death soon succeeds. In a malignant Paronychia, within a few Hours, the Part is often affected with so intolerable Pain, that the corrupted soft Parts are dissolved into a gangrenous Gore, and the Bone of the affected Finger falls off mortified. But a Gangrene principally succeeds Pain, when an Inflammation and violent Fever are present at the same time; for then, by the increased Impetus of the Circulation, the Parts are quickly destroy'd.

In this Case the Difference of Anodynes is to be estimated and determined by the Diversity of the Causes producing Pain.

There is only one proximate Cause of Pain, and that is such a Disposition of a nervous Fibre arising from the Brain as threatens its Dissolution. Every thing, therefore, which removes such a Disposition of the nervous Fibre, will be a Remedy for the Pain: But because such a Condition of the Nerve may depend on a great many different Causes, hence a proportionable Variety of Anodynes is requisite, since distinct Remedies must be applied for removing each particular Cause. Hence it is necessary, that the particular Cause of the Pain should be known before we can determine what will weaken or remove this Cause. We have already enumerated the Causes of Pain, and reduced them to distinct Classes; and the following Aphorism proposes the Remedies suited to these Causes.

The Cause of Pain is, therefore, taken away,

1. By relaxing the distended Fibre.
2. By resolving whatever is concentered.
3. By diminishing the Motion of the Fluids, and lessening the distending Matter.
4. By removing the unequal and violent Traction.
5. By correcting the present Acrimony.
6. By dissolving it; and,
7. By removing that which dissolves the Fibres.

1. Such a Distraction alone as is ready to produce a Rupture, excites Pain: Now if we can by any Art manage things in such a manner as that the Fibre may be distracted without Danger of a Rupture, the Pain ceases, tho' the Cause distracting the nervous Fibre continues to act. If we attempt to break a Piece of dry and rigid Wood it breaks; but if it is macerated in Water, it may be bent. Thus a green fallow Twig may be twisted without breaking; but when dry, an Attempt to bend it, breaks it. Hence in Disorders, accompanied with the most intense Pain, such Remedies have in all Ages been used as relax'd the solid Parts of the Body. In the Iliac Passion, *Hippocrates* ordered the Body to be fomented and anointed with Oil. In a Pleurisy he commanded the affected Side to be covered with the most soft and tepid Substances, injoining at the same time, the internal Use of things of a like Nature. *Galen*, as is already observed, on himself allay'd the most intense Pain, and prevented the Convulsions to be dreaded from it, by continually applying warm Oil to the Part affected. Whilst a Phlegmon, by an inflammatory Tumor of the subjacent Membrana Adiposa, distends the Skin, and by a Distraction of the cutaneous Fibres produces Pain, tho' such a Tumor being entirely irremovable, tends to a Suppuration, and consequently the distending Cause not only remains, but is rather increased, yet if Cataplasms of the most emollient Substances are continually applied, the Pain will be mitigated, since the nervous Fibres are so relaxed, that they may be distracted, without Danger of a Rupture. A large Quantity of any soft expressed Oil taken internally, greatly alleviates iliac, colical, and nephritic Pains. The Steam of tepid Water affords great Relief to Parts affected with the greatest Pain. When by the Puncture of a Nerve immense Pains are produced, skilful Surgeons continually foment the Parts affected, with the most emollient Substances. Hence they affirm, that emollient and relaxing Medicines are an universal Remedy against Pains, because they remove the proximate Cause of Pain which is the Danger of Rupture in the nervous Fibre; whilst other Remedies act only on the remote Causes of the Pain. And tho' we should be ignorant of the particular Cause so disposing the nervous Fibres as to produce a Sense of Pain, yet these Medicines may always be used with Safety and Advantage; for they have this good Property, that they are sufficient for removing many of the remote Causes of Pain, without augmenting those which they cannot remove; for the Vessels being relaxed, the distending stagnant Fluid

passes more easily through them, and at the same time, all Acrimony is corrected by such Medicines. But every thing which augments the Strength and Contractility of the Parts of the Body, whilst the Cause distending the Fibres remains the same, will increase the Pain. Thus a Pleurisy is observed to be far more violent in robust Persons accustomed to Exercise, than in Patients of weak and lax Constitutions; in whom, also, luxated Bones are far more easily reduced than in Persons of firm Habits; for in some, the Elongation of the Ligaments is so easy, that the Reduction may be made without Pain. When Executioners, in racking Malefactors, forcibly distract all the Parts of the Body, they greatly increase the Pain by sprinkling cold Water upon them. When, therefore, the Efficacy of emollient and relaxing Substances can reach the Part affected, it will never fail to produce an Effect: If, for Instance, the nervous Fibril in the middle Substance of a Tooth is pain'd by too great a Tension, that Pain must necessarily be allay'd by relaxing Medicines. The same holds true, when from a Disorder of the Marrow of a Bone intolerable Pains arise; as, also, when in a malignant Paronychia, the Cause of the Disorder is lodged under the cartilaginous Part which covers the Tendons of the Flexor Muscles of the Fingers. It may, also, sometimes happen, that tho' the Pain is very intense, yet other Symptoms prohibit the Use of relaxing and emollient Medicines. Thus, for Instance, if from a latent or exulcerated Cancer, an intense Pain should arise, Emollients would prove hurtful, because they would greatly increase the Putrefaction, and fungous Excrescence of the Cancer. But almost in all other Cases, relaxing Medicines are universally used for alleviating Pains.

2. When a Stone impacted in the Ureters produces Pain, the Persons who could dissolve that calculous Concretion would remove the Pain. All those things which are capable of resolving Blood concentered by an inflammatory Density, will alleviate pleuritic Pains. The same holds true in all other Cases, where an obstructing Matter stuffing the Vessels, or Tumors arising from a Concretion of congested Matter, press or distend the adjacent Parts. Under the Article OBSTRUCTION, are considered the various Manners in which the Molecules of the human Fluids before separate, may become concentered; and under that Article are, also, specified the Remedies capable of dividing these Concretions. Hence the Nature of the Concretions ought to be investigated from what has been said, before we can find a Remedy, which, by resolving that Concretion, will remove the Pain arising from it.

3. All Pain supposes a remaining Principle of Life; and if it arises from a stagnant Humour distending the obstructed Vessels, it will be the more intense the more brisk the Circulation of the Blood is. Hence in a Pleurisy when a violent Fever is present, an intense Pain is produced, because the Humours are impetuously forced on the obstructed Part, and by dilating the Vessels, forcibly distract the nervous Fibres constituting the Texture of these Vessels. Every thing, therefore, which diminishes the Impetus and Velocity of the Circulation of the Humours, will alleviate the Pain, as is certain from daily Experience; for Venesection till the Patient falls into a Deliquium, forthwith either removes, or at least greatly abates, the most acute pleuritic Pains. Hence the ancient Physicians in the most violent Pains, recommended Venesection till a Deliquium was brought on. And *Galen*, in *Comment. 1. in Aphor.* tells us, that he removed a long and fixed Pain in that Part of himself where the Liver is joined to the Diaphragm, by opening the Artery between the Thumb and fore Finger of his Right Hand, and permitting the Blood to flow till it stopt spontaneously. For the same Reason, the Antients, as we find from *Cap. 23. of the last quoted Work*, recommended great Rest in the most acute Diseases, which are generally accompanied with an intense Pain of the Head. Nor in such Cases is Venesection only useful, because by weakening Life it diminishes the Motion of the Blood, but, also, because by means thereof the Quantity of the distending Humours is lessened. In plethoric Patients intense Head-achs are frequently present, tho' the excessive Motion of the Blood is checked, and almost suffocated by the Redundance of the Humours to be moved. But as soon as by a spontaneous Hæmorrhage from the Nose, or a liberal Venesection, the Redundance of the Blood is diminished, the Pain forthwith ceases, because the Matter which distends the too full Veins is removed.

But a Diminution of the Motion of the Blood is not only beneficial in those Cases, where an excessive Velocity of the Circulation, or too great a Distension of the Vessels produce Pain, or augment it when produc'd by any other Cause; but it is, also, highly beneficial in alleviating those Pains which arise from an acrimonious Quality of the Humours; for acrid Substances rendered active by the Circulation of the Blood and Heat of the Body, may produce bad Effects: But in a Carcase where there is no Motion,

Motion, except only the common Heat of the Atmosphere, they produce scarcely any Effect. Thus *Helmont* and *Petit* inform us, that Cantharides applied to a Carcase, produce no Effect. And in *Mem. de l'Acad. Royale des Sciences l'An. 1732.* we are told, that a potential Caustic applied to the Skin of a Carcase produced little or no Effect in fifteen Hours; but when the Part to which it was applied was cherished by warm Linen Cloths, it destroy'd the Skin, and a Part of the subjacent Fat. It is observable, that those Diseases in which the Pain arises from an Acrimony of the degenerating Humours, are always rendered worse by an Increase of the Circulation, or an Augmentation of the Heat, which succeeds that of the Circulation. The nocturnal Pains, which so severely afflict those labouring under a *Lues Venerea*, are by the Heat of the Bed so increased, that the miserable Patients are forced every Night to get out of Bed in order to cool their Bodies, and by that means alleviate their Pain. When an acute Fever seizes a Person labouring under a malignant Scurvy, the Pains are greatly increased, and sometimes the Vessels being suddenly burst by the augmented Impetus of the acrid Humours, the Blood is discharged every-where. Thus, in *Mem. de l'Acad. Royale des Sciences l'An. 1699.* we have an Instance of a malignant Scurvy greatly increased by the Heat of the Air. The same is evinced by many other Observations.

In what Manner, and by what Means the Motion of the Fluids thro' the Vessels may be diminished, is shewn under the Article SANGUIS; but the distending Matter can only be removed by Evacuants.

4. When by a Luxation the Bone slips out of the Cavity of its Articulation, it distracts the Ligaments, and presses upon the adjacent Parts. Hence arises Pain, which soon ceases, or at least is greatly diminished, as soon as the Bone is replaced; for some Degree of Pain often remains after the Reduction, in consequence of the Ligaments; for which Reason they are frequently inflamed. The same holds true, when the tendinous Parts half-torn, and continually elongated by an unequal Traction excite an intense Pain; for if, in that Case, by a proper Situation of the Part affected, and a due Application of Compress and Bandage, this unequal Traction is hindered, the Pain ceases. This is evinced by a memorable Case related in *Mem. de l'Acad. Royale des Sciences l'An. 1728.* But if the distracting Force cannot be removed, when, for Instance, the luxated Bone cannot be reduced on account of the Tumor, and violent Inflammation, then emollient and relaxing Substances are alone proper, since by their means the Fibres may be elongated without Danger of a Rupture.

5. When without a too great Motion of the Humours, any Signs of an excessive Distension of the Parts by a Concretion or Accumulation of the Fluids, or without any external distracting Force, a Pain arises, then we begin to think of the Acrimony of the Humours, which is often said to produce that Pain which arises from other Causes. For a great Degree of Acrimony is very rarely found in the Blood, since the tender Vessels of the Brain would soon be destroy'd if the acrid Humours passed through them. Hence acrid Humours are scarcely ever found, except in the *Primæ Viæ*, or when stagnant or extravasated Humours lodged in any Part of the Body become acrid, either from their own Nature, or a particular Caco-chymy, as in a *Lues Venerea*, and Scurvy. Hence such an Acrimony of the Humours in particular Parts is always bad. If it is, therefore, certain, that Acrimony is the Cause of the Pain, it is sufficiently obvious, that the Pain is removed or mitigated by correcting that Acrimony. But this is done either by a specific Medicine opposite to the known Acrimony; when, for Instance, an acrimonious Acid is enervated, and rendered mild by terrestrial Absorbents, or by alkaline Salts; or the same End is obtained by the general Remedies against Acrimony of all Kinds, such as diluent, obtunding, and inviscating Substances, by which all Acrimony is subdued and corrected.

6. When in a malignant *Lues Venerea* the Bones are affected, intolerable Pains arise from a slow Corrosion and Tumor of the affected Bones distending the highly sensible Periostium: But when in such Cases the Body is filled with a large Quantity of the Decoction of Guaiacum, and a Sweat excited by kindled Spirit of Wine, that Decoction is convey'd thro' all the Vessels, the latent Poison is deterged and carried out of the Body, and the Pain either greatly alleviated, or totally removed. The same will happen when there is a considerable Caco-chymy of the acrid scorbutic Kind; for Instance, in the Body of a wounded Person: For in that Case, the Humours convey'd to the Wound, soon acquiring a greater Degree of Acrimony, may excite Pain. This acrid and irritating Matter is washed away and corrected by highly soft and gently diaphoretic Medicines, such as all the vulnerary Decoctions exhibited in large Quantities.

7. So long as the Remains of the wounding Instrument,

the Fragments of the wounded Bone, or any other Substances, which can by their acute Figure and Rigidity injure the Parts, remain in the Wound so long, the Pain will continue, especially because the Parts perpetually irritated become inflamed and tumid. Hence the Parts pressed to this foreign Body left in the Wound are more lacerated, till it is extracted by surgical Instruments, or expelled by a due Suppuration. But in what Manner, and with what Cautions such Bodies should be removed from Wounds, has been already specified.

The Sense of Pain is taken away whilst the Cause remains;

First, by rendering the Nerves insensible by means of Compression, Cutting, or Burning: And,

Secondly, By obtunding the common Sensory by the Force of Narcotics; and by these some of the Effects arising from the Sense of Pain are taken away.

The most perfect Cure of Pain is the Removal of its Cause. But sometimes the Causes even of the greatest Pains are latent, and when they are known they cannot often be removed. But the ungrateful Sense of Pain requires an Alleviation, since by its Effects such as Restlessness, Watchings, and Fevers, the Body will be so changed that terrible Misfortunes may succeed. In this Case, the only remaining Method to be taken is to remove the Sense of Pain, tho' its Cause remains. But the Sense of Pain is produced when there is a free Commerce between the Brain and the affected Nerve, and when the Functions of the Brain remain entire: All things, therefore, which destroy the Sense without removing the Cause of Pain, act either on the affected Nerve, or on the Brain itself.

1. It is certain from Experience, that when a Nerve which alone runs to any Part of the Body is destroyed, all Sense of Pain in that Part is abolished, as has already been observed; for the Change produced in the Extremity of the Nerve, so affecting the common Sensory, that an Idea of Pain arises in the Mind, is by the Soundness of the affected Nerve convey'd to the Brain. Every thing, therefore, which destroys the Soundness of the Nerve between the Brain and that Part of the Body to which the Cause exciting Pain is applied, will remove all Sense of Pain, tho' the Cause of that Pain not only remains, but, also, continues to act with the greatest Violence. They who in consequence of a Luxation of the Spine of the Back, have the spinal Marrow compress'd, feel no Pain from the Application of live Fire to their Legs. Nor is it of any Importance, whether by a violent Compression the Commerce is hindered between the Brain and the compressed Part of the Nerve, or whether by Cutting or Burning, the Continuity of the Nerve is destroy'd. When in the Amputation of Limbs the Vessels are by a tight Ligature compressed, in order to stop the Hæmorrhage, there arises at the same time such a Stupor and Insensibility of the Parts from a Compression of the Nerves, as greatly diminishes the Pain of the Operation. A certain Empiric of *Amsterdam* cured the Tooth-ach by twisting the Patient's Hairs about his Fingers, and then by a strong Pressure of his Thumb below the Lobe of the Ear, confusing the Nerve lodged there, which distributes Ramifications to the superior Jaw. The same Effect was produced by compressing the Nerve which on both Sides enters the inferior Jaw, under the first *Dens Molaris*. The most violent Tooth-ach is allayed by all those things which destroy the pain'd Nerve in the Tooth. Hence, if by a Corrosion of the Tooth, free Access may be had to the Nerve, they burn it with an Iron Probe red-hot, which affords present Relief, provided the Heat of the ignited Iron reaches the pain'd Nerve. This Method was commended by *Hippocrates*, who in *Traët. de Affectionibus*, tells us, "That in a Tooth-ach, if the Tooth is corroded and loose, it is to be drawn; but if it is neither corroded nor loose, it is to be burned." Others with a similar Effect, put highly acrid distilled Oils, such as those of Cloves, and Origanum, into the hollow Tooth, which by their hot Quality immediately destroy the Nerve they touch. In many other Pains which obstinately resisted the Efficacy of other Medicines, *Hippocrates* used live Fire, or Scarifications, by both which means he removed the Sense of Pain, by destroying the Nerves. Thus, in *Traët. de Affectionibus*, after recommending many Remedies against Head-achs, he adds, "But if the Disorder of the Head is so violent and long-continued, that it cannot be removed by purging the Head, the Patient's Head must either be scarified, or the Veins in its Circumference must be burned, since there is no Hope of Relief from any other Remedy." And in his *Tr. de Locis in Homine*, he tells us, "That in Head-achs we are to use Venesection; but if the Pain does not cease, but continues for a considerable time, we are to burn the Veins in the Head, by which means

" means the Patient will recover." In several other Passages he gives the same Directions with respect to the Cure of an Head-ach. In *Tr. de Affectionibus*, in a violent ischiadic Pain, he orders "the Part affected, where-ever it is, to be softened by Baths, Fomentations and Liniments, the Body to be rendered soluble, and a Purge to be exhibited after the Pain is alleviated; after which the Patient is to drink Asses Milk. But if the Pain seizes one Part, fixes in it, and cannot be removed by Medicines, it is to be burned whatever Part it is." In *Tr. de Internis Affectionibus*, when treating of the same Disorder, he tells us, that if after the Use of various Remedies, the Pain is not alleviated, the Part where-ever it is, is to have many deep Crufts burned upon it, in the bony Parts by Fungi, but in the fleshy Parts by ignited Iron. The same Directions are, also, given in *Aph.* 59. and 60. of *Seç.* 6. and in other Passages of his Works.

Hence, in *Asia*, the *Moxa* is greatly used for removing arthritic Pains, and even the Gout; whilst the Inhabitants take the old Leaves of a sort of Mugwort triturated, and freed from all their hard and fibrous Parts; and having thus reduced them to a soft kind of Down, they make them up into pyramidal Bodies, the Base of which they apply to the Part affected. Then kindling the Apex or Top of the Pyramid, the Fire gradually descends and burns the Part; this is so mild a Cure, that *Kempferus*, in *Amœnitat. Exotic.* tells us, he has an hundred times seen Children submit to it without shrieking, or testifying the least Sign of Pain. Hence, in *Asia*, the Use of the *Moxa* is so frequent, that every six Months, for the sake of Health, many submit to have some Parts of their Bodies burned by it; and even those who are confined to perpetual Imprisonment, are permitted to come abroad, in order to enjoy that Advantage.

But because in consequence of the Destruction of the Nerve, all the Functions depending on its Soundness, are abolished, so this Method of alleviating Pain is not used, except when the Pain is very intense, and the Medicines specified above have been used in vain, or when the Condition of the Part affected is such, that these Remedies cannot be so applied, as by their Efficacy to remove or correct the Cause of the Pain.

1. When the Cause of the Pain cannot be removed, or when it is of no Importance, or absolutely impossible to destroy the pained Nerve, without injuring the Soundness of which it cannot without great Loss or Danger be remov'd, then the only Method remaining is so to change the common Sensory, as to render it insensible of Pain; for that the Cause of the highest Pain may be in the Body, without any Sense of Pain, even tho' the Soundness of the Nerves remains, is obvious from apoplectic Patients, and Persons excessively drunk, who are entirely deprived of all Sensation. Now there are in Nature Medicines, which, for a certain time, remove the Sense of Pain in the Mind, tho' they by no means take away or correct the Causes of that Pain. These, from the Stupor they induce, are call'd *Narcotics*, which we have already treated of. The principal of these is Opium, which by a surprising Quality removes the Sense of Pain, whilst it remains in the Stomach; for a Grain or two of Opium, when swallowed, by its resinous Tenacity, which renders it difficult to be dissolved, remains long in the Stomach, and generally for eight Hours at least, allays the Sense of Pain; and which is surprising, a Pill of undissolved Opium is frequently vomited up next Morning. Hence it does not seem to act, because being dissolved and mixed with the Humours, it is, by the Laws of the Circulation, convey'd to the Brain; but because it remains applied to the internal Surface of the Stomach, and induces such a Change on the Nerves dispersed there, as is able to obtund the sensitive or perceiving Power of the Brain; for the great Influence of the Nerves dispersed through the Fabric of the Stomach, on the common Sensory, is sufficiently evinced from many Diseases in which the Functions of the Brain are greatly disturb'd, tho' the material Cause of all these Symptoms is only lodged in the Stomach. Corrupted Bile lodged in the Stomach, excites violent Head-achs, Vertigos, and Deliriums; but when that fordid Matter is carried off by Vomits, all these Symptoms cease. This is confirmed by many Poisons, which even when they remain in the Stomach, induce surprising Changes on the Body; but as soon as they are removed from it, all the Symptoms produced by it cease. This is confirmed by *Wepfer*, in *Cicut. Aquat. Hister. & Noxæ*, where he gives us the History of two Boys, and six Girls, who eat the *Cicuta Aquatica*.

It is, therefore, highly probable, that Opium lodged in the Stomach may, only by its touching the Nerves there, produce such a Change in the common Sensory, as that tho' the Cause of Pain, and the Soundness of the Nerves remain, yet the Idea of Pain is not excited in the Mind. And Heaven, whose Designs are always pregnant with Compassion to the wretched State of Mortals, seems to have granted us these Remedies, in order to allay for a time these intolerable Pains, whose Causes can-

not be removed, or at least weaken'd, except in a long time. Hence *Sydenham*, being convinced by many Experiments, concluded, that without Opiates, Medicine would be very imperfect; and adds, that the most celebrated Preparations of Opium neither increased its Virtues, nor corrected that Malignity, of which many falsely supposed it to be possessed. Certainly the prudent Exhibition of due Doses of Opium produces no bad Effects, even tho' continued for some Months. Hence the learned *Joannes Terentius Lynceus*, in his Notes on *Hernand. Rerum Mexican. Novæ Hispan. Thesaur.* justly affirmed, that as all the Inhabitants of the Eastern and Southern Parts of the World every Day used Opium, Thorn-apples, and Bang, with Safety, it was to be lamented, that such a Number of Mortals should, through Ignorance of this Remedy, be cut off by violent and racking Pains, who might be preserved, if induced by the universal Consent of Physicians, they used it more frequently. And though *Prosper Alpinus*, in *Med. Lib. 4. Cap. 1.* condemns Opium as poisonous, yet he is obliged to confess, that the *Egyptians*, who used it daily, perceived no Harm from it, though some of them gradually increasing the Dose, used three Drams of it each Day. But if such as were long habituated to it suddenly gave over the Use of it, they were seized with Syncopes, and other violent Symptoms, till they again used it, or drank large Quantities of the most generous *Aretian* Wine with Aromatics.

It is not to be denied, that the imprudent Use of Opium exhibited in large Doses, has produced Deliriums, Convulsions, and mortal Apoplexies. But many Medicines which are every Day safely exhibited in moderate Doses, prove injurious when used to Excess. A memorable Instance of this with respect to Opium, is found in *Hist. de l'Acad. des Sciences P. Ann. 1735.* But though that surprising Case proves, that a large Quantity of Opium exhibited to one not accustomed to it, may produce numberless terrible Symptoms, and Death; and even that by its poisonous Quality the Fluids of the human Body may be corrupted, yet it is certain from numberless Experiments, that it is a safe Medicine when prudently used; for in Diseases it is a matter of great Importance to alleviate Pain; and nothing prevents the Removal of the known Cause of the Pain by other Remedies, whilst by Narcotics the Sense of Pain is obtunded. But it is carefully to be remembered, that though there is then no Sense of Pain, yet the Cause of Pain continues to destroy the Body. For when in the most painful inflammatory Disorders, such as a Pleurisy for Instance, the Pain is soothed by Narcotics, a violent Inflammation proceeding to destroy the affected Vessels, produces a Gangrene, and the Patient awaking out of his Sleep often dies suddenly: Such fatal Events are then ascribed to the Remedies, whereas they are only owing to this, that the Physician hearing no more of the Patient's Complaints, falsely imagines, that the Disease is become milder, though it continues with equal, and sometimes, perhaps, with greater Violence, after the Exhibition of such Medicines; for when by a Suppression of all animal Motion a profound Sleep is induced, the vital Motions are augmented. But in inflammatory Disorders there is too great a Velocity of the Circulation. Hence in these the Use of Narcotics seems never to be safe, unless by Venesection, and other liberal Evacuations, the excessive Force of the Disease is previously broken. *Sydenham*, in *Febr. Contin. Ann. 1661.* carefully gives the same Caution, though from Experience he had learn'd the salutary Effects of Narcotics in many Diseases, and used them boldly. In what Manner, and with what Cautions, Narcotics are to be exhibited, has been already specified. The Remedies adapted to this and the preceding Aphorism are before enumerated, when treating of the Means of procuring Sleep.

By these Remedies are removed all the Effects produced by the Sense of Pain, such as Restlessness, Jactation, and especially Watching: But the other Effects depending on the Cause of Pain, so far as it endeavours to destroy the pained Nerves, continue, tho' the Sense of Pain is soothed.

CONVULSIONS CONSIDER'D AS A SYMPTOM OF WOUNDS.

A Convulsion is a violent, unavoidable, and alternately repeated Contraction of a Muscle.

Here we only treat of a Convulsion which arises from a Wound as its Cause; for a febrile Convulsion arises from quite different Causes, and consequently requires a different Cure.

Every Convulsion is an Affection of a Muscle; and when the Muscles act, their Tendons are stretched; and since this is done alternately, the Tendons are at one time stretched, and at another relaxed. Hence, when Physicians, in feeling the Pulse, perceive the Tendons, as it were, to leap, in consequence of a Convulsion of the Muscles of the Arm, they generally call that Symptom a *Subsultus* or *Leaping of the Tendons*. But as the Antients included the Tendons under the general Name

Name of *Nervus*; for the Ligaments and Tendons were by them call'd *νῆδες*, as well as the Nerves arising from the Brain and Spinal Marrow, as we find from *Galen, de Usu Part. Lib. 15. Cap. 1.* Hence *Celsus* calls that Disorder, which is at present commonly call'd *Convulsions*, a *Distension of the Nerves*.

In every Convulsion there is a Contraction of the Muscle, which if it was voluntary, would not constitute a Disorder. Hence it is added in the Definition, that it is an involuntary Contraction of a Muscle. Besides it is requisite this Contraction should be violent, otherwise there would be no Difference between a Convulsion and a Tremor, in which the Muscles are, without the Concurrence of the Will, alternately relaxed and contracted; but these Contractions are only weak, whereas in a Convulsion they are violent. It is, also, added in the Definition, that this Contraction is alternately repeated, that is, ceases for a short time, and then begins again.

But it is to be observed, that if the Cause, whatever it is, which produces the involuntary Contraction of the Muscle, continues to act without an alternate Intermission, then the Muscle remains constantly contracted so long as the Action of that Cause continues. That this Disorder is to be ranked among Convulsions, is sufficiently obvious, because the same occasional Causes at one time produce the alternate involuntary Contractions of the Muscles, and at another, their steady, though involuntary, Rigidity. This appears in epileptic Patients, in whom, during the Paroxysm, the alternate Convulsions are at one time present, and a little after they become rigid like Statues, almost all the Muscles of the Body being contracted, whilst soon after they again fall into the alternate Convulsions. What the ancient Greek Physicians call'd *σπασμοί*, is by the modern Physicians call'd Convulsions. A Tetanus was by them call'd, that Species of Disorder in which the Muscles, being involuntarily contracted, became rigid; which *Distemper Celsus*, in *Lib. 2. Cap. 1.* calls a *Rigor*; but gives the Name of *Distension of the Nerves*, to what they call'd *Spasmus*; for the Name of *Convulsion* in this Sense is only found among the modern Physicians; though in *Aræteus de Morb. Acut. Lib. 1. Cap. 6.* when treating of a Tetanus, and its Differences, the Word *ἐνσπασμὸς* occurs, which is properly enough translated *Convulsio* in the Version. But the Author seem to have used *Tetanus* and *Spasmus* promiscuously for the same Disorder, as is sufficiently obvious from the same Chapter. And *Galen, in Comment. in Sect. 4. Aphor. No. 57.* tells us, "That a Tetanus is a Convulsion, though the Parts seem not to be convulsed, because they are equally drawn forwards and backwards."

Hence we may conclude, that though at present the Word *Convulsion* is used, when an involuntary violent and alternately repeated Contraction of a Muscle is present, yet under its more general Signification, we may, also, include that involuntary and violent Contraction of a Muscle which remains without alternate Remissions, since these Words were formerly promiscuously used, and since the Disorders often arise from the same Causes, and seize the same Parts, that is, the Muscles. That Species of Convulsion in which the Muscles remain'd contracted, they divided into the *Tetanus*, in which the Patient was strait, but so rigid, that he could not be bended in any Direction; the *Emprosthotonus*, in which the Body being bended forward, remain'd stiff and inflexible in that Position; and the *Opisthotonus*, in which the Body was incurvated backwards in the like manner. Besides, a *Tetanus* may be either universal, when all the Muscles of the Body being thus affected become rigid in a Moment; or it may be partial, when, for Instance, by a spasmodic Contraction of the Muscles of the Jaw, the Mouth is obstinately closed.

The Cause of Convulsions is, whatever drives the nervous Fluid with alternate Force into the convulsed Muscles.

An human Creature has a surprising Faculty by which it can at Pleasure, by means of the Muscles subservient to the Will, excite a Motion, sustain and direct it, augment and diminish it, suppress it after it is excited, and again renew it after it is suppressed. And these so delicate Motions excited in the Body, and which by so great a mechanical Force change other Bodies, seem to be hardly corporeal with respect to their Principle, and are all performed without any Knowledge of the Cause, or Instruments requisite to this Purpose; for the most skillful Anatomist can perform these Motions no better than the most ignorant and illiterate Child. But what is most surprising is, that in exciting these Motions, no physical Change appears in the Body, except in the thing changed; and when by the Influence of the Will such an arbitrary Motion is suppressed, no Mark of so great a Change remains. And all these things may be done in an almost imperceptible Portion of Time; for whilst one wills to elevate his Arm, it is elevated. In order to this, as is obvious from Physiology, it is only requisite, that there should be a free Commerce between the Brain and Muscles, by means of the Nerves convey'd from the medullary Substance of the Brain to the Muscles subservient to the Will. Since, therefore, a Convulsion from its Definition is such an alternate Excitation of Motion, and a Suppression of it when excited; and since we can at Pleasure imitate such a Convulsion, as Beggars

feigning epileptic Fits do, it is obvious, that a Convulsion may be excited by every Cause, which without a Concurrence of the Will, by means of the Nerves, induces such a Change on the Muscles, as a sound Person could bring about by the Act of Volition: And as we are ignorant of the Manner in which, by the Will, we excite Motion, but only observe the Effect, so we may be equally ignorant of that last Change in the common Sensory, by which a Convulsion is produced. All that Art can do is, to observe those Changes of the Body which are succeeded by such an involuntary Contraction of the Muscles, and then to remove or correct these known Changes, though we by no means understand in what manner these Changes of the Body affect the common Sensory, or that Part of the Brain where the Mutability of Thought is produced by the Change of the Body, and the Mutability of the Body by the Change of Thought.

But because it is certain from medicinal Observations, that many things capable of exciting Convulsions may happen to the Body, and as we only here treat of Convulsions as they succeed a Wound as their principal Cause, so we are to inquire what things there may be in a Wound itself, by which Convulsions have been observed to be excited: And these are enumerated in the following Aphorism.

And, therefore, the Cause of Convulsions may be inherent in the Wound itself, whether it be foreign Matter irritating the Parts, or the Condition of the wounded Nerve, or a previous excessive Evacuation of Blood.

As for a foreign Matter irritating the Wound; if that tender pulposus Production of the medullary Substance of the Brain, which constitutes the Substance of a Nerve, properly so called, and which in the larger Nerves is fortified by so many Coats, that it may be safely convey'd to the destin'd Parts, is irritated by an acrid Substance, or by any other Body, which by its mechanical Figure or Hardness, is capable of injuring or destroying that soft Pulp, Convulsions may be produced by that means. Now there may be lodged in the Wound, Nerves and Tendons divided, or so stript of their Coverings, that acrid Substances may be easily convey'd to the internal Part of that pulposus Substance which is so easily irritated: Thus it is certain, that when naked Nerves are only touched by Fluids to which they are not naturally accustomed, violent Pains and Convulsions are produced. When by the Caries of a Tooth, the hard Crust covering the small Nerves dispersed through its Substance is corroded, the cold Air acting on these naked Nerves, a Particle of Sugar, or the softest Butter touching them, throw the Patient into Convulsions, on account of the intense Pain. The touching of a Tendon divested of its Coats, in a Moment renders the Patient rigid, by producing an universal Tetanus, as is already observed; whereas Tendons covered with their mucous, or pinguedinous Coats, may be protracted, elongated, or sewed together, without any great Pain. Since, therefore, in a Wound these highly sensible Parts are often rendered naked, a Part of the wounding Instrument, Fragments of the Bones, or other things of a like Nature left in the Wound, may, by irritating the Parts, produce the most violent Symptoms. The same will happen from the Humours discharged into the Cavity of the Wound, and acquiring an acrid Quality; as, also, from acrid Substances applied to the Wound.

As for the Condition of the wounded Nerve; it is already shewn, that Nerves and Tendons pricked, or half torn, produce Convulsions, and other violent Symptoms, which is evinced by many practical Observations.

As for a previous excessive Evacuation of Blood; when so great a Quantity of Humours is discharged from the Body, that the remaining Part, by the Force of the Heart convey'd thro' the Vessels, is not able to fill them equably, the Pressure on the Arteries of the Brain is wanting; hence the Motion of the Spirits through the Nerves of the Brain ceases; and hence arises a Palsy of all the Muscles, and from a similar State of the *Cerebellum a Deliquium*; so that all the nervous and arterial Fluids begin to stop. In the mean time the Parts being contracted by the greater Cold succeeding a Diminution of the Circulation, convey the venous Blood to the Heart, which, being fill'd, contracts itself, and with the greatest Velocity moves the Blood through the empty Arteries, since nothing resists it when thus impel'd. In this Case, therefore, the Blood is moved with a violent Impetus through the Vessels of the Brain. Hence the Motion of the Spirits into the Muscles becomes very quick, but ceases immediately, though it will return again when the Heart, which is gradually fill'd, contracts itself. In one Moment, then, the strongest Cause of Motion is apply'd to the Muscles, but next Moment ceases. Hence arises that alternate, violent, and involuntary Contraction of the Muscles, which we call *Convulsions*.

This is evinced by what daily happens in the killing of Animals; for when by a Division of the Carotid Arteries in Calves, Sheep, and Hogs, the Blood flows out with a full Stream, about the Death of the Animal the Flux of Blood begins to cease, and only return at certain Intervals for the Reasons now alleged; and then the Animal is always strongly convulsed till it dies. When by Abortion, or after Labour, Women lose large Quantities of Blood from the open Vessels of the Uterus, they are often seized with Convulsions, and frequently die suddenly.

iently. The same is, also, to be observed, when by an excessive Purging, too great a Quantity of Humours is carried out of the Body. Hence *Hippocrates*, in *Aphor. 3. Sect. 5.* tells us, "That after the Loss of much Blood, Convulsions, or an Hiccup, are bad Signs." In *Aphor. 39. Sect. 6.* he tells us, "That Convulsions proceed both from Repletion and Inanition." Thus, also, in *Aphor. 4. Sect. 5.* he affirms, "That Convulsions, and an Hiccup, succeed excessive Purging;" for Convulsions arising after excessive Evacuations denote, that there is so great an Evacuation of Fluids from the Body, that the empty Vessels collapse, and the Blood propel'd from the Heart, cannot propagate the Motion it has receiv'd, through the full Vessels, but rushes freely into the empty Vessels. Hence the due and equable Pressure on the Vessels of the Brain on which Life and Health depend, is wanting. Hence it is obvious, how great Danger accompanies Convulsions arising from excessive Inanition.

Hence, also, the Effect of a Convulsion, which is a Perturbation of all the Functions, is known.

The Effects of Convulsions are not only surprising, but almost numberless; for not only all the Solids and Fluids, but, also, the Actions depending upon them are disturbed; for when by this alternate and violent Contraction the Muscles are at one time rigid, and at another time flaccid, the Motion of the Blood through the Muscles is at one time hindered, whilst next Moment it freely passes through the flaccid Muscles with the greatest Impetus. The Veins adjacent to the convulsed Muscles are quickly emptied, in consequence of which, the Impetus of the venous Blood towards the Heart is accelerated. Hence the equable Reception of the Blood into the Heart, and its Expulsion from it, are greatly disturbed. Respiration is, also, surprisingly disturbed, since it becomes laborious, and cannot be performed without the greatest Uneasiness. Sometimes, also, a violent Suffocation happens, as *Aretaeus de Causis & Signis Morb. Acut. Lib. 1. Cap. 6.* has observed, when describing the Effects of a *Tetanus*. Nor is a less Disturbance observed in the animal Actions; for those enormous Motions of the Muscles are not determined by the Will, but happen in an involuntary manner, and often without the Knowledge of the Patient. Often, also, all the external and internal Senses are totally abolished, or surprisingly disordered; nor is it to be wondered at, since the Convulsions testify, that the Brain, on which Life and Health depend, is affected. In the natural Actions surprising Changes are, also, often observed, since when the Jaw-bones are frequently so constricted and closed, that they cannot be separated by a Wedge, Deglutition is impossible. Inflations of the Stomach and Intestines, often distend the Abdomen, so that it is ready to burst. Sometimes neither the Faeces nor Urine are discharged, whilst at other times, both are evacuated without the Knowledge of the Patient. In a word, every thing in the Body is so surprisingly chang'd by Convulsions, that nothing of the former Health remains, and the miserable Patients are hardly known by their intimate Acquaintances. All these Changes are accurately observed and described by *Aretaeus*, who in the Passage last quoted, concluded, that it was lawful to wish for the Death of such Patients, that their miserable Lives, and excessive Torments, might end together.

For if such Patients survive, violent Symptoms often remain, such as Distortions of the Limbs, Distractions of the Muscles, and a Destruction of the Functions of the Brain. Thus it is certain from Experience, that Palsies, Atrophies, and Folly, have remained incurable, during Life, after violent Convulsions.

Sometimes, also, Convulsions are succeeded by an Abolition of all the vital, animal, and natural Functions, which is Death. *Hippocrates*, in *Aphor. 2. Sect. 5.* tells us, "That Convulsions accompanying a Wound, prove mortal." *Aretaeus*, in the Passage last quoted, when treating of Convulsions, tells us, "That they generally happen on account of Wounds; when for Instance, Membranes or Muscles, or Nerves, are punctured, in which Case, the Patient generally dies; for Convulsions happening after a Wound are mortal."

Convulsions are cured, 1. By artificially removing whatever irritates the Parts. 2. By correcting or dissipating the Acrimony. 3. By removing the morbid Condition of the Nerve by proper Remedies. 4. By Repletion with some mild, friendly, liquid Aliment, often taken in small Quantities. And, 5. By stopping the Haemorrhage.

Though Authors abound with antispasmodic Remedies, yet every one must perceive, that as Convulsions arise from so different, and even often, opposite Causes, there can be no universal Remedy for them. But after investigating the Cause, we must determine the Remedy capable of removing, or weakening this known Cause. But as Convulsions after Wounds arise, either from some irritating Matter lodged in the Wound, or from a Puncture or partial Division of the Tendons, Membranes, and Nerves, or lastly, from an excessive Loss of Blood, so the whole Intention of Cure must be directed to these three Indications. Hence, in the first and second Numbers following, we shall treat of those means which remove or mi-

tigate the irritating Matter. In the third, we shall consider these Methods which remove the preternatural Condition of the affected Nerve or Tendon. And in the two last Numbers we shall specify those Remedies by which a Loss of Blood may be stop'd, and that Portion of it which is lost, restored.

1. *As for a Removal of irritating Substances*; if a Thorn is fix'd in any nervous Part, under the Nail, for Instance, in such a manner as to wound the nervous Papillae, after an intense Pain Convulsions frequently arise, which cannot be easily removed so long as the Thorn is lodged there. Hence we are as much as is possible, in the first Dressing, to enquire, whether such a Substance is lodged in the Wound. But how this is to be done, and with what Cautions such Substances are to be removed, we have already specified.

2. *As for correcting or dissipating the Acrimony*; Acrimony rarely arises in a Wound from the Humours convey'd to it, unless there is a great Cacoehymy in the Body before, or large Quantities of acrid Aliments have been eaten. This far more frequently happens from the imprudent Application of acrid Remedies, such as Arsenic, or other corrosive Medicines to the wounded nervous or tendinous Parts. But these Applications when known, are to be removed or weakened by Medicines, which by an opposite Virtue are able to correct the known Acrimony. In this respect nothing universal can be determined, but a Remedy suited to each particular Acrimony is to be applied. The softest Balsams are, however, beneficial, because they hinder the Parts from being corroded by the acrid Substances, and at the same time weaken them by sheathing them up in their mild Fat as has been already observed. The Medicines belonging to this Number are found under the Article ACIDA, and ALCALI.

3. *As for a Removal of the Condition of the Nerves by proper Remedies*; the Cause of Convulsions arising from a Wound, is frequently such an Injury done to a Nerve, as that being partially divided, its remaining entire Fibres are distracted. Hence arise excessive Pain, Convulsions, and the other Symptoms already enumerated. But all these arise from a slow and continual Distraction of the nervous Fibres, which is always accompanied with Pain, as is obvious from the Definition of it already given. Those Remedies, therefore, which remove the Pain, will, also, cure the Convulsions arising from it. But these Remedies act either on the Cause of the Pain, or render the Nerve incapable of Sensation, by destroying the Commerce between it and the Brain; or lastly, they so obtund the common Sensory, as that it cannot perceive that Change of the Nerve produced by the Cause exciting the Pain. But that all these things have been with Success used for the Cure of Convulsions, will be obvious from what follows.

For among the things recommended above for removing Pain, the most considerable and universally useful, are relaxing and emollient Substances, by the Application of which the nervous Fibres may be so disposed, as that they may be distended without Dread of a Rupture; and these have in all Ages been used for removing Convulsions: Thus for the Cure of a *Tetanus*, *Hippocrates*, in *Tr. de Morb.* recommends warm and fat Broths prepared of Fowls, together with tepid, moist and pinguious Fomentations, contained in Bladders and Bottles, and applied every-where, but especially to the Parts affected. He, also, orders the Patient to be liberally and frequently anointed with warm Oil. And in his *Tr. de internis Affection.* for the Cure of a *Tetanus* arising from a Wound, he orders Unctions with pinguious Substances before a Fire, Fomentations, Steams of hot Liquors, Sweats excited by pouring warm Water on the Patient, and the drinking of tepid Milk and Water, if the Patient can; if not, he orders it to be pour'd into his Nostrils. Besides, in *Aphor. 22. Sect. 5.* when mentioning the Use of warm Substances, he says, that they alleviate Pain, Rigors, Convulsions, and a *Tetanus*. And on the other hand, in *Aphor. 39.* of the same Section, he affirms, that Cold produces Convulsions, and a *Tetanus*; for Heat relaxes all Bodies, so that they may be distracted and bended without Danger of breaking; whereas Cold contracts and renders every thing brittle, as is obvious from daily Experience. The same Measures are recommended by *Celsus*, in *Lib. 4. Cap. 3.* who orders Patients thus affected, to bathe in warm Oil, or warm Water in which Fenugreek has been boiled, with an Addition of a third Part of Oil. *Galen*, when afflicted with a violent Distraction of the Ligaments, freed himself from approaching Convulsions by continually anointing with warm Oil, and perceived the Convulsions just coming upon him, as soon as the Use of the Oil was intermitted. *Aretaeus de Curat. Morb. Acut. Lib. 1. Cap. 6.* orders the like Measures to be taken for the Cure of a *Tetanus*. Hence it is obvious, that the antient Physicians unanimously recommended the most emollient Remedies which so effectually allay Pain, for the Cure of Convulsions.

It is, also, sufficiently obvious, that if a Nerve, the Wound of which disturbs the common Sensory, can, without the Danger of a greater Evil, be destroy'd by Compression, Division, or Caustics, there is no longer any Dread of Convulsions, because the Commerce between the Brain and the affected Nerve, is removed. This is evinced by practical Observations in the Cure

of a certain Species of Epilepsy, in which there is felt, in a particular Part of the Body, the great Toe, for Instance (a Case of which Kind, says *Van Sweiten*, I myself have seen) a certain Titillation, as if Ants crept through the Part (See *ALBADARA*). And this titillary Motion ascends through the Leg, Thigh, and Abdomen, to the Præcordia, upon which the Patient falls down convulsed all over his Body. If, when he first perceives the Disorder beginning in his great Toe, he speedily applies a tight Ligature below the Knee, he is freed from the Paroxysm. In similar Cases it is often beneficial to burn deep, by means of a Caustic, into the Part where this surprising Motion first begins, in order to destroy the small Nerve, the Disorder of which is capable of disturbing the whole Body in so surprising a manner. Something like this is found in *Celsus*, *Lib. 5. Cap. 26.* where he tells us, "That a Muscle when wounded, is to be divided, because when wounded it proves mortal; but when it is divided, the Disorder of the Part may be cured."

But those things, which by their narcotic Quality so obtund the common Sensory, as to remove the Sense of Pain, are often surprisingly efficacious in checking these convulsive Motions, as is often observed, especially in hysteric Convulsions; though among the Antients we do not find, that these Remedies were frequently used in such Cases. But *Hippocrates*, in *Lib. de intern. Affection.* for the Cure of a *Tetanus*, among other Remedies, orders the Head and Body to be anointed with a warm Infusion prepared of the Seeds of Henbane and Wine, with the Addition of an equal Quantity of Oil.

4. As for a Repletion with some mild, friendly, liquid Aliment; *Hippocrates*, in *Aphor. 22. Sect. 2.* in the Cure of Diseases, lays it down as a general Rule, "That the Diseases arising from Plenitude, are cured by Evacuation, and those proceeding from Inanition, by Repletion." When, therefore, in consequence of a Division of the Blood-vessels, there is a great Loss of Blood, so that the equable Pressure on the Vessels of the Brain is by that means disturbed, the Convulsions arising thence, have an excessive Inanition for their Cause, so that they will be cured by Repletion. The most celebrated Antispasmodics, such as Spirit of Hartshorn, and of Raw Silk, the Tincture and Oil of Amber, of Castor, and the finest distill'd aromatic Oils, which in other Cases are so efficacious in checking the inordinate Motion of the nervous System, are in this Case prejudicial by their Stimulus, by which, augmenting the Motion of the Blood, they expel that small Quantity of it which remains in the Body through the divided Vessels till the Patient dies. The whole Cure consists in distending with a new and laudable Liquid the Vessels collapsed, in consequence of too great an Inanition. But here there is a considerable Difficulty; for the Aliments by the concurring Action of the Viscera and Vessels, and by their Mixture with a large Quantity of laudable Humours pre-existing in the Body, are assimilated to our Natures, and acquire the Properties requisite in human Fluids, as is shewn under the Article *FIBRA*: But after a great Loss of Blood, this Quantity of laudable Humours is wanting, which in a State of Health absorbs that small Quantity of crude Juice convey'd through the Thoracic Duct into the Subclavian Vein. By the same Cause, also, the Action of all the Viscera and Vessels is weakened. Hence the two most efficacious Causes which change crude into concocted Juices are wanting, or at least, very languid. All, therefore, that can be done with Success, is to exhibit such Liquids as are most similar to the Humours in a sound State, such as contain nothing of a stimulating Acrimony, but may be easily borne by a weak Body, and subdued by the remaining languid Action of the Viscera and Vessels. All those things will, therefore, be beneficial which contain a Nourishment almost like that prepared in a sound and robust Body; but especially Broths prepared with Flesh, and in which the Juices before elaborated in the Body of the Animal are dissolved by the boiling Water. And such Broths are still better with the Addition of a small Quantity of Citron-juice, which hinders their easy Degeneracy to Putrefaction. For the same Reason a little Sorrel may be boiled in them, with the Addition of Rice, Barley, Oats, and other soft Grains. All these are to be exhibited frequently, but in small Quantities, lest the weak Body should be overpowered, and that there may gradually be such a Repletion as may sustain Life; and at the same time keep it so low, that the wounded Vessels may be consolidated, without any Dread, lest by a sudden Repletion of the Vessels, or an increased Circulation, those Parts should be again lacerated, which had begun to be united; for unless it was confirmed by unexceptionable Facts, it could hardly be believed, how small a Quantity of Blood is sufficient for the Support of Life. The Propriety of this Method is evinced by its happy Success in Women, who, by Abortions, have lost so much Blood as to be seized with Convulsions, and given over for irrecoverable. A memorable Instance of the surprising Efficacy of Broth, after a great Loss of Blood, may be seen in *Louise de Corde*.

5. As for stopping the Hemorrhage; We have already explained, how an Hemorrhage from a Wound may be stopt and shewn, that many Hemorrhages may be stopt by different Applications and Operations. But when the Hand has no Access to the wounded Vessels, as, for Instance, when the Vessels of

the internal Parts of the Body are wounded, then tight Ligatures applied to the Arms and Thighs, are highly beneficial, that thus the Veins being compressed, the easy Return of the Blood to the Heart from these Parts may be prevented. By this means the Hemorrhage is, at least for a time, stopt, and, perhaps, an Opportunity given to the wounded Vessels to contract themselves, and be consolidated. But after the Hemorrhage is stopt, these Ligatures are not to be removed all at once, but gradually slackened, lest the Hemorrhage should return. If the Patient enjoys great Ease both of Body and Mind, if Life is kept as low as possible, and the Patient not supported by Cordials, there is still some Hope of a Cure even in the most dangerous Cases.

A small Tumor, and Inflammation in a Wound, are good; but they prove hurtful if too much increased. Baths, and Fomentations, together with anodyne and antispasmodic Substances, applied to the wounded Parts, and to the Whole of the Patient, are beneficial; for which see *INFLAMMATIO*.

It is already observed, that on the second or third Day there appears in the Lips and Bottom of a considerable Wound, a greater Heat, Pain, Redness, and Tumor, and that all these Symptoms continually happen to a Wound inflicted even in the soundest Body. Such a slight Inflammation, therefore, which is almost always accompanied with a gentle Fever, is never bad; for the divided Extremities of the Vessels being contracted, resist the impel'd Fluids. Hence arises an Obstruction; and by the Force of Nature, accompany'd with a slight Fever, acting with a greater Impetus on the obstructed Extremities of the Vessels, a gentle Inflammation is produced, which is succeeded by a benign Suppuration separating the Extremities of the obstructed Vessels, together with their stagnant Fluids, and restoring a free Circulation of the Humours through the whole Surface of the Wound; by which means a Regeneration of the lost Substance, and an Union of the divided Parts are brought about. The same Observation is made by *Hippocrates*, who pronounces it a bad Sign when Tumors do not appear in large Wounds. In another Part he commends lax Tumors in a Wound, but condemns such as are crude, as being Signs of a greater Inflammation. *Celsus*, in *Lib. 5. Cap. 26.* beautifully expresses this in the following manner: "When a Wound swells too much, it is dangerous; but if it swells not at all, is still more dangerous. The former is a Sign of a violent Inflammation, and the latter of a Mortification; nor is a Fever terrible in a large Wound, when it lasts only whilst the Inflammation is present. But that Fever is dangerous which either succeeds a slight Wound, lasts beyond the time of the Inflammation, or brings on a Delirium." But when by a great Obstruction about the Wound, or an Increase of the Circulation by means of a Fever, the Pain, Tumor, Redness, and Heat, are greatly increased, we know from the Obstruction of the Phenomena common to all Wounds, that there is a greater Inflammation than is requisite. If, therefore, this Inflammation should proceed, it would destroy the Part by a gangrenous Corruption; or at least, a far stronger Suppuration would ensue, separating the irresolvable inflamed Parts from the other live Parts, which cannot happen without a great Loss of the Substance of the Body, especially of the *Membrana Cellulosa*, which seems to be the principal Seat of a Suppuration. Hence a slow Consolidation of the Wound, an unseemly Cicatrix, and all the Misfortunes arising from too great a Consumption of the Parts by a strong Suppuration, may ensue. It is, therefore, requisite the too violent Inflammation should be removed by proper Remedies, which is done by relaxing the Vessels, and resolving the Fluids, which by their inflammatory Tenacity, had become stagnant. Hence Baths, and Fomentations prepared of the most emollient Herbs are of great Use. It is, also, carefully to be observed, whether the Cause of the Inflammation is lodged in the Wound itself, or whether it is owing to the Violence of the Fever, or the inflammatory State of the Blood. In the former Case, Topics are often sufficient; but in the latter, an universal Remedy; checking the increased Circulation, or resolving the inflammatory Spissitude, is requisite. With respect to such Medicines see *OBSTRUCTIO*; and *INFLAMMATIO*:

Antispasmodics are, 1. Laxatives. 2. Diluents. 3. Resolvents. 4. Absorbents, such as Crabs-eyes, Pearls, Ivory, Hartshorn, Goat's-blood, Boar's-tooth, and Elk's-hoof. See *ACIDA*: And; 5. Opiates, which are already considered.

Extravasated Blood fallen into any Cavity of the Body, should be immediately brought away by a proper Situation of the Body; by Suction with a Pipe, if recent; otherwise after proper Dilution, by dilating the Aperture of the Wound, or by making a fresh Incision.

Besides those Parts of the Body in which the Humours secreted from the Blood are accumulated for their proper Uses, or being collected, are eliminated from the Body, there are hardly found any Cavities in the Body: Thus the Cranium, Thorax, and Abdomen, are full; for when Wounds are made into the Cavities, their Contents burst out as soon as they can find a Passage. But the Blood flowing from the divided

vided Vessels may so compress the Parts contained in these Cavities of the Body, as to possess the Place naturally occupied by the Viscera lodged in them. Blood, therefore, extravasated into these Cavities, by its Pressure, injures the Action of the Viscera contained in them, and afterwards becoming corrupted, it may, by its Acrimony, corrode and corrupt every thing it touches. Whilst it is, also, attenuated and render'd putrid, being resorbed by the bibulous Veins every-where open, both in the external and internal Parts of the Body, it infects the whole Mass of Blood with a putrid Taint, and produces the most terrible Disorders. *Hippocrates*, in *Aphor. 20. Sect. 6.* tells us, "That if Blood is preternaturally discharged into the Abdomen, it naturally corrupts and suppurates." And *Galen*, in his Comment on this Aphorism, by the Word *καταρρέειν*, understood any preternatural Cavity, and tells us, that by the Word *Suppuration*, any Degeneracy of the Blood is here meant. But by the Word *εκχυσμός*, is probably meant, not a *Suppuration*, properly so called, but only that the Blood extravasated, and contained in a preternatural Cavity, after a Suppuration makes a Way for itself through the Parts, tho' the extravasated Blood is not converted into Pus, properly so call'd.

Besides these large Cavities of the Body, there is under the Skin, and every-where in the Intestines of the Muscles, the cellular or pinguinous Coat, which being easily dilated, yields to the extravasated Blood, and may be distended often to an inordinate Bulk, as is obvious in spurious Aneurysms, and Sugillations, after violent Contusions. The Blood lodged in these preternatural Cavities may, in like manner, by its Pressure and Corruption, produce many Misfortunes; for which Reason it ought to be soon removed, if it can be commodiously done. But it is to be observed, that extravasated Blood may for a long time remain incorrupted, provided the Air has not free Access to it; and that sometimes by the Application of diluting and resolvent Medicines, it may be so attenuated as to be resorbed by the bibulous Vessels, and gradually disappear. See **CONTUSIO.**

But when Blood is extravasated into any Cavity of the Body, and proves injurious by compressing the Parts; or if its Corruption is dreaded, and no Hopes of its Dissipation remain, it is then to be evacuated by Art: And this is done.

By the Situation of the Body: Which ought to be such, that the extravasated Blood may, by its proper Gravity, be discharg'd from the Orifice of the Wound. In order to this, it is of great Importance to know the Posture of the Patient when he received the Wound; and he is then to be placed as nearly as possible in the same Posture, otherwise the *Membrana Adiposa* often so closes up the Wound of the Skin, that no Blood can be evacuated. Then let the Orifice of the Wound be put in a declining Situation, that the Blood may have a free Passage. Thus, for Instance, if there is extravasated Blood in the Cavity of the Abdomen, it will be expedient to lie flat on the Belly. *Paré* evacuated Blood lodged in the Cavity of the Breast, and saved the Patient by ordering him to lie with his Feet elevated, and his Head low.

As for Suction with a Pipe; this is useful when Blood is extravasated into the Cavity of the Abdomen, and especially that of the Breast. In which Cases they take a flexible Pipe of Lead, Leather, or Whalebone, with an obtuse Point, lest it should injure the Parts. By means of this introduced into the Cavity of the Body, the extravasated Blood may be evacuated either by Suction, or the Application of a Syringe. But when the Blood is collected under the Skin in the Cells of the *Membrana Adiposa*, it is sufficiently obvious, that this Method is of no Use.

But unless the extravasated Blood is sufficiently fluid, it can neither be evacuated by Suction, nor the Situation of the Body. If, therefore, the Blood is formed into grumous Concretions, it is to be so diluted as that it may easily pass through the Orifice of the Wound, or the Aperture of the Pipe. In this Case we take Water, with an Addition of a proper Quantity of Honey, or Venice Soap, and a little Sea Salt and Wine. This Liquor is to be injected tepid; and shaken gently, or agitated by the Motion of Respiration with the concreted Blood, which it dilutes and dissolves. Then by the Situation of the Body, or Suction, the injected Liquor is to be evacuated, and this is to be repeated till the injected Liquor returns pure, and not ting'd with any bloody Colour. Thus *Paré*, by a simple Decoction of Barley with Honey, brought out the Blood lodged in the Cavity of the Breast; and when next Day he injected an Infusion of Centaury, Wormwood, and Aloes, in order to cleanse the Parts the better, he found the Patient complain of a certain ungrateful Bitterness and Nausea. But it is sufficiently obvious, that these Measures cannot be taken so long as there is any Danger of an Hemorrhage.

The extravasated Blood, when coagulated, is diluted by these or other Preparations of a like Nature.

Take of common Honey, two Ounces; of Venice Soap, two Drams; of Sea Salt, four Drams; and of Rain-water, twelve Ounces: Mix all together. Or,

Take of Sal Ammoniac, and Nitre, each three Drams; of the recent Urine of a sound Person, twelve Ounces; and of common Honey, two Ounces: Mix all together. Or,

Take of Aloes dissolved in Water, duly cleansed from its resinous Faeces, and again gently inspissated, four Drams; of Sal Ammoniac, two Drams; of Borax, two Drams; of pure Honey, two Ounces; of Rain-water, nine Ounces; and of French White Wine, two Ounces: Mix all together.

The prudent Injection of these Preparations when tepid, and a gentle Conquassation of them with the stagnant Blood, dilutes it, resolves it, preserves it from Putrefaction, and prepares it for an Evacuation. Hence such Preparations are much used, when extravasated Blood becomes stagnant or coagulated in the large Cavities of the Body.

As for a Dilatation of the Aperture of the Wound, or a fresh Incision; if the Wound is too narrow, or if the *Membrana Adiposa* forced into its Aperture obstructs its Orifice, then Dilatation becomes requisite. It sometimes, also, happens, that the Aperture of the Wound is pretty high, and the extravasated Blood situated in a Place so far below it, that it cannot be evacuated through the Orifice of the Wound, unless the Posture of the Body is inverted, which the Patient cannot bear without great Uneasiness. Thus, when in a Wound of the superior Part of the Thorax, a large Quantity of Blood is from the divided Vessels discharged into the Cavity of the Thorax, that Blood lodg'd towards the posterior Part of the Thorax, where the Diaphragm descending deep, much enlarges its Capacity, will remain, nor can it easily be evacuated through the Wound, unless the Patient was to stand on his Head. Hence that Blood is rather to be evacuated by making a new Aperture towards the posterior and inferior Part of the Thorax on the affected Side. The same holds true, when by a Wound inflicted about the Loins, Blood is lodged in the Cavity of the Abdomen, and this Blood by its Gravity falls to the anterior and inferior Part of the prominent Abdomen. Hence it will be far more easy, by the *Paracentesis* perform'd in this Place, to evacuate the Blood, than, by a Compression of the Abdomen, and a Change of Posture in the Body, to eliminate it thro' the Aperture of the Wound: It is, in like manner, requisite, there should be a new Aperture of the Wound, when Blood, extravasated in the *Membrana Adiposa*, descends into a lower Part.

If the Wound descends among the firm Parts of the Body, way must be made for the *Sordes*, by Pressure, Lotion, Ligature, and a fresh Aperture, or Dilatation of the Wound.

It sometimes happens that the Instrument, when forcibly applied, descends pretty deep into the Parts, especially into the *Membrana Adiposa*; then the Liquids, discharged from the divided Vessels into the Cavity of the Wound, and the Pus collected, will remain there, and, by their proper Gravity, descending into the easily-dilated *Membrana Adiposa*, will augment the Depth of the Wound; nor can they easily be discharged from the Orifice of the Wound, which is situated higher. The collected Matter, also, often makes surprising and sinuous Ways for itself thro' the *Membrana Adiposa*, between the Muscles, from which Circumstance there afterwards arises a great Difficulty in the Cure: This is best discovered, if, by a Syringe, tepid Water is gently injected into the Orifice of the Wound; for the greater or lesser Quantity of the Water injected will determine the Deepness of the Wound, and the Largeness of the concealed Cavity: For when the Deepness of a Wound is examined by the Probe, whilst this Operation is rudely performed, the Probe, passing thro' the *Membrana Adiposa*, will form a new Cavity: Hence the Cure will afterwards be more difficult. A memorable Instance of this is found in *Hildanus, Observat. Chirurg. Cent. 4. Obs. 84.* So that it is far safer to inject Water, provided it is gently done; for if it should be injected with Violence, the Water might lacerate the *Membrana Adiposa*, and form surprising Sinuses.

As for Pressure and Ligature; when, by an Injection of tepid Water, or the prudent Introduction of the Probe, we know how far the Wound penetrates, we then apply to that Place a Compress, which is to be secured by a Bandage; by which means the collected Humours are hindered from descending farther into the Cavity of the Wound; then, at each Dressing, the Situation of the Compress is to be gradually changed, so as to proceed more and more towards the Aperture of the Wound; thus ascending slowly from the inferior Parts: The Orifice of the Wound is, in the mean time, to be kept open, that the Contents of its Cavity may be discharged; hence the Bandage is to be so ordered, as only to compress the lower Part of the Wound, but leave its Orifice entirely open, which, for the same Reason, is never to be closed by a Tent.

As for Lotions; when the extravasated Humours become stagnant in the Cavity of the Wound, and remain long there, as they cannot be easily evacuated, on account of the superior Situation of the Orifice of the Wound, they are corrupted by their Continuance and the Heat of the Place, and may, therefore, acquire a very malignant Degree of Acrimony. The most laudable Pus, when long retained in a Wound, becomes ichorous, thin, and acrid: By this means, the whole Surface of the Wound will be so affected, as to become sordid; but so long as the Surface of the Wound is not pure, there will never be

be an Union and Consolidation of the Parts, tho' they are rendered contiguous, by proper Compression and Ligature. It is, therefore, requisite the Wound should be first depurated by Digestives: But these cannot be applied to all the Surface of the Wound, unless they are previously so diluted, that, when injected into the Aperture of the Wound, they may penetrate thro' all the Parts of it. The Medicines, therefore, before recommended for cleansing fordid Wounds, are proper in this Case; but they ought to be diluted in Water, or some other such Vehicle, that they may be of a duly-penetrating Quality. Aloes and Myrrh, mixed with the Yolk of an Egg, together with a little *Sal Ammoniac* and Honey, and then diluted with a little Water, are the best Medicines for answering this Intention.

As for a new Aperture, or Dilatation of the Wound; after some Days Trial of Compression, and the Application of a Ligature acting on the Bottom of a deep Wound; as, also, after injecting depurating Digestives, if the Condition of the Wound is not changed for the better, we are to think of other Expedients. If the Orifice of the Wound is so small, that the Liquids, collected in the Cavity of the Wound, cannot be discharged, then the former is to be dilated: But if the Situation of the Orifice of the Wound is such, that the Liquids contained in its Cavity can neither, by their proper Gravity, nor a Change of the Patient's Posture, be eliminated, then we are to think of a new Aperture, thro' which all those Things, which, being left in the Wound, would prove prejudicial, may be commodiously removed. In order to this, the Orifice of the Wound is closed with a Tent, so that nothing can be discharged; then the congested Humours will be spontaneously collected in the lower Part of the Wound, and there form a Tumor, which will indicate the Part where the new Aperture is to be made. The same may be done, when, by injecting Water, the Bottom of the Wound protuberates outwards; as, also, when a Probe, introduced into the Aperture of the Wound, can so reach its Bottom, that its Point may be felt by the Surgeon's Finger; for then the Integuments may be safely cut upon the Point of the Probe, in order to make a new Aperture: But if the Wound descends deep through thick muscular Parts, though in such a manner as that the Bottom of the Wound does not lie near the Skin, but is concealed in the more internal Parts, it is far more difficult to make a new Aperture with Success: In this Case it is most expedient, after closing the Aperture of the Wound, to apply the most emollient Cataplasms to that Part where the Bottom of the Wound is suspected to be, that the external Parts, being softened, may easily yield to the Liquids collected in the Cavity of the Wound; by which means, the Place proper for the Incision will be found.

Dilatation is made by the Knife, Lint, Sponge, Gentian-root, and other such Substances, introduced dry, with a Thread ty'd to them, which swelling, and absorbing the Humours, by this means dilate the Wound.

The best Dilatation of a Wound is made by the Knife; the Pain is, indeed, intense, when the live Parts are dividing, but it soon ceases, whilst the other Things, subservient to the Dilatation of a Wound, by a slow Dilaceration, excite a pretty acute and long-continued Pain, and, at the same time, confuse the Margins of the Wound; and these confused Parts must afterwards be separated by a Suppuration: Hence those, who, thro' a groundless Dread, will not permit the Incision to be made by the Knife, are racked with greater Torments.

But, in order to dilate a Wound without the Knife, they introduce into its Orifice Lint, or the like dry and bibulous Bodies, which, by absorbing the Humours convey'd to them, are distended; by this means they distract and enlarge the too narrow Orifice of the Wound. Nor is the Force of bibulous Bodies, render'd wet, small, in removing from each other the Substances which confine them; for Water has a surprising Property, known from Fact tho' not easily explain'd, by which it distends and enlarges the Bodies into which it insinuates itself, and that so effectually, that, by this Force alone, immense Weights are rais'd, and the hardest Stones cloven by dry wooden Wedges, introduc'd into them, and afterwards moisten'd, as the Quarry-diggers generally do in separating from the Rocks those enormous Stones from which the Mill-stones are work'd. See *Mem. de l'Acad. des Sciences, P. An. 1730.* and *Boyle, on the Usefulness of Experimental Philosophy.* Nor do we, as yet, know the Limits of this surprising Power. It is, however, sufficient for our present Purpose to know, that it is capable of surmounting very great Obstacles. They, therefore, put into the Orifice of the Wound dry Lint, wrapt up into a Tent, or a Piece of the most fungous Gentian-root, or a Piece of compress'd Sponge; then, by an adhesive Plaister, or proper Bandage, they so secure these, that they cannot slip out, whilst, by a Resorption of the Humours convey'd to them, they begin to swell: Thus the whole Force, by which these bibulous Bodies are distended, is employ'd in dilating the Wound. But among the various Substances us'd for dilating Wounds in this manner, none can be compress'd into so small a Space, and yet afterwards swells so much, by the Resorption of the Fluids, as Sponge; for which Reason, it is generally prefer'd to the others, especially if, by an artificial Preparation, its Efficacy, for these Purposes, is aug-

mented. Some use strongly to compress a Bit of Sponge, by wrapping a Thread about it, and then introducing it into the Orifice of the Wound, in such a manner, that the Knot of the Thread may remain without the Wound, and be cut off with Scissars: But as this cannot be done without Difficulty, the Design is far better obtain'd, in the following manner: They melt Rosin and Wax with a little Oil, in order to make a Plaister of a pretty tenacious Consistence; in this Plaister, melted over the Fire, they immerse a pretty large Piece of pure and dry Sponge, which is to be every-where penetrated by the melted Plaister; then they place the Sponge between two Plates of Iron, moderately warm, and, by the strong Action of a Press, express as much of the pinguious Substance from it as they possibly can, leaving it in the Press till it is totally cold; then the Sponge is compress'd into its smallest Bulk, and is so compact, that, like Wood, it may be cut into any Shape: That Substance, of an emplastic Nature, which remains in the Sponge after its strong Expression, keeps the dry Parts of the Sponge apply'd to each other, whilst, at the same time, it does not hinder Water, and all-*aqueous* Fluids, from entering into the bibulous Sponge, and distending it to its former Dimensions. When, therefore, a Sponge, by strong Pressure reduc'd to the narrowest Compass, and introduc'd into the Orifice of a Wound, is, by the Humours, distended to the greatest Dimension which it is capable of, it is sufficiently obvious, how great a Dilatation may be produc'd by this means: Besides, a Sponge, thus prepar'd, has this Advantage, that it can be cut into the smallest Shreds capable of entering the narrowest Orifices of Wounds and *Fistulas*; which Advantage cannot be obtain'd by Lint, Gentian-root, or any other Substance us'd for that Purpose.

But to all these Tents, whether of Sponge, or any other Substance, a Thread must be ty'd, lest they should slip into the wider Cavity of the Wound, and there produce many bad Consequences; for without this Caution, they could not be extracted, without great Difficulty. *Van Swieten. Com. in Boerb. Aphor.*

Of GUN-SHOT WOUNDS.

Gun-shot Wounds are attended with worse Consequences than those which are inflicted with sharp Instruments, as the Parts are more bruised and shatter'd, especially when the Bones, Joints, or some of the principal Members, receive the Shot.

As Wounds of this kind have generally an Eschar form'd upon them, little or no Effusion of Blood at first ensues, unless some of the large Veins or Arteries be wounded; but when, after some Days, the Eschar falls off, a violent Hæmorrhage is produc'd, which, without the Assistance of a Surgeon, may occasion the Death of the Patient. For the first Days, also, little or no Matter is discharg'd; whence it is not surprising, that no Wounds are so subject to Inflammations, Pains, Gangrenes, and Putrefaction, as Gun-shot Wounds.

As these Eschars resemble those produc'd by the Application of a red-hot Iron, they were formerly imagin'd to be produc'd by the Heat of the Bullet; but they rather appear to be produc'd by the sudden Collision of the Parts: And to this Collision may be ascrib'd all those Inconveniences which accompany those Wounds. Formerly it was thought that these Wounds were poisonous; but this Opinion seems to be ill-grounded, as neither the Powder, nor the Ball, have any poisonous Substance in their Composition.

Gun-shot Wounds are more or less deep: In some the muscular Parts, in others the larger Blood-vessels, the Bones, or *Viscera*, are wounded. Sometimes the Ball penetrates thro' the Part, and sometimes remains fix'd in it; sometimes Pieces of the Cloths, or Wadding, are forc'd into the Wound.

Wounds of this kind, in the *Cranium*, are commonly extremely dangerous: For tho' they may appear but slight, and the Ball may seem only to have lightly graz'd upon the Part; yet their Consequences are so pernicious, that either the *Cranium* itself is fissur'd in several Places, or the internal Blood-vessels are broke, and the Blood is discharg'd into the *Sinuses* of the Brain. It is sometimes surprising how slight a Wound of this kind, will occasion a speedy Death, unless the Blood in the *Cranium* be timely evacuated, by the Assistance of the Trepan. But these Wounds, in the *Cranium*, are dangerous, in Proportion to their Violence.

Internal Wounds, of this Sort, are difficult to heal; but if none of the larger Veins or Arteries are lacerated, they may admit of a Cure. When the Bones or Joints are shatter'd by the Ball, violent Inflammations, a Gangrene, *Sphacelus*, *Caries*, and incurable *Fistulas*, can scarcely be avoided; which either require Amputation, or deprive the wounded Part of Sense and Motion.

If any Part of the Cloths, Linen, Skin, or Wadding, is lodg'd in the Wound, it ought not to be heal'd before the extraneous Substance be extracted: This Caution must be observ'd with regard to carious Bones, and offensive Splinters.

In the Cure of these Wounds, observe the following Rules: 1. To extract any foreign Substance lodg'd in the Wound. 2. To suppress the Hæmorrhage. 3. To promote Suppuration. 4. To fill the Wound with new Flesh. 5. To induce a Cicatrix.

As soon as the Surgeon is call'd, he should carefully see if he can find any extraneous Substance conceal'd in the Wound; if there is, he should immediately extract it with his Hand, if possible,

possible, or else with a toothed or hollow Forceps, or with a two-prong'd Hook (as represented in *Tab. XXIV. Fig. 3, 4, 5, 6, 8*). If the Substance lodg'd in the Wound be deeply seated, the Wound must be search'd with the Probe, and the Substance with all convenient Expedition be extracted; for this Operation is much easier perform'd when the Wound is recent, than when it becomes tumefy'd and inflam'd. Another bad Consequence, attending a Delay in this Case, is, that the Balls, sinking deep under the Muscles, cannot be taken out, and, consequently, malignant *Fistulas*, a Stiffness of the Limb, and other bad Symptoms, are produc'd. In extracting these Balls, the Operator must take particular Care, not to break any of the Veins, Arteries, Nerves, or Tendons, which would occasion very dangerous Consequences; upon which account, he should introduce the Forceps shut, and not open them till the Point touches the Ball.

If the Ball, or other extraneous Body lodg'd in the Wound, has sunk deep, or if the Wound be so narrow, that it cannot be conveniently extracted, the Orifice must be enlarg'd by Incision, on that Side which may seem most safe and proper: But particular Care must be taken, not to wound a Nerve, Vein, Artery, Ligament, or Tendon. When an extraneous Substance is lodg'd in a Wound of this kind of some Standing, the Orifice of which is contracted, with the Swelling and Inflammation, this Sort of Incision is often very beneficial; for it not only opens a convenient Passage for discharging the inspissated Blood, but, also, prevents violent Inflammations, and the like Inconveniences. But as two Balls frequently happen to be lodg'd in the same Wound, the Surgeon, after one is extracted, must carefully search for another; for as long as any extraneous Substance is conceal'd in the Wound, the Cure will be protracted.

In extracting these foreign Substances, the Patient should be plac'd in the same Posture he was in when the Shot enter'd his Body; for, by changing the Posture of the Body, the Shot is subject to be lost in the Muscles, Membranes, or Fat, so as not to be reach'd by the Probe, or other Instrument: But when the Ball has penetrated so deep, as to be felt by the Finger on the opposite Part of the wounded Limb, the Surgeon ought to consider, from the Disposition of the wounded Parts, whether it be preferable to extract the Ball by the Orifice of the Wound, or by laying the opposite Part of the Member open by Incision: But if the Wound can neither be enlarg'd, nor the Shot extracted, without endangering the Nerves and Arteries, it ought to remain in the Wound, till the Pain is abated, or till the Passage is render'd so easy by Suppuration, that they work themselves out. On the other hand, extraneous Bodies ought to be extracted, without Delay, when, by their Continuance in the Wound, they threaten to raise Convulsions, Pain, and other pernicious Symptoms. If the Ball has penetrated into any of the Cavities of the Body, whence it cannot be conveniently or safely extracted, the best Method is, to leave it where it is lodg'd, and heal the Wound: In this manner they have long continu'd, and often, during Life, without any Danger, or Inconvenience; and sometimes they will work themselves into other Parts of the Body, whence they may be safely and easily extracted.

When the Shot is lodg'd in the Bones, it ought to be extracted in the same manner, with the notch'd Forceps, or Hook: If that Method proves unsuccessful, it may be brought out with a Screw: But where the Shot is cover'd with much Flesh, as in the Calves of the Legs and Thighs, a peculiar Sort of Screw is requir'd, like that delineated in *Tab. XXIV. Fig. 7*. But if the Shot is too firmly fix'd to yield to any of these Methods, it must be suffer'd to remain in the Wound till it is loosen'd by Suppuration. Balls lodg'd in the Joints must be extracted with the utmost Expedition; for, in this Case, Delays are extremely dangerous: Nor can violent Pains, Inflammations, and Caries of the Bones, which generally require Amputation of the Limb, be, without Difficulty, prevented.

When, in a Gun-shot Wound, the Joint or Bone is extremely bruised, it is better to remove the Limb immediately by Amputation, than to labour long in vain, to obtain a Cure: For as the natural Form of the Joints can never be restor'd, so the Nerves, Tendons, and Ligaments, which adhere to the shattered Bone, being broken, violent Inflammations, a Gangrene, and *Sphacelus*, are by these means induc'd: But when the Collision of the Bone is not very violent, the Surgeon should gently remove any Splinters of the Bone, or extraneous Substance lodg'd in the Wound, which may then be cur'd after the usual Method.

If a large Artery, of the Arms or Legs, should be wounded by the Shot, which may appear from the Effusion of Blood, the *Tourniquet* must be immediately apply'd, to stop the Hæmorrhage, till the Artery can be stich'd up with a crooked Needle and Thread: and this Method I have successfully try'd. But if this should be impossible to be perform'd, the Limb must necessarily be amputated, taking care, first, to apply the *Tourniquet*, a little above the Wound, in order to stop the Hæmorrhage.

The Wound being cleansed, and the Effusion of Blood stop'd, if necessary, the first Intention of Cure is, to prevent, or, at least, alleviate the Swelling and Inflammation: For this Purpose, let the Wound be fill'd with Lint dipt in warm Spirit of Wine, and apply Compresses, moisten'd in the same Liquor, or in camphorated Spirit of Wine, or in Spirit of Wine diluted with Lime-water.

The next Intention is, to forward the Suppuration of the bruised and corrupted Parts; and, for this Purpose, besides the common digestive Ointment made of Turpentine and the Yolk of an Egg, the following may be used:

Take of *Unguentum Basilicon*, and *Arcaus's Balsam*, each an Ounce; Spirit of Wine, and Oil of Eggs, each a Dram: Mix, and make them into an Ointment.

Add to these, if the Corruption is violent, a little Myrrh, and Aloes, *Theriaca*, *Unguentum Fuscum*, and, in Parts not very nervous, a little red Precipitate.

In Wounds where the Ball has quite penetrated the Limb, pass a long, blunt Needle (see *Tab. XXVI. Fig. 1*), arm'd with a small linen Cord, well moisten'd in the Ointment above-prescrib'd, thro' the Middle of the Wound, like a Seton; let this Cord be drawn backwards and forwards, and kept in the Wound, till, from its Redness, it appears that the corrupted Parts are thrown off, and that the Wound is ready to heal: then the Cord may be drawn out.

You may now proceed to incarn, and induce a neat Cicatrice, with balsamic Medicines, as in other Wounds. Some use here a vulnerary Water, call'd, by the French, *L'Eau d'Arquebuse*. See *AQUA SCLOPETARIA*.

The concomitant bad Symptoms of Gun-shot Wounds, such as the Hæmorrhage, Fever, Swelling, Inflammation, Pain, and Convulsions; may be treated as in other Wounds, unless where the Violence of the Collision and Confusion make them more subject to Corruption and Putrefaction. If, as it almost always happens, the Lips of the Wound become black, livid, flaccid, and fetid, Care must be taken to separate the corrupted Flesh from the sound: For this Purpose, apply the *Unguentum Egyptianum*, diluted with Spirit of Wine, or mix'd with an equal Quantity of the digestive Ointment; or a little red Precipitate may be add'd to the digestive Ointment; then put on the Compresses, after they have been thoroughly moisten'd with warm camphorated Spirit of Wine, mix'd with *Theriaca*; or with Lime-water strengthen'd with Spirit of Wine. If the Corruption penetrates deep into the Flesh, Scarifications and Incisions must be made, till the latent corrupted Humours are discharg'd, and the Applications reach to the sound Parts: If these Remedies are not effectual, more powerful Medicines must be used for consuming the Flesh; such as the *Aqua Phagedenica*, made of Lime-water and Mercury Sublimate; or one Pound of Lime-water mix'd with one Ounce of crude Quicksilver dissolv'd in two Ounces of *Aqua Fortis*. These Applications are, also, useful, in a Caries of the Bone; but in Wounds of the Joints or Ligaments, as these acrid Applications cannot be made with Safety, we must have recourse to Balsamics; such as the *Eau d'Arquebuse*, *Peruvian Balsam*, Tincture of Myrrh and Aloes, prepar'd with *Sal Ammoniac*, and Spirit of Wine, Essence of Amber, Spirit of Mastich, *Hungary Water*, Oil of Turpentine diluted with this Water, and the like; which must be infil'd into the Wound moderately warm.

Internal balsamic Medicines which resist Putrefaction, are, at the same time, not to be neglected: Of this kind are, the *Elixir Proprietatis*, the Essence of Myrrh and Aloes, the Essence of Amber, *Peruvian Balsam*, and the like; thirty or forty Drops of which may be given to the Patient, for several Days. If the Patient be very weak, let him take some cordial Pills, with the *Confectio Alkermes*, and some cordial Syrup: Proceed in the Remainder of the Cure as in other Wounds.

By the Explosion of Guns it often happens, that some Grains of Gunpowder enter the Skin of the Face, and produce unseemly Spots, if they are not timely taken out: When the Grains do not entirely penetrate the Skin, they may be taken out with a Forceps, or a Quill shap'd like a Tooth-pick, or an iron Instrument in the Form of an Ear-pick; but if they reach below the Skin, before they can be laid hold of, the Skin must be laid open with a slender Knife, or Lancet, and then they may be extracted as before: The Operation must be repeated till all the Grains are taken out, and Care must be taken, that they are not broken in the Extraction, otherwise the Spots will continue. *Heist. Chirurg.*

Mr. Ranby, in his *Method of treating Gun-shot Wounds*, tells us, that, in removing the Accidents produc'd by the Ball of a Musquet or Pistol, the first Intention is, if possible, to extract the Ball, or any other extraneous Bodies which may be lodg'd in the wounded Part; and whenever Misfortunes of this kind are attended with an excessive Effusion of Blood, in consequence of the Rupture of some considerable arterial Vessel, it is absolutely necessary, with all Expedition, to stop the Hæmorrhage, by taking up the Artery with a proper Needle, and so carefully, that the Hold may not prove elusive; because, in Cases of this Nature, no Applications, however styptic, are to be depended on.

In order to get at the Ball, or any other foreign Matter infesting the Wound, Searches by the Probe are to be used as sparingly as possible; since it is certain, from Experience, that such a Practice is highly detrimental to the Patient: And where there is an absolute Necessity for this Method, the Finger is always to be prefer'd, as the best, and least dangerous Probe.

If the Ball, or any other Substance, is lodg'd near the Orifice of the Wound, or is, by the Finger, perceiv'd to be under

the Skin, tho' at some Distance from the Mouth of the Wound, we must, in the former of these Cases, remove the extraneous Matter, with all Expedition; and, in the latter, cut upon it, and take it out: But if the Ball, or other Substance, should be sunk so deep, as to be absolutely beyond the Reach of the Finger, it is by no means advisable to extract it, by forcibly introducing a Pair of long Forceps: Since it is certain, from Experience, that such a Practice seldom fails to produce a Train of terrible Symptoms; and since numberless Instances occur, in which Balls, after having been lodg'd in the Body for many Years, without incommoding the Patient, have, in Process of time, work'd their Passage to the Surface, and were, consequently, easily extracted.

As Wounds, made by the Balls of a Musquet, or Pistol, are but small; so it is necessary to dilate them, with all Expedition; but if they should be inflicted near a Joint, or in a very membranous or tendinous Part, the Knife, as well as Forceps, should be used, with the greatest Caution, and no larger a Dilatation made, than is absolutely requisite for the free Discharge of the Matter lodg'd within: For Wounds in the Joints, whether produc'd by a Bullet, a cutting Instrument, or any other Cause, are always dangerous. And such Parts as are membranous, or tendinous, never fail to suffer, by being expos'd to the sensible Impressions of the Air.

If a Ball has gone entirely thro' any Part, both Orifices, where it can be done with Safety, are to be dilated, and both carefully kept open, especially that in the most depending Part: Tents are never to be us'd where there is a Possibility of avoiding them; light, easy Dressings, are always best, and ought to be secur'd with a Bandage of thin Flannel, if it can be had; no tighter than is necessary to keep them on the Part.

When the wounded Person has not suffer'd a great Loss of Blood, it is expedient, immediately, to take a large Quantity from a Vein open'd in the Arm, and to repeat Venesection the second, and even the third Day, if Circumstances call for it: This timely Precaution will prevent a good deal of Pain and Inflammation, promote the Digestion, and contribute to prevent a numerous Train of complicated Symptoms, which otherwise generally interrupt the Cure, miserably harass the poor Patient, and too often endanger his Life.

During the first twelve Days after the Reception of the Wound, it is proper to observe a cooling Regimen, both with respect to the Medicines prescrib'd, and the Diet requisite for the Support of Nature: And as, in Circumstances of this Nature, the Body should, by all means, be kept soluble, a Stool should every Day be procur'd, either by emollient Clysters, or some gentle Laxative taken internally.

All Applications of an hot and spirituous Nature are remarkably injurious, and productive of such Pain, that the wounded Part can by no means bear them. The first Dressing should consist of Lint, either dry, or moisten'd with a little Oil, and secur'd by a very slight Bandage; the next should consist of a proper Digestive, warm'd, and cover'd with the Bread and Milk Poulitice, mix'd with a Quantity of Oil sufficient to keep it moist; and where there is great Tension, and the Wound large, a proper Fomentation is to be us'd: This Course is to be continu'd till the Wound is clean, after which, it is to be heal'd in the ordinary manner: This Method generally promotes a constant and easy Perspiration, abates the Pain, greatly facilitates the Digestion, and removes all Apprehensions of an approaching Inflammation. The Reason why the Lint should be moisten'd with Oil is, the great Ease procur'd to a contus'd Wound from such an Application, in comparison of a drying and absorbent Dressing; which, instead of giving a free Discharge to the sanious Blood, and preventing an Inflammation by unloading the Part, would possibly obstruct the Mouths of the capillary Vessels, and hinder Nature from getting rid of that Incumbrance, which, it is observable, she so much endeavours to throw off.

When an Inflammation seizes any Part, in consequence of the Lodgment of a Bullet, or any other foreign Body which might have been safely extracted immediately after the Reception of the Wound, all Attempts to dislodge such extraneous Matter must be postpon'd, till the Swelling is, in some measure, abated, and the inflammatory Disposition of the Fibres nearly remov'd; unless the Ball, or other offending Matter, lies at no great Distance from the Orifice, and there is, on that Account, a Certainty of removing it, without any great Uneasiness to the Patient.

When a Wound is of such a desperate Nature, as to render Amputation necessary, which frequently happens when it is inflicted in any important Joint, it is expedient to perform the Operation immediately, and without Delay; lest, by postponing it, an Inflammation, which is reasonably to be dreaded, should prevent a Work which ought rarely to be attempted during the Continuance of so unlucky a Circumstance. The neglecting this favourable Juncture of taking off a Limb, frequently reduces the Patient to so low a State, and subjects the Blood and Juices, to such an Alteration, as must unavoidably render the subsequent Operation, if not entirely unsuccessful, yet, at least, exceedingly dubious: And even in Wounds where Amputation is not necessary, it is equally advisable, not to defer the Measures proper to be taken, lest, in consequence of the exposing the Parts to the Air, a Series of very dangerous Symptoms should be brought on.

Wounds contiguous or adjacent to any considerable Artery are ready to bleed afresh, upon any Motion of the Patient, or the Return of a free Circulation of the Blood into the Part, which was at first obstructed by the Violence of the Injury done it; and this generally happens when the Eschar begins to separate: For this Reason, we should never attempt a forcible Removal of the Eschar, but patiently wait for its perfect Separation; without being in the least shock'd at the Opening of the Arteries, which is found to be almost inevitable: But the Approach of this Accident may be frequently predicted, from the Patient's complaining of an excessive Weight and Fulness of the Limb, which Symptoms are always accompanied with more or less Puffation; an infallible Prognostic of the Consequences: When these Symptoms appear, Bleeding, and the use of the Bark, are instantly to be order'd, in whatever Part of the Body the Wound is inflicted.

I have known, says our Author, several Instances of Persons losing their Lives, from the starting of an Artery, before the Surgeon could come to their Assistance; especially where an Amputation has preceded; and I dare affirm, the Quantity of Blood lost, particularly after an Amputation, has not amounted to twelve Ounces; which I cannot account for otherwise than by the Drain which had been made from the Mass of Blood, both before and during the Operation: Whence the sudden Discharge, tho' of so small a Portion of Blood, after the great Quantity before lost, gives a Check to the Circulation, and produces immediate Death: This Reflection ought to be a Lesson of Instruction to every Practitioner, to be particularly careful in tying the Vessels.

Repeated Bleedings in the Beginning are attended with many Advantages, since they generally prevent, and always lessen any feverish Paroxysms, and seldom fail to guard against Impostumations: The Body must always be kept in a laxative State, and when the Patient is rack'd with Pain, we must have immediate recourse to proper Preparations of Opium.

Probes, Forceps, Mallets, Chissels, and various other Instruments, ought never to be us'd, except in Cases of absolute Necessity; since, without doing any Honour to the Surgeon, they not only rack the Patient with Pain, but, also, expose his Life to Danger. But, for a farther Confirmation of this, let us suppose a Ball lodg'd in any Part beyond the Reach of the Finger, and entirely out of the Way of being perceiv'd by the external Touch: In such a Case, it must evidently appear, upon the least Reflection, that thrusting first a long Probe in quest of the Bullet, and then a Pair of long Forceps, either with or without Teeth, into a Wound of this kind, tho' with a kind of Certainty, to extract the foreign Matter, must either contuse, or irritate and inflame the Parts to a great Degree, and, consequently, do as much, or, perhaps, more Mischief, than the Ball did at first by forcing its Passage so far into the Parts: And should the Forceps lay hold of any Nerve, Artery, or even common Membrane of a Muscle, together with the Ball, which, in all Probability, must continually happen, very shocking Consequences must necessarily attend such a Practice: Nor would Attempts of this kind prove less injurious, in Cases where Bullets are lodg'd in the Cavities of the Abdomen, or Thorax; whereas it is certain, from Experience, that Lead may lie for a long time in several Parts of the Body, without producing any considerable Pain, or even Inconveniencies.

Chissels ought, on no Occasions, to be us'd, since they too frequently split the Bone up to the next Joint, or shatter it in such a manner, that, instead of promoting a Cure, by safely removing the Part affected, they generally bring on Symptoms worse than the original Disorders they were intended to remedy: A good Knife is certainly all that is necessary, for taking off a Finger; or should one of the Bones of the *Metacarpus* require Amputation, a small Spring-saw does the Work, with great Ease and Safety. With respect to the use of the *Peruvian Bark* in Gun-shot Wounds, see the Article *QUINQUINA*.

It is observ'd in maritime Places; and the Fat, which is the Part us'd in Medicine, is recommended, by some, against the Herpes, and Tumors of the Face. *Dale.*

VULPECULA MARINA. The Sea Fox, otherwise called *Simia Marina*, or *Alopecias Oppiani*. This is a very large Fish, of the cetaceous kind, the Fat of which is esteem'd emollient, and resolvent.

VULPES. Offic. Schrod. 5312. Aldrov. de Quad. Digit. 195. Raii Synop. A. 177. Schv. Quad. 133. Ind. Med. 125. Jonf. de Quad. 92. Charlt. Exer. 15. Gein. de Quad. Digit. 966. Mer. Pin. 167. **THE FOX.**

Adapted to medicinal Uses are the *Fat, Lungs, Liver, Gall, Milt, Skin, Blood, the whole Animal, and its Dung.* The *Fat* is of use in Convulsions, Contractions, Tremblings, and the like Disorders; also, in Pains of the Ears, Wounds of the Head, and an *Alopecia*. The *Lungs* are consolidating, and abstergent, and therefore of Efficacy in Diseases of the Lungs, and

and Straitness of the Breast: The *Liver* of a Fox is of use in hepatic and splenetic Cases; the *Gall* cures a *Pterygium* of the Eyes; the *Spleen* removes a Hardness and Tumor of that Part; the *Skin*, with the Hair on it, is successfully wrapt about such Limbs as are refrigerated, or infested with arthritic Pains; the *Blood*, dry'd and triturated, cures the Stone in the Kidneys and Bladder; for which Purpose, it is said to be more effectual if taken recent: The whole Fox, or its Flesh, burnt, is commended for Disorders of the Breast: The Animal, boil'd in Water, or Oil, is a Remedy for Affections of the Nerves, and therefore good in Contractions, and Pains of the Joints; and the *Dung*, in the last Place, clears the Skin from Asperities. Dale, from Schroder.

VULSELLA. The same as **VOLSELLA**.

VULSIO. This is sometimes us'd to express a Convulsion, or Spasm.

VULTUR. Offic. Schroder. 5. 324. Schw. A. 373. *Vultur niger*. Aldrov. Ornith. 35. Gesn. de Avib. 707. Raii Ornith. 66. Ejusd. Synop. A. 9. Jonf. de Avib. 7. *Vultur nigriscans*. Charlt. Exer. 71. *Vautour brun*. Bellon. des Oyse. 85. **THE VULTURE.**

The Parts in use are, the *Flesh*, *Fat*, *Brain*, *Gall*, and *Dung*. The *Flesh* is esteem'd effectual in cephalic Affections, as the Epilepsy, *Hemicrania*, and the like: The Decoction of it is said to be good for cutaneous Diseases; and the *Fat* is proper for the Nerves: The *Brain* strengthens weak Heads; the *Gall* is said to cure the Epilepsy, being taken in Wine; and the *Dung*, by its nidorous Smell, to precipitate the Birth. Dale from Schroder.

VULVA. The Female Pudendum.

VULVARIA. A Name for the *Chenopodium Foetidum*.

UVULA. See **PALATUM**.

Of an excessive Extension of the UVULA.

It sometimes happens, from various Causes, that the *Uvula* swells, and extends itself to such a Degree, as to descend almost upon the Larynx, or *Aspera Arteria*, and, by that means, to cause a Difficulty not only of Respiration, but of Speech, and Deglutition. If the Disorder be recent, and excited by an Inflammation, as may be known from the Pain attended with a Heat and Redness, it will be proper to treat it with Gargarizations and Injections, endu'd with a lenient and resolvent Virtue, such as simple Water mix'd with a little Spirit of Wine, or a Decoction of the Funguses of the Elder-tree, Barley-water, a Decoction of the Flowers of the *Ligustrum*, or Mallows, mix'd with a small Quantity of Nitre, Alum, or *Sal Ammoniac*: With these must be used internal, tempering Medicines; and if the Inflammation be more violent than ordinary, Blood is to be taken away from the Arm or Foot, the Belly is to be evacuated, and Clysters are to be administer'd, in order to prevent a Quinsey, or Inflammation of the *Fauces*, which may prove of very pernicious Consequence: Scarifications, also, are not improper in this Case; for I have long since found them of Service, when try'd upon myself, as well as others, not only by allaying, but preventing an Inflammation of the *Uvula*. If the Swelling of the *Uvula* be occasion'd by a pituitous Humour, it is generally white, and void of all Pain and Inflammation. In this Case there is nothing better than the use of a Gargarism of warm Spirit of Wine, temper'd with a little Water, or one prepar'd of some astringent Decoction, as that of Roses, Flowers of the *Ligustrum*, Rinds of Pomgranates, and the like, mix'd with a little Spirit of Wine, or Spirit of *Sal Ammoniac*: But if the Disorder will not yield to these Remedies, we must take another Method for the Cure, or Digestion of the pituitous Matter; which is, to take some pounded Ginger, or Pepper, mix'd with an equal Quantity of Pomgranate-rinds, in Form of a Powder, or made up with Honey, and with a small Spoon, *Tab. XXII. Fig. N.* apply it to the diseased Part, not neglecting, however, the use of internal Medicines, both purgative and digestive: Sometimes all these means prove of little Effect, and the affected *Uvula*, from a Redundance of the pituitous Matter, becomes swell'd, and extended to such a Degree, as to hang down upon the very *Aspera Arteria*, and, by that means, prove a considerable Impediment to Respiration, as well as Speech and Deglutition. In this Case, the Use of Medicines is insignificant, and there remains no Remedy, but to separate as much of the *Uvula* as extends beyond its natural Dimensions. There are several Ways of making this Separation: The first is, by Ligature; and because this Way of Operation cannot be performed merely by the Hand, there is a proper Instrument contrived for the Purpose, and represented *Tab. XLII. Fig. 6.* from *Heldanus* and *Scultetus*. Here a thick Thread, *A*, is, by help of a pretty long Needle, *Fig. 7.* drawn thro' this hollow Instrument, so as to make a Noose within the Ring *B*; thro' this Noose so much of the *Uvula* is depressed as is judged to be superfluous, and, by drawing the Thread *C*, it comes under a strong Constriction, or Ligature: This done, the Instrument is withdrawn, and the Ligature left on the *Uvula*, and is to be straitened, now-and-then, every Day, till the lower Part of the *Uvula* falls off. But this Method, tho' ingenious enough, is too slow, and troublesome, as well to the Patient as the Sur-

geon. A more expeditious Way is, first, to depress the Tongue with a flat Probe, or Spatula, *Tab. XXII. Fig. P* or *R*, and then, with long Scissars, to cut off the superfluous Part of the *Uvula*; but Care is to be taken, in this Operation, that no more nor less of the *Uvula* be separated, than just as much as is required: For if too small a Part be cut off, the Operation is both troublesome, and of little use to the Patient: On the contrary, if too little be left, the Speech is injured. If the Surgeon be not dexterous enough to hold the Spatula right, and, at the same time, to manage the Scissars as exactly as he ought, the best, and most commodious Method of Operation, as it is esteemed by some, is, what is performed by help of an Instrument invented by a Peasant of *Norway*; in which Country this Disease, it seems, is very frequent. *Bartholine* and *Scultetus* have given us a pretty accurate Description of this Instrument: A Knife, adapted to the Purpose, is fastened to a broad Iron Plate, perforated in its fore Part, in such a manner, that the Knife is impelled by a Spring, and cuts off the superfluous Part of the *Uvula*. The famous *Rau* has, I think, made some Alterations in this Instrument [see *Tab. XLII. Fig. 8.*], so as that the Spring is wanting; but the *Uvula*, being extended, and depressed through the Perforation *A*, as far as is required, is, with the Knife *C*, by strongly depressing the Stick *B*, separated at one Stroke. In this Operation the Instrument is; by means of the Handles *D*, *D*, so held in the Mouth, as to depress the Tongue in the most convenient manner, and render the Use of a *Speculum Oris* unnecessary.

The superfluous Part of the *Uvula* being thus cut off, it will be proper to let the Blood flow for a little while; and then, in order to stop the same, and to comfort the diseased Part, it will be proper to gargarize with red Wine warm, or with Vinegar, or *Oxyrcras*, also, warm: If the Blood be not, by this means, repressed, it is to be stopped, by an Application of burnt Alum, with the Spoon, *Tab. XXII. Fig. N.* or, after the manner of the Antients, with an Iron heated, but not to the Degree of Redness, and held to the Place till the Blood stops: But when the *Uvula*, as it sometimes happens, besides its Intumescence, is, at the same time, infested by some venereal Contagion, the Surgeon is not to put his whole Confidence in his Dexterity of Hand, but to make use, also, of proper Medicines, if he hopes to make a perfect and effectual Cure. *Heister, Chirurg.*

UZEG. *Lycium Indicum creditum Alpino*. Park. *Indicum Alpino putatum*. J. B. *Lycium Indicum alterum*. C. B.

This is a Shrub rising up with a Multitude of very strait Branches, three Cubits and more in Length, which shoot forth firm, numerous, hard, and ligneous Roots, which run obliquely; the Branches are furnished with many long and very sharp Spines, some of which are clothed with Leaves; about the Bases of the Spines grow four or more Leaves, of unequal Sizes, smaller and tenderer than Olive-leaves, and not narrow'd into a Point, but rounded like Box-leaves; the Flowers are small, and numerous, not bellied, but from a pretty narrow Tube gradually dilating, open at last into a labiated Figure, of a pleasant and smiling Aspect; they have their inner Bosom tinged with yellow, with some purple Spots where the Petals part; and in all other Parts have a Mixture of the Colour of the Hyacinth with the Violet, but far excel them, both in the rich and most grateful Fragrancy of their Smell. *Veslingius*. These Flowers are succeeded by small black Fruit, resembling that of the *Ebulus*, smooth, and of a bitter and astringent Taste. *Prosper. Alpinus, de Plantis Egypti*.

Whether the Juice prepared of this Shrub be the *Lycium Indicum* of the Antients, may be more easily guessed, from the Characters of the Plant, than the Language of the Egyptians, as *Veslingius* observes.

P. Alpinus found it upon a Branch of the Nile, called *Calig*, ten Miles above *Alexandria*.

The Juice brought into Egypt from the neighbouring Parts of *Arabia* and *Ethiopia*, condensed in Bottles, has manifest Characters of the *Lycium Indicum*, says *Veslingius*, especially when it is rightly prepared; but *Alpinus* believes the *Lycium* in use among the Egyptians, and brought from *Arabia*, to be spurious; for it is hard, he says, and black on the Outside, like the Juice of *Acacia*, and, when broken, is of the Colour of Aloes on the Inside; is of a faint, tho' not unpleasant Smell, of a sweetish Taste, astringent, but not at all bitter; viscous, and, when handled, sticks to the Fingers: For which Reason, he believes it not to be the true *Lycium*, especially since it has neither Bitterness, nor, when kindled in the Fire, yields a redish Spume, as it is recorded by many of the true *Lycium*.

The Egyptians use this Juice for all Sorts of Ulcers, particularly of the Mouth, Ears, Nostrils, Anus, and Intestines; as, also, for an Hæmoptoe, Dysentery, and Diarrhoea, and for other Fluxes of the Belly and Uterus. Being anointed on any Part, it effectually secures it from a Flux of Humours.

There is, in the *German Ephemerides*, *An. 13. Obs. 1. p. 9, 10, 11.* a Method of preparing *Lycium Indicum* from a Species of *Acacia*. *Raii Hist. Plant.*

UZIFIR. *Cinnabar*. *Rulandus*. *Ussur*, is the same.

W.

WAAGENBOOM. A Name for the *Lepidocar-podendron, folio saligno lato, caule purpurascente.*

WAGA H. M. A filiquous Indian Tree, with a tetrapetalous, stellated Flower, and flat Pods three Inches in length. It is very like the *Intsia*, but without Spines, and climbs about high Trees. The Pods are two Inches in Breadth, thin and very flat, when dried of a reddish Colour, and have a Cortex of a Snow-white Colour on the Inside. The Beans are astringent, bitter, round, and smooth, a little flattish, lying in a transverse Position, with respect to the Pod, and of a green inclining to a Chestnut Colour.

It is an Ever-green, and grows in the thick Woods of *Warapouli*, and other Parts of *Malabar*.

The Juice of this Tree, together with Lemons, and green Turmeric, boiled for a considerable Time in Oil of the Cocoa-Nut, is good to anoint for the Leprosy; it is of great Use also in inveterate Ulcers. *Raii Hist. Plant. 1766.*

WAMCABEC *Insula Maragnanica* De Laet. The Name of a Tree resembling an Apple-tree. The Fruit is yellow; the Kernels are acrimonious, and, therefore, not eatable. *Raii Hist. Plant.*

WARICORAMARI FRUCTUS. The Fruit of the *Waricoramari*. The Name of a Fruit, said to grow near the River *Arriwar*, of no Use in Medicine. *Raii Hist. Plant.*

WARNAS. Vinegar of the Philosophers. *Rulandus.*

WATTA-TALL. The Name of a Tree which grows in *Malabar*. The Leaves bruised and infused together with green Tobacco and Rice, are said to cure inveterate and verminose Ulcers. Of the same boiled in Water, Baths are pre-

pared, said to be good against chills Fevers: Of the Flow and Fruit contused, tied in a Rag, and boiled in Woman Milk, an Errhine is made, which is recommended in the same Fevers. *Raii Hist. Plant.*

WELLIA TAGERA H. M. A filiquous Plant of *Malabar*, with a pentapetalous Flower, and long flat Pods, with transverse Partitions between the contained Seeds. It grows to the ordinary Height of a Man, with a Stem as big as a Man's Arm, and is transplanted from Woods into Gardens, only on Account of its Beauty; it is an Ever-green.

All the Parts of this Plant, the Root excepted, are exhibited with an Addition of Cummin, white Sugar, and Milk, against a virulent Gonorrhœa. The Leaves boiled in Cows Milk, or used in Baths, expel the Gout. The Bark triturated with Sugar and Water is proper in the Diabetes. The Bark of the Root, and green Saffron mixed with Milk, give Relief under the nodous Gout, called by the *Malabrians*, *Sonida badda*. *Raii Hist. Plant.*

WINTERANUS CORTEX. See **CORTEX WINTERANUS.**

WISANCK. A Name for the *APOCYNUM SYRIACUM.*

WISMAT. *Rulandus* explains this, *Leprosum, non tractabile, vel malleabile, rude stannium.*

WITTEBOOM. The Dutch Name for the *Conocarpodendron, foliis argenteis, sericeis, latissimis.*

WURTZII UNGUENTUM FUSCUM. This is an Ointment invented by *Felix Wurtzen*, not unlike the *Unguentum Egyptianum*, and of much the same Virtues.

X.

XAGUA MARTYRIS *Nieremberg.* A Kind of Indian papyriferos Tree. The Fruit is said to fatten Swine.

XALXOCHILT. A Name for the *GUAJAVA.*

XANTHIUM. See *BARDANA MINOR.*

XANTHOBALANUS. The same as *CHRYSOBALANUS.* *N. Myrepsus, Sect. i. C. 349.*

XANXUS. A large Sea Shell, found near *Ceylon*, like those with which Tritons are painted. It is, like other Testacea, alkaline and absorbent.

XELSES. The Name of a Star in *Paracelsus*, which, he says, shines upwards, but not downwards.

XENEXTON. An Amulet worn at the Neck as a Preservative against the Plague. *Paracelsus.* It is, also, wrote *Xenechton.*

XENINEPHIDEI. Certain imaginary Spirits mentioned by the Adepts, said to delight in discovering the occult Properties of Things to Men.

XENOPHILI ANTIDOTUS. The Name of an Antidote described by *Aetius*, Tetrabib. 3. Sermon. 3. C. 13.

XENOPREPES. *ἑνωπρεπής.* *Hippocrates*, in his Treatise of Fractures, uses this Word, to express, unusual, uncommon, or foreign.

XERANTHEMUM.

The Characters are;

The Root is fibrous and annual; the Leaves are somewhat hoary, resemble those of the Olive-tree, and are disposed in alternate Order. The Calyx is squamous, smooth, silver-colour'd, and consists of a quadruple or quintuple Series of Scales lying one upon another. The Flowers are dry, consisting of flat Bractæe, barren, destitute of Ovary or Stamina, rigid, cuspidated, with a flosculus Dish, whose Florets are of the same Composition. The Seeds have a foliaceous Head.

Boerhaave mentions seven Sorts of *Xeranthemum*, which are;

1. *Xeranthemum*; flore simpliciter, purpureo, majore. *H. L. Jacca, Olea folio, capitulis simplicibus, C. B. P. 272. Ptarmica Austriaca, Dod. p. 710.*

2. *Xeranthemum*; flore pleno, purpureo, majore, *H. L.*

3. *Xeranthemum*; flore simpliciter; albo, *H. L.*

4. *Xeranthemum*; flore pleno, albo, *H. L.*

5. *Xeranthemum*; flore simpliciter, purpureo, minore, *T. 499. Jacca, Olea folio, minore flore, C. B. P. 272.*

6. *Xeranthemum*; capitulo variegato. *Jacca, folio olea, capite variegato. Sher.*

7. *Xeranthemum*; flore purpureo, simpliciter, minimo, semine maximo. *H. L. Flor. 2. 37. Boerb. Ind. Alt. Plant.*

Xeranthemum is from *ἄνθος* (*Xeros*) dry, and *άνθος* (*Anthos*) a Flower, that is to say, a dry Flower. *Clusius* calls it *Ptarmica*, not because it provokes Sneezing, but because it has some small Resemblance of the *Ptarmica* of *Dodonæus*. It is commonly called *Immortalis Herba*, the immortal Herb, because its Flower may be preserved many Years, as consisting of rigid Bractæe, which found like so many thin Plates of Metal. The Virtues of this Plant in Medicine are unknown. *Hist. Plant. ascript. Boerhaave.*

XERAPHIUM. The Name of a drying Topic described by *Aetius*, Tetrabib. 4. Sermon. 2. C. 13.

XERASIA. *ξηρασία*, from *ἄνθος*, dry. A Species of *Alopecia*, consisting in a Dryness of the Hairs, for want of due Nutriment.

XERION. *ξηρίον*. A dry Medicine reduced to Powder: The same as *Cataplasma*.

XEROCOLLYRIUM. A dry Collyrium.

XEROMYRON. A Composition of dry Aromatics reduced to Powder; called, however improperly, a dry Ointment.

XEROPHTHALMIA. It is the same as *SCLEROPHTHALMIA.*

XEROTRIBIA. *ξηροτρίβια*, from *ἄνθος*, dry, and *τριβω*, to rub; a dry Friction.

XESTES. *ἑξήκω*. A Sextary.

XIPHIIUM.

The Characters are;

It has the Fruit and Flower of the *Iris*, with a bulbous Root.

Boerhaave mentions eleven Sorts of *Xiphium*, which are;

[+ A]

x. *Xiphium*;

1. Xiphium; Persicum; præcox; flore variegato. T. 363. *Iris, bulbosa, Persica*, Park. Parad. 172.
2. Xiphium; angustifolium; flore albo; labio inferiori rictus aureo. *Iris bulbosa* III. *sive versicolor*. Clus. H. 211.
3. Xiphium; angustifolium; flore variegato, petalis repandis flavis cum maculâ aureâ; petalis incumbentibus pallidè cærulescentibus, petalis erectis pallidè cærulescentibus cum lituris violaceis.
4. Xiphium; angustifolium; flore ex violaceo-purpureo & cæruleo pallescente variegato notata.
5. Xiphium; angustifolium; flore luteo, inodoro. T. 364. *Iris, bulbosa, lutea*. J. B. 2. 705.
6. Xiphium; angustifolium, cæruleo-violaceum; non odorum. *Iris, bulbosa, flore cæruleo & purpureo*. H. Eyf. Æst. 4. F. 10. Fig. 1.
7. Xiphium; angustifolium; petalis repandis aureis; petalis incumbentibus pallide flavis; bifidis, erectis verò ex cæruleo & pallido striatis.
8. Xiphium; angustifolium; petalis repandis ex viridi ferrugineis, petalis incumbentibus vietè cæruleis, bifidis erectis verò violaceis.
9. Xiphium; angustifolium; cæruleo-violaceum; non odorum; majus.
10. Xiphium; angustifolium; petalis repandis albis; erectis dilutè cæruleis; incumbentibus pallidè cærulescentibus.
11. Xiphium; angustifolium; petalis repandis aureis; incumbentibus pallidè flavis, erectis dilutè cæruleis. *Boerb. Ind. Alt. Plant.*

The Name is from the Greek *ἔπιφος* (*Xiphos*) or *ἔπιφιδιον* (*Xiphidion*) a small two-edged Sword with a sharp Point, to which its Leaves have a Resemblance; so that the Greek Name *Xiphium*, is the same in Sense with the Latin *Gladiolus*.

The Plant is of an acrimonious Quality like the *Gladiolus*. *Hist. Plant. ascript. Boerhaave.*

XIPHION, is also a Name for the *Gladiolus*; *floribus uno versu dispositis; major; floris colore purpureo rubente.*

XIPHOEIDES. *ἔπιφιδιος*. An Epithet for the Ensiform Cartilage of the Sternum.

XIPHYDRIA. Limpins. Oribasius, Collect. Medic. L. 2. C. 58. mentions them as the Product of *Ægypt*.

XIR. Mercury. *Theatrum Chymicum*. Vol. 5.

XISINUM. Vinegar. *Rulandus*.

XOCHINACAZTLIS, seu *Flos Auriculæ*, Hern. 30. Raii Hist. 2. 1671. *Fructus oblongus, cineraceus, acidulus*, C. B. P. 406. *Orjeulas seu Orichelas*, Hughes.

It grows in *New Spain*, and the Flower enters the Composition of Chocolate, in order to give it a fine Smell, and a pleasant Taste.

The Plant is hot and dry, dissolves Flatulences, attenuates Phlegm, and heats and strengthens a weak and cold Stomach.

XOCHIOCOTZO QUANHUITL. The same as *Li-quidambra*. See *AMBRA*.

XOCOXOCHITL, seu *Piper Tavaſci* Hernandez. A Name for the *Cassia Caryophyllata*. See *CARYOPHYLLUS*.

XYLAGIUM. A Name for the *Lignum Sanctum*. See *GUAIACUM*.

XYLOALOE. Aloës Wood. See *AGALLOCHUM*.

XYLOBALSAMUM. See *BALSAMUM*.

XYLOCASIA. The same as *CASIA LIGNEA*. See *CINNAMONUM*.

XYLOCINNAMOMUM. The Wood of the Cinnamon Tree.

XYLOCOCCA. *ξύλοκκα*. The internal Grains of the Fruit of the Carob Tree. *N. Myrepsus*. Sect. 1. C. 6.

XYLOCOLLA. The same as *TAUROCOLLA*.

XYLOGUAIACUM. Guaiacum Wood.

XYLOEBENUM. Ebony Wood.

XYLON.

The Characters are;

It has the Leaves of the *Makva* or *Alcea*. The Flower is monopetalous, Bell-shaped, open, multifid, adorned with a pyramidal staminous Tube. The Fruit is divided into four or more Cells, gaping at the Top, and full of Seeds covered with Cotton.

Boerhaave mentions three Sorts of *Xylon*, which are;

1. *Xylon*; arboreum. J. B. 1. 346. *Gossypium, arboreum, Göttnersgiar*. Alp. *Ægypt* 2. 38.

This is a shrubby Plant, cultivated in some Gardens in *Ægypt*, and differs from the herbaceous *Gossypium* only in Tallness, and the Figures of its Trunk, Branches and Leaves. It grows to the Height of ten Cubits, and has a hard and ligneous Trunk and Branches. The *Ægyptian* Surgeons make their Tents of the Cotton which this Tree produces, instead of Lint, which is in Use among us, for the Cure of Wounds and Ulcers, for they use no Lint: They employ it, also, as we do Lint, in stopping an *Hæmorrhage*. They also make very frequent Use of the Mucilage of the Seeds

in all burning Fevers, and Poisons, which threaten an Erosion of the Stomach and Intestines, and for Coughs proceeding from Distillations of acrid and salt Humours. *Prosper Alpinus de Medicina Ægyptiorum*, Vol. 2. p. 38.

2. *Xylon*; five *Gossypium Herbaceum*. See *BOMBAX*.

3. *Xylon*; five *Gossypium ex Cypro*. *Volk. Boerb. Ind. alt. Plant.*

It has the Virtues of the *Alcea* and *Althæa*. The Seeds are very serviceable in Diseases of the Breast, and in violent Coughs, and promote Expectoration. *Hist. Plant. ascript. Boerhaave.*

XYLOSTEUM.

The Characters are;

The End of the Pedicle forms a Calyx, consisting of two larger and four shorter Leaves, two of which latter are interposed, one on each Side, between the greater. In this Calyx grow two round Ovaries, which have their Apex adorned with a quinquefid Calycle, and shoot out from the Centre of their Top a long Tube furnished with a globous Apex. The Flower grows on the Apex of the Ovary within the Calyx, and is monopetalous, oblong, tubulous, Bell-shaped, quinquefid, expanded, and furnished with five Stamina, which grow out of the Inside of the tubulous Part of the Flower.

Boerhaave mentions but one Sort of this Plant, which is;

1. *Xylosteum*; *Pyrenaicum*. T. 609. *Chamæcerasus, Pyrenaica, folio Oleæ, fructu gemino, rubro, Grossulariæ similis*. Schol. Bot. Par? H. R. D. *Boerb. Ind. alt. Plant.*

It is called *Xylosteum* from *ξύλον*, (*Xylon*) Wood, and *ὀστέον* (*Osteon*) a Bone, because its Wood in Whiteness and Hardness resembles a Bone. *Hist. Plant. ascript. Boerhaave.*

There is no Mention made of its Virtues.

XYLOSTEUM. A Name for the *Chamæcerasus*; *Alpina; fructu gemino, rubro; duobus punctis notato*, and also for the *Chamæcerasus; dumetorum; fructu gemino, rubro*.

XYMPATHESIS. Sympathy.

XYMPHYSIS. The same as *SYMPHYSIS*.

XYNAGOGES. *ξύναγωγος*. The Sphincter Muscles.

XYNCLERLÆ. *ξύνκληρλαι*, of *ξύν*, Attice for *σύν*, and *κληρ*, a Preposition importing some Tie or Union, State, Condition, are Concerts or Agreements in Circumstances. Thus *ξύνκληρλαι καθήκοντων*, 6 *Epid. Sect. 7. Aph. 2.* are Conjunctions or Complications of morbid Affections, and here spoken of a Cough, in Conjunction with a Quinsy and Peripneumony. Others understand by *ξύνκληρλαι*, in that Place, no more than a fortuitous Concourse of Affections, which happened in the same Manner as if they were appointed to meet together by the Chance, *τῷ λόγῳ*, "of a Lot."

XYNERISIS. *ξύνερσις*, of *ξύν* for *σύν*, and *ἐρίσθαι*, to establish, fix firmly, to rest upon; is a firm Cohesion or Connexion. Thus *ξύνερσις ὀδόντων*, 7 *Epid.* is a firm Connexion, or what we call clenching of the Teeth, expressed 5 *Epid.* by *ὀδόντων στήλησις*, (*Syntripſis*) Contrition, or rather Confection of the Teeth. The Verb *ξύνερσθαι* is used in the same Sense, *Lib. 2. πρὸς γυναικ.* *Lib. de Morb. Sacro*, and *ξύνερσθαι* in *Coac. 235.* where, for *συνέλθω*, I read *ξύνερσθαι*, *Foessus*.

XYRIS, *Iris fætida*, *spatula fætida*, Offic. *Spatula fætida*, plerisque *Xyris*, J. B. 2. 731. *Xyris*, Ger. 53. Emac. 60. Raii Hist. 2. 1190. *Xyris sive spatula fætida*, Park. Theat. 256. *Gladiolus fætibus*, C. B. P. 30. *Iris sylvæstris quam Xyrim vocant*, Raii Synop. 3. 375. *Iris fætissima seu Xyris*, Tourn. Inst. 360. STINKING GLADDON.

The Root of Gladwyn, which is a Species of wild Iris, or Flower de Luce, is thick and spreading in the Earth, with many Fibres, from which spring many Leaves, longer, narrower, and sharper pointed than the common Flower de Luce, of a very strong Smell: The Stalk arises from among the Middle of the Leaves, smooth and round, and bearing two or three Flowers on the Tops, included in thin Skins or Husks before they are opened, each Flower consisting of nine Leaves, whereof the three Falls are of a dull Colour, full of Purple Veins; the Arches are of the same dull Colour, and the Uprights are of a whitish Purple towards the Top. They are smaller than most other Flower de Luces, and are succeeded by large, somewhat triangular Pods, which, when ripe, burst open into three Parts, like Pionies, shewing the roundish Seed. It grows in Hedges, Thickets and Bushes, particularly by *Jack Straw's Castle* beyond *Islington*, and in the Back Road or Lane which goes from the End of *Newington* to *Southgate*, and flowers in June. The Root only is used, and but seldom.

It is reckoned by some a Specific against the King's Evil and scrophulous Swellings, both given inwardly, and applied outwardly. It is said likewise to provoke Urine, and to be useful in hysterick Disorders. *Miller's Bot. Off.*

The Root smells like the *Cotula*, or Buggs, but is endued with such Virtue and Acrimony, as to render it, as we are assured by *Dioscorides*, effectual in Wounds of the Head, and Fractures, and in drawing out Splinters, and all Kinds of missile

missile Weapons without Pain. Made into a Composition, with a third Part of *Flos Æris*, a fifth Part of the Root of Centaury, and with Honey, and applied with Vinegar, it cures Tumours and Inflammations. The Root bruised in Passum is taken for Convulsions, Ruptures, Sciatica, Strangury, and Fluxes. The Weight of three Oboli of the Seed taken in Wine, is a most effectual Medicine to provoke Urine; the same drank in Vinegar, wastes and consumes the Spleen.

It is taken for a Looseness, in the same Manner as *Rhabarbarum* and *Asarum*, and cures the Disease by diverting the morbid Matter, and discharging it by Urine. It is usual with the poorer Sort and Rustics in *Somersetshire*, to take

the Decoction, or even Infusion of the Root, after the Manner of Iris, for a Purge.

I should be loth, says *J. Baubine*, to use so very hot a Root for all Kinds of Fluxes of the Belly, perhaps its Use might be tolerated in a pituitous Flux. The Root taken inwardly is of extraordinary Service in the Scrophula, says Dr. *Needham*.

The Powder of the dry'd Roots is a very useful Remedy in the hysteric Passion, Orthopnea, and hypochondriac Affections. *D. Bowle*, *Raii Hist. Plant.*

XYSMA. *ξύσμα*. A Strigment: Any Thing scraped off from a Body; from *ξύω*, to scrape.

XYSTER. *ξύστης*. A Lenticular, or Raspatory.

XYSTOS. *ξύστος*. Scrap'd Lint.

Y.

YARIN. *Flos Æris*. *Rulandus*. See *Æs*.

YAWS.

The *Yaws* is a Distemper epidemical, or rather endemical to *Guinea*, and the hotter Climates in *Africa*, seldom failing to attack each Individual of both Sexes one Time or other in their Lives, but most commonly in Childhood or Youth; it makes its first Appearance in little Spots on the Cuticle, level or smooth with the Skin, at first no larger than the Point of a Pin, which increase daily, and become protuberant like Pimples; soon after the Cuticle frets off, and then, instead of finding Pus or Ichor in this small Tumor, you only find white Sloughs or *Sordes*, under which is a small red Fungus growing out of the *Cutis*, increasing gradually to very different Magnitudes, some less than the smallest Wood-strawberry, some as big as a Rasp-berry, and others even exceeding in Bigness the largest Mulberries, which Berries they very much resemble, being knobbed as they are. While they are coming to this Height, the black Hair that grows out of the Parts now covered with the *Yaws*, changes gradually to white; I do not mean appears white by the Ichor of the *Yaws* drying upon it, as all the Skin does towards the End of this Distemper, but the Substance of the Hair itself is changed from black to a transparent white, like the white Hairs of old Men.

I think it impossible to calculate the exact Time that the Distemper requires to go through these different *Stadia*: Some Constitutions may be more adapted to produce this nauseous Distemper, or to receive it from others by Infection; nay the same Constitution may be apt to receive or produce it at one Time more than at another; and if it is produced by external Infection, the Degree and Quantity of Infection may hasten or retard the Symptoms. This I know by Experience, that Negroes who were lusty, in good Plight, and had full Nourishment allowed them, in a Month after discovering the white Spots, have had several *Yaws* as big as a Mulberry; and in Negroes that were low in Flesh, and have had but a poor scanty Diet, in three Months Time none of the *Yaws* have exceeded a common Straw-berry in Size.

The *Yaws* appear indeterminately on all the Parts of the Body, but the most and biggest are generally on the Groins, about the Privities and *Anus*, in the Armpits and Face. When the *Yaws* are very large, they are few in Number, and when many in Number, they are small in Size. All this Time the Patient is in good Health, does not lose his Appetite, and seems to have no other Uneasiness but what the Nastiness of the Sores occasion, for they are not painful except they are touched too roughly. This is the natural Appearance of the Distemper, when left to itself, and in this State it will continue a long Time, without any sensible Alteration; and what might be the Consequence in Time, I cannot pretend to tell you, whether it might not consume itself, and cure as soon as the peccant Matter is thrown entirely out and exhausted: Or, whether these *Funguses* might not turn corrosive Ulcers, and at the same Time affect the Bones with *Nodes*, *Exostoses* and *Caries*, as it does when the Cure is attempted without Success: Or, whether it might not alter the Diameter of all or some of the Excretory Ducts of the miliary Glands, and adapt them to excrete a Fluid more viscid than the natural Sweat, or insensible Transpiration, which drying on the Skin would render the Patient scorbutick or scabby, that is, leprous. This I imagine to be the most probable Conjecture, and that as soon as the *Funguses* are dry, the Infection is exhausted. This Distemper being infectious, it is the Business of the Negro's Master to seek for a Cure, as well for the Sake of the Negro affected, as for himself, Family, and other Ne-

groes on the Estate, that have not had it before, who are in danger of being infected.

The *Yaws* do not prove often dangerous, if the Cure is undertaken skilfully at a proper Time, and the Patient has not undergone any Course of Physic for them before; but if the Patient has been once salivated, or taken any Quantity of Mercury, and the Skin once cleared, and they appear again, they are always difficult to cure, and often incurable; and indeed I am of Opinion, that the following Train of terrible Symptoms owe their Original as much to the untimely and unskilful Use of the Mercury, as to the Distemper itself. I am induced to this Belief by these Reasons:

All the Negroes that have had the *Yaws* in *Africa*, and have been cured there, never have them again here, or any bad Symptom that seems to proceed from them; and in the Course of nine Years Practice here, I never had any Patient that relapsed when I was first employed, nor ever lost one, tho' I have cured Numbers of both Sexes, and of all Ages. Nor is it to be admired that the *Africans* should understand their Country Distemper better than we *Europeans*; they, probably have had above three thousand Years to gain Experience of it by Observation, we have not had one hundred Years.

As soon as a Negro is perceived to have the *Yaws* coming out upon him, he must be removed to a House by himself, or, if you cannot be sure whether it is the *Yaws* or not, shut him up seven Days, and look upon him again as the *Yaws* are commanded to do with their Lepers, *Levit. xiii.* and in that Time you may commonly be certain. As soon as you are convinced that the Eruptions are really the *Yaws*;

Take Flowers of Sulphur, one Scruple; Camphire dissolved in Spirit of Wine, five Grains; *Venice* Treacle one Dram, and of Syrup of Saffron a sufficient Quantity to make a Bolus, which is to be taken every Night at Bed-time.

Repeat this Bolus every Night for two or three Weeks, or till the *Yaws* are at their Height, which is easily discovered by their being at a Stand, neither increasing in Size or Number; then is the Time to throw your Patient into a gentle Salivation by Calomel, without any further Preparation of the Body. Give the Calomel in small Doses at a Time, that it may neither vomit nor purge. I never exceeded five Grains at a Time in Pill or Bolus, and repeated the Dose, once, twice, or thrice a-day, as I found the Patient could bear it, and never designedly raised the Salivation to above a Quart spitting in twenty four Hours: Very often by the Time you have got the Salivation to this Height, all the *Yaws* will be covered over with a dry scaly Crust or Scab, which in Patients that have been full of them, makes a very terrible Figure. These Crusts or Scabs fall off daily in small white Scales, and in ten or twelve Days leave the Skin smooth and clean: Then I leave off giving any more Calomel, and let the Salivation go off gradually of itself. After the Salivation, sweat them twice or thrice in a Frame or Chair with Spirit of Wine, and prescribe the following Electuary:

Take of *Æthiops Mineral*, an Ounce and an half; Gum Guaiacum, half an Ounce; *Venice* Treacle and Conserve of red Roses, of each one Ounce; Oil of Sassafras twenty Drops; and Syrup of Saffron a sufficient Quantity to make an Electuary. Let two Drams of this Preparation be taken Morning and Evening.

I likewise order them to drink the Decoction of Guaiacum and Sassafras, fermented with Syrup or Molasses, for their constant Drink, while they take the Electuary; and to be continued for a Week or a Fortnight after the Electuary is done.

Sometimes after all the other Yaws are fallen off, the rest of the Skin is clear, and the Salivation is over, there remains one large Yaw, high knobbed, red and moist; this is commonly called the *Master Yaw*, and has cost many a Negro his Life, by the Practitioners believing that this required another and another Salivation; in reality this requires no more than being destroyed by a gentle Caustick, or mild Escharotic, about an eighth or tenth Part of an Inch lower than the Skin, and then it will cure up as easy, and as soon as any other Ulcer of the same Bigness and Figure. I commonly have used red Precipitate and burnt Alum, of each equal Parts, for my Escharotic; digested with yellow Basilicon one Ounce, and red Precipitate one Dram; and cicatrized with Lint pressed out of Spirit of Wine, and with the Vitriol Stone.

After the Yaws are cured, some Patients are afflicted with Carbuncles in their Feet, which sometimes render them incapable of walking, or if they do walk, it is with much Pain.

This Distemper seems to be owing intirely to the yawy Matter being confined by the Hardness of the Cuticle in the Soles of their Feet, by continually walking barefooted. Sometimes the whole Sole of the Foot will be affected, and they cannot bear any touching it, and at other Times there is only one Spot, no bigger than an *English Shilling*. In Time the Pain brings on an Inflammation and Suppuration, and the Patient is easy; it seems to be cured, and often is so, by the whole yawy Fungus being consumed by the Suppuration. At other Times, in five or six Weeks, as the Skin hardens, the Pain, Inflammation, &c. begin again, and thus the Symptoms go and return for Years, till either the Fungus is consumed by the frequent Suppurations, or destroyed by Art. The Planters and Negroes try many *Nostrums* for this Malady, but the only effectual Method is by Bathing and Paring to destroy the Cuticle, and then proceed as in the *Master Yaw*. The gentle Escharotics are to be preferred, especially here, and all imaginable Care is to be taken to avoid the Tendons and *Periosteum*.

In Children under six or seven Years old, who cannot be supposed to have Sense enough to go through a Salivation, at the proper Time of salivating, I begin to give them a Grain or two of Calomel in white Sugar once a-day, once in two Days, or once in three Days, so as only to keep their Mouths a little sore till the Yaws dry, and falling off in white Scales, leave the Skin clean. This succeeds always, but requires a longer Time than in Adults.

I have thrice had the Mother with her sucking Child under my Care for the Yaws; both Mother and Child were full of them. Two of the Children I cured by curing their Mothers, without giving the Children any Medicine but what they received from their Mothers in sucking their Milk; the third Child, who was both bigger and older than the former two, when his Mother was well, his Yaws were dry, and in one white Crust or Scab, but did not scale off, and I was obliged to finish his Cure with three or four small Doses of Calomel, and a Course of *Æthiops*. I have been well informed, that even in Adults the *Æthiops Mineral*, given in large Doses for three or four Months, will make a perfect Cure: I never tried it, because it requires so long a Time, and there is no trusting a Negro to take his Medicines himself, and the Planters neither care to lose their Labour, nor to take the Trouble of attending them so long; but I am convinced it would succeed with Safety.

Some may be surprised, that in my Mercurial Course for this Distemper, I neither prepare the Body with bleeding and purging before the Salivation, nor purge after it. As to the first, the Distemper is cutaneous, or rather the Skin is the natural emunctory by which the peccant Humour is thrown off in this Disease, by a very extraordinary and preternatural Crisis. All that I mean by a preternatural Crisis is, that the Cause of this Distemper, like the Small-Pox, can never be concocted, so as to go off by any of the natural Secretions; and the Funguses here are as natural as the Pustules in the Small Pox; for if you salivate your Patient before the Yaws are at their Height, the best that you can expect is their appearing again soon after the Salivation: And what can be expected from Bleeding and Purging, but retarding the Yaws in coming out to their Height, and probably carrying off some Fluids that are absolutely necessary to Nature in her Operation, or perhaps intimately mixing the Cause of this Distemper with the Fluids, so that an intire Separation can never be procured afterwards?

And as to purging after Salivation, if the morbid Matter is intirely exhausted, what Occasion is there for Purges? Can we propose carrying the Matter off by the Intestines, which naturally seems to go off by the Yaws themselves? Is it not more probable, that some small Particles that are left about the Skin, might be washed off by the natural Perpiration and Heat, which by purging may again be returned to the Blood, and create fresh Disorders? Add to all this, the *Master Yaw*, when in full Bloom, is merely topical, and easily cured by Topics, tho' it contains Infection enough to produce the Yaws in Hundreds by Inoculation.

The venereal Disease and the Yaws, as far as I have described the latter, are very distinct Distempers, but the Symptoms, in consequence of the Yaws ill-cured, coincide so exactly with the Symptoms of an inveterate *French Pox*, and too promiscuous Copulation of the Negroes renders them so liable to the venereal Taint, that in most Cases it will be very difficult, if not impossible, to distinguish them, especially if the Patient has had both Distempers at any Time in his Life before his present Complaints.

The Symptoms are, violent Pains in the Limbs, even nocturnal, which with some are attended with Nodes and Exostoses, in others with Ulcers, which render the Bones carious. I shall not pretend to determine which Distemper they belong to; but I think if a Patient, that never had any Symptoms of the venereal Disease, and had the Yaws, was to labour under these Symptoms, I should make no doubt of their proceeding from the Yaws, and more so, if these Symptoms did not yield to the Method of Cure that either palliates or cures the Pox, but rather irritates and increases them. I shall give an Observation or two, where I think the Case proceeded from the Yaws, and leave you to judge for yourself.

In the Year 1727 I was desired to look upon a young Negro Man, long afflicted with Ulcers in his right Leg and Foot, occasioned, as was supposed, by the Yaws being ill-cured in his Child-hood; he seemed to be healthy in every other Respect, and had undergone several Salivations and Courses of Physic unsuccessfully. I found two of the *metatarsal* Bones consumed, and the other three carious, the *Os Calcis*, and the lower *Epiphysis* of the *Tibia* were likewise carious. I told the Lady to whom he belonged, that it was not in my Power to serve him; these Bones would rot, and not exfoliate, and if I proceeded to Amputation, as they desired, I either should not be able to cure up the Stump, or if I did, he would not long survive it: However, upon the continual Entreaties of both the Mistress and Negro, I at last condescended to amputate his Leg.

I bled and purged him twice or thrice, and made him an Issue in the opposite Leg, and one in each Arm. Some Days after they were digested, I took off his Leg at the usual Place, and cured the Stump with all the Ease imaginable, and he was very glad to walk about on his wooden Leg. About a Month after the Stump was perfectly cicatrized, he was seized with a Fever, and in a few Days after, with a violent Pain and Inflammation in his Thigh and Knee of the amputated Leg; in a Fortnight after the Approach of the Fever, I found a Fluctuation of Matter in his Ham, and opening it by Incision, discharged a Pint of Matter at first. As the Imposthume digested, the Fever wore off, and he recovered; he is now alive and in Health, but keeps the Incision still open as an Issue.

A young Woman of a good Education came from England here, as a School-mistress to a Gentleman's Daughter; some time after, she married an Overseer, who gave her the Yaws; as soon as she perceived the Distemper, being much frightened, she went to a Planter, who used to cure a great many Negroes; there was then but just Yaws enough to show that Distemper. He immediately shut her up in the Hot-house, (as they call it here), and that Night anointed her with the mercurial Unction, according to *Serjeant Wiseman's* Proportion of the Quick-silver. This once anointing threw her into a deep Salivation, which lasted between six and seven Weeks: Four Weeks of that Time she could not speak a Word, and the Saliva was deeply tinged with Blood. After the Salivation she seemed perfectly well, soon recovered her Strength, and engaged to go to England with a Gentleman's Lady as her Chambermaid, and accordingly embarked in May or June 1728.

Some Weeks after she arrived in London, she was attacked with violent Pains in her Arms and Legs, and applied herself to a Surgeon or Apothecary of her Acquaintance, who gave her many Medicines to no Purpose; for while she was under his Care, an Ulcer broke out in her Leg, and another in her Arm: Upon this her Money beginning to fall short, and thinking she had a better Chance of getting well in a Country where her Distemper was known, than where they knew little of it, (at least those she applied to) she got a Passage to this Island again.

In August 1729, she came to me begging my Assistance; she was really an Object of Charity, and I promised to give her my utmost Endeavours to serve her, without the least Prospect of Gain. The Pains of her Limbs then continued severe, and she had five or six Ulcers in different Parts of her Arms and Legs, all covered with an *Hyperfarcosis*.

I told her she must be very sincere in answering what Questions I asked her; for as her Husband had given her the *Yaws*, he might as well have given her the *venereal Disease*, and that I should have more Hope of curing her, if the present Symptoms proceeded from the last, than if they were the Consequence of the first. She told me she never had any venereal Symptom in her Life, either before she had the *Yaws* or since, that a few Days before she discovered she had the *Yaws*, her Husband left her, and went to Sea, his first Profession; that she had never seen him since nor conversed criminally with any other Man. Her sincere and sensible Way of answering every Question I could ask her, as they occurred to me, and the good Character she bore among her Acquaintances, as well as its being her Interest to tell me the Truth, which she might without any Shame, convinced me she was sincere, and had no Design to deceive me, or ruin herself.

I immediately dressed the Ulcers with gentle Escharotics to destroy the *Hyperfarcosis*, and put her into a Course of *Æthiops*, with the Decoction of the Woods in Lime-water, and gave her gentle Cathartics twice a Week with *Mercurius Dulcis*. After a Month or six Weeks spent in this Method, I found it had no Effect; for after the *Funguses* were consumed, the Ulcers seemed to digest a few Days, and then gleeted again, and never in the least contracted. I then threw her into a gentle Salivation with *Calomel*, designing to keep her long in it gently; after she had spit about a Quart a-day for four Weeks, finding it not answer, the Ulcers enlarging, and the Pains becoming more violent, I was resolved to let it go off: But at Night there fell a great Rain, and the Room not being tight in the Roof, was very wet. The next Day the Salivation stopt, and she had a Fever for a Fortnight, which at length went off, and left her so weak and emaciated, that I was afraid she would die consumptive at last.

I then put her into the Milk-Diet, and ordered her a Decoction of *Sarsaparilla* and *China* Roots, to be drunk for her constant Drink, with one third Milk. In about eight or ten Weeks she recovered her Strength and Flesh, and was advised by some of her Neighbours to use a Diet-drink that a certain Negro made, which they said had cured Numbers in her Case, after all other Means had failed. This she used six or seven Months, and dressed the Ulcers with Tincture of Myrrh, bathing them every Dressing with warm Lime-water: But both they and her Pains increased; the Bones became carious in every Ulcer, and she lingered under the Distemper to the End of the Year 1734, and died.

When I come to this Island, it was the Practice here, as soon as the *Yaws* appeared, to give the Patient 25 Drops of a Solution of two Drachms of *Mercur. sublimat. corrosiv.* in eight Ounces of strong Rum in the Morning, drinking warm Water after every Puke, and they would vomit and spit all the Forenoon. This Dose they repeated every Morning, increasing the Quantity five Drops every Dose they took, in a few Days they were seemingly well: But I observed that most that had been treated after this manner, either broke out again, or in process of Time complained of gnawing Pains in their Bones, or were subject to Ulcers in several Parts of their Bodies. The Disease at its second Appearance was long in coming to an Height, and required a longer Course of Mercury to clear their Skin; and sometimes, after all, they would relapse a third and fourth Time.

Of those Patients that were affected with Ulcers, I have succeeded with some by Salivation, and long Courses of the *Æthiops*, with the Decoction of the Woods in Lime-water, many I have been foiled in, and never been able to cure, but left them, I think, rather worse than I found them, to linger out their Days miserably. Nor can I pretend to better Success in those that have complained of Pains in their Bones, they have generally ended in *Nodes*, *Exostoses*, and *Caries*, and the Bones of the Arms and Legs break without any external Violence.

A Negro Man, called *America*, belonging to Sir William Stapleton, after having had the *Yaws*, complained of Pains in his Limbs, and had been useless in the Plantation for nigh twenty Years, most of his Bones being full of *Nodes* or *Exostoses* and *Caries*. In the Year 1733 his *Os humeri* broke in the Middle, without any external Accident. I reduced and dressed it as a common Fracture. About six Weeks after, when the *Callus* ought to have been grown strong, I found the Ends of the Bones move easily one on another; and upon a gentle Extension of his Arm, the Ends of the Bones were a full Inch distant from each other. In about twelve Months more the *Os humeri* was consumed entirely within an Inch of the *Scapula*, and about the same Distance from the Elbow. Soon after this he died tabid.

It is worth while to compare the Description of the *Leprosy* among the Jews in Chap. xiii. of *Leviticus*, with the Account which I have here given of the *Yaws*; the two Distempers seem to have a great Resemblance to each other. *Edinburgh Med. Essays*.

Upon the Coast of *Antigua*, they have a large turbinated Shell, which they call the *Conch*. This they calcine, and give to the Negroes and others labouring under the *Yaws*, as is said, with great Success, insomuch that they esteem it an almost infallible Remedy; but it must be continued for some Time.

YAYAMA. A Name for the *Ananas*; *aculeatus*; *Fructu Pyramiditato*; *carne aurea*.

YC. Good. *Rulandus*.

YEAR. A Medicine. *Rulandus*.

YDRARGYROS. Quicksilver. *Rulandus*.

YECOTL. The same as PALMA-PINUS.

YELION. A barbarous Word for *Yalos*, Glass.

YERVA. The same as CONTRAYERVA.

YERVA MORA. The Spanish Name for the *Arbor bacifer Canariensis*, *Syringa cerulea foliis, purpurantibus venis, fructu monopyreno*. The Name of a Plant now very common in the English Gardens, but of no Use in Medicine.

YETTUS. The Name of an opaque, hard Stone of a red Colour, used instead of the *Lapis Lydius*, or Touch Stone.

YGROPISSOS. Liquid Pitch.

YLECH. See ILECH.

YLEIDOS, or YLIADOS. See ILIADOS.

YLIASTER. The same as Iliaster. See ILIADOS.

YOMO. YOS, or YN. Verdigrise. *Rulandus*.

YPSILOGLOSSI. A Name for the Muscles called *Basioglossi*.

YPSILOIDES OS. The *Os Hyoides*.

YQUETAIA. A Plant of *Brasil*, as yet but little known, but whose Virtues are highly extolled by a French Surgeon settled in *Portugal*, who found it in *Brasil*. M. *Marchand*, with the Assistance of M. *Hombert*, has made a Discovery that this rare and foreign Plant is every Day trodden under our Feet, and is no other than the *Scrophularia aquatica major*. They ascribe to the *Yquetaia* the Property of depriving Senna of its ill Taste and Smell without diminishing its Virtue, which would much facilitate the Use of a Cathartic so excellent on other Accounts. And the very same Property is found to belong to the Species of *Scrophularia* before mentioned, but was unknown before it came to be discovered by the Resemblance of this Plant to the *Yquetaia*. If this *Brasilian* Plant proves as good as it is said to be for the Pleurisy and Apoplexy, possibly the *Scrophularia* may carry on the Resemblance thus far, and come in for an equal Share of the same Virtues. M. *Marchand* is persuaded that we bestow not enough of our Time in studying the Plants of our own Country, which are often of as much Value as Exotics, and that the Misfortune they lie under in being Natives of our own Soil, and growing among us, has too much injured them in our Esteem. *Histoire de l'Acad. des Sciences* 1701.

YRCUS. A male Cony, whose Blood is said by the Spagiriasts to mollify Glass, and Flints. *Dornæus*. *Rulandus* calls it *Yrius*.

YRIDES, or YRIDE. Orpiment. *Rulandus*.

YRIS. Iron. *Rulandus*.

YSAMBRA. A Species of Poison, prepared in Spain of Hellebore; or Hellebore itself.

YSIR. The Powder, or Philosopher's Stone in a dry Form.

YSOPUS. The Art of Separation in Chymistry. *Rulandus*.

YSPAR. The same as YSIR. *Rulandus*.

YTZAMOTL. A very large Indian Tree, from which a Species of Manna is procured not unlike ours, but somewhat harder, and more glutinous. *Raii Hist. Plant.*

YUCCA.

The Characters are;

The Root is thick, and as it were tuberos, and the Plant has the Appearance of a Tree. The Leaves resemble those of the Aloe, are rigid, with an aculeated Apex, narrow and long. The Flowers are monopetalous, Bell-shaped, divided into six Segments, naked, disposed in long Spikes, with a single Row, and embracing an Ovary, which becomes a tri-lobular Fruit, as in the Aloe.

Boerhaave mentions but one Sort of *Yucca*, which is;

Yucca; foliis Aloes, C. B. P. 91. *Boerb. Ind. A. 2.* 132.

Yucca, Offic. *Yucca sive Yucca Peruviana*, Ger. Emac. 1543.

Raii Hist. 2. 1201. *Yucca sive Yucca*, Park. Parad. 434.

INDIAN BREAD.

It grows in *America* spontaneously, but is cultivated with us in Gardens.

It is of no Use in Medicine, and is even said to be poisonous, tho' erroneously, since it conduces to the Sustentation of Life, by affording a Sort of eatable Bread prepared of the Root reduced to a Flour. And the Root itself may be eaten with Safety, and even with Advantage, without any Preparation.

This Plant is not the same as that of whose Root they make the Bread called *Cassavi*, commonly eaten in *America*, as some have erroneously thought. *Raii Hist. Plant.*

The thick and fleshy Root affords a soft Pulp, which some condemn as Poison, others affirm to be esculent. Consult the Historians. The recent Root eaten is poisonous, but being bruised, then dried in the Sun, affords a Bread commonly eaten by the *Indians*. The Juice of the Root is so poisonous that they take Care to convey it deep under Ground, that it may not come to the Taste of Animals, to which it would certainly prove mortal. *Hist. Plant. ascript. Boerhaave.*

YXIR. A good Medicine.

YZTACTEX. *Calceatol, seu virga nigra Saxorum.* Hernandez.

Z.

Z. This Letter formerly stood as a Mark for several Sorts of Weights. Sometimes it signified an Ounce and half, and very frequently stood for the eighth Part of an Ounce, that is, a Dram or half a Sicilicus. From an ancient Copper-plate it appears to be the Character of a *Duella*, or the third Part of an Ounce, consisting of eight Scruples. *Rbodius ad Scribonium Largum.*

ZZ. This double Letter among the ancient Physicians used for *Myrrh*, *quædam*, because *ζωμην*, *Zmyrne*, was as much as *quædam*, *Smyrne*. At present by ZZ is generally understood *Zingiber* or *Zinziber*. *Gorræus.*

ZAAR, with the *Arabians* and *Persians*, signifies Poison, whence *Belzaar*, for *Bezoar*, is as much as to say, the Lord or King of Poisons. *Castellus.*

ZAARA in *Avicenna*, is a Name for the *Vigilia morboſa*, or morboſus Watching.

ZACCHARUM; used by some for *Saccharum*, as is also *Zuccarum*, by *Salmaſius de Manna & Saccharo.*

ZACCON. *Caſt. Zacon Hiericuntæ, Foliis Oleæ, J. B. Prunus Hiericuntica, Folio anguſto Spinoſo. C. Bauh.*

This is a Species of exotic Plum-tree, growing in the Plain of *Jericho*, about the Bigneſs of an Orange-tree, with Leaves reſembling thoſe of an Olive-tree, but ſmaller, narrower, more pointed, and very green. The Flowers are white, and the Fruit of the Bigneſs of a Plum, round, green at firſt, but as they grow ripe, yellow, and incloſing a Stone like that of a Plum. From the Fruit they extract an Oil by Expreſſion, which is good to diſcuſs and reſolve cold and viſcous Humours. The Tree is called *Zaccon*, becauſe it grows near the Churches of *Zaccharus* in the Plains of *Jericho*. *Lemery des Drogues.*

ZACINTHA.

The Characters are;

The Calyx is ſquamous. The Ovary becomes a little ſtri-ated Head, having in the Middle an erect Axis, in which grow a Multitude of Eggs, which, when ripe, fall off with their Involucrum or Cover, and are as ſo many Capſules, containing ſmall downy Seeds.

Boerhaave mentions but one Sort of *Zacintha*, which is;

Zacintha; five *Cichoreum vernicarium. Tourn. Inſt. 476. Boerb. Ind. A. 90. Park. Theat. 779. Zacintha, Cichoreum verrucarium, Offic. Cichoreum verrucarium ſive Zacintha, Ger. Emac. 289. Raii Hiſt. 1. 255. Cichoreum verrucarium ſive Zacintha, Hieracii adnumerandum, J. B. 2. 1013. Chim-drilla verrucaria foliis Cichorei viridibus, C. B. P. 130. Inbybus ſive Endivia lutea, verrucaria, Hiſt. Oxon. 3. 53. WART SUCCORY.*

It grows ſpontaneouſly and plentifully in ſome Parts of *Italy*, but is cultivated with us in Gardens, and flowers in *June*. The Plant is diuretick and edulcorating, and allays the immoderate Heat of the Blood. *Mont.* It is reported to be of ſurpriſing Virtue in removing Warts, whether it be eaten in Salads, or the Juice thereof rubbed on them. *Raii Hiſt. Plant.*

ZACYNTHIUS. A patronymic Epithet of liquid Bitumen. *Galen. de C. M. G. Lib. 4. Cap. 13.*

ZADURA. *Ξαδουρα*, a barbarous Name, but adopted by the latter *Greeks*, for an exotic Root, round and ſmooth, and of the Colour of Ginger; it is imported from the *Indies*, and is good againſt the Peſtilence. *Gorræus.*

ZAFFABEN. Putty. *Rulandus.*

ZAFFRAMEN. Crocus. *Castellus.*

ZAFFRAN, ZAFFRAN. Signifies *Crocus* principally, and next to that *Oker*. *Rulandus Johnson.*

ZAGU. *Ferd. Lopez. Sagu pigofetta. Cluſ. Arbor fari-*

It has the fibrous Root of the *Aſarum*, and the Fibres, which appear, a great Part of them, above Ground, are in Taſte and Smell not inferior to the *Nardus*, and far ſuperior to the common *Valerian*. The Leaves are ſerrated, like thoſe of the *Nettle*, the Stalks Purple, round and ſmooth, and four Cubits in Length, on the Tops of which the Flowers grow in Tufts, and are of a white Colour, inclining to a Purple.

It grows in rocky Places in *Braſil*. The Taſte of this Plant is exactly like that of *Aniſe*. A Pugil of the Root bruised, and taken in Water or Wine provokes Sweat in thoſe who labour under any Pains, and mitigate the ſame in a ſurpriſing Manner. *Raii Hiſt. Plant.*

nifera Cluſ. extot. Arbor vaſta in Regno Fanſar. Polo Veneto.

This is a large Tree, reſembling the Palm-tree, and growing in the Iſland of *Ternate* near the Equator. At the Top it bears a round Head like a Cabbage, in the middle of which is a kind of farinaceous Subſtance, of which the Inhabitants of the Country make Bread.

ZAHIR. An Arabic Name in *Avicenna*, for a kind of dyſenteric Flux from the Inteſtinum Rectum, attended with a tenſive and abraſive Senſation. *Castellus.*

ZAIBAC, *Zaibach, Zaibar*, Names for Mercury, or Quickſilver. *Rulandus, Schroder.*

ZAIDIR. Copper, or Verdigreaf. *Dorn. Rulandus.*

ZALE. *Ξαλιν*, in *Mohſcion de Morb. Mulier.* ſignifies a Storm.

ZAMIAE. Are thoſe Nuts of the Pine-tree which have looſen'd themſelves, and unleſs they be gather'd will hurt the reſt which are not yet fully ripe. *Plin. Lib. 16. Cap. 26.*

ZANDIK. Aqua foliate. *Rulandus.*

ZANTHOXYLUM. See LIGNUM FLAVUM.

ZAOCEL. Taxus. *Rulandus.*

ZAPHARA, *Zaffara*. The mineral Matter of Biſmuth, which belongs to *Smalt* or *Amanſa*, which ſtains Glaſs with a bluifh Colour, whence it is uſed by Potters for the ſame Purpoſe. *Cæſalpinus* call'd it a Stone, others Earth, and ſome *Lazarius ex Biſmutho. Castellus.*

ZAPHIRUS. Corruptly for *Saphirus*.

ZAPOTUM, *Zapote*. Is a Fruit of *New Spain* in *America*, called by the *Spaniards Zapote blanco*, of the Shape and Size of a Quince, of an agreeable Taſte, but not wholeſome, and incloſing a Kernal which is ſaid to be dangerous Poiſon. This Fruit grows on a large Tree called by the *Indians Cochitſapotl*, whoſe Leaves are like thoſe of the Orange-tree, diſpoſed by Threes at Intervals, and its Flowers very ſmall, and of a yellow Colour.

ZARAS. Gold. *Rulandus.*

ZARUTHAN. A hard and unequal Tumour of the Breſt attended with a Pain which is not quite continual, and a burning, Heat much reſembling that of a Cancer, whence it is called a *ſpurious Cancer*. The Cauſe is ſuppoſed to be an ichorous, aduſt and acid Blood. *Castellus.*

ZARDA. A Diſeaſe in Horſes. *Castellus.*

ZARIFU. Tin. *Rulandus.*

ZANNA. A Medicinal Earth, found in that Part of *Armenia* which borders on *Cappadocia*, very drying, of a pale Colour, and very eaſily diſſolv'd like Calx. It is called by the Natives *Zarina*, but in *Syria*, *Zarnacha*. The Mountain whence it is taken is near the City called *Bagauona*, and the Territories about it *Agarra*. The Earth itſelf, without the Mixtures of any heterogeneous Subſtance, is ſuppoſed to be of a drying Quality, without Stimulation. But ſince there is no Body perfectly free from Mixture, the Nature of what enters its Compoſition is to be examined, with reſpect to Gravity and Taſte. If there be any Aſtringency diſcover'd, its Coldneſs is to be eſtimated in Proportion to that Aſtringency; if it appears to be acrimonious, its Heat is in Proportion to that Acrimony. With reſpect to Lightneſs, and Gravity, the firſt ſhews a cupious Mixture of Air throughout its whole Compoſition; but the more ponderous it is found, the more of pure Earth it contains. Now it is the Property of Earth not to be fuſed when ſubjected to the Fire, and to be eaſily diſſolved into Clay when it is moiſtened with Water. *Oribaiſius, Med. Collect. Lib. 15.*

ZAR-

ZARNACHA. See the preceding Word.
ZARNEG, *Zarneq, Zarnich.* Orpiment. *Rulandus.*
ZARSA PARILLA. See **SARSAPARILLA.**
ZATANEA. The Flower of *Agnus Castus*; it is also called **ZUCCAJAR.** *Rulandus.*

ZATA-HENDI Raii. A Name for the *Majorana*; *rotundifolia*; *scutellatu*; *exotica.*
ZAUIHIRON. Oriental Crocus. *Rulandus.*

ZEASPELTA. Offic. *Zea five Spelta*, L. B. 2. 412. *Raii Hist.* 2. 1242. *Ger.* 62. *Emac.* 69. *Zea dicoccos, five Spelta vulgo*, Park. *Theat.* 1122. *Zea dicoccos vel Zea major*, C. B. P. 22. *Theat.* 413. **SPELT WHEAT.**

Zea is a Sort of Wheat with the Husk or Chaff, so closely adhering to it, as not to be separated by Threshing. They will have it called *Zeia*, *Zeia*, or *Zeia*, *Zeia*, *Zeia*, *Zeia*, from Living, because before the Invention of Wheat, Men lived thereon. The most ancient Romans, as we are informed by *Dionysius Halicarnassensis*, called *Zea* by the Name of *Far*, which, however, is a Word of ambiguous Signification.

Zea, or Spelt, is not unlike Wheat, with a manifold Root, whence arise numerous, slender, jointed, firm Stalks, higher than those of Barley, but shorter than those of Wheat. The Spike, or Ear, which is in Flower about Midsummer, is a Palm, or a Palm and half in length, rough, compressed, generally without a Beard, tho' sometimes furnished with a longer or shorter one, and bearing a double Row of Grains, or the Grains so disposed that the Middle of one Grain shall answer alternately to the Beginning of another. The Grains are closely included in a manifold Husk, a Pair of Husks being joined to a Pair of Grains, and are longer than those of Wheat, of a sharp Back, and a russet Colour. The Husk pertinaciously adheres to the Grain, and will not be separated from it by the Stroke of the Flail, by which, says *J. Bauhine*, you may distinguish it from the common Wheat, which it otherwise so well resembles, that when both are stript of their Coats and Husks, it will be difficult to know the one from the other.

It grows in many Parts of *Italy*, *France* and *Germany*, thriving well enough in any Sort of Soil, even tho' more humid than ordinary, tho' delighting most in a rich and fat Soil.

Zea is sown in Flower, and reaped at the same Times with Wheat. If *Zea* be husked and cleaned, and afterwards sown, it is changed into Wheat on the third Year, if we may believe *Theophrastus*. And *Pliny* says, "We are told that *Zea* and *Tiph* being a degenerate Kind of Grain, return to "Wheat, if husked and sown, tho' not immediately, but on "the third Year." We deny not but that it may sometimes happen for *Zea* to pass into Wheat, but see no Reason why such an Effect should always follow, when it is sown decorticated; let the Authors speak for themselves.

The *Germans* make Bread of Spelt, as white as those of Wheat, but lighter, and less nutritive; while new it is sweet, and easy of Concoction, but when stale it is not so grateful, and is besides difficult to be digested. Puddings are prepared of the same with Milk, Almond Milk, Wine, or Beer and Sugar, which are good for sound as well as sick Persons. Broth or Gruel made of the Flour is astringent, and therefore adapted to the same Purposes as one prepared with Rice, being proper in a *Hæmoptysis*, *Dysentery*, *Diarrhæa*, and the like, especially when boiled with the Feet of Calves or Weathers; outwardly, also, it serves the same Intentions.

The Antients, we may observe, unanimously condemn Bread made of *Zea* or Spelt, whence it is plain, says *C. Bauhine*, that this *Zea* was different from that which *Pliny* says, the Romans called *Seed*, [See **ALICA**.] of which was prepared that excellent Food *Alica*. *Raii Hist. Plant.* p. 1242.

ZEBD. Butter. *Rulandus.*

ZEBET. Dung. *Idem.*

ZEC. *Tragacanthum*, or *Tragacanthum*. *Rulandus.*

ZEDOARIA. Zedoary.

We have two Kinds of this Root, one named *Zedoaria longa*, C. B. P. the other *Zedoaria rotunda*, C. B. P. But they are both the Roots of the same Plant, the Body of which is round, and the Protuberances, or Ramifications, long. The Plant they belong to is a kind of *Colchicum*, described by *Herman* in the *Paradisus Batavus*. They are brought from the East Indies, and have an aromatic, camphorated Taste. They are reckoned attenuant, detergent, emmenagogue, carminative, anthelmintic, cordial, alexipharmic, stomachic, diuretic, &c. The Dose is from five Grains to half a Dram in Substance, and it may be used in Infusion like Tea. Some correct Opium with this Root. *Simon Pauli* pretends it is the best Carminative now known, and values it as a grand Specific for voiding Wind. *Geoffrey*.

The first Sort is thus distinguish'd.
ZEDOARIA LONGA. Offic. C. B. P. 31. Park. *Theat.* 1612. *Raii Hist.* 2. 1340. *Zedoaria*, *Ger. Emac.*

1623. *Gedwar aut Geid.* var. *Ejusd.* *Zedoaria Zeilanica Camphoram redolens*, Boerh. *Ind. A.* 2. 128. *Haronkaba*, *Herm. Mus. Zeyl.* 50. **ZODOARY.** Dale, p. 251.

This has a Root two, three or four Inches in Length, and as thick as the little Finger, and ending at both Extremities in a blunt Point. It is white on the Outside, and within of an Ash Colour inclining to brown, of a dense, solid, fat and ponderous Substance, and of a fine Taste and Smell, bitterish, moderately acrimonious, with a kind of Heaviness, and emitting, while pounded or chew'd in the Mouth, a Fragrance highly aromatic, a very small Portion of it sweetening the Breath, and penetrating into the Head.

Chuse what is large, thick, full, and not wrinkled, of a fattish, viscous Substance, resisting in some measure the Teeth, on account of its Solidity, remarkably fragrant, and without Perforations; the longer to preserve it, it must be kept in a dry Place. It grows spontaneously in the Woods of *Calecut* and *Cananor* in the Kingdom of *Malabar*, and is supposed to be the *Zerumbet* of the *Arabians*, the *Gistus Arabicus* of the *Anguillara*.

The Part in use is the Root, which is tuberous, nodous; somewhat compressed, Ash-colour'd on the Outside, of an acrid, bitterish, aromatic Taste, and a fragrant Smell.

It is heating, drying, inciding, discutient of Flatulences, and Alexipharmic; and is principally used in Pains of the Chollic, and of the Stomach: It cures the Bites of venomous Animals, stops a Lientry, represses Vomiting, provokes the Menses, and kills all manner of Time infesting the Belly. Dale from *Schroder*.

The second Sort is thus distinguish'd.

ZEDOARIA ROTUNDA. Offic. C. B. P. 31. Park. *Theat.* 1612. *Raii Hist.* 2. 1340. *Malankua*, *Hort. Mal.* 11. 17. Tab. 9. *Colchicum Zeylanicum flore violæ odore, & colore Ephemero.* *Herm. Par. Bat. Prodr.* 324. **ROUND ZEDOARY.** Dale, p. 251.

This Species in Weight, Solidity, Colour, Taste and Smell is altogether like the *Long Zedoary*, and differs only in its Figure, which is globous, an Inch in Thickness, or Diameter, with a Superficies somewhat uneven, and tuberous, with the Marks of the Fibres which have been cut off, resembling the Bulb of the *Arum*, and sometimes ending in a short Mucro, or Point, at which, while it yet adheres to the Ground, it usually shoots forth a Bud. It grows plentifully in *Java* and *Sunda*.

The *Round Zedoary* seems not to differ from the *Long*; but only in being a distinct Part of the same Root. For *C. Bauhine* thinks that *Avicenna* called the round Part *Zedoary*, and the long Appendix *Zerumbeth*, not knowing from what Plant, or in what Country the Root was produced; but when he happen'd to see it imported into the *Persian Gulf*, sometimes cut into round, sometimes into oblong Portions, imagin'd them to be distinct Species.

The Root cut into Slices, dry'd, and preserved in Sugar, is more excellent and commodious for Use than Ginger. C. B.

It agrees in Virtues with the *Long Zedoary*, but is seldom found in our Shops. Dale.

Besides the two before-mention'd, *Raii* gives us from *C. Bauhine* two others, which are,

First, *Zedoaria tuberosa foris nigricans*. C. B.

This Sort is of around Figure, like the *Aristrolachia rotunda*, blackish without, and sometimes of an Ash Colour, and whitish within, and of the usual Taste of *Zedoary*. It is to be had, as *Clusius* writes, at some Perfumers at *Amsterd.* who call it *Black Zeduar*. *Lobel* joins it with the common *Round Zedoary*.

The second is the *Zedoaria Geidwar*, *Avicenna Garfia*. C. B.

This is a Root of the Size of an Acorn, almost of the same Figure, and of a subluclid Colour; but it may more properly be said to be like the smaller Bulb of the *Anthora* or *Aphodelus*; it is of an Ash Colour without, and yellowish within, hard and solid, and of an acrid and heating Taste.

Garcias observ'd this to be sold at a great Rate in the neighbouring Provinces to *Cbina*; and says, it is difficult to be obtain'd, unless it be from some strolling sort of Mountebanks, which the *Italians* call *Jogues*. The same Author supposes *Zedoaria* to be a corrupt Word, and that it ought to be called *Geidwar*.

C. Bauhine thinks that the *Arabians* gave the Name of *Zerumbeth* to three sorts of Plants. The first was the *Long Zedoary* of the Shops, which was the *Zerumbeth* of *Avicenna*, as appears from its Description. The second was what we call the *Zedoaria rotunda*, or *Round Zedoary*, which is the *Zerumbeth prima Serapiani*, and the *Zedoaria Avicenna*. And the third is that remarkable Tree on Mount *Libanus*, with the Leaves of the *Salix*, and the Smell of the *Lenan-Tree*, the *Zarucio*

Z. crabo at present unknown to us, unless, perhaps, it be the *Saffas-Syrorum Rauwolfii*.

Zedoaria was unknown to the ancient Greeks; the more dern, as *Aetius* and *Aetuarus*, call it *Zadac*, (*Zadar*) *Zadepa*, (*Zadura*) and *Zadipa* (*Zadera*) borrowing the Name from the *Arabians*.

It has the Leaves of *Zingiber*, or Ginger, but larger, longer and broader, and also the Root of the same Plant; it has much the Taste too of Ginger, whence in *Calicut* it is called *wild Ginger*, as we are told by *Garcias*.

They make three Species, which, by some of the most skilful Botanists, are supposed to be all Roots of one and the same Plant.

The Root of *Zedoary* is esteemed hot and dry, fattens the Body, and strengthens it when weak; as the *Arabians* say, and dissolves Flatulences. It takes away the Smell of Onions, Garlick and Wine, is good for the Bitings of venomous Beasts, stops a Looseness, resolves Abscesses of the Uterus, represses Vomiting, and is effectual in the Wind-Cholic. The modern Physicians use it as a Preservative against pestilential Airs, and mix it with a Multitude of Compositions. It is good for the Stomach in promoting Concoction, and heating that and the other Viscera. The *Germans* prepare a *Vinum Zedoriatum*, or Wine of *Zedoary*, for the before-mention'd Purposes, by bruising *Zedoary*, and hanging it in a Bag in a Vessel full of boil'd Must. *Raii Hist. Plant.*

ZEFR. Pitch. *Rulandus*.

ZEGI, *Zetus*, *Zexi*, Vitriol. *Idem*.

ZEHERECH. Flowers of Copper, called also *Alkas*. *Idem*.

ZEIA, *ζία*. See *ZEA*.

ZEITRABRA, in the Jargon of the Alchymists, signifies *fluxile*. *Rulandus*.

ZELOTUM. *Mercurius lapideus*. *Idem*.

ZELOTYPIA, *ζήλωσις*, Jealousy, is a vehement Affection of the Mind, in which one of the conjugal Pair suspects the other of Adultery, and is here mention'd because it comes within the List of morbid Causes. *Castellus*.

ZELPHO. See *ZENDO*.

ZEMA, *ζημα*, from *ζωω*, to boil; Broth, Decoction; in *French*, *Bouillon*, is a Term sometimes used for *Decoction*, in *Apicius de Re Culinaris*. It is also read *ζημα*, in *Dioscorides*, *Lib. 6. Cap. 7*.

ZEMASARUM, *Cinabrium*, vel *Cynobrium*. *Rulandus*. I suppose he means *Cinnabar*. *Rulandus*.

ZEMECH. *Lapis Lazuli*. *Idem*.

ZENDA. A general Term coin'd by *Paracelsus*, by which he would signify extraneous or equivocal Generations, effected without a seminal Principle. But *Zerenda*, *Zerunda*, or *Zerundis*, signifies such a monstrous Generation of Men in particular, as in other Animals, the same is expressed by *Zelphi*.

ZENECHDON, an *Arabic* Term from *Zenech*, signifying in that Language *Arsenic*; it means the same as *Diarfenicum*, or a Composition of *Arsenic*. *Blancart*.

ZENEXTON. See *XENEXTON*.

ZENEXTOR. *Mercury*. *Paracelsus*.

ZENGIFUR. The same as *Zemasarum*, that is, *Cinnabar*. *Rulandus*.

ZENICON, *ζηνικόν*, the Name of a Poison in use among the *Gauls*, called *Celtæ*. It had the Denomination of *Venenum Cervarium*, or *Deer's Poison*, and was of so great and speedy Efficacy, that as soon as a Deer, or other Beast, fell down under a Wound from an Arrow ting'd with this Poison, the Hunters were obliged to run immediately, and cut away the Flesh, for the Breadth of a Span, round the wounded Place, before the Poison could disperse itself, and induce a Putrefaction. The Antidote to this Poison was said to be the Leaf of an Oak, or a Beech, or of the *Laurus Alexandrina*. *Castellus*.

ZENITH, besides its proper Signification, is, in a very improper and enigmatical kind of Sense, made to signify the first menstrual Efflux. *Castellus*.

ZEOCRITHON. *Boerb*. A Name for the *Hordeum*; *distichum*; *Spica brevioris & latioris*; *Grani confertis*.

ZEOPYRON, *ζεόπυρον*, a kind of Corn which is a Medium between *Zea* and *Wheat*, as the Term imports: It grew in *Bithynia*, and is mentioned by *Galen de Alm. Fac*. It is also a Name for the *Triticum spica Hordei Londinensibus*.

ZEPHENUM, ZEPHENA, Terms in *Paracelsus* to signify the Extremity or external Periphery of any Perforation of the Ears or Lips. The Contraction of this Periphery into a preternatural kind of Roundness, constitutes the first Sign of the Leprosy. *Castellus*.

ZEPHYRUS. The same as *FAVONIUS*, which see. *Zephyrus festus*, in *Hartman*, is an Expression for a Mole.

ZENI. Vitriol. *Rulandus*.

ZERICUM. *Arsenic*. *Idem*.

ZERNA. An ulcerated Impetigo. *Dornaeus*. *Ruland*. We meet, also, with *Zerna* for *Lepra* or *Impetigo*, in Writers of the Alchymistic Strain. *Castellus*.

ZEROS. A Name in *Pliny*, *Lib. 37. Cap. 9*. for a pellucid Gem, resembling another called *Iris*, and having its Crystal distinguish'd with black and white Spots.

ZERTA, the Name of a Fish which lives both in Sea and Rivers; and therefore called by *Gesner*, *Capito Anadromus*, because it passes out of the Sea into the River *Elb*. It is reckon'd among Fishes of good Juice. *Castellus*.

ZERUMBET. *Offic. Garz. Zinziber latifolium Sylvestre*, *Herm. Cat. Hort. Lugd. Bat. 636. Prod. Par. Bat. 386. Comm. Hort. Amst. 371. 1. Kua, Hort. Mal. 11. 13. Tab. 7. Walingburi, Herm. Mus. Zeylan. 51. ZERUMBETH*.

This is set down in the Catalogue of Simples in the Dispensatory; but it is not known what it is, being never seen in our Shops, the round *Zedoary* being taken for it. *Herman*, in his *Catalogus Hortens. Lugd. Bat.* gives the Figure of a *Zingiber latifolium Sylvestre*, which he proposes for the *Zerumbet* of the *Arabians*; but the Descriptions they give both of this, and several other Parts of the *Materia Medica*, are so short and lame, that little is to be learn'd from what they say of them. *Miller's Bot. Off.*

It grows spontaneously in the Kingdom of *Malabar*, and agrees in Virtues with the long *Zedoary*. *Dale*.

ZERZERA. The same as *QUERQUERA* or *EPIALOS*, which see.

ZESTOLUSIA, *ζεστολία*, from *ζωω*, to be of a fervent Heat, and *ωσιν*, Washing or Bathing; a Bathing in hot Water, as oppos'd to *ψυχρολυσία*, (*Psychrolusia*) Cold Bathing. The Word occurs in *Galen, Lib. 3. de sanit. tuend. Cap. 8*.

ZETÆ, with the Antients, were *Vaporaries*, or Rooms which had a Stove underneath, on whose Floor they diffused hot or cold Water, as the Season requir'd; and by transmitting the Vapours through Pipes placed in the Wall, heated or cooled the *Zetæ* at Pleasure. *Castellus*.

Zetæ, or *Zeteculæ*, were also private Rooms in Baths, and other Edifices, furnished with Beds for the Entertainments of Feasting and Gallantry.

ZEUS. The Name of a Fish, called also *Faber*. *Pliny, Lib. 9. Cap. 18*. See *FABER*.

ZIAZAA. The Name of a Gem, from the Place where it is found, of so various Colours that it cannot be said to be of any Colour. It is said to render the Wearer litigious, and to excite terrible Visions in Sleep. *Castellus*.

ZIBACH. The same as *Zeibar*, which see.

ZIBELLINA, *vulgo Sebela*, or *Zobela*; a kind of Weasel, which we call *Sable*, whose Skin is well known to bear a great Price.

ZIBETHUM.

The Animal which produces the Civet, is distinguished by Authors after the following Manner. *Animal Zibethicum*, *Offic. Raii, Synop. A. 178. Animal Zibethi, Caius de Animal. 43. Aldrov. de Quad. Digit. 340. Catus Zibethinus, Schrod. 5. 280. Zibethicum Animal Americanum, Rech. in Herm. Hyæna veterum, Bellon. Obs. ed. Clus. 94. THE CIVET CAT*.

The Animal which yields Civet, is a kind of wild Cat, called by the Antients *Hyæna*. There are two kinds of it; one that comes from *Holland*, and another that comes from *Guinea*, which is browner than the former. When Civet is mix'd with Musk and Ambergrease, or lower'd by a Mixture of any other Powders, it has a very fine Smell; but alone, the Smell is disagreeable. It is very little used in Physic. Some rub Children's Navels with it, to cure their Colics; and it was formerly applied to the Pudenda of Women in Hysterical Fits; but this last Practice is not only useless, but hurtful. *Geoffroy*.

Civet is a fat and unctuous Substance, of the Consistence of Honey or Butter, and of a most fragrant and grateful Smell.

It is hot, moist and anodyne, of frequent Use in the Pain of the Colic, and to anoint the Navels of Children for Pains in the Belly; it is also applied to the Pudenda, or the Pit of the Navel, in hysterical Fits. *Dale* from *Schroder*.

Civet is not the Seed, nor Sweat, nor Testicles, nor Scrotum of the Animal call'd the *Civet Cat*, as some would persuade us, for these have no Smell; but it is a peculiar Excrement, secreted by Nature, and collected in some little Bags of a glandulous Substance, which in the Male are seated between the Penis and Testicles, in the Female between the Uterus and Anus. The best is what comes from *America*, and is not adulterated with Butter; the black imported from the *East Indies* is not good. *Dale*.

ZIBIBLÆ, or *Zibebæ*, are a large sort of Raisins, much resembling the Stones of Dates, whence they are also called *Dattily*; they consist of much Pulp, but very little Juice.

ZICCARA.

ZICCARA. *Guatimalensium. Capote, De Lart.*

It is a Fruit resembling a Pine-Nut, and contains twenty, and sometimes thirty Kernels. *Raii Hist. Plant.*

ZIGIR, *Gyr*, in *Dioscorides, Lib. 1. Cap. 7.* is an Epithet of a kind of aromatic Cassia, of a Purple Colour inclining to black, and esteemed of greater Value than ordinary, and more fragrant. Some read the Word *Gizir, γίζιρ*.

ZIMEX. *Verdigrease. Rulandus.*

ZINARIA, is an *Arabic* Term, and Epithet of a vicious and preternatural kind of Bile, called by the ancient Physicians *Eruginous*.

ZINCHUM.

Zinch, named *Zinchum Officin. Zinchum seu Marcasita pallida Schrederi, Zinch vel Tutenague Gallor.* is a metallic, sulphureous, heavy Substance, resembling Lead in Colour, fusible and ductile to a certain Degree, being very hard to break, inflammable and volatile. It seems to have been quite unknown to the Antients, and even the Moderns knew very little about its Nature or Origin, till *Stahl* explained it in his *Dissertation de Metallurgia*. It is extracted from the Lead-Ore of the Mines of *Gosselar*, which Ore is very hard to melt, though it appears neither stony nor barren to the Eye, but rich and shining. Three Substances are separated from it; Lead, Zinch, and a kind of *Cadmia Fornacea*, which being melted with Copper, makes a Prince's or Bath Metal.

The Furnace, in which this Ore is melted, is so disposed as to have the Side and Back Wall of Brick, but the Foreside is shut by Plates of a greyish fissile Stone, about a Finger's-breadth in Thickness. During the Time of the Fusion, this Foreside being much thinner than the rest, remains considerably cooler; and they increase this Cold by often sprinkling it with Water, and covering it with wet Clothes. The Ore, which is put in the Furnace at one Time, is about twelve Hours in melting; and as soon as the Fusion is begun, Bellows are set a blowing upon it, by which the Zinch mixed with the Lead is driven in form of Flowers or Vapour against the Brick Walls, to which it sticks, to about the Thickness of a Writing-Pen, and of the Consistence of very hard and half-vitrified Grey Tartar. At proper Intervals of Time, they open the Furnace, and beat this Substance off from these Walls, because, otherwise, it would in time become so thick as to make the Capacity of the Furnace too small for Use.

On the Front, or stony Part of the Furnace, is found not only a Substance like that just mentioned in Form of melted Stone, but also another resembling melted Metal, with Streaks of a Substance half-burnt, or reduced to Ashes, running through it. Therefore at the End of each Operation, or Period of melting, having removed the burning Coals from the Bottom of this Part of the Furnace, they substitute others in their Room, reduced to small Pieces, and not burning. Then, by repeated Strokes of Hammers, they shake the Wall, and the Zinch which sticks to it runs down between the Laminæ of the half-burnt Substance in form of a melted Metal, emitting a white lucid Flame, and in few Minutes Time would all fly off in a whitish or Ash-colour'd Vapour, if it were not received and extinguished by the Coal-dust placed under it; for as soon as it mixes therewith, the Flame ceases, and it hardens into Metal. When it is cold, they remove it, separate it from the Coals; and having melted it again over such a gentle Fire as is sufficient to melt Tin, it is cast into proper Masses or Pigs.

The Advantage to be made of this Metal is very uncertain, because sometimes the Workmen lose all their Labour employed about it, either because the Heat has been too great, the Bellows have been blown too fiercely, or through some other Neglect.

That Part which sticks to the Brick-Walls, from whence it is broke off at proper Intervals, as has been said, makes the *Cadmia* used in Prince's Metal; but before it is fit for that Use, it is mixed with the *Scoria*, and other Refuse of Metals, and exposed in Heaps for a long time in the open Air, where being penetrated to some Degree by the Air, or something contained in it, it rarifies a little, and swells, and then it becomes fit to communicate a Gold Colour to Copper, by being melted with it. This Substance is called, very properly, *Cadmia Fornacea*, by *Stahl*; for tho' its Origin be different from that of Tutty, the *Cadmia Fornacea* of *Agricola*, yet its Nature and Effects are nearly the same, for both equally give a yellow Colour to Copper.

The Lead is found melted at the Bottom of the Furnace; and the Workmen are of Opinion, that no Part of the Zinch remains in it, because they think the Fire to which the Lead continues so long exposed, is more than sufficient to evaporate all the Zinch.

Zinch is a Metallic Substance, but sulphureous and perfectly volatile. *M. Homberg* observed, long ago, that when thrown into a red-hot Crucible, it emitted many Fumes, and when stirred with an Iron-Rod, it presently took Fire, and a white

fining Flame appeared, like that which is seen by firing a Mixture of Nitre and Sulphur. At the same Instant, the whole Cavity of the Crucible was filled with very small, white, light, smooth Filaments, like Threads of Cotton, or of a Cob-web. If these Filaments be carefully collected, and afterwards the remaining Zinch be stirred in the same Manner as before, this Operation may be continued so long till almost the whole Substance of the Zinch shall be converted into these Filaments or Flowers. By macerating these Flowers in distilled Vinegar, *M. Homberg* prepared an inflammable Oil of very great Subtlety, which he judged to arise from the Zinch; but I should rather think was owing to the distilled Vinegar. The white Flowers taken inwardly are sudorific, and sometimes purge both upwards and downwards, being given from four to twelve Grains. Externally applied, their Effects are in nothing different from those of *Pompholyx* or *Nihil Album* of the Shops. They dry very powerfully, without Acrimony; and gently astringe and consolidate. They are much recommended by *Barbette* as a sure Remedy in an *Ophthalmia*, and Flux of sharp Lymph, being dissolved in Rose-Water; by another in Fissures of the Nipples, being spread on a fine Linnen Rag; and by *Emanuel Koning*, in Ulcers, arising from a long Confinement in Bed. They are likewise of Service in drying Ichorous Ulcers.

Of Zinch and Copper melted together is made the finest kind of Prince's Metal, so called from Prince *Rupert*, who is said to have invented it. It is made in this Manner:

Take of Copper, three Ounces; melt it in a Crucible; and while it remains in Fusion, add an Ounce and a half of Zinch. Mix them well, and then immediately remove them from the Fire. The Mass, when cold, will be of a beautiful Gold Colour, and in some Degree ductile.

The Pewterers use Zinch in whitening and purifying Tin, mixing it in the Proportion of one to six hundred. *Geoffroy*.

ZINDULUS. A River-Fish, much commended for its Tenderness and Friability.

ZINETUS. A Species of *Marcasite*, much resembling Copper. *Paracelsus Archidox. Lib. 3.*

ZINGAR. *Verdigrise*, or Flowers of Copper. *Rulandus.*

ZINGI. *Fructus stellatus sive Anisum Indicum. I. B. 1. 586. Raii Hist. 2. 1835. Anisum Indicum. Offic. Anisum stellatum seu sinense & Philippense. Cod. Med. 10. Anisum Indicum stellatum, Ger. Emac. 1035. Anisum peregrinum, C. B. P. 159. Anisum exoticum Philippinarum Insularum, Park. Theat. 1569. Fœniculum Sinense, Redi Exper. Nat. 172. Cardamomum Siberiense. Patavinorum, Hort. Besian. Euonyma ad Philippinarum Insularum, Anisum spirans, nuculas in capsulis stelliformiter congestis, proferens, Pluk. Almag. 140. INDIAN ANISE.*

The Kernel of this Fruit, which is brought from the *East Indies*, is good for the Cholic.

ZINGIBER. *Offic. Zingiber, Zinziber. C. Comm. Plant. Ufu. 92. Zinziber, Ger. 54. Emac. 61. Zingiber, C. B. P. 35. Theat. 651. Raii Hist. 2. 1314. J. B. 2. 743. Zingiber Orientale, Park. Theat. 1613. Zingiber Indigenis Gingibil fœmina, Pison. Mant. Arom. 187. Iris latifolia, tuberosa, Zingiber dicta, flore albo, Hist. Oxon. 2. 350. Mangaratia, Pison. 227. Chilli India Orientalis seu Zingiber fœmina, Hern. 169. Inschi, Com. Flor. Mal. 148. Inschi vel Inschi-kua, H. M. p. 11. 23. GINGER.*

This is a yellowish, white, and flatish round Root, somewhat knotty and branch'd, of an aromatic Smell, and a very hot biting Taste. We have two Sorts, white and black. The White is the best, being the Root only dried and cleansed; the other is the same scalded, and of a darker Colour, more shrivel'd, and is less used in Medicines. *Morison* and *Herman* believed Ginger to be a Species of Iris; but others, as *Piso* and *Hernandez*, say it is a Reed or Cane, to which, by the Figure of the Leaf, which I have seen, it seems to come nearer than to an Iris. It is brought at present principally from *Jamaica*, and the *Carribbee* Islands, though it grows in both the *East* and *West Indies*.

Ginger is used in Food as well as in Physic. It heats and comforts the Stomach, expels Wind, helps Digestion, prevents the Colic, and strengthens the Bowels. It is brought over, preserved in Syrup, from the aforesaid Places, which is much better than any preserved here. *Miller's Bot. Off.*

Zingiber, by the *Greeks* called *Ζίζυβη*, took its Name from the *Indian* Word *Zengibil*, and has one and the same Name among all Botanists. It is described by *C. Baubine* as having a Root which runs three or four Palms deep in the Ground, after the Manner of the *Arundo*, and is of an irregular Figure, somewhat flat, divided by frequent Joints into many lateral Parts or Branches creeping on all Sides, of the Length of 21. Inch and half, or more, and of the Thickness of a Man's Thumb, or less, whitish, or of a light brown on the Outside, and of a white friable, tender Substance within, interspersed with

with Veins running lengthways, of a Taste like Pepper, very hot and acrimonious, and of an aromatic Smell. It has somewhat of a fervid Taste, when green, as we are assur'd by *Acosta*, but is not so biting as when dry; and the more humid the Places are in which it grows, the less Acrimony it retains. It has the Leaves, as *Garcins* writes, of the *Iris Aquatica*, or *Gladiolus*, not of the *Arundo*; but *Acosta* gives it the Leaves of the *Lachrima Jobi*. Others, as *Linschoten* and *Ruellius*, make it have the Leaves of the *Arundo*, which seems most probable to us, since *Lobel*, and *Bodæus a Stapel*, who saw the Plant when green, tell us, that in Stalk and Leaves it has the Appearance of an *Arundo* newly sprung up; and therefore *Margrave* and *Hernandez* seem to be the less exact in their Comparison, when they make it resemble the *Iris* or *Gladiolus*. The Stalk is not of any considerable Thickness, but rises to the Height of a Foot, or a Foot and a half, and is adorn'd with a small Head, resembling in some measure that of *Stachas*. *Hernandez*.

There are two sorts of *Zingiber*, the Male and the Female; the last is what we have described, the Male, called by the *Mexicans*, *Anchoas*, has Leaves which grow not above three Feet in Height, and are rougher and thicker than those of the common or Female *Zingiber*, and are distinguish'd by one single strait Nerve running lengthways, growing on both Sides to the Stalk without Pedicles, single towards the Bottom, but thicker and more frequent towards the Top; the Root is also larger and thicker, and has a more acrid Taste mix'd with a kind of Bitterness. *Hernandez*.

The Roots are of different Weight and Bigness, but all smooth and tuberous, and spreading upon the Surface of the Ground like those of the young *Arundo*.

It grows in all Parts of the *East Indies*, and is propagated from the Root or Seed by way of Culture; for what grows spontaneously is of no Value. It does not seem natural to *America*, but was transported from the *East Indies*, or the *Philippine Islands*, to *Brasil* and *New Spain*. That of *Malabar* is most esteemed; and they plant it in a fat, well dung'd and manured Soil, setting a Root, which has one or two Joints, in a Pit, and immediately watering it more or less, according to the Dryness of the Ground. The next Year after planting they take it up again, and pass it for *Zingiber*. The usual Season for collecting it is the Beginning of *January*, when the Leaves are wither'd. After these Roots are a little dry'd, they cover them with Mud, lest being deprived of their native Humidity, they should be eaten by the *Teredo*, to which on other Accounts they are very obnoxious: But *Linschoten* assures us that they collect the Roots into a Heap of a certain Bulk, which they cover with Potters Clay, and carefully secure it from all Injuries by Air or Winds; and this is the Method by which they manage the recent Roots, and defend them from the Worms. In the Spicery Shops we meet with white and red Roots, but they are of the same Kind with the others, only stained with Oker, or whiten'd with Chalk, to keep them from the *Teredo*.

To preserve the Roots, they first take off the Bark, and then put them into Brine or Vinegar, and let them macerate for an Hour or two; after which they expose them to the Sun for almost an equal Space of Time, then take them again under Covert, heaping Clothes upon them, and suffering them to lie till all their Humidity be exhale'd. If the Roots are to be transported to a distant Place, they inclose them in Boxes, and watering them, cover them at Night with Earth, but leave them open in the Day-time. Being thus prepared, they season them not only with Sugar, but Brine and Vinegar; after which they have no remarkably hot Taste, nor leave any ungrateful Filaments in the Mouth: But if there be too much Cookery used about them, or they pass through too many Washings and Cleansings, they lose not only their hot Taste, but Part of their aromatic Acrimony.

Green *Ginger*, preserved with Sugar, is imported from the *East Indies*, and is proper for old Persons, and those of cold and phlegmatic Constitutions, especially when it is new; it is also good for viscid Phlegm in the Lungs.

The *Indians* use the Leaves in Broths, Sallads, and other tulinary Preparations; the green Roots cut small with some other Herbs, and season'd with Oil, Salt and Vinegar, serve them for a Sallad. New *Ginger* is also an excellent Remedy with them against the Cholic, Celiac Passion, and Lientery, a long Diarrhæa proceeding from Cold, Wind and Gripes, and other like severe Disorders, as *Bontius*, while in the *Indies*, often happily experienced, as he himself assures us. It ought, however, to be administer'd with proper Cautions, that they who abound with hot Blood, whether sick or sound, should be very sparing in the Use of it, because all *Ginger* kindles a Heat in the Blood, and opens the Mouths of the Vessels. *Piso*.

Ginger, as well as *Pepper*, is more used in culinary than medicinal Preparations; because, among all Spices, those two only have very much of an acrimonious, and but little of an

aromatic Quality. *C. B. Galen* infers, that *Ginger* is not of so fine Parts as *Pepper*, because its Heat, tho' equally strong, is not so soon felt, but lasts longer; hence he concludes *Ginger* to be of a grosser, and more humid or aqueous Substance: For as in dry Reeds, a Flame is very soon kindled and dispersed, whereas in moist, like green Wood, it is more slowly kindled, and lasts the longer; so it is in Medicines.

Dioscorides says, that *Ginger* greatly loosens the Belly; but this must be understood of the tender and fresh Roots, which contain a considerable Quantity of Humidities, capable of lubricating and opening the lower Passage, as we observe in the *Iris*; for when they are old, they are rather drying, and bind the Belly, by promoting a good Digestion.

The Roots are sometimes added to Cathartics, to increase their Force, tho' being exhibited with the more violent Medicines of that Kind, they correct their Malignity. *Ginger* obsterges and dissipates Infractions of the Stomach and Lungs, by consuming the superfluous Humour, and comforts and strengthens the Brain and Memory: It is also of Service in Dulness of Sight, proceeding from Humidity; it stimulates to Venery, and dissolves Flatulences. In whatever manner taken, whether fresh or dry, it corroborates the Stomach, and promotes Concoction; it is an Ingredient in Antidotes.

ZINGIBER FUSCUM. *C. B. Zingiberis species Mechinum dicta.* *L. B.* This is different from the common Sort, not only in being less mature, and worse, but as it is of a more compact Consistence, harder, and interwoven with fewer Fibres, of an Ash-Colour inclining to black, of a more acrid Taste, and not so subject to be eaten by the *Teredo*; this is also preserved, and sold in the Shops.

ZINGIBER AFFINIS CORTICE SQUAMATO. *C. B. Zingiberis Mechini rara Varietas.* *J. B.* This is a Root resembling the common *Zingiber*, or *Mechinum*, but has a finer Appearance, is distinguish'd by many Nodes, and jointed almost like the *Doronicum*. It has a Bark like the *Gingiber*, of a Lemon kind of Colour, is of the Thickness of a Man's Thumb, and destitute of Fibres; it is also ponderous and solid, and being broken shews white Veins. The Taste is acrimonious and aromatic; and if it be not eaten out with Rottenness, much more acrid and dryer than that of *Zingiber*. *Raii Hist. Plant.*

Ginger is good for the Stomach, Thorax, and the other Viscera, restores lost Appetite, and resists the Putrefaction and Malignity of the Humors. *Dale*.

ZINGITES, or ZINGRITES. The Name of a fabulous Stone, of the Colour of Glass, mention'd by *Albertus Magnus*, to which he ascribes many imaginary Virtues, as that, if worn about the Neck, it cures the *Nyctalops*, restrains Hemorrhages, and prevents Alienation of Mind.

ZINIAR. Verdigrease. *Rulandus*.

ZINIAT. Ferment. *Rulandus*.

ZINK. See **ZINCHUM**.

ZINZALA. A small Fly, or Gnat.

ZINZIBER. See **ZINGIBER**.

ZINZIFUR, or ZENGIFUR. Cinnabar. *Libanius*.

ZINZILLA. The Shingles.

ZIRBALIS HERNIA. A Rupture caused by the Descent of the Omentum; from,

ZIRBUS. The Arabic Name for the Omentum.

ZIZANION. *Zizanthus*. The same as **LOLIUM**.

ZIZERIUM. The Intestines of Fowls of the Gallina-cæous Kind. *Apicius*.

ZIZIBI, or ZIBEBÆ. *Rulandus* uses this Word, as *Castellus* imagines, to express Raisins of the Sun; or, perhaps, Jujubs.

ZIZIPHA. A Jujub.

ZIZIPHUS.

The Characters are;

The Leaves are conspicuous for three Nerves or Fibres; the Calyx is monophyllous and quinquefid. The Flower is rosaceous, pentapetalous, herbaceous, small, sessile, and almost destitute of a Pedicle. The Ovary in the Bottom of the Calyx becomes an Oval Fruit resembling an Olive, and including under its Pulp a Stone divided into two Cells, each full of an oblong Kernel; the Pedicle is short.

Boerhaave mentions two Sorts of *Ziziphus*, which are;

1. *Ziziphus*, *Tourn. Inst.* 627. *Boerb. Ind. A.* 2. 245. *Jujuba*. *Offic. Jujuba Arabum sive Zeiziphus Dodonæi.* *Ger.* 1318. *Emac.* 1501. *Jujuba majores oblongæ.* *C. B.* P. 446. *Ziziphus sive jujuba major.* *Park. Theat.* 250. *Raii Hist.* 2. 1533. *Zizyphus rutila.* *Jonst. Dendr.* 86. THE JUJUBE TREE.

The Jujube-Tree has several crooked Branches with small whitish Twigs, on which grow winged Leaves made of several Pinnæ, growing not directly opposite, with an odd one at the End; they are small, oval, and finely serrated about the Edges. Towards the Top of the Twigs, at the setting on of the Leaves, grow small, yellowish five-leaved Flowers, followed by roundish red Fruit, in shape of a small Olive, of a pleasant

a pleasant, sweet, somewhat clammy Taste, including an hard oblong Stone, pointed at both Ends. They grow in *Italy* and *Spain*.

Jujubes are mollifying and pectoral, good for Coughs, Pleurifies, and hot sharp Humours, falling on the Lungs; they help the Heat and Sharpness of Urine, and the Gravel; but they are now quite out of Use, and are hardly to be met with in the Shops. *Miller's Bot. Off.*

The *Jujube-Tree* flowers in *May* and *June*, and the Fruits are gather'd in Autumn, or later, together with the Sprays; and being collected into Bundles, after an Insolation of some Days, are hung up at the Roofs of the Houses. Some crop the Jujubes, and strewing them on Hurdles, or Matts, expose them to the Sun so long as till they grow wrinkled. They are sold fresh in great Quantities by the Fruiterers at *Venice*.

It is doubted whether this Tree were known to the ancient *Greeks*. *J. Baubine* says, he is much inclin'd to think that the *Lotos* of *Theophrastus*, and the *Osteo-Lotos* of *Pliny* are the same with the *Lotos* of *Athenæus*, and that the *Lotos* of *Athenæus* is the *Jujuba*.

The *Serica* in *Galen*, which most suppose to be *Jububes*, are judg'd by that Author to be of small Efficacy towards the Preservation of Health, or Cure of Diseases, being eaten only by Women and Children who set no Bounds to their Appetite, and affording but little Nourishment, tho' difficult of Concotion. By the later *Greeks*, however, and *Arabians*, they have been received into the *Materia Medica*, and applied to medicinal Uses. They are moderately hot and moist, and therefore used in Julaps or Decoctions, mitigate the Heat of burning Fevers, and correct the Acrimony of the Blood. They are also good for Disorders of the Breast and Lungs, stubborn Coughs, Roughness of the *Aspera Arteria*, and Difficulties of Breathing. They are also of Service in Diseases of the Kidneys and Bladder, Heat of Urine, and the like Disorders. *J. Baubine* thinks Syrup of *Jububes* proper to be exhibited in pulmonary Disorders proceeding from a cold as well as a hot Cause, contrary to *Matthioli* and others, who judge it convenient only in hot Affections of the Lungs, for they are sweet and moderately hot. We are assured, from Reason and Experience, says *C. Hoffman*, that *Jububes* have the Virtue of cooling and correcting hot and acrimonious Humours.

An Ziziphus; quæ Jujube Americana; spinosa; Lotti Arboris foliis & facie; fructu rotundo, parvo, dulci. Cat. Hort. Beaumont. Leguanaria vulgæ. H. A. 1. 141. Boerh. Ind. Alt. Plant.

Jububes are pectoral and aperient, and enter the Composition of pectoral and nephritic Decoctions; they are compar'd with Dates and Figs. *Hist. Plant. ascript. Boerhaave.*

Besides the foregoing Species of *Jujube*, *Dale* mentions the following;

ZIZYPHA. *Offic. Zizyphus Cappadocica*, Ger. 1306. Emac. 1491. *Zizyphus Cappadocica Olea Bohemica*, J. B. 1. 27. *Olea Sylvestris folio molli, incano*, C. B. P. 472. *Raii Hist.* 1576. *Oleaster Cappadocicus*, Park. Theat. 1441. *Elæagnus Orientalis angustifolius, fructu parvo Olivæ formi, subdulci*, Tourn. Cor. 54. **WILD JUJUBE.**

This is a Tree of a moderate Bigness, of the Size of the *Salix*, according to *Dalechampsius*, with a whitish Bark, which is very much wrinkled and thick in the Trunk, but thinner and smooth on the Branches, and cover'd with a soft kind of Down. The Leaves are soft, and much unlike those of the *Ziziphus*, but resemble more those of the *Salix*, or rather are like those of the Garden-Olive, sometimes disposed alternately, sometimes irregularly, about an Inch and half in Length, and near an Inch in Breadth, or narrower, whitish all over, especially the lower Part, furnished with a short and soft Down, moderately obtuse, and adhering to a short Pedicle. From the Bosom of the Leaves proceed the Flowers, which are of a Silver Colour, cut into six cuspidated Parts, and sweet-scented, or, as *Clusius* says, of a strong tho' not unpleasing Smell, which affects the Head. The Berries are oblong, resembling small Olives, or Jujubes, white, fungous, and cover'd with a sweet Flesh or

Pulp, which has an Apex like a Pin, and includes a Stone containing a hard channel'd Kernel.

It grows in *Syria*, *Ethiopia*, and on Mount *Libanus*, as *Rauwolfius* observed; it also grows spontaneously in the Woods of *Bohemia*, as we are told by *Matthioli*, and it is found in the Hedges, together with the *Ramnus* and *Vitex*, near the City of *Guadix*, in the Kingdom of *Granada*, in *Spain*. *Clus.* It flowers in the Beginning of Summer, and the Fruit is ripe in Autumn.

I doubt not, says *Dalechampsius*, quoted by *J. Baubine*, but from the Flowers might be distill'd a Water of a very fine Smell, and an Oil might be prepared of an exquisite Fragrancy; but there are no medicinal Uses mention'd of this Plant. *Raii Hist. Plant.* p. 1576.

ZMILACES. A sort of Gem, said, by *Pliny*, L. 37. C. 10. to be found in the River *Euphrates*.

ZOARCHIA, or XOARCHIA. The Name of an Antidote describ'd by *N. Myrepsus*, Sect. 1. C. 241.

ZOEPIHILOS. The pompous Name of an Antimonial Medicine, invented by *Quercetan*, and describ'd by *Schroder*, L. 3. C. 17.

ZONA. The Shingles.

ZONITIS. A Name for a Species of *Cadmia*, collected in Furnaces in the Shape of a Zone, or Girdle.

ZOOMINERALIA. A Name for certain Substances, which have the Appearance of an Animal, and Mineral Nature; as Pearls, and all sorts of *Testacea*.

ZOOPHTHALMOS. A Name for the *AEIZOON*.

ZOOPHYTON. A Substance which partakes of an Animal and Mineral Nature.

ZOOTOME. The Anatomy of Brutes.

ZOPISSA. Some call the Pitch and Rosin scrap'd off Ships by this Name: Some call it *Apochyma*: It is said to have a dissipating Virtue, because it has been long macerated in Sea-Water. Others understand by *Zopissa*, the Resin of the Pine-Tree. *Dioscorides*, L. 1. C. 98.

ZOPYRI ANTIDOTUS. The Name of an Antidote describ'd by *Scribonius Largus*, Nq. 169. *Celsus*, L. 5. C. 23 takes Notice of another Antidote, given by *Zopyrus* to King *Ptolemy*, which he there describes.

ZORABA. Vitriol. *Rulandus*, 610.

ZORONISIOS. The Name of a Gem, said to be found in the River *Indus*.

ZOSINIS ILLITIO. The Name of an Unguent, recommended against Tremors, by *Paulus Aegineta*, L. 8. C. 19.

ZOSTER. The same as *ZONA*.

ZOTICUS. A Name given by *Hartman*, to a Species of

Calomel.

ZUB, or ZUBD. Crude Butter. *Rulandus*.

ZUCCAIA. See *ZATANEA*.

ZUCCARUM. Sugar.

ZUCCHA. The Gourd, or the Pumpkin. *Raii Hist. Plant.*

ZUITTER, or ZITTER. A Marcasite. *Rulandus*.

ZULAPIUM. A Julap.

ZYGÆNA. The Name of a Fish with a monstrous Head, describ'd by *Aldrovandus*.

ZYGIS. A Name for a Species of *Serpyllum*. *Raii Hist.*

ZYGOMA, or Os Jugale. The Name of a Bone of the superior Jaw. See *CAPUT*.

ZYGOMATICUS MUSCULUS. The Name of a Muscle of the Lip, thus call'd, and which arises fleshy from the *Os mali*, near its Conjunction with the long Process of the *Os Squamosum*, and is inserted near the Angle of the Lips. Its Use, is with its Partner, to draw both Lips upwards.

ZYMAR, ZYNAR, or ZINSER. Verdigrease.

ZYME. *Zyma*. Ferment. Leaven.

ZYMOMA. *Zymoma*. Ferment; or, fermenting Liqueur.

ZYMOSIS. *Zymosis*. Fermentation. In *Hippocrates*, *Epidem.* L. 4. it imports a flatulent or *CEdematous* Tumor of the Liver.

ZYTHOGALA. Beer Poffet-Drink.

ZYTHOS. *Zythos*. Beer. *Dioscorides*, L. 2. C. 119.

ADVERTISEMENT.

THOSE who have ever been concern'd with the Mechanical Manufacturers of Books and Plates, will not be surpriz'd to find some Typographical Errors, and Inaccuracies of the Engravers, tho' all possible Care has been taken to prevent them. But there are some Errors of greater Moment than those of the Press. Thus under the Article *Amygdalus*, in a Prescription quoted from *Paulus Aegineta*, *ονόμελι* is translated, *Wine and Water*, instead of *Honey and Water*. And under the Article *BUSSII SPIRITUS BEZOARDICUS*, in the Prescription for this Medicine, *three Pints of the highest rectify'd Spirit of Wine*, which should be added after *Oil of Cedar, or of Juniper, half an Ounce*, is entirely omitted.

Note 1. Quadrantal is the same as the Amphora, Cadus, Congiarius, & Dolium denote no certain Measure.
 Note 2. The Romans divided the Sextarius as the Libra into 12 equal parts called Cyathi and therefore they denominated their Calices, Sextantes, Quadrantes, Trientes according to the number of Cyathi which they contain'd.

EXPLICATION

O F

The TABLES in Volumes II. and III.

TABLE XXXVI.

FIG. 1.

REPRESENTS an actual Cautery for making Issues in the Head. A, the Handle; B, the Part applied to the Head.

FIG. 2.

A Shews the Cannula, or Tube, for receiving the actual Cautery of the last Figure.

FIG. 3.

Is a Trepan. A represents the Crown; B, the Place where the Crown is fixed by a Screw; C, the superior Part on which the Hand is fixed in the Operation; D, the Handle or Arch by which the Trepan is turned round; E, the Spike in the Crown. Some chuse the Crown fixed otherwise than with a Screw, but *Heister* says the Difference is not material.

FIG. 4.

Is the Spike screw'd out of the Crown.

FIG. 5.

Represents the Key which serves to screw in and out the Spike.

FIG. 6.

Denotes the Lenticular Knife for smoothing the rough Edges of the Perforation of the Bone made by the Trepan.

FIG. 7.

An Instrument called a Depressor, with a circular, flat Button at its End, for pressing down the Dura Mater, in order to discharge the latent Blood. By some it is named a *Meningophylax*.

FIG. 8.

A pointed Instrument, which, after the Crown is unscrew'd, is to be fixed in the Trepan at B, in *Fig. 3.* for beginning the Perforation in order to introduce the Spike, and, also, for perforating Bones affected with the Spina Ventosa, whence it is called the perforating Trepan, or Perforator. A, the Point. B, the Screw by which it is fastened to the Trepan.

FIG. 9.

A Hair-brush for cleaning the Crown of the Trepan.

FIG. 10.

An Instrument called the exfoliating Trepan, used in abrading Bones affected by a Caries. A, the Point; B B, the Sides or Wings, which, in turning round, scrape the Bone.

FIG. 11.

A Linen Ball, with a long Thread, used in dressing Wounds of the Cranium made by the Trepan.

FIG. 12.

A Pledgit, or round Compress made of Lint, armed with a Thread.

FIG. 13.

Another round Pledgit of Lint, but without a Thread, for filling the Perforation of the Cranium.

FIG. 14.

The Leaden Plate of *Belloste*, which is sometimes proper to be applied over the Dressings.

FIG. 15.

Shews how the Plate should be bent before it is applied.

FIG. 16.

A represents an encysted Tumor, or *Atheroma*, on the superior Eye-lid; B, another on the inferior Eye-lid.

FIG. 17.

A large, depressed Wart, on the superior Eye-lid, with a slender Root, which obstructed the Opening of the Eye, and was extirpated by *Heister* with a Ligature made of a filken Thread.

FIG. 18.

An external Tubercle on the Eye-lid, sprouting from a small Root, commonly called an Excrescence, and, also, a *Sarcoma*.

FIG. 19.

Shews a *Phalangosis*, or *Ptofsis*, of the superior Eye-lid. A represents the Disorder itself in the left Eye; B B the Instrument contrived by *Bartisch* for removing the Disorder C, adapted to the right Eye; D D, the Screw by which the Arms or Plates of the Instrument are screwed hard together.

FIG. 20.

A similar Instrument, improved by *Verduyn*, and represented by *Ruyssch. Epist. Anatom. 13.* A A and B B represents the two Plates, or Arms, without Perforations; C C the Screw for confixing and removing the Tubercles. D, the Hinge.

FIG. 21.

An Instrument of the same Kind, but larger, contrived also by *Verduyn*, with Perforations a. a. a. a. for making a Suture in this Disorder of the Eye.

FIG. 22.

An Instrument for the same Purpose, improved by *Rau*, in his *Epistle de Septo Scroti*, which is incurvated, and shuts differently. A, shews how the Needle is introduced through the Perforations; B, the Thread drawn through for uniting the Wound of the Eye-lid.

FIG. 23.

Represents an Eye with the Eye-lids, A A conglutinated or concreted; a Disorder called by the *Greeks* *Ancyloblepharon*.

FIG. 24.

Is a slender grooved Probe, useful in the Cure of the *Ancyloblepharon*.

FIG. 25.

A small crooked Bistory, with spherical Point, used in various Disorders of the Eye.

† D

FIG.

An EXPLICATION of the TABLES in Vol. II. and III.

FIG. 26.

A. A. Shews the Form of an Incision in the lower Eye-lid, when they are two short, or retracted.

FIG. 27.

A represents a Tubercle in the greater Canthus of the Eye, called in Greek *Encanthis*.

FIG. 28 and 29.

Represents *Sarcomata*, *Hypersarcosis*, or fleshy Excrescences, sprouting between the Eye and its Lids; A is one growing under the inferior Eye-lid; B another under the superior Eye-lid.

FIG. 30.

A small Hook used in removing these Tubercles, and other Disorders about the Eyes; whose curved Point A may be sometimes single, and sometimes double, by the Help of the moveable Ring B. as in Fig. 31. C. C. D. D. are the Handles.

TABLE XXXVII.

FIG. 1.

Is an obtuse Hook, bent in a particular Manner, useful for separating the Eye-lids in some Operations on the Eye and Eyelids, call'd by the French *Hameçon Plat*. A. is the obtuse Part of the Hook; B the Handle.

FIG. 2.

Represents a Needle A. fixed in a Handle B. for elevating and dividing the Blood-Vessels of the *Tunica Adnata*, and for the same Purposes in a *Pterygium*.

FIG. 3.

A Beard of Rye for making the *Ophthalmorystum*, or Eye-brush. A. denotes the Hooks with which the Veins of the Eye are lacerated in Scarification.

FIG. 4.

Is the Eye-brush, composed of ten, twelve, or fifteen of these Beards, tied together and cut; A. the Handle; B. the Part with the Hooks, with which the Scarification of the Eye-lids, and sometimes of the Eye, are performed.

FIG. 5.

Is the Eye-rasp of *Celsus* and *Ægineta*, made like a Spoon; A. the Handle; B. the rough convex Part, with which the Antients used to scarify the Eye.

FIG. 6.

Represents the left Eye, the *Puncta Lachrymalia* of which are seen at *a. a.* and the lachrymal Caruncle between these is shewn at *b.*

FIG. 7 and 8.

Represent the lachrymal Ducts, as they proceed from the Eyes to the Nose; *a. a.* the lachrymal Sac; *b. b.* the *Puncta Lachrymalia*; *c. c.* the Ducts leading from the *Puncta* to the Sac; *d. d.* the nasal Duct; and *e. e.* the Opening of this Duct into the Nostrils.

FIG. 9.

Shews how the lachrymal Duct is conjoined with the Left Eye; *a. a.* are the *Puncta Lachrymalia*, *b.* the Caruncle; *c. c.* the Ducts between the *Puncta Lachrymalia* and the lachrymal Sac; *d.* the lachrymal Sac; *e.* the nasal Duct; *f.* the Opening of the Nasal Duct into the Nostrils.

FIG. 10.

A. B. represent the Tumor, or *Hernia*, of a relaxed lachrymal Sac, called a lachrymal *Hernia*, and, also, an *Anchylops*.

FIG. 11.

A very small, slender Silver Probe, a little bent, armed with a small Olive-shaped Head at *a.* used for clearing Obstructions in the nasal Duct when the Eye is watery or fistulous, as proposed by *Anel*.

FIG. 12.

Anel's Probe, which that it may more easily penetrate the obstructed Nasal Ducts, is made stronger, by being made thicker towards the other Extremity *b.*

FIG. 13.

Another Probe for the same Purposes, but more convenient, as it is shorter.

FIG. 14.

A Silver Syringe after *Anel's* Manner, for injecting proper Liquids by the *Puncta Lachrymalia*; A is the small Tube,

the Extremity of which only can be introduced into the *Punctum Lachrymale*; B, the Piston; C, the upper Part to be held in the Right, and D the Part to be held in the Left Hand.

FIG. 15.

A, Another small Tube of a different Shape, but for the same Purpose, which may be joined to the same, or a like Syringe, by the Screw B.

FIG. 16 and 17.

Shew different Ways in which the lachrymal Sac may be relaxed or distended.

FIG. 18.

Represents how Abscesses and Tubercles may sometimes be formed, which may corrode them near the lachrymal Ducts; *a.* one upon the superior Duct; *b.* another on the inferior Duct.

FIG. 19.

a is a *Fistula Lachrymalis* perfectly formed, with a large Orifice; *b* is another with a smaller Orifice. The prick'd Line *c. d.* shews where the Lachrymal Fistula may be cut.

FIG. 20.

Is a Steel Instrument for compressing the lachrymal Sac, taken from *Platnerus*; A is the Button to be placed upon the Sac; B, the Hinge; C, the Screw which presses the Button on the Sac; D, its upper Part, which rises over the Forehead; E, the Hook with which the Strap, F, with many Holes, is tied, for fixing and securing the whole Instrument on the Head.

FIG. 21.

Is an Iron Instrument for burning the *Os Lachrymale*, when affected with a Caries; A, the Part with which the Bone is burnt; B, the Handle.

FIG. 22.

An Iron Cannula adapted to the preceding Cautery, of which the Part A is to be fixed upon the Bone affected with a Caries before the Cautery be applied; B is the Handle.

FIG. 23.

Is an Instrument made of Silver or Brass, which at *a* is concave like a Spoon, to cover and secure the Eye, while the Cautery is passed through the Aperture *b*, to the carious Bone; *c* is the Handle. This Instrument may, also, be used for covering the Eye, when an Incision is to be made in the *Fistula Lachrymalis*.

FIG. 24.

Is an Instrument for perforating the Integuments, lachrymal Sac and Bone, or even the *Os Unguis*, after the Sac is opened; A, the Point; B, the Handle.

FIG. 25.

A. B. are small Tubes, which, according to *Woodhouse's* Method, are to be inserted into the Perforation of the *Os Unguis*, and the Wound is to be healed up over it.

FIG. 26.

A Tube of the same Kind, but a little larger, which may be used for the same Purpose, and may be most properly made of Lead or Gold.

FIG. 27 and 28.

Are Silver Tubes, used by *Platnerus*, furnish'd with Margins, to keep open the new made Passage to the Nostrils, till it becomes callous.

FIG. 29.

The Forceps of *Lemoriere*; A, its sharp, crooked Point, with which the *Os Unguis* is perforated; B. B., its Handles for opening and shutting its Points.

FIG. 30.

The upper Part of the same Forceps opened, as it is used when the Perforation of the *Os Lachrymale* is required to be larger.

FIG. 31.

Is the Shape of the Wax-Candle which *Lemoriere* used for keeping open the Perforation of the Nose, instead of a Tent; A, its Head; B, the End which is introduced into the Nostrils.

TABLE XXXVIII.

FIG. 1.

Shews the proper Posture of the Patient, Surgeon, and Assistant, in couching for a Cataract. See CATARACTA.

FIG. 2.

Is a Silver Couching-Needle, used by the Antients, with a slender, round Point like common Needles.

FIG.

An EXPLICATION of the TABLES in Vol. II. and III.

FIG. 3.

Another Needle for the same Purpose, with a triangular Point.

FIG. 4.

Another Couching-Needle, with one steel Point A small, the other B broader; C is the Handle, which may be made of Silver, Brass, Ivory, or Wood.

FIG. 5.

Another Couching-Needle, with a broader Point, but sharp, properer for the Purpose than those with smaller Points.

FIG. 6.

A Needle similar to the last, but groov'd towards the Point, which is recommended by *Brisseau*, and described under the Article CATARACTA.

FIG. 7 and 8.

Are two Needles from *Solingen* and *Nuck*, said to be invented by *Smalfus*, which are used together in the same Operation. That represented by *Fig. 7.* is grooved and sharp, like that of *Brisseau*. But that at *Fig. 8.* is blunt, and so fitted, that it may be introduced into the Eye thro' the Groove of the other, in order to depress the Cataract, while the other is drawn back.

FIG. 9 and 10.

Are two Needles for the same Intention with the two last. They are taken from *Albinus*.

FIG. 11.

Is a Needle contrived, also, by *Albinus*, for extracting membranous Cataracts, which is so contrived, that the Point A, by depressing the Handle B, opens like a Pair of Pliers in the Eye; though I question if it was ever used successfully.

FIG. 12 and 13.

Represent the Parts of this Needle separate. *Fig. 12.* is the grooved Point which receives the other Point, *Fig. 13.* made so slender that it may be received into the former, and together with that commodiously introduced into the Eye. Near B, *Fig. 12.* is a small Perforation, fitted to receive the prominent Part D of *Fig. 13.* which are fastened together with a small Pin at C, *Fig. 11.* like a Joint. *Fig. 13.* E is a Spring which firmly retains the two Points, *Fig. 11.* in contact, and prevents them from receding, till by depressing the Handle B, they open like a Forceps, for taking hold of and extracting the Membrane.

FIG. 14.

Shews how the Eye should be held in one Hand, whilst the Needle is introduced by the other at A; and, also, how the Needle appears behind the Pupil in depressing the Cataract.

FIG. 15.

Is called a *Speculum Oculi*, or an Instrument contrived to keep the Eye steady in Couching and other Operations.

FIG. 16.

Is another Instrument of the same Kind, but more commodious, as the two Arches AA, and BB, may be widen'd or contracted by the Button C. D is the Handle.

FIG. 17.

Is a Needle, directed by some, for depressing a Cataract in the Right Eye with the Right Hand, A, the Point of the Needle; B, the Handle; C, an Incurvation for resting on the Nose.

FIG. 18.

A Sheath for the Point of this Needle.

FIG. 19.

Is taken from the Appendix to the fourth Edition of *Chefelden's Anatomy*, to shew how the Needle should be directed in opening and dividing the closed or contracted Uvea.

FIG. 20.

A denotes the Manner of dividing the Uvea, in its Middle, by the same Instrument, to transmit the Rays of Light to the Eye.

FIG. 21.

Shews how Mr. *Chefelden* cut a concreted Uvea in the lower Part A, because of an *Albugo* in the middle Part of the Cornea of this Eye.

TABLE XXXIX.

FIG. 1.

Represents an *Unguis* on the Eye, a; and, also, the Method of passing a Needle and Thread under it, bb, for its Removal.

FIG. 2.

Represents another Sort of *Unguis*, or *Pterygium*, aa, with a Thread drawn through bb, the Extremities of which are tied in a Knot, making a Kind of Loop, having been first tied with a double Knot aa, that the *Unguis* may not slip out in the Separation.

FIG. 3.

Is a Hook used in curing *Ungues*, and other Tubercles of the Eyes.

FIG. 4.

Is a front View of a *Staphyloma*, or Protuberance on the *Tunica Cornea*, which was cured by *Heister*.

FIG. 5.

A lateral View of the same *Staphyloma*.

FIG. 6.

A front View of another *Staphyloma*, larger and more depending, cured also by *Heister*.

FIG. 7.

A lateral View of the same *Staphyloma*.

FIG. 8.

Is a smaller *Staphyloma*, aa, having a Needle with a double Thread passed under it, from *Solingen*.

FIG. 9.

A concave Rasp for abrading carious Bones in a *Fistula Lacrymalis*, from *Platerius*.

FIG. 10.

An Instrument invented by *Mecklen* for penetrating the Cornea in an *Hypopyon*. AA, the Handle; B, the Knife, or rather the Point of a Knife, armed with a Button at its Base, that it may not penetrate too deep into the Eye; C, a Screw to fix in the Case, *Fig. 11.*

FIG. 12.

A large Needle for making Setons, which may also serve to perforate the *Tunica Cornea* in a *Hypopyon*, if a Piece of Plaster be put round the Part A, which answer the same Intention with the Button mentioned in the last Fig.

FIG. 13.

Represents an Instrument designed to perforate the Cornea in an *Hypopyon*. A, its Handle; B, its triangular Point a little bent like the Needle. Its Point must, also, be armed with a Piece of Plaster.

FIG. 14.

AB represents a scirrhus Eye, swelled to the Size of a Hen's Egg; C, a Tubercle growing out of the large Tumor, like a black Berry; D, the vitiated Cornea and Tumor; E, the lower Eye-lid greatly depressed by the Tumor.

FIG. 15.

A prodigious Fungus of the Left Eye, which weighed half a Pound, and, as well as the last, was cured by *Heister*.

FIG. 16.

A Bandage contrived by *Solingen*, for curing squint Eyes in Children. AA, are two concave Plates of Silver, Ivory, or Ebony; BB, are small Perforations in the Middle of the Plates; CC, the Bandage itself for keeping the Plates fixed upon the Eyes; thus the Children may acquire a Habit of turning their Eyes forwards to the Perforations, and by Degrees acquire a better Way of looking.

TABLE XL.

FIG. 1.

An Instrument inserted in a Tube, used in burning the external Part of the Ear called Antitragus, in order to remove the Tooth-ach; A, the Tube; B, its Handle; C, the Cautey appearing without the Tube; D, the Handle of the Cautey.

FIG. 2.

An acoustic Instrument, shaped like a Horn or Trumpet; of which the narrow Part A, is put into the Ear, and the broad Part BB, is held in the Hand, and opposed to the Sound, which greatly augments the Faculty of Hearing.

FIG.

An EXPLICATION of the TABLES in Vol. II. and III.

FIG. 3.

Is another acoustic Instrument, with its Tube wreathed several Times; it is held by the Handle B, and its narrow Part A, is applied to the Ear, and the broad Part C, receives the Sound.

FIG. 4.

Another Instrument for the same Purpose contrived by Deckers; it is made of Silver, and the turbinated Part A, is applied to the Ear, and then it is tied fast with the Strings B B, so as to be concealed by the Wig or Hair, and without the Trouble of holding it in the Hand.

FIG. 5.

An Instrument for holding the Lobes of the Ears while they are boring.

FIG. 6.

A Needle of Silver or Steel; A, its Point; B, its other End, with a Tube for receiving a leaden Wire. This Needle not only serves to bore the Lobe, but also to introduce the leaden Wire into the Perforation.

FIG. 7.

The leaden Wire to be left in the Perforation till it heal.

FIG. 8.

Another Needle for the same Purpose, but slit at one End like a larding Needle, for receiving the leaden Wire.

FIG. 9.

A Pair of blunt Forceps, from Palfyn, for extracting the Polypus of the Nose.

FIG. 10.

Another Pair, perforated towards the Extremities, for taking firmer Hold of the Polypus.

FIG. 11.

Another Pair of Forceps, with the Extremities crooked, for extracting Polypuses of the Nostrils which depend towards the Fauces.

FIG. 12.

An Instrument for applying a Ligature to a Polypus, which is not too deeply rooted. A, the Handle; B, the obtuse Point, with an Eye like a Needle, through which passing a waxed Thread, it may, by means of the Instrument, be brought round the Root of the Polypus. The Curvature C, is useful for the easier surrounding and laying hold of the Root of the Polypus.

FIG. 13.

Represents a Polypus extracted by Heister with the last mentioned Instrument. A, the Root which grew to the internal and middle Part of the Nose; B, the Part appearing without the Nose.

FIG. 14.

Shews Part of a Face, in which not only the Nostrils were concreted, but the upper Lip bent backwards, and firmly joined to the Nose.

FIG. 15. and 16.

Are two Pipes of Lead or Brass, with Wings designed to keep open the Nostrils, after they have been opened by Incision. Fig. 15. for the Right Nostril, and Fig. 16 for the Left.

T A B L E XLI.

FIG. 1.

Represents the Head of an Infant about two Years old, afflicted with a Hare-lip A; and the whole of whose Palate was fissur'd, and in the Left Side two *Dentes Incisores* appearing.

FIG. 2.

Exhibits a Needle, or rather a small Instrument furnished with a Head, as also a triangular Point, and contriv'd for joining Hare-lips.

FIG. 3.

Represents a like Instrument with a flat Point, and made of Brass or Silver.

FIG. 4.

Exhibits another Needle or Instrument, with a flat Point, but without a Head.

FIG. 5.

Represents two Needles of this Kind passed through a Hare-lip, and a Thread twisted orbicularly about them.

FIG. 6. and 7.

Represent two *Tenacula*, by some used to prevent the too large Effusion of Blood in the Operation for the Hare-lip. The Edges of the Lip are to be laid hold of by the Part A B, and secured by moving the Ringlets C C to B. B.

FIG. 8.

Is a Needle in Form of a larding Pin, invented by Mr. Petit, a French Surgeon, for the commodious Perforation of Hare-lips, and the Insertion of the Pins for their Retention. A denotes the Fissure into which, after the Needle is half passed through, a certain Fibula is introduced, and by that Means conveyed into the Lip.

FIG. 9.

Represents a flexible Silver Fibula, with a Head at each End, and recommended by Mr. Petit.

FIG. 10.

Exhibiting another Fibula, with a Head at one End only, and which Mr. Heister prefers to the foregoing in several Respects.

FIG. 11.

Represents the Face of a Man afflicted with a Cancer of the inferior Lip. The Letters *a a a* exhibit the corroded Lip, or the open and exulcerated Cancer, the Teeth and Gums, in the mean time appearing; and the Letters *b b b* represent the cancerous Tumor situated in the internal Part of the Left Corner of the Mouth.

The remaining Figures of this Table, which relate to the Instruments used in Operations on the Teeth, are explained at the Conclusion of the Article *DENTS*.

T A B L E XLII.

FIG. 1.

Represents the Method of dividing the Frenum of the Tongue in Children with the Knife.

FIG. 2.

Shews how the same Operation is to be performed with a Kind of Fork and a Pair of Scissars.

FIG. 3.

Is the Fork used in this Operation for sustaining the Tongue, according to its proper Size.

FIG. 4. and 5.

Are thin Plates of Gold or Silver for supplying such Parts of the Palate as may be consumed, having a Piece of soft Sponge fixed at *a a*.

FIG. 6.

Represents the Brass Instrument of *Hildanus*, for taking off the Uvula by a Ligature. A A is the Thread or Ligature properly disposed and fastened in the Instrument; B, the Part which takes Hold of the Uvula; C, that Part of the String to be drawn with the Hand. But the true Size of the Instrument is three Fingers Breadth larger than it is in the Figure.

FIG. 7.

Is a Brass or Steel Wire, furnished with an Aperture A, to convey the Strings through the preceding Instrument, to the Size of which it should be proportioned. B, its Handle.

FIG. 8.

Represents an Instrument to make an Abcision of the Uvula, A, the Part which is to receive the Uvula; B B, the Part by which the Knife C is thrust forward to cut off the Uvula; D D D is the Handle of the whole Instrument, to be held in the left Hand.

FIG. 9.

Is an Instrument that may be call'd *Paristhmotomus*, serving to scarify the Tonsils, when inflamed, or open them when suppurated. A, the concealed Scarificator; B, the Button by which it is to be gently thrust out in the Operation; C, the Handle by which the Instrument is to be held firm. The true Size of the Instrument exceeds the Figure about two or three Fingers Breadth.

FIG. 10.

Is an Instrument contrived for extracting from the Fauces the small Bones of Fish, Thorns, &c. A A is a Sponge; B B a Rod of Whalebone to which the Sponge is to be fasten'd.

FIG. 11.

A Brush for the Stomach, *Ventriculi Excitua*; A A, the Brush, made of fine Hairs; B B, the Handle of Brass Wire, covered with Silk, by which it is to be introduced into the Stomach.

FIG. 12.

Exhibits the wry Neck; A A, the two Mastoide Muscles, which are to be divided in their lower Parts, when preternaturally contracted.

Fig.

An EXPLICATION of the TABLES in Vol. II. and III.

FIG. 13.

Represents an Instrument for straitening the Wry-Neck; A, the Collar, lined with Fur, which should be exactly fitted to go round the Neck; B B, an Iron Arch which is connected to the Collar, and furnished with the Ring C, by which the Patient is to be suspended.

FIG. 14.

A A, Exhibit the Part and Manner in which the Integuments are to be divided in *Tracheotomy*.

FIG. 15.

Is a Kind of *Trocar* with a sharp and triangular Apex for piercing the *Aspera Arteria* in that Operation.

FIG. 16.

Is another Kind of these Instruments proposed by *Dekker*; A A, is the Point; B B, the Pipe which contains the Point, and is left in the perforated *Trachea*.

FIG. 17.

Is that Part of the Neck in which the transverse Seton should be made.

FIG. 18.

Is a Glass Instrument, whose Bowl A, being applied to the Nipple, and the Part B B, in the Patient's Mouth, the Nipple, if too small, and the Milk may be both drawn out by Suction.

FIG. 19.

Is a small Cucurbit. of Ivory or Alabaster, for drawing out small Nipples, and covering them when ulcerated.

FIG. 20.

Is a small Glass Cucurbit to draw out the Nipple, but especially the Milk.

TABLE XLIII.

FIG. 1.

A B, exhibit a latent or occult Cancer, occupying but Part of the Breast, and reaching from the Nipple almost towards the Shoulder.

FIG. 2.

A B, represent the simple and rectilinear Cicatrix left after the Cure of that Cancer.

FIG. 3.

A. B. Shew a large occult Cancer occupying the whole Breast; which weighed twelve Pounds, when it was extirpated by *Heister* with the Knife.

FIG. 4.

Shews the Method formerly practised in extirpating a cancerous Breast, *a a*, with large Needles *bb*, and Threads *c c*, perforating the lower Part.

FIG. 5.

Exhibits the Manner of joining these Threads after they are drawn through, in the Hand A, to elevate the affected Breast, and afterwards amputate it with the large Knife B.

FIG. 6.

Is a Fork proposed by *Solingen* and *Bidloo* for piercing large cancerous Breasts, and afterwards amputating them.

FIG. 7.

Is a large Knife for amputating cancerous Breasts.

FIG. 8.

Is an Instrument of *Bidloo*, resembling a Sword, for elevating small cancerous Breasts, when they are intended to be cut off.

FIG. 9.

A, Is a large, broad, crooked Needle, for making a longitudinal Seton, which may also be furnished with a wooden Handle at the Part B, to force it more easily through the Skin of the Neck.

FIG. 10.

Shews the Point of this Needle, in its true Size, viewed on the internal or concave Side.

TABLE XLIV.

FIG. 1.

Is the Forceps or Tenaculum of *Helvetius*, serving to squeeze and hold up the cancerous Breast by its two Arches A A, while the Surgeon takes it off by cutting below them.

FIG. 2.

Shews another Instrument for this Purpose, also invented by *Helvetius*; A, B, its two Sides or Wings; C C, the Rings for the Fingers by which it is held or shut; D, the Hinge on which it moves.

FIG. 3.

Represents a new Instrument for amputating cancerous Breasts. A A, is a double semicircular Bristle Plate, so joined at the lower Part, C, as to leave an Interstice, D D D, to receive and direct the crooked Knife, E F. The undermost Part of the double Plate appears by the Letters *a a a*. B B, is a semicircular fingle Plate, so joined with the other by the Button or Screw at G, that they together form a complete Circle, and exactly compress the Breast. C C, the Handles of the semicircular Plates. F, the Handle of the Knife; which, when the Legs of the Plates are shut may pass through the Fissure D, as is shewn in the following Figure.

FIG. 4.

A, represents the cancerous left Breast of a Woman; B, the Arm extended; C C, the semicircular Plates, which compress and raise the Breasts from the Under-parts; D, the left Hand of the Surgeon holding the two semicircular Plates; E, his right Hand, with the Handle of the Knife, guiding it upwards, in the Direction F, G, H, to divide the Breast.

FIG. 5.

Is a particular Needle for making a transverse Seton; A, the Eye of the Instrument through which the Cord or Thread is to be drawn; and when it has passed through the Integuments to B, the Cord is to be drawn out of the Eye, and left in the Wound whilst the Instrument is drawn back again; C, the Part of the Instrument which is to be fastened in a Wooden Handle.

For the Explanation of TAB. 45, and 46, see HERNIA.

TABLE XLVII.

FIG. 1.

Represents an *Enterocoele* on the right Side, as it appears before any Incision is made in the Integuments out of *Mauchart's Differt. de Hernia incarcerata Scroti*, whence the two subsequent Figures are also taken.

A A, the Thighs drawn asunder, that the Hernia may be more distinctly viewed; B, the right Groin distended by a Prolapsus of the Intestine; C, the left Groin, sound, flat and more depressed than the other; D, the Penis retracted, as it usually appears in this Disorder; E E, one Side of the Scrotum, very much swelled and distended from the Groin almost to the Bottom; F F, the Bottom of the Scrotum, neither swelled nor distended, in which the Testicle may be felt separate, and not confused with the Intestine; G G, the other half of the Scrotum, in its natural State and Figure; H H, the Suture which divides the Scrotum in the Middle.

FIG. 2.

Exhibits the affected Side of the Scrotum laid open by Incision; A A, the Skin opened the whole Length of the Scrotum, and drawn aside that the subjacent Parts may come in View; B B B, the Membrana Adiposa divided and drawn aside in the same Manner; C C, the Ring of the *Musculus Obliquus Externus* which being preternaturally dilated, permits the Peritonæum, or Bag with its included Intestine, to fall through; D D, the Aponeurotic Coat of the Testicle, called Dartos, which invests the whole external Surface of the Bag, including the Intestine and Testicle, divided in the Middle, and separated from the Bag, to which it internally adheres, and then drawn on each Side; E, the Cellular Membrane of the Peritonæum which is here conspicuous, and inflated with the Pipe F; G, the internal Hernial Sac formed by a Dilatation of the internal Membrane of the Peritonæum, immediately containing the Intestine, and divided in the Middle, so that the Intestine appears marked H H.

FIG. 3.

Represents the Situation of the Intestine and other Parts in the Scrotum, together with the internal Hernial Sac. A tendinous Fibres from the Aponeurosis of the oblique external Muscles, marked D D, in the preceeding Figure; B, the external Membrane of the Peritonæum, turned a little backward, which being naturally elongated, is called the Process of the Peritonæum, or *Tunica Vaginalis* of the spermatic Vessels and Testicle; but when preternaturally distended, it makes, together with the Aponeurotic Membrane, (See D D, Fig. 2.) the external Part of the Hernial Sac; which could not

An EXPLICATION of the TABLES in Vol. II. and III.

not be here represented without Confusion; C, the interior Membrane of the Peritonæum, which, by preternatural Distention, being protruded into the Scrotum, forms the internal Hernial Sac next the Intestine; DD D, the same Membrane continued to the Septum, which usually forms the *Tunica Vaginalis* upon the Testicle, turned a little aside, as is the lower Side EE, that the subjacent spermatic Vessels may appear; FF, the *Tunica Vaginalis* loosely investing the Testicle opened; opened, so as to shew, G, the Body of the Testicle, now covered only with the *Tunica Albuginea*; H, the Epididymis or Parastata; II, the *Corpus Pampiniforme*, or the spermatic Artery and Vein, between the external and internal Membranes of the Abdomen, thus burst through the Ring of the Abdominal Muscles; L, the Canal called *vas deferens*; MM, Part of the Intestinum Ilium, included in the internal Bag, but here taken out and laid on one Side, variously convolved.

FIG. 4.

Is a Knife contrived by *Guillemeau*, for dividing the Preputium in a Phimosis, and denudating the Glans.

FIG. 5.

Is an Instrument contrived by *Dr. Frew* for retracting the Preputium in a Phimosis; A A, are two elastic Plates which are contracted or dilated by the Screw B.

FIG. 6.

A kind of very thin Trocar, design'd for perforating the Glans of the Penis, especially in Children and new born Infants.

FIG. 7.

Represents the Brass or Steel Réceptacle, recommended to be fasten'd between the Thighs for receiving the Urine in Cases of Incontinency. It should be large enough to hold about half a Pint. B, denotes the Mouth of the Vessel to receive the Penis; and CC, the Strings for tying it round the Body.

FIG. 8.

Is an Instrument made of two Iron Plates cover'd with Leather, A A, which is design'd to stop an involuntary Flux of Urine, by being applied to the Penis, and compressing the Urethra. B, is the Hinge on which the Plates move; C, a Turn-ketch to open and shut the Instrument at Pleasure.

FIG. 9.

Is nearly the same Instrument, only a little improv'd; the Difference consisting in having a graduated Ketch, C, whereby it may be contracted or enlarged at pleasure, according to the Size of the Penis. The rest is explained by the Letters in the preceding Figure.

FIG. 10.

Represents another Instrument for the Incontinency of Urine taken from *Nuck*. A A, the Steel Girt or Belt to pass round the Body; B, the Buckle, by which the Leather-part, C, is fasten'd. D, the Screw, which presses against, and raises the Plate E, whose Button, F, being defended with a Compress, is urged against the Urethra in the *Perinæum*.

TABLE XLVIII.

FIG. 1.

Represents the Copper or Silver Pipe called a Catheter, used principally in Women either in searching for the Stone, or in procuring a Discharge in a Suppression of Urine.

FIG. 2, 3, 4, 5.

Are Silver Catheters of various Sizes, to be applied for the same Purposes in Male Subjects, according to the Patient's different Age and Size of Body. A A, is the Handle of the concealed Silver-Wire, by which it is to be drawn out of the Cannula, when that may be necessary; B B, oblong Apertures on both Sides of the Extremities of the Instruments which admit the Urine to be discharg'd; CC, the Handles of the Catheters.

FIG. 6.

Represents a flexible Silver Catheter, which is sometimes very necessary to discharge the Urine, when another Catheter must be introduced several times successively, which might occasion an Inflammation of the Urethra, or it may be conveniently left in the Bladder, when the Passage of the Urine is entirely stop'd by a Stone. The Letters A, B, and C, denote the same Things here as in the preceding Figures.

FIG. 7.

Exhibites another Silver Catheter without lateral Apertures, having only one Opening at its End, marked A, which is shut by the Button marked B; which is in a manner the Extremity of the included Wire: If the Handle of the Wire, C, be

press'd, the Button comes out in the Manner represented by D. in the adjacent Figure, by which means the suppress'd Urine will enter by the Mouth of the Catheter, and be discharged through it.

FIG. 8.

Is a large open Knife, or Bistoury, which has been hitherto mostly used in the Operation of Lithotomy; and is by some termed Lithotomus.

FIG. 9.

Is the same Instrument, armed with a Piece of narrow Linen wound round it, in such a manner as not to leave above an Inch of the Edge uncovered, sufficient to make the Incision.

FIG. 10.

Is the Hook which is sometimes necessary for extracting the Stone in the several Methods of Lithotomy; it being furnished with small Teeth in its concave Part for more firmly holding or retaining the Stone.

FIG. 11.

An Iron Instrument, having a long narrow Spoon at one End; and, being round at the other, is also furnished with a round Button for performing the Office of a Probe and Director, which is often used with various Intentions for the Stone in the Bladder by the Lithotomists.

FIG. 12, 13, 14, and 15.

Denote Steel and groov'd Catheters, which are commonly used in cutting for the Stone by the *Apparatus major*, that the Knife might be guided in the Groove. D D, represent their Handles; E E, their Grooves.

FIG. 16, 17.

Are two Stones of an unusual Size, which *Heister* successfully cut out of a sort of Hernia of the Urethra before the Scrotum.

TABLE XLIX.

FIG. 1.

Represents the Manner in which a Boy should be held in the Operation of cutting for the Stone, according to the Direction of *Celsus* and *Tolet*; which is neither proper nor convenient.

FIG. 2, 3.

Represent the ensiform Directors, often used in the *Apparatus major*, and in the lateral Operation. FIG. 2. is furnished with a small oblong and obtuse Beak A, and is generally denominated Male: The other, at Fig. 3. B. has a Groove, and is generally the Female Director.

FIG. 4.

The Concave or canulated Director, called by the *French* *Gorget*, which is generally prefer'd to the two preceding. A, the Beak of the Instrument which is introduced by the Groove of the Catheter; B B, its crucial Handle; CC, the Channel or Groove through which the Finger is pass'd, and then the Forceps into the Bladder.

FIG. 5.

A Pair of straight Forceps for extracting the Stone out of the Bladder, furnished with Teeth, of which Kind it may be necessary to have some larger.

FIG. 6.

A crooked Pair of Forceps, to be used principally when the Stone lies towards the Side of the Bladder.

FIG. 7.

Represents a Pair of large Forceps, furnished with large and sharp Teeth; of a pyramidal Figure, fitted for breaking large Stones within the Bladder: But the Instrument may be made as large again as the Figure, to exert the greater Force.

FIG. 8.

Represents an Instrument called a Dilatator, being designed to widen the Wound in Lithotomy, though it is now little used. The Beak A, like a Crane's Bill, is inserted in the Wound; and the two Arms, B B, being press'd together, the Beak of the Instrument opens by means of the Hinge marked C.

FIG. 9.

Shews a commodious Table, adapted for performing the Operation of Lithotomy, marked at each Corner with the Letters A A A A. The Letter B, denotes the Place on which the Patient is to be seated, being hollow, that the Corners may more commodiously support the Feet. C, the Prop for supporting the Patient's Back; which for the greater Convenience, is capable of being elevated or depressed more or less, to raise the Patient higher or lower, as the Surgeon may see proper, by means of the Iron Rod marked D.

TABLE

An EXPLICATION of the TABLES in Vol. II. and III.

T A B L E L.

FIG. 1.

Represents the Urethra of a Male Subject, freed from the other Parts of the Penis, together with the Bladder, prostate Gland, and Intestinum Rectum, all viewed on their left Side, and figured as much as possible to the Life, so as to exhibit the natural Disposition of them as they appeared in a Lad aged fourteen. A, the Glans Penis; B C D E F, the Urethra in its natural Curve Position; E, the Bulb of the Urethra; F, a Part of the Urethra, termed membranous; G, the Body of the Bladder itself; H, its Bottom; I K L, the Neck or Entrance of the Bladder, invested with the prostate Gland, and deprived of its muscular Fibres, which compose the Sphincter of the Bladder, to render it the more conspicuous; I, is the Beginning or Apex of the Gland; K, the Body of it; L, its Extremity or Margin next the Bladder; M N, denote the lower Part of the Bladder next the Intestinum Rectum, in which is formed the left Cavity, which often makes as it were a kind of Depressure in the Rectum, in which Stones are lodged; N O P, denote the back Part of the Bladder, which lies next the Os sacrum, and Cavity of the Abdomen, being covered with the Peritonæum; Q R, is the anterior Part of the Bladder in our erect Position, but the uppermost when we lie supine: It is this Part which is divided in the high Operation, being not invested with the internal Membrane of the Peritonæum, but is free and separated from the Cavity of the Abdomen, as may be plainly perceived by inflating or injecting some Liquor into the Bladder of a dead Subject; but concerning this we shall be more particular in our Explanation of the succeeding Table. S S, represent the Intestinum Rectum connected to the Bladder; T, the Sphincter Ani, or Muscle destined to close the Mouth of the Rectum; V, is part of the left seminal Vesicle; X X, the Interstice between the Intestinum Rectum, Bulb of the Urethra, and Neck of the Bladder, filled partly with the Membrana Adiposa, and partly composed of muscular Fibres detached from the Sphincter and elevating Muscles of the Anus.

FIG. 2.

Represents the Position of the Bladder and Urethra in Women, as they are seen on the left Side, together with their Connection to the Uterus and Vagina, taken from *Alghisi*. A, denotes the Bladder; B B, its Sphincter Muscle, including the Urethra, marked C C; D, the external Orifice of the Urethra opening into the Vagina; E, the Clitoris and its Preputium; F F, the Nymphæ; G G, the Labia Pudendi; H, the external Orifice of the Uterus called the Os Vaginæ; I I, the Body of the Vagina; K, the Uterus itself; L, the internal Orifice of the Womb seen through a lateral Slit made in the Vagina.

FIG. 3.

Shews the Manner in which the Catheter is to be introduced into the Urethra. A, denotes the Surgeon's left Hand elevating the Penis; B, his right Hand introducing the Catheter into the Vagina, so that the convex Part of the Catheter looks towards the Abdomen.

FIG. 4.

Denotes the Position into which the Catheter is to be turned in the Urethra. When it has reached the Bulb, marked E, in *Fig. 1* it is to be then inverted, so that the concave Part of the Instrument may be turned towards the Abdomen; and the Extremity of it marked B, gradually insinuated through the Neck of the Bladder into its Cavity. C, denotes the Handle of the Catheter, by which it is to be guided by the right Hand.

FIG. 5.

Exhibits the ancient Method of Lithotomy used by *Celsus*, performed by introducing the two Fore-fingers into the Anus, whereby the Stone and Neck of the Bladder are thrust outward in the Perinæum, and the Incision, B B, is there made upon the Stone in the most prominent Part of the Perinæum, marked A.

FIG. 6.

Shews the Method of extracting the Stone marked A, by the Hook B, when it sticks in the Wound so as not to be extracted from the Bladder by the Fingers alone.

FIG. 7.

Is a Brass Instrument of Mariners, adapted to extract Stones out of the Urethra. A, that Part of the Instrument, which is to be insinuated into the Urethra behind the Stone, and by

means of which the Stone may be laid hold of and cautiously drawn out. B, the round Handle, by which the Instrument and Stone are to be then drawn out of the Urethra.

FIG. 8.

Represents an anterior View of the Bladder taken out of a Boy. A A, denote the Necks of the Bladder and Beginning of the Urethra; B B, the Body of the Bladder; C, its Bottom, with the adjacent Parts of the *Urachus*; D D, the prostate Gland investing the Urethra; E E, the seminal Vessels, in part visible on each Side, which in Adults are more protuberant, and extended up to F F; where, being hollow internally, they form a sort of Sinus in the Bladder on each Side, in which the Stone often lies concealed; they may therefore not improperly be called the Sinuses of the Bladder, which are yet wanting in the Bladders of Infants and Children; the Figure of the Bladder in Adults is therefore somewhat different from that in Children. The Bladder indeed resembles the Form of a Pear in both of them; but with this Difference; that in Children the Apex of the Pear is downwards to the Urethra, as in this Figure; but in Adults the Apex of the Pear is upwards, the Bladder being broadest downward, as may be seen in *Fig. 1* of this Table, and in *Fig. 1*, and 2. of Table 51.

FIG. 9.

Represents the Manner in which the adult Patient should be placed and held for Lithotomy, according to *Alghisi*, which is in part different from the Method of *Tolet*, and other modern Operators. A, denotes the Posture of the Patient; and B, the Surgeon with the Catheter in his left Hand, and the Incision-Knife in his Right; C C, two of the Assistants, who are placed on each Side of the Table, to secure the Patient's Limbs, holding the Foot in one Hand, and the Knee in the other; D, the Assistant, who kneels upon the Table, and, by striding over the Patient, keeps his Body from rising or moving, while with his Hands he draws up the Scrotum, and extends the Skin of the Perinæum; E E, a Cushion placed under the Patient's Buttocks; F, a Vessel placed beneath the Patient to receive the Blood, and perhaps the Fæces, discharged in the Operation; G, denotes the Part of the Perinæum in which the Incision is to be made; H, the Case for containing the Instruments, to be fastened about the Waist of the Operator; this is represented by itself in Tab. 51. *Fig. 6*.

FIG. 10.

Exhibits one of the open Nooses with which *Raw* used to fasten the Patient's Hands and Legs together. A, the Loop for containing the Wrist; B B, its two loose Ends to be fastened round the Leg.

T A B L E II.

FIG. 1, 2, 3.

Are taken from Mr. *Chefelden's* Treatise of the high Operation, in order to the Position and State of the Bladder when distended with Liquor, preparatory to the Operation. These Figures have been already sufficiently explained under the Article LITHOTOMIA.

FIG. 4.

Represents the Abdomen opened, the Bladder being but slightly distended, either by the Urine or any other Liquid, to shew how small a Space is remaining between the *Ossa pubis* and Bottom of the Bladder covered with the Peritonæum A A A, being the Part where the Incision is to be made in the Bladder, B B. This Figure has been also explained under the Article LITHOTOMIA.

FIG. 5.

Is also taken from Mr. *Chefelden*, and denotes the Pipe or Tube by which the Liquor is conveyed into the Bladder, in order to distend it for the Operation. A A, is a Silver and inflexible Catheter which is to be passed through the Urethra into the Bladder; B, the Aperture in each Side, by which the injected Liquor enters the Bladder; C, a Brass-Pipe which is to be adapted to a sizeable Syringe. D D D, a flexible Pipe made of Leather, or of the Ureter of an Ox which joins the Brass-Pipe and the Catheter; and thus the Injection will be more easily performed than if the whole was an inflexible Tube, as was used by *Rossatus*. E, the Part of the flexible Tube which is tied with a Thread to the Catheter, where there is also a transverse Handle, which serves to hold the Catheter steady, that it may not hurt the Patient during the Injection.

FIG. 6.

Represents the Case for holding the several Instruments for Lithotomists, disposed in their proper Order. This is to be fastened

An EXPLICATION of the TABLES in Vol. II. and III.

fastened round the Lithotomist in the Manner represented at *Fig. 9. Tab. 50.* and was always used by *Raw*, as being more ready and expeditious, than to trust to an Assistant, who may chance to be attending something else. A A A A, the Case itself; B B, the Instruments disposed in their proper Order; C C, the Side or Cover of the Case; which may be fastened with the Buttons marked D D, that so the Instruments may be concealed from the Patient's Sight, to prevent him being intimidated; E E, the Strings by which the whole is fastened round the Waist of the Lithotomist.

TABLE LII.

FIG. 1.

Represents a lateral View of *Raw's* groov'd Catheter, as it is delineated in its true Figure and Thickness by *Albinus*. But *Heister* observes, that, in 1706 and 1707, while he was *Raw's* Pupil, he used a common groov'd Catheter, like that represented in *Tab. 48.* only it was a little thicker than those commonly used. A, denotes a lateral View of its Handle; B, the Part which he asserts to be more crooked than the common ones; tho' it seems to be less crooked than those which have been figured for the *Apparatus major*, by *Tolet*, *Alghisi*, *Garengot*, *Le Dran*, *Heister*, and others. C, denotes the Beak of the Catheter, which is longer and straighter than the common.

FIG. 2.

Exhibits an oblique View of the Handle of this Catheter, which may as well be made in the Form of a Heart, like that in *Tab. 48.* or else flat and solid, as that of *Mr. Cheselden* in *Fig. 6.* of this Table, or with a Ring like that of *M. Le Dran* in *Fig. 17.* of this Table.

FIG. 3.

Represents the Beak or Groove of *Raw's* Catheter, in which may be seen its thin, but smooth and obtuse Sides, marked *a a*, between which is the large Groove marked *b b*; C, is the Termination of the Groove in a smooth and obtuse Point.

FIG. 4.

Is a transverse Section of the groov'd Part of this Catheter, to shew its Form and Depth, that the Knife may not easily slip out of it.

FIG. 5.

Exhibits the grooved Catheter of *Cheselden*, which is more slender and less crooked than that of *Raw*, and the common Sort; *a a*, denotes the Edge of its Handle in the Shape of a Heart; *b b*, the Body of it in a rectilinear Form; *c c*, the Curve and grooved Part; *d*, the Beak of the Instrument, which has little or no incurvation.

FIG. 6.

Represents the flat Side of the Handle of this Catheter *a*, with Part of its Groove, *c c*, and its whole Body, *b b*.

FIG. 7.

Denotes the straight Beak of the Groove in *Cheselden's* Catheter, whose Sides, marked *a a*, are smooth and obtuse like *Raw's*; but its End, *b*, is left open, and not made obtuse or closed as in the other Catheters. But I am not sensible of any Advantage that attends this particular Make, nor does its Author mention any.

FIG. 8.

Is the Incision-Knife of *Mr. Cheselden*, which he uses in cutting for the Stone, whose Blade is fixed to the Handle, *a a*, and its Point directly in the Middle.

FIG. 9.

Shews the concave Part of *Mr. Cheselden's* Director, B B, having its Handle, A A, inclined to the left Side, for the commodious Introduction of the Forceps through it into the Bladder; C, the Extremity of its Beak terminating in a flat Point, shewn side-ways in *Fig. 10.* and in *Fig. 11.* its Handle is represented separate.

FIG. 12.

Is the common small Forceps of *Cheselden*, most frequently used by him in extracting the Stone; but for large Stones, *Douglas* represents a Pair three Inches longer. A A, the Handles, shaped like Hooks, which are commonly in others in the Form of Rings; and in the large Forceps one Handle is represented annular, and the other like a Hook. B B, are the two Ends of the Forceps made so as not to shut quite close, left in searching for the Stone they should lay hold on and hurt the Bladder.

FIG. 13.

Represents the internal Surface of one of the Jaws of these Forceps, which is concave, and furnished with many small Teeth inclining backwards, towards the Handle, that it may hold the Stone firm.

FIG. 14.

Gives a lateral View of a Needle, used by *Cheselden* in taking up any Artery that may be divided in the Operation.

FIG. 15.

a, Represents the convex and angular Point of the same Needle towards the Point; *b*, its Concave or internal Part, which is smooth.

FIG. 16.

The Bistoury or Incision-Knife of *Le Dran*; A, its Point; the Lines B B, shew how far the sharp Edges extend; C C, the two Sides of the Handle.

FIG. 17.

Is a new Catheter of *Le Dran*, which he uses for the lateral Operation instead of *Raw's*; *a a*, its Handle; *a b*, its Body; *b b b*, its Concave or crooked Part; *c c c*, the Groove in its convex Part; *d*, its obtuse Point; the Lines, *e e*, denote the Length of the Fissure in its Groove.

FIG. 18.

Is the Incision-Knife recommended by *Garengot* in the lateral Operation.

TABLE LIII.

FIG. 1.

Represents a human Bladder taken from a Male Subject, in the anterior Part of which may be seen various empty Tubercles, or Cells, which are distended by inflating the Bladder, in which Cells the Stone lies sometimes concealed. A A A A, shew the pyramidal Figure of the Bladder; B, denotes the prostate Gland investing the Neck of the Bladder, which is tied with a Thread near the Urethra; C, is the preternatural Cavity formed on the right and posterior Side of the Bladder; D, represents a less Cavity of the same kind; E, shews a like Cavity on the left Side, another of which is at the Bottom of the Bladder, marked F; *a a a*, are the Blood-Vessels which are distributed on the Bladder.

FIG. 2.

Represents a posterior View of the same Bladder, being explicable by the same Letters; to which add, G G G G, Cells which are still smaller, and not to be discerned on its anterior Part.

FIG. 3.

Exhibits the Trocar of *Denys* in its Silver Canula, which differs from the common, in its having three Apertures at the End of the Canula, two of which are visible at A A, the other being in the back Part; through these Apertures the Urine passes into the Pipe; B, the triangular Point; C C, the Plate of the Canula perforated with two Openings. D, the Handle of the Instrument.

FIG. 4.

Represents the Canula of the Trocar alone, in which A A, denote the Apertures at the End of the Canula in the preceding Figure; B B, represent other corresponding Apertures through which the Urine flows, after it has entered by those at A A; these Apertures do not appear in *Fig. 3.* being obscured by the Plate C C.

FIG. 5.

Exhibits the Perforator out of its Canula. D D, the Part of its Body immediately below the Point, which is made cylindrical to fit the Canula; but the Part between D D, and its Handle E E, is triangular, and made a little concave on each Side, so as to give a Passage to the Urine; F, its Handle.

FIG. 6.

Represents a Stone of an uncommon Size and Figure, which *Heister* extracted without much Difficulty by the high Operation; it weighed near four Ounces; and its Representation was given by that Author, for the Conviction of those who deny that large Stones can be extracted by the high Operation. A A, the Basis of the Stone, which lay near the Neck of the Bladder; B, a small Eminence of it which lay near the Neck of the Urethra; C, the upper Part which lay next the Bottom of the Bladder.

An EXPLICATION of the TABLES in Vol. II. and III.

FIG. 7.

Represents the Silver Catheter, which is strait and hollow for Women, being of a particular Make, different from that represented in *Tab. 48. Fig. 1.* A A, are two Rings near its Handle; B, an Aperture in its Side near that Extremity, which is to be passed into the Bladder, opposite to which there is another similar Opening; C C C, a Groove in the convex Part of the Catheter, serving for various Uses, and particularly for directing the Male Conductor into the Bladder, and for guiding the Knife when the Neck of the Bladder is to be divided, as in grooved Catheters.

TABLE LIV.

FIG. 1.

Shews the Method of examining the State of the *Os Uteri* with one or two of the Fingers, to discern whether it be in an oblique or strait Direction, or whether it be dilated or contracted; whence the Operator may form a Judgment concerning the Delivery, whether it will come naturally, or preternaturally, easily, or difficultly, speedily, or after a considerable Time. A, denotes the Uterus; B B, the Vagina laid open; C C, the internal Orifice of the Uterus as yet contracted, but in its right Situation; D, represents the Manner of examining the Mouth of the Uterus with one or more of the Fingers, which, if obliquely situated, either forwards toward the *Os Pubis*, backwards on the *Os Sacrum*, or towards either Side, denotes a difficult Delivery.

FIG. 2.

Represents the natural Posture of the Child in the Birth, with its Head protruding into the *Os Uteri*, under the Arch of the *Osfa Pubis*. A, the Infant; B B, the Uterus laid open that the most usual Situation of the *Fœtus* in a natural Birth may be viewed; C C, the *Osfa Pubis*; D D, the *Osfa Ischii*; E E, the *Osfa Ilei*; F, the Umbilical Cord; G, the *Secundines* adhering to the Uterus.

FIG. 3.

An Infant presenting with its Feet foremost.

FIG. 4.

Shews the Buttocks offering first, the Method of applying the Fingers to extract and promote the Birth.

FIG. 5.

Represents the *Fœtus* in a transverse Position, with its Back towards the Mouth of the Uterus; with the Hand of the Surgeon endeavouring to find the Feet by turning the Infant in the Uterus.

FIG. 6.

Exhibits the Manner of apprehending the Infant's Feet, turning and extracting them.

FIG. 7.

Shews a *Fœtus* also in a transverse Position, with its Belly towards the *Os Uteri* and Vagina; in which Posture the Navel-string frequently protrudes to the great Danger of the Child's Life.

FIG. 8.

Represents the Head obstructed by the left Side of the Bones of the Pelvis, and the Neck being violently contorted, by the Contraction of the Uterus, the Birth is thus rendered extremely difficult, and sometimes impracticable.

FIG. 9.

Shews the Infant's Head inclined towards the right Side of the Pelvis, and how it may be brought by the Hand to a direct Situation, immediately after the Discharge of the Waters.

FIG. 10.

Is a *Fœtus* presenting the Elbow or Shoulder to the Mouth of the Uterus, and the Method of introducing the Hand and Arm as far as the Elbow, for finding the Feet in this and other preternatural Postures, by which the Child should be turned and extracted, as shewn in *Fig. 6.*

FIG. 11.

Shews the Method when the Arm of the Infant is protruded, of introducing the Hand to search for the Feet, and extract the *Fœtus*.

FIG. 12.

Represents the Infant with one Foot protruded, and the Method of searching for and extracting the other.

FIG. 13.

Exhibits the Manner of separating the *Secundines* from the Uterus, when they do not immediately follow the Child. The Navel-string, A A, is held by the left Hand, B, while the right Hand, D, is guided into the collapsed Uterus, C C, to the Placenta, E, which is hereby separated from the Uterus.

FIG. 14.

Represents a Chair frequently used in delivering Women. A A, its Back; B B, the Sides; C, the Seat, having a semicircular Piece cut out of the Middle, that the *Os Coccygis* may be free, and yield to the Egress of the *Fœtus*; D D, the Handles of the Chair, which are grasped by the Patient in each Hand.

FIG. 15.

Is another Chair for the same Use, with a flexible Back, that if the Birth should be preternatural, it may be let down, and the Patient inclined on it, as if upon a Bed, to facilitate the Delivery; but, in defect of this Chair, a common Bed or Table may suffice.

FIG. 16.

Gives an Idea of the broad Steel Hook used by *Palfyn* for extracting a live Infant without Injury, when its Head obstinately sticks in the Vagina; but its true Size is as large again as the Figure. It is necessary to be supplied with two of them, that one may be applied to each Side of the Head.

FIG. 17, and 18.

Represent lateral Views of the Hooks generally used by *Heister*, in extracting a *Fœtus*; A A, their Points; B B, their Backs.

FIG. 19.

The Handle of these Hooks with Notches, *aaaaa*, in that Part which corresponds to the Back of the Instrument, that, by feeling with the Thumb, the Operator can know how the Point is directed toward the *Fœtus*, without hurting the Uterus. And in the Groove, *bb*, a String may be fastened, by which the Extraction may be also forwarded by an Assistant.

FIG. 20.

Represents a View of the anterior Part of the Hook separate.

FIG. 21.

Exhibits a double prong'd Hook, which may be sometimes used for the same Purpose.

TABLE LV.

FIG. 1.

Represents the Uterus, with a Mole adhering to it. A, is a Mole, such as *Sigismunda* happily extirpated, with a Pair of large obtuse pointed Forceps, in a Lady of Quality.

FIG. 2.

Exhibits a Prolapsus Uteri without Inversion. A A, the Pudenda; B, the Uterus appearing externally; C, the internal Orifice of the Uterus, which here appears on the Outside of the Pudenda.

FIG. 3.

Shews a Prolapsus Uteri, which is at the same time inverted. A A, the Pudenda; B, the inverted Uterus protruded, without any Appearance of its internal Orifice shewn by C, in the preceding Figure; C, the lower Part of this inverted Uterus.

FIG. 4.

Represents a peculiar kind of Prolapsus Uteri, as it was first denominated; though it was in reality no more than a falling down of the Vagina, according to the Observation of *Widmannus*, in *Ephem. Nati Curios. Cent. 8. Obs. 98.* where the History of the Case is more fully delivered, and the Figure of the Parts represented as large as the Life. A A, the Labia Pudendi; B B, the Nymphæ; C, the Clitoris lodged between them; D, the protruded Body, resembling a falling down of the Uterus, though it is only a Relaxation of the whole interior Coat of the Vagina, which is prolapsed and changed into a Tumor. E, its Root at the external Orifice of the Vagina; F, its Basis or broader Part, with a Mouth resembling the internal Orifice of the Uterus; this derives its Origin from the Recess of the Coat of the Vagina from the

An EXPLICATION of the TABLES in Vol. II. and III.

internal Mouth of the Uterus, which it naturally covered; GH, the Uterus itself seated in the Pelvis. We have omitted here the Tubes, Ovaria and Ligaments, as not necessary for our Purpose.

FIG. 5.

Is taken from the chyrurgical Observations of *Meckren*, to shew a Prolapsus of the Vagina and Uterus together. A, the Uterus; B, its Neck; C, its internal Orifice; D, the Pudenda; EE, the Vagina laid open; F, the Root of the Tumor appearing without the Vagina, resembling a Prolapsus Uteri; G, the Ligature with which the Root of the Tumor was compressed during its Removal.

FIG. 6, 7, 8, 9, and 10.

Represents various sorts of Pessaries. Fig. 6. is round like a Ring, to which are fastened Strings for extracting it out of the Vagina. That at Fig. 7. is of an elliptic or oval Figure; Fig. 8. is quadrangular; Fig. 9. triangular; they are made of Cork, or Wood wax'd over, or else of Silver or Gold made hollow. Fig. 10. is solid like an Egg, but less convenient than the former.

FIG. 11.

Is an elastic Pessary of Iron Wire, turned into a conical Form, as described by *Goelicke*. This has also a String fastened to it; but if there was another fixed to the opposite Side, it might be drawn out so much the more easily.

FIG. 12.

Represents the Machine used in *Germany* and *Holland*, for injecting Clysters. AA, is the Bladder for containing the Liquor, which, for Adults, is about two or three times larger than the Figure, and holds about a Pint or more. BB, the Pipe of Bone or Ivory to transmit the Liquor into the Intestines; CC, the superior Ligature which should be untied after the Pipe is introduced into the Patient's Anus; DD, the inferior Ligature, by which the Bladder is closed, and the Liquor prevented from running out.

FIG. 13.

Represents a Machine for impelling the Smoak of Tobacco into the Anus and Intestines; A, is the Brass Bowl or Capsuli, which contains the burning Tobacco; B, the Ivory Pipe which is to be introduced into the Anus; C, the Pipe, which being in a Person's Mouth when the Tobacco is on fire, the Smoak E, is thereby blown through the flexible leathern Pipe DD, into the Patient's Bowels.

FIG. 14.

Denotes a Brass Pipe for conveying Fumes or Vapours into the Vagina. A, is the upper Part full of small Holes, which must be inserted in the Vagina; B, the lower Part, open, for receiving the Pipe of the Funnel.

FIG. 15.

Is a Speculum Ani, or Instrument for dilating the Anus or Vagina, in order for inspecting these Parts when diseased. AA, and BB, represent the hollow Beak shaped like a Cone, consisting of two Sides or Canals, AA, and BB, which being shut, a little warmed and lubricated with Oil, are to be gently passed into the Anus or Vagina. When the Handles C, and D, are pressed together, the two Sides of the Beak gradually widen, and dilate the Anus or Vagina, for Inspection; E, is the Hinge in manner of a Ginglymus.

TABLE LVI.

FIG. 1.

Exhibits the two kinds of Fistulas in the Anus. AA, is part of the Intestinum Rectum; B, the Sphincter Ani; CC, a perfect or complete Fistula of the Anus, terminating with one Aperture externally, and the other in the Intestine; DD, a flexible Probe or Silver Wire passed through the two Orifices of the Fistula, and bent so as to come through the Anus, E; the two Sides of the Wire intercepting the fleshy Parts to be divided, are drawn gently outward, for the more safe and convenient Performance of the Incision. F, represents an imperfect or incomplete Fistula, having only the Orifice G, opening into the Intestine; HH, denote the two Extremities or Heads of the Silver Wire.

FIG. 2.

Represents an Instrument like a large Needle from *Garengest*, made of flexible Silver, having an Eye marked A, for the Transmission of a Thread, when the Intention is to use a Ligature in cutting the Fistula after the Manner of the Antients; it may also serve to convey a Slip of Linen through a Wound

or Ulcer in the Manner of a Seton; B, the Point of the Instrument, which is to perforate the Intestine in an incomplete Fistula, and then to be bent and brought out through the Anus; it has a Groove running through its whole Length by which it may serve to guide the Knife instead of a Director.

FIG. 3.

Is a kind of Syringotomus taken in part from *Garengest*. AAA, denotes the concave and sharp-edged Part for cutting; BBB, the convex Back which is obtuse; CD, the Silver Wire or probe End which is flexible, and beginning at the Letter C, terminates at the Point D; the Part marked EE, being bent in Form of a Hook, serves as a Handle to facilitate the cutting of a Fistula when it is very hard or callous. F, denotes where the Instrument terminated, as made according to *Heister's* Directions, without the Part DF; by which means he found it more commodiously perform its Office, than if it were of the whole Length here represented.

FIG. 4, 5, 6, and 7.

Represent several common Syringotomi of the Antients, of different Sizes or Curvatures, and furnished either with obtuse or sharp Points, according to the different Circumstances of Fistulas; in which AB, denotes the cutting Part; C, the probe End; D, the convex and obtuse Back.

FIG. 8.

Is a Knife or Syringotomus, first published by *Bassius*. AAA, denote the Edge of this falciform Knife; BB, the flexible probe End made of Silver; C, its Point; DD, its Handle.

FIG. 9, 10, 11, 12, and 13.

Represent Instruments recommended to *Heister* by *Rungius* a Surgeon in *Bremen* in curing these Fistulas; especially Fig. 9. which is a sort of grooved Probe or Director, furnished with a peculiar Handle; AB, its grooved Probe or Director; CD, the Handle; E, the Part where the Probe is bent in a peculiar Manner, according to the Use for which it is designed. Fig. 10. gives a direct View of the Groove in the Director, as the former gave an oblique one. Fig. 11. AB, is a large Canal to be passed into the Anus, for the Reception of the Edge and Point of the Knife, Fig. 13. in cutting Fistulas, that it may not injure the adjacent Parts; CB, its Handle inclined to the opposite Side. Fig. 12. gives a direct View of the Cavity of this Canal, that its Width may be the better perceived. Fig. 13. is a long and narrow Knife, which, in cutting for a Fistula, is conducted through the Groove of the Director, Fig. 9. into the Cavity of the Canal, Fig. 11.

FIG. 14.

Is a flexible Silver Probe or Wire, so inflected that the bent Part A, may be introduced through the Intestine into the internal Orifice of the Fistula, F, for the more convenient and certain Incision of it.

TABLE LVII.

FIG. 1.

Represents *Meckren's* Method of removing Ganglia, by beating with the Fist on the Tumor, A.

FIG. 2.

AA, Shews a small, slender, straight Needle, with a flat Point, for the Suture of Tendons of the Hand; BB, a strong but slender waxed double Thread, with a Knot, C, at the End; with a square Bit of Leather, D, through the middle of which the Needle and Thread are passed up to the Knot.

FIG. 3.

A, and B, exhibit two Pieces of Leather, perforated in the Middle, used in making the Suture of the Tendon of *Achilles*, as at Fig. 7. EF.

FIG. 4.

Represents three different Methods of performing the Sutures of Tendons; aa, aa, aa, shew the Places where the exterior Tendons of the Fingers are divided in the Back of the Hand; A, the Manner of fixing the Knot of the double Thread on a square Piece of Leather on the superior Part of the Tendon; B, shews the Method of tying the double Thread with a slip Knot upon a small round Compress in the other inferior Part of the Tendon. C, shews the Knot of the double Thread intercepted upon the End of the Tendon by a round Compress instead of a square Piece of Leather, the other Ends of the Thread D, being fastened with a Slip-knot, on a like Compress as before. E, denotes the Method of Suture used by *Nuck*,

An EXPLICATION of the TABLES in Vol. II and III.

Nuck, in which the upper End of the Tendon is perforated in two distinct Places, *bb*, with two small Needles and one Thread, the Loop-end of the Thread being intercepted by a Bit of Leather, or round Compress, *E*, after which the other End of the Tendon is perforated on its Inside in two Places by the same Needles, and the Ends of the Thread tied upon a Compress or Bit of Leather.

FIG. 5.

Represents a Splint, made of thin Wood or the stiffest Past-board, used in a Suture of the Tendons of the Back of the Hand, which, being applied to the Palm of the Hand, keeps the Fingers properly extended.

FIG. 6.

Is the small crooked Needle of *Garegeot*, for making the Sutures of Tendons, which is preferred by the Moderns to the strait Needle, because it can be better held, and more easily transmitted through the Tendon; but it has no sharp or cutting Edges at its Point, like the common crooked Needles, Tab. 22. lest it should wound the transverse Fibres of the Tendon. *Garegeot* thinks there may be a sharp Edge in its concave Part, *A*, but *Heister* prefers it on the Convexity, *B*. The Eye of this Needle is not made sideways, as is common, but answering to its Concavity and Convexity, for the more easy Transmission of the Thread. This small Needle is for the lesser Tendons, as those of the Hand; but for the larger, as the *Tendo Achillis*, the Needle must be proportionably stronger, as at Fig. 9.

FIG. 7.

Shews the Method of uniting the *Tendo Achillis* by Suture, as taken from *Kisneri Dissertatio de Tendinum Læssonibus*. *A*, the Bottom of the Calf of the Leg; *B*, the Heel into which this Tendon is inserted or fixed; *C*, the Wound or Division of the Tendon; *D*, the Knot of a strong double Thread, with a Piece of Leather, *E*, under it; *F*, the same Thread fastened with the Slip-knot, *G G*, upon another square Piece of Leather. But the generality of Surgeons chuse to perforate the upper Part of the Tendon first, and to make the Slip-knot upon its lower End.

FIG. 8.

A exhibits a large, strong and strait Needle with a flat Point, recommended by some for the Suture of the *Tendo Achillis*, and the Tendon of the *Extensor Tibia*; *B B*, the double waxed Thread armed with the Knot, *C*, at its Extremity.

FIG. 9.

Is a large crooked Needle, shaped like that at Fig. 6. for the Suture of the *Tendo Achillis*.

FIG. 10.

Shews *Cowper's* Method of performing the Suture of the Tendon of *Achilles* with two Needles. *A, B*, the two Ends of the divided Tendons; *C, D*, two strait Needles with Threads, by which the Tendon is again united; *a b*, the Incision of the Integuments, for the easier Access to both Ends of the Tendon.

FIG. 11.

Is a kind of Stocking made of Leather or coarse Linnen, to be fasten'd tight about the naked Leg, by the Lace *B*, to be constantly wore for Varices and œdematous Swellings of the Legs, especially when recent.

FIG. 12.

Represents a Pair of strong Scissars for extirpating Part of the Nail of the great Toe, when it runs into the Flesh; it has one obtuse Point *A*, to rest easy upon the Flesh; *B B*, its two Handles, by the Compression of which the Scissars cut, and they are again opened by the Spring *C*.

FIG. 13.

Is a Pair of Nail-Scissars described and recommended by *Garegeot* for the same Purpose. The cutting Parts, *A A*, are concave and sharp-pointed; and its two Handles, *B B*, are closed by Compression and opened by the Spring *C*.

FIG. 14.

Exhibits the Boot of *Paré* open, for Children who are either *Vari*, having their Feet inflected inward, or *Valgi*, having their Feet turned outward.

FIG. 15.

Shews the same shut by three small Hooks.

FIG. 16.

Another Machine for reducing distorted Legs to their natural Figure, proposed by *Hildanus* in Cent. 6. Obs. 89, and 90. *A A*, the two Sides, made of stiff Leather, or of Plates of Iron or Brass, according to the Strength of the Child, which must be exactly fitted to his Leg; *B B*, is a Piece of soft and flexible Leather, by which the two Sides are connected; *C C*, the two Ligatures on each Side, by which the Machine is fastened tight about the crooked Leg.

FIG. 17.

Represents the preceding Instrument fastened upon the Leg, which is explained by the same Letters; but only the Inner side of the Instrument can be here viewed.

TAB. LVIII, and LIX. See FASCIA.

T A B L E LX.

FIG. 1.

A convenient Forceps made use of in the Operation to take out the circular Piece of Bone, of the Trepan when it does not stick to the Saw; the Contrivance by which they readily lay hold of it, is to make the Extremities that are to grasp it, with an Arch of the same Circle as the Saw is. Upon one of the Handles there is aded a little Elevation to lift up any small Splinter, but it is not of much Use.

The Remainder of this Plate is explained in the Tables.

T A B L E LXI.

This is already explained in the Plate.

T A B L E LXII.

This is already explained in the Table.

T A B L E LXIII.

FIG. 1.

Represents the Backside of the Leaf of the *Asa Fœtida* taken from *Kempfer*.

FIG. 2.

Represents the Foreside of the same Leaf.

FIG. 3.

Represents the Seeds of the same Plant.

FIG. 4, 5, and 6.

Represent the Roots of the same Plant.

FIG. 7.

Is a Medal of *Alexander*, the Son of *Ammon*. The Reverse is the *Silphium* of *Cyrene*, in token of the Oracle of that Country, which declar'd him to be the Son of *Hammon*.

FIG. 8.

Is another Medal, either of *Hammon* or *Old Battus*. The Reverse, as the first, is the *Silphium*, with the Legend *XY* for *Cyrene*.

FIG. 9.

Represents the whole *Asa Fœtida* Plant, as preserv'd in a very ancient Manuscript of *Dioscorides*, and now in the Imperial Library of *Vienna*.

A N I N D E X

O F

Those ENGLISH Words which are different from the LATIN Names contained in this DICTIONARY.

N. B. *Those Articles which are the same in English as Latin, are not inserted here, as being to be found under their proper Heads.*
